3627. That must be in comparatively suburban districts, I suppose ?—The only way of doing it is to purchase land in the outer ring, and they have done a great deal in that way, which shows also, it seems to me, that the County Councils, and other bodies might also do that to a greater extent than they have hitherto done. No effectual work in that way can be done unless the land is freehold and bought right out. The London Playing Fields Society, and other similar movements, have also rented ground ; but after spending a certain amount of money on renting and laying down the ground, they have been turned out, and so the money that has been subscribed for the purpose has been practically lost. Profiting by their experience they have bought land and saved as open spaces fifty acres at Raynes Park, and now they are preparing a scheme for providing ground in South London, which is very badly off indeed for ground for games, and they have nine acres of land at Earlsfield on a forty years' lease, but their ground at Willesden, which is on a short term, they will have to give up as it is required for building purposes.

3628. Both outside the Metropolitan area ?—That is the only way in which they can work by getting cheap tickets if they can, and so enabling the people who want to take part in those games to go there and back again on easy terms.

3629. Do the railway companies promote that ?—The railway companies have assisted us materially both in East London and in other parts, but on the south-west side of London we have not had the facilities given us to the extent that we have had in the north.

3630. Do they refuse it ?—The South Western have not given us the same facilities as the Great Eastern have done, for instance. The Great Eastern have given good terms to the Oxford House settlement. It would not be a very great drain upon public resources if more assistance were given than has hitherto been done by the County Councils. The London Playing Fields Association has done a great deal in that way, and provided London with an increase in open spaces for games, etc.

3631. Can the Borough Councils spend money under the present law ?—I am not sure. My impression is that they cannot.

3632. (*Mr. Lindsell.*) They have power ?—But it seems to me that it would be more effectively done by the County Councils.

3633. (*Chairman.*) Than by the Borough Councils ?—In conjunction with the Borough Councils.

3634. (*Colonel Fox.*) You were speaking just now about the uniform of cadet corps and lads' brigades ?—Yes.

3635. Do not you think that a cap and a belt and haversack is all that should be supplied to them free. It seems to me that very many boys could provide themselves with

Mr. Eyre. good strong blue serge clothes, which together with a cap and belt and haversack would be the very best uniform for the purpose?—Yes.

3636. If that was all that the Government would have to supply I think that they perhaps might do it; but then so many of the corps expect rather elaborate uniforms, and I think that is a very great pity, because they will never get it, and they would get the other, I think. The boys would look very well in it, too?—You want to add the tunic, although a less elaborate tunic than that supplied to some might be provided.

3637. The present idea of a uniform is a really practical kit, is it not?—Yes.

3638. I think we have accepted that for the real uniform, you cannot make it too practical, and I think that with a turn-down collar of the ordinary boy's jacket and loose pair of trousers, which may be of serge, and a cap, belt and haversack you have mentioned you would have a very practical uniform?—Yes, for younger boys.

3639. For all hands. I think you would find things much easier if you asked only for a belt, cap and haversack, and a blue serge is the most durable stuff you could have?—Yes.

3640. I am speaking not only of cadet corps but also of those connected with the Lads' Drill Association and boys' brigades. I think that a smart, well-set up boy would look well in it?—The cadet battalions are practically attached to some regiment of the line or to some volunteer battalion—and they have been expected to adapt themselves to the uniform in vogue in those battalions.

3641. The elaborate uniform, you know, at once necessitates great expense?—That is where the expense comes in so much, and prevents the development of the cadet and brigade systems now to my mind.

3642. You have been enumerating all those excellent clubs and brigades, but it strikes me that one of your greatest difficulties must be the provision of capable instructors?—Yes; I wanted to say something about that.

3643. I had the experience of seeing the other day at Oxford House two most promising instructors who came from the class to which the boys belonged, and they appeared to show efficient training?—Yes.

3644. It seems to me what you want is State-aid in having a school for the purpose of training these young men with a natural aptitude for drill and gymnastics, at a nominal fee, as instructors at your clubs. Do you not think that is so?—I wanted to say that the State provision of gymnastic instruction is a very practical and most important thing in connection with physical development.

3645. Do you not think that you have many men in your district with natural aptitude who could be there in the evening, who would be well trained, and go forth to the different clubs, and get a small fee as instructors in your clubs?—Yes; they would be competent in gymnastics.

3646. Both in drill and gymnastics?—Yes.

3647. In fact the whole of the physical training, or what we may call drill and gymnastics?—Yes, and they would be glad to earn a grant.

3648. They would be satisfied with a shilling a night for their work, whereas if you want a military instructor it would cost you a great deal more, and you would have to pay an instructor from the West End 5s. or 7s. 6d. per night; but if you could get a man in your own district it would be an inducement to boys to work for a position of that description?—It is rather difficult to get the boys to cotton to the instruction of somebody they know has really only been through the course they are going through themselves.

3649. You think that you want outside assistance?—Yes; an outside man to supervise it and to head it, so that the whole thing should be under a military man.

3650. Do not you think for the provision of leaders it would be a very good thing to have a school of instruction, provided by the State, for the instruction of those leaders under proper supervision?—Just so.

3651. Like those young men I saw the other day?—Well, you want a State-paid gymnastic instructor who would supervise and superintend, and then these leaders may be developed in this way at a very small fee.

3652. At the State-aided school—the evening classes?—That would be the most efficient way of doing it. A little payment—a little more than an honorarium—if they were confined to being the leaders, and not the actual instructors, would be sufficient.

3653. You were speaking just now about the girls' clubs, and that they are taught to be domestic, and you suggested that they should have physical training. At those clubs are there any rooms suitable for the purpose?—Very few of them. You want central halls in each of those areas, which could be used for the purpose of gymnastic instruction to girls on certain evenings and under the really efficient system of gymnastic instruction, such as you suggested, should be applied to boys.

3654. Have they accommodation at those clubs for gymnastic training?—They are very inadequate.

3655. Another question—Have you had any experience of the home life of the very poorest classes—the actual home life—the inner life?—It is as bad as it can be, and it is because of the badness of the home that the boys are bad.

3656. Have you had any experience as to the habits of the mothers—as to whether they are thrifty, or whether the food is bad?—I have not had any experience about the feeding, but I have heard others speak of it.

3657. Have you had any experience of the home life of the Jews?—I have seen their homes.

3658. Which would you consider the best?—I think the Jews look after their children better than the poorest portion of the English community.

3659. Are they not inclined to overcrowd their rooms more than the others?—Yes, they would submit to overcrowded conditions, but I think as to their nutriment they treat their children better than the English.

3660. Are they more thrifty generally?—Undoubtedly.

3661. Do you think that the fathers of the Jewish children drink less and are more abstemious than the fathers of the English children?—Yes.

3662. You are sure of that?—I feel sure of that.

3663. When you spoke just now about hooligans, or what are commonly called larrakins, what class do they come from, is it the lowest stratum, or simply the lads who have greater energy—what is commonly called “devil”?—I think you could not confine them to one particular kind of home or to one particular sort of parent. A boy is dragged into a gang of this sort of fellows by his own weak disposition very often, whereas his home may be a very good one.

3664. Do you not think that it is owing in the majority of cases to boys having superfluous energy?—I do, distinctly. I feel that if adequate provision were made for their recreation, almost the whole of this larrakin business would vanish.

3665. That is to say, if you provided them with footballs and made them kick footballs, they would not be so inclined to kick policemen in the street?—That is so. They simply want recreative facilities.

3666. (*Dr. Tatham.*) Referring to your general views on the subject of physical deterioration, does your experience tend to convince you whether or not the immigration of aliens is harmful in London?—It appears to me to be very harmful when they migrate into over-crowded areas. That is what I have seen myself in Bethnal Green and Whitechapel, the areas are already over-filled and they come into those very areas, and not some other areas.

3667. Do you think that they do so to any great extent?—Yes, I do, to a great extent. I am not at all sure that the Jewish element will not extort altogether the English element even from Bethnal Green, apart from Whitechapel and Stepney, if it goes on without any restriction.

3668. You think that in the poorer neighbourhoods alien immigration is doing harm?—In so far as it crowds out our own population it is, and the Jewish community, by buying up those properties in the eastern quarters of London, turn the Englishman out.

3669. Have you had any experience of the work of the Salvation Army in the poorer districts?—Yes, to a certain extent. I have been into their labour homes, and I certainly think they have provided for a large portion of the submerged tenth which nobody else has made any attempt to deal with.

3670. And you approve generally of their work?—I think that the social side of their work has been in many respects very effective, but they have not much hold upon the population of the east, as far as I can see, religiously.

3671. Can you trace it to any cause?—I should have thought that the population as a whole does not respond to their methods of proselytising, but the organisation of the army seems to me to have a good deal to commend it.

3672. (*Colonel Fox.*) Have you any experience of the Charity Organisation Society in that part of London?—Yes.

3673. Are they doing any good amongst the very poor in that district?—I think some of the most experienced who are at the work have got ideas in their heads about dealing with the people which would be very useful indeed to this Committee.

3674. Do you think that there is any information that we could get from them on the subject of the life of the poor that would be useful?—Yes, I should certainly call in aid the experience of some of the most experienced of the Charity Organisation Society.

3675. Mr. Loch is the secretary, I think?—Yes.

3676. Do you think that he could give that information himself?—Yes. I might particularly say that Mr. Paterson, who has been working at the Clerkenwell organisation, would be a very useful witness. As far as I have seen, he is one of the ablest and most practical of the workers in the field of charity organization.

3677. But they have the means of seeing and knowing the life of the poorer classes?—Certainly. They make such very close inquiries as to the causes of failure and so on, that the ablest of them would give you some very important information.

3678. (*Mr. Lindsell.*) You spoke about the injurious effects of those cheap sweet shops?—Yes.

3679. Can you say much from your own personal experience of them; have you any personal knowledge?—I have only seen the effects of frequenting them on the juvenile population I have had to deal with.

3680. I have had a very strong representation upon the subject of this gambling that you have just touched upon. The representation made to me was that they have these machines, and that a child puts a penny in and may get 3d. worth of sweets or lose his penny altogether?—Yes.

3681. Have you heard that there is a prosecution being instituted upon that point from Shoreditch?—Yes, I did hear about that.

3682. And it has been taken up to the Court of Appeal. The question seems to be whether it comes within the meaning of the Gambling Act, and the defence is that it requires skill—according to the way the penny is thrust into the slot, and if you exercise that skill you may be sure of your 3d. worth of sweets?—Yes. If you are clumsy you lose the penny, that is the point of the defence, that it is a game of skill and not gambling.

3683. Yes, I understood so. If this conviction is sustained the police will be able to cope with these machines?—I think so. Directly the police get control they can counteract the effect of this evil.

3684. It is not confined to London, but the complaint that I had came from Sheffield?—I should think that it is general.

3685. And the other complaint is that they sell cheap cigarettes and bad cigarettes?—Yes, that is so.

3686. Unless they take the precaution to get a licence they will also be liable to prosecution?—Yes.

3687. You have not heard that they do sell cigarettes without a license?—I have not sufficient information, but it is my idea that they do, and my opinion is that they do, from what I have heard.

3688. You talk about the hardship of having your premises rated?—Yes.

3689. You know that schools are exempt from rating, and you would like that extended to the places you were speaking of?—Yes, to where all this work is done.

3690. Cannot you get the use of the central halls of large elementary schools for the purpose?—They are not adapted to all the purposes of a club, you cannot put in any heavy furniture.

3691. You could not put in gymnastic appliances very well?—Not easily. Then you have to attract boys to this sort of thing by providing such things as bagatelle and billiards, and no tables could be put in there.

3692. But for the purpose of purely physical exercises and drill they would be available?—I think it would be very easy to adapt these splendid school buildings that exist, more in the future than they have been in the past, for the purpose of gymnastics. That leads me to say that gymnastics and musical drill, and also proficiency in swimming in the summer, might be encouraged more by grants being made available for them—that they should be made grant-earning subjects.

3693. Do you know that physical exercises are grant-aided under the Education Act?—But only in combination with some other form of education.

3694. But they are recognised as instruction under the Code?—But only in combination with some other form of education.

3695. Yes, it is part of the school curriculum—it can be made part of the school curriculum?—My suggestion is that it should be made grant-aided, quite independently of the Board Schools; and in very many parts of the poor portions of London, splendid work is being done in developing swimming instruction, for instance, in the public baths in their neighbourhood.

3696. I was coming to the teachers. I suppose you find that they co-operate with all your societies?—Yes, they do. The teachers of the public elementary schools take a tremendous amount of interest in their pupils, and they are exceedingly anxious for their welfare, but it would overwork them to involve them in night as well as day work. But they do a great deal at present.

3697. Do not several of them have clubs for their own boys?—Yes, they do, and it is a very good idea indeed.

3698. They work in harmony with those associations, I suppose?—Oh, yes.

3699. (*Colonel Fox.*) I remember the last day I was at Oxford House there was a squad of boys came into your club-house headed by a teacher from the school to which they belonged, and the teacher was a man who took a vast interest in it?—Oh, yes.

3700. He practically marched them up to your club to go through their exercises?—Yes, and they do the same in the summer when the swimming baths are open, and, therefore, you get those masters who are able to organize on a very large scale, the physical and moral welfare, irrespective of the school hours.

3701. He was a splendid young man who was in charge of those boys?—Yes, and there are others.

3702. (*Mr. Lindsell.*) When that large force of boys were on the Horse Guards' Parade, they were nearly all officered by teachers, were they not?—No, those were Church Lads' Brigades and Boys' Brigades, as distinguished from cadet corps—they were not confined to the London Brigades.

3703. But they were officered by teachers, were they not?—To a certain extent by teachers, but mainly by members of religious associations, church workers, etc.

3704. Have you any experience of the Public School Mission?—Yes, I know a great deal about it.

3705. Do they take this work up?—Yes, very well, and they are very successful. They lean more towards cadet corps than Church Lads' Brigades.

3706. Do you consider that the Church Army does much the same kind of work as the Salvation Army?—I think it does.

3707. Does it reach a lower stratum?—I think that it does reach the lowest strata on a smaller scale altogether than the Salvation Army.

3708. The difficulty is to get the lowest strata into your organisation, is it not?—Yes, it is a difficulty. But if you strengthen the hands of the existing agencies, you seem to enable them to go down to the lower strata, and the condition of reaching the lower strata is to do something for the higher strata first.

3709. (*Mr. Legge.*) I gather from the last portion of your examination that you would like to get this State-aid from the War Office in connection with cadet corps just as it is taken from the Board of Education with grants for physical exercises, and so on?—I should have thought that the two would have been independent; that if the War

Mr. Eyre.

Office considered cadet corps part of the military system of the country, they would provide for them in the same way as for the volunteers.

3710. Yes, but generally the grant would be from the Board of Education on physical training?—On physical training pure and simple.

3711. (*Mr. Lindsell.*) I do not know whether you know it, but last year the experiment was tried of allowing attendances in camp to a boys brigade from a particular school, to reckon as part of the attendances for purposes of grant?—Yes.

3712. It was made an experiment and succeeded very well. That would be the way of receiving aid for these institutions?—I think that a camp grant would be the first thing.

3713. Of course, it went to the general education, but still a grant was allowed of attendances made not in the school, or at any particular manual instruction centre or in any sort of actual school hours for boys, but in the camp?—Yes; I think that that is a very important part of any scheme of help.

3714. Would you like to see that further developed?—Yes; a camp grant by itself would be a very important source of assistance to all those agencies, and particularly to the cadet corps and brigades.

3715. (*Mr. Legge.*) You are aware, no doubt, that before the Board of Education stopped the grant for physical training to evening continuation schools an attack upon the administration of it was made by Sir John Gorst?—Yes.

3716. In which he accused the London School Board of encouraging dancing, and so on?—Yes.

3717. You are also aware, of course, that some very severe strictures were passed upon the fairness of Sir John Gorst's attacks, both by Mr. Stewart Headlam, of the London School Board, and Dr. Macnamara?—Yes.

3718. But so far no answers to those have been vouchsafed by Sir John Gorst—you have seen no answer from him?—No.

3719. Well you would rather like to see those grants reintroduced under proper regulation?—I think that they should be.

3720. Did you see that report by the Scotch Royal Commission on physical training?—I have not studied it carefully for I have not had time yet, I have seen portions of it.

3721. They had a special recommendation to meet the cases of the roughest classes in the country, namely: that special evening continuation classes with a particular curriculum, suited to their needs and designed to make the class attractive, should be instituted; would you be in favour of that?—I should if I knew that they were workers who could deal with them when they got them into the buildings.

3722. It would be a very elastic kind of thing?—Yes, and nothing in the shape of mental work would be successful at first.

3723. Nothing at all?—But their chief need would be a physical side entirely.

3724. (*Mr. Lindsell.*) Boys of what age are you speaking of now?—From fourteen to eighteen years.

3725. (*Mr. Legge.*) Supposing local education authorities provided such evening schools, would you be prepared to go so far as to enable a charge to be preferred against any loafer in the street of that age to account for himself and his evenings, or to attend one of those schools? That was another recommendation of this Commission?—Directly the work for them was sufficiently organized, it seems to me that they should be brought to account for loafing about and getting into mischief.

3726. Do you think it would be a good thing that the club should form a part of the regular elementary school system of the country, or in certain districts which should be scheduled, that the schools should be supplemented by a club carried on in the same building, or in part of it, for its own old pupils?—Yes, I think that there would be very great advantage derived from that. That is one of the great weaknesses of their system, the way in which all the associations, both State and volunteer societies, lose sight of old pupils so to speak; lose sight of lads and girls

whom they have been brought into contact with up to fourteen. There is so very little done for them afterwards, and both the schools and those religious societies ought to be strengthened in that direction.

3727. You would like to see more inspection of clubs and so on?—I should be quite prepared to see that as a condition of their earning the grant for physical work.

3728. Your league does not at present do anything in that line; they have not a man who travels round and makes reports, pointing out where the work done is bad, fair, good, and so on?—Our league is getting together an organisation for that; but we have not yet been able to undertake this ourselves. Supposing we get money subscribed, we should certainly send round the most experienced people we can get associated with us for the sake of looking into the adequacy of the work.

3729. As I understand, this Twentieth Century League deals with the Metropolis only?—That is all at present.

3730. You would be glad to see an extension of the organisation to cover the whole country, and to co-ordinate it?—That is what we want.

3731. Because the work of one of these clubs would be more effective if you could exchange boys with Glasgow and Edinburgh, or even Aberdeen?—Yes, there should be a practical scheme of commendation from one to the other.

3732. Are you aware that the Roman Catholics have an organisation of that sort?—I did hear of it. I do not know to what extent.

3733. And can transfer boys when desirable from London to Liverpool, and from London to Edinburgh, and so on?—Yes.

3734. I think you did not mention, though no doubt you had it in your mind, the Metropolitan Association for Befriending Young Servants amongst the girls' agencies?—I did not mention them because there is no physical side to them, as far as I know. I may be wrong, but I did not know there was any physical side to their work.

3735. Now with regard to Colonel Onslow's question as to the danger of stigmatising clubs as recruiting agencies. I suppose most of those clubs are to a certain degree employment bureaux, and help to find work for boys?—Yes, if they find boys out of work they do their best to recommend them.

3736. Surely the difficulty would be overcome if, in addition to civil employments in ordinary life, the clubs were posted up with information as to the junior branches of the Civil Service, Post Office sorters, and telegraph boys, and so on, and there would be no harm in adding to them the full information as to the employment of boys in the army and navy?—I think the chief ground taken by parents against the army and navy is that they lose the wages of the boys, which constitute an important source of income to the family.

3737. But if information with regard to enlistment was simply supplied as one item in the general work of helping boys to employment, the prejudice would be an unreasonable one, would it not?—Yes. It seems to me that it very often is even under existing conditions, when a boy really wants to go into the Army or into the Navy.

3738. (*Colonel Onslow.*) That is perfectly true with regard to the parents, that their fear is the losing of the wages. That is the greatest drawback in recruiting to the Navy, which has an enormous number of eligible boys who come up, whose parents refuse their consent mainly, as a rule, because they know the boy will not for some years be able to send anything home; is that your experience?—Yes.

3739. To go to another point: a short time ago two brother officers of mine, old Rugby boys, were working in London for the Rugby Mission Club, at Notting Hill, and they wanted a sergeant as an instructor, and an excellent man went there who would have been well fitted for the work; but the parents heard that they were going to have this sergeant and the man had to go away, and he was going to give his services voluntarily?—Quite so. I do not think that the prejudice would be carried so far as a general rule.

3740. (*Chairman.*) One more question. Is it the practice in these clubs and brigades to take any note of the physical characters of these boys at entrance with the view of recording physical progress?—Some officers do it, and it ought always to be done if you have time to attend

to those things. I understand Captain Bennett, one of the officers of the West Surrey cadets, is going to give you evidence upon that point. He has taken the chest measurements in the Southwark District, and I understood that he was going to give you the results of his investigations, and he has sent round to the other officers in the same battalion. I have not taken it up myself personally.

3741. Do not you think it would be a good thing for your central organisation to bring to the notice of the different bodies affiliated to it the system of taking some note of a physical character with the view of recording development, and contributing to the general knowledge

on the subject?—Yes, I think it would be a good thing, and I will mention it to the Council. *Mr. Eyre.*

3742. It would not add much to the labour of those organisations if the boys were examined on entrance and had their height and weight and chest measurements taken?—No.

3743. And notes of the same character at intervals of their membership or when they left?—Yes, it could be done.

3744. (*Colonel Fox.*) This could easily be done when they are stripped?—Yes.

Mr. JOHN TWEEDY, F.R.C.S., L.R.C.P., called; and Examined.

3745. (*Chairman.*) You are President of the Royal College of Surgeons and you are President of the Ophthalmological Society of the United Kingdom?—Yes.

3746. Have you formed any opinion as to the bearing of the question of eyesight upon physical deterioration?—I have divided my notes into the two questions, first of all, whether there was any evidence of physical deterioration, and, secondly, more particularly with respect to the disabilities of those who offer themselves for enlistment. From the standpoint of ophthalmic medicine and surgery I do not see there is any evidence so far as the eyes or the sight of the population is concerned, of any physical deterioration of the people; there is no evidence in the eyes that degenerative diseases are more common than they were. I may say, perhaps, my experience in the hospital and in private is a very large one. I have been for thirty years connected with Moorfield's Hospital, which is the largest ophthalmic hospital in the world, where they have about 35,000 new patients every year. Of course it was only a certain proportion of those who came under my care, but I reckon that my share would amount to an aggregate of about 120,000 patients. During the whole of that time I have been connected with University College Hospital as well, where the number of patients is very much smaller. Altogether, I suppose, I must have seen well on to 150,000 to 180,000 different individuals suffering eye troubles. As the result of that experience I do not see that there is any evidence of any physical deterioration of the people or of their sight. I do not think diseases of the eye are more common. I do not think defective vision is more common.

3747. Is there any correspondence between deterioration of the eye and general deterioration?—Oh yes, that matter I incidentally mention in my *précis*. There are many persons who are degenerating as regards physique or constitution—I mean in some types of people or families you see evidence of deterioration of the sight and eyes. For instance, there is a very close connection between the eye and the development of the brain. The retina which is the sensitive membrane with which the eye sees, and the optic nerve, are in the early stages of development an actual offshoot from the brain, so that the essential structures of the eye, the nervous mechanisms of the eye are really buds thrown off from the brain tissues, and they retain that continuity throughout life.

3748. And, therefore, they are very susceptible to causes which affect the general health?—Very. The same thing applies to the lens of the eye; and there is a very close relation between development of the eye, the brain, and the teeth. In large numbers of people who suffer from essentially degenerative types of diseases of the eye there is often great deterioration of the teeth as well. The foundation of the teeth is laid about the same time that developments are going on in the eye, so there is a very close and intimate relationship between the two. On the other hand there is a very marked reduction in the number and severity of many diseases of the eye which used to be very common, among them is the condition of what is called trachoma or Egyptian ophthalmia.

3749. Is that congenital?—No, that is an acquired disease and a disease which used to play terrible havoc with our soldiers. In fact up to about thirty years ago there was no large community of the people such as those in workhouses and barracks, and so on, in which this disease was not more or less rampant. It is an acquired disease. I remember quite well in my early days, when I was a student, it was my business every morning to attend to twelve, fifteen, or twenty of these cases, and dress them. Now it is rather a rare thing in the London hospitals.

Surgeons coming from the Colonies and from the United States are all struck with the small amount of what is called "granular lids" in London compared with what they get in the Colonies and in America. *Mr. Tweedy.*

3750. To what do you attribute that change?—A greater attention to personal hygiene, greater care in cleanliness, and earlier attention to any eye trouble, any simple inflammation of the eyes, and I think it is entirely the outcome of the improved habits of the people, greater cleanliness, isolation of these cases directly they are discovered, and earlier attention. The havoc that this disease used to play was terrible. I should like to quote from a speech which I made at the Mansion House on behalf of Moorfield's Hospital with regard to the damage that this Egyptian ophthalmia used to inflict:—"In the Egyptian Campaign at the end of last century many here may know as a matter of history, that when Napoleon landed in Egypt he had with him some 32,000 troops and it is said that within two months every one of those men were attacked with ophthalmia. During the English occupation at the beginning of the century a similar disaster overtook the British soldiers. Particulars may be given with respect to one battalion alone which was by no means exceptional or unusual. The battalion was of 700 men, and among these there were 636 cases of ophthalmia, and of these 636 cases, 50 became totally blind in both eyes, 40 became totally blind in one eye, and many others had more or less damaged sight." In Lord Wolseley's campaign in Egypt it was a source of great anxiety to the authorities as to how they were to deal with the soldiers. Surgeon-General Marston spoke to me at the time about it. Precautions were adopted; men were instructed what precautions they should take about their eyes, and the result was that in the Tel-el-Kebir campaign there was not a single soldier who lost his sight from ophthalmia. This result was entirely due to the wise foresight of the Army Medical Department and to the intelligent co-operation of the officers and men. Surgeon-General Haubury who was the principal Medical Officer in the Campaign was amply justified in concluding his report with these remarks:—"These results, when contrasted with those which have been recorded of the same disease in the war of 1801, justify the expression of my opinion that the Army Medical Department has never performed a better service than this or one that they have more reason to be proud of."

3751. (*Colonel Fox.*) Is not the poison generally conveyed by flies?—Flies may convey it. I have brought with me a drawing of the disease (*handed to the Chairman.*) This is called granular lids; it is under the lids. The disease can only be seen when you raise the lids, but it leaves a terrible destruction if it is allowed to go on unchecked. Any form of ophthalmia may be conveyed by flies. These granular lids, true trachoma, is a distinct and specific thing. It eventually becomes a growth in the lids, invades the front of the eye, and if not skilfully and thoroughly treated for a long time, leads to partial or total blindness.

3752. To what do you attribute the cause of ophthalmia?—This form is no doubt caused by some agent of a specific character, most probably bacteria.

3753. (*Dr. Tatham.*) You would call it an infection?—Yes. It is very much like tubercle in many of its characteristics. Tubercle—consumption—is due to the presence of a specific bacillus, and this is also probably due to a specific bacillus.

3754. (*Colonel Fox.*) Is it conveyed by dust, perhaps?—Mere dust would not cause it. But it is right that the Committee should know that from this cause alone—the diminution of this disease in England which, I believe, is

Mr. Tweedy. entirely a matter of cleanliness, care, and attention—there has been an enormous reduction of eye disease and blindness also. The same may be said with regard to purulent ophthalmia. Purulent ophthalmia in infants was the cause of 30 per cent. of the blindness in England.

3755. (*Chairman.*) That is from the neglect of precautions at child birth?—It is due to some sort of infection. Of course, it is neglect to some extent. These cases have become comparatively rare. Twenty or thirty years ago there were in England 20,000 to 30,000 people blind from that one cause alone. Now-a-days one, comparatively speaking, very seldom sees a case of bad purulent ophthalmia in an infant. So that upon the whole, so far as mere eye disease is concerned, I should say that there is less eye disease from preventable causes, and especially from causes implying want of care or want of cleanliness, or even want of physique.

3756. Do you include syphilitic diseases of the eye under that?—I think there are fewer, and certainly less severe, forms of syphilitic diseases of the eye than there were twenty-five or thirty years ago. I do not mean to say that there is less syphilis—I do not know. Of course I only see the later phases of the disease. I do not see the earlier stages of syphilitic disease, but I see it either in the later phases of acquired disease, or still more the congenital inherited syphilis.

3757. Have you formed any opinion as to whether eye disease is more prevalent in towns than in the country?—I do not think there are any data on which one could form a definite opinion. Eye diseases are so various and varied. The great majority of eye patients that come to hospitals really now come on account of optical defects; that is, from some cause or another they need glasses. A great many of these cases of children are brought on account of headaches, that is the explanation of so many more people wearing glasses now. I do not believe at all that there is any evidence of any increase of even these optical defects.

3758. Defects of eyesight receive attention now which they did not do before?—Quite so, and especially in connection with headaches. It is now understood that an optical defect will cause headache, and children are now looked after, whereas twenty-five years ago it was not suspected that there was any connection between the two. Then with regard to town and country, I may say I have been in the habit for years of remarking how frequently the really degenerative types of disease occur in people from the rural districts. Of course there are many explanations. There is an affection called *retinitis pigmentosa* which is an essentially degenerative type of disease and occurs in persons who have other forms of degenerative changes.

3759. Do you expect to find them in the country rather than in the towns?—Yes. I have observed more cases of this *retinitis pigmentosa* which is associated with deaf-mutism, epilepsy, and things of that kind, from the country districts. There are many explanations of that. I think very likely one explanation is that in the rural districts there is probably more inter-marrying, and *retinitis pigmentosa* is often found in the offspring of blood relations. This is the appearance of a healthy eye. (*Handing drawing to the Chairman.*) The second picture shows the degenerative progressive pigmentation of the retina which goes on to actual blindness in time.

3760. Is that partly due to the fact that the stronger types in the rural districts are apt to migrate into towns and leave only the weaker vessels to propagate the species in the country?—Yes, and I think there is also a reverse current.

3761. Debilitated people from the towns go into the country?—Yes.

3762. The country suffers in both ways?—Yes, many people in the better classes of society are told by their medical advisers that they are not fit for certain occupations and they had better lead an outdoor life and follow a pursuit which does not require so much use of their eyes; and they take to farming and things of that kind. There is a current of the better and more adventurous people into the towns and also a smaller reverse current of the feeble and less strong and fit, who are driven back to the land again.

3763. The country is both the recruiting ground and the asylum of the town?—Yes, it is.

3764. Turning to these questions, so far as they affect the enlistment of soldiers, you have some observations to make on that point?—In the table which was drawn up by the Director-General, all the rejections from defects of vision were grouped together. Of course that may mean anything—it may mean that a man is simply short sighted, and could not see the necessary type that he ought to see without glasses.

3765. Upon that point I put some questions to Sir William Taylor, I said “I observe that ‘defective vision’ ranks very high. In the tables you gave for rejections for 1901 and 1902, I see that the labourers’ class ranks first. I want to ask you as to the method in vogue for the examination of recruits. Is it only acuteness of vision that you aim at testing?—Yes, but if a man has got a chronic disease of the eyes that is likely to be infective—altogether without the range of vision—we reject him. A man with chronic inflamed eyelids we reject”?—Diseases of the lids are placed in another group. If you have the table you will find there are defects of vision, and then another classification for diseases of the eyelids; that is a different thing. Defects of vision and diseases of the eyelids are two different causes of rejection. It may be purely an optical defect. It may simply mean that a man has got so much shortsightedness, we will say, or it may mean that he has an eye which has been unused. Many people are born with, or anyhow acquire early in life, unequally sighted eyes, and one eye may fall out of use in consequence. Many of these eyes, if they were taken in hand early could be brought into use and be made useful. But, of course, the examiner for the army simply says the man has failed at this or that test, and, therefore, he is rejected with both eyes. These are the types that are used—Snellen’s types (*the document was handed to the Chairman.*) The other is a dot test for people who do not know their letters. It is the same sort of thing. It is necessary for an officer to read *this* type, which is called No. 24 Snellen, at twenty feet or six metres. He must do that with each eye separately, otherwise he is rejected. A few years ago it was *this* type, No. 36 Snellen, which was accepted. That difference excludes many men—the difference between what is called $\frac{3}{8}$ and $\frac{1}{4}$. I do not mean to say that the present standard is too high, especially with the long range guns which are in use, but it is the fact that many men are rejected on this test, who would not be rejected with the former test. There is a good deal of difference between these two types seen at twenty feet. There is nothing in the Director-General’s tables to show how many of these men were rejected for purely optical defects, such as short-sightedness, or how many were due to physical defects of the eyes, films on the eyes, or diseases of the eye. I do not think it is possible to form any idea as to what is really included, or to be understood by defects of vision. It is simply that the men cannot read that type, No. 24 Snellen, at twenty feet, or count those dots.

3766. Sir William Taylor told us that all the men he employs are specialists in ophthalmia, so that I presume a further sub-division could be given?—They simply test the man by asking him to read these letters. If he stops at *this* line, No. 36, you cannot pass him. It would require a prolonged examination of the eye to say why he cannot see more than that. It would require ten minutes or a quarter of an hour at least for a skilled person to find out whether it was simply shortsightedness or what. It would take six weeks to examine 1,000 men in that way, to find out why they could not see that type. They are simply asked what they can read. There are many of these cases which probably are improvable, if taken in hand early enough. I do not venture to offer any suggestions as to dealing in any way with these defects or mitigating them; but I think that there are many agencies at work now which are bound to lead to a good deal of improvement, both in the physique and in the condition of the eyes, although they may not lessen the amount of shortsightedness.

3767. Shortsightedness is not a proof of degeneration?—Not at all. In fact some people think it is rather an evidence the other way. The shortsighted eye is the eye of civilised races. The farsighted eye is the eye of primitive man. Primitive man wants a long range to spot his game.

3768. And to protect himself from his enemies?—Yes, whereas the civilised man mostly works within a yard of his eyes, so that a short-sighted eye, provided it is healthy,

is rather an advantage to civilised man. In the German army short sightedness is not regarded as a disqualification.

3769. (Sir William Taylor.) I put a question on that point to Sir William Taylor, as to whether a great many of these people would not form useful soldiers if equipped with glasses, and he appeared to think that that was too big a question to enter upon?—On the other hand, in countries where there is conscription, short sightedness would not be a disqualification at all, otherwise half the Germans, I suppose, would claim exemption on account of short-sightedness.

3770. (Colonel Fox.) Do you not think that short-sightedness is the result of education—of overtaxing the eyes in the young?—The short-sighted eye is simply an eye that exceeds a certain length. Any eyeball that exceeds a certain length is short-sighted. It is just like an opera-glass that is screwed out a certain distance. The prevailing type of eye in England is the opposite type of that, namely, the far-sighted eye. The short-sighted eye has become a large eye, a big eye, and may be perfectly healthy, and provided the short sightedness is not great it is positively an advantage for most purposes of civilised life. On the other hand, it is quite true that some eyes become short-sighted, because the coats of the eyes are weak, and they yield under pressure, under stress of work, and so on. Those eyes are often very poor eyes. They become subject to very serious degenerative changes at the back, leading to serious impairment of the sight, but simply short sightedness in itself is certainly not a sign of degeneration, and short sightedness, with healthy eyes, is rather an indication of an advancing type of race.

3771. (Chairman.) Arising out of what you have been saying, do you not think that the testing of the eyesight, whether for colours or objects, should take place in childhood, and before a youth has wasted time in acquiring technical knowledge, which his faulty sight precludes him from using to the best advantage?—Certainly; and this is being done to a large extent now, as I daresay you know, by the London School Board.

3772. Would you not approve of a medical inspection of schools, taking special note of eyesight?—Certainly; both of eyesight and other things. Much good is being done now by the systematic testing of the sight of children in board schools, and in the high schools, and many cases of defective vision are now recognised by the inspectors, whoever they may be. These children are spotted and sent for advice. Many of these children get greatly helped, and the eyesight improved by early attention, whereas left to themselves they would not discover there was anything wrong, and they would go from bad to worse. I think a great deal is being done now. It might be possible to extend it and make the benefits more general still. As to whether the work of the school boards is doing much harm to the eyes, I very much doubt it. Of course there are many children who perhaps would be better if they were not only doing less work with their eyes, but working under more favourable conditions—I do not mean at the schools, but at their own homes. Many of these children acquire the reading habit at schools, and they go on reading in the bad and miserable lights of their own homes. It has been quite clearly shown that so far as short sightedness is an acquired disease it increases in proportion to the use of the eyes, and to the want of proper illumination.

3773. By the conditions under which they are used?—Yes.

3774. Are there any particular forms of eye disease which you think may be due to the use of the eyes at school under the least favourable conditions?—I should say some of these cases, which are sometimes called malignant forms of shortsightedness, might be but not the true physiological type of eye. But I do not think there is much actual disease produced. I think it is far more the case that these children get headaches and get irritable eyes, and then attention is directed to the eyes, and advice and treatment are obtained. I do not think there is any evidence of definite disease being produced.

3775. How about the use of different sorts of light—gaslight and electric light; have you formed any opinion of the effects of those agents upon the sight?—No, I have not. Provided the room is fairly well lighted, I do not think it matters what the illuminant is. Good daylight is preferable, of course, but for many weeks in the year we cannot

get that anywhere in London. I do not think it matters what the illuminant is, provided it is well placed and there is enough of it without being too much.

3776. (Dr. Tatham.) With regard to the subject of syphilis, according to your experience is there an increase in the amount of that disease in this country?—No, my experience is rather the other way, but, as I have said, I only see the later phases of it. Of course, whether there are more or fewer cases of primary syphilis I do not know, but my strong impression is that there is nothing like the same amount of secondary and tertiary disease, or disease transmitted to the children; I am quite sure of that. I have been struck with it myself, and only a few days ago I was talking to one of my assistants, who has worked with me for over seventeen years, and he quite confirmed me in that respect, especially with regard to inherited syphilis. There is a very remarkable and peculiar disease of the eye which is essentially a disease of inherited syphilis. I am sure these cases are enormously less than they were—what is called interstitial keratitis, that is far less frequent than it was. Whether that is because there is less syphilis or not I cannot say—probably not. I think it is largely due to the fact that the parent is probably more efficiently treated and cured, so far as you can say a case of that kind is cured, and I think now that all surgeons, even those who are not experts in the treatment of syphilis, would always caution a man that he ought not to marry within a certain time, and not till after a prolonged course of treatment and certain period of absence of symptoms. So that it is quite possible that it may be from the improved treatment in the parents one sees less inherited syphilis in the children—certainly as regards the eyes.

3777. I daresay you are aware that so far as the statistics of mortality will help us, syphilis is at any rate a very much less fatal disease now than it was twenty years ago?—I do not know that specially, but that only confirms what I believe, as a matter of observation and experience, that syphilis is nothing like so malignant as it was.

3778. (Mr. Lindsell.) You would strongly advocate some sort of systematic examination of school children?—Very strongly.

3779. Could that preliminary examination—I mean the tests—be satisfactorily conducted without calling in expert assistants?—Yes. Anybody could employ those tests; it is not necessary to have a medical man. I daresay you know that the London School Board does employ certain young surgeons?

3780. I know they do, but, of course, there is the question of the rates. You say it could be done in its initial stage without the necessity of employing medical men?—Yes. These are the recognised types on this sheet, and all that is wanted is to measure off the distance and ask what the children can read. This line is to be read at 20 feet, and the others at 30, 40, 50, 70, 100, and 200 feet. If a person can read the smallest type of letter at 20 feet he has got normal acuteness of sight, and his vision is said to be $\frac{1}{20}$. It means 6 metres, which is practically 20 feet. On the other hand, supposing a person at 20 feet could only read this big E—the largest type—his vision would be called $\frac{1}{200}$. That is, standing at 20 feet he can only see an object which a natural sighted eye should see at 200 feet or 60 metres. If you look at those types you will see they are made up of little squares, a fifth of the height and a fifth of the breadth. The basis of those letters is what is called the minute angle. The smallest object that can be seen by the healthy human eye is an object which subtends an angle of one minute at the optical centre. Two stars, for instance, can only be differentiated as two if there is an interval of a one minute angle—it does not matter if it is one hundred million miles away or one foot away, the minute angle is just the same. This gap in the letter E gives a minute angle at 200 feet, 60 metres; just as this gap in the Z gives a minute angle of 6 metres. That is the basis of the whole test. The whole letter gives a five minute angle, but the gap is one minute. That is all that is wanted as regards the mere test of sight, to find out what letters a person can see.

3781. It would only be necessary to send a child to an expert examiner if he failed in the test?—Just so. If a child can see the last line of letters it is all right; if he cannot there is something wrong, and you must find out what it is. That is really all that the examiners of the London School Boards do. They find out the child's sight and then, if faulty, they say it must be treated. They

Mr. Tweedy. do not treat the children in the Board School, they send them away to be treated. Any person could conduct that examination ; it is just as easy as teaching the time by the clock. It would involve no expense whatever, and it would be a good thing, perhaps, if every child when he went to a school was first of all tested in that way, if he knew his letters, and then at certain intervals of a year or something of that kind.

3782. (*Chairman.*) It might be made part of the treatment of an Infants' School, and be part of the ordinary school work ?—Yes. A great many of these children were formerly left to grow up with one unused eye which might have been saved. There are many cases of very slight inequalities of vision—the eyes being otherwise healthy—where one eye drops out of use and becomes dull-sighted simply from non-use.

3783. Colour blindness may be also detected ?—Yes ; that could be detected in a rough and ready way by colour types.

3784. Is colour-blindness increasing so far as you know ?—I do not think there is any evidence to show that one way or the other.

3785. (*Colonel Onslow.*) Very often there is an ignorance of colours ?—Yes ; a good deal of it is ignorance of colours. You mean ignorance of a colour vocabulary ?

3786. Yes ?—But that does not apply to the ordinary test that we use. There are several tests that are used. There is the test of sorting cards, and a more common test is the test by Holmgren's wools. You do not ask the patient the name of the colour, but you simply ask him to match it

3787. In the recruiting examination for the Navy, we use the colours of flags, the actual bunting ?—Yes. You ask the man the names of the colours ?

3788. Yes ?—Of course if a man says it is red, or blue, or green, or what not, that is sufficient ?

3789. We have found in cases between yellow and green, and green and blue, that a man really seems hardly to know the names of the colours, especially in the case of some countrymen ?—Blue is nearly always present. But if you test these people with the wool, you do not ask them the name of the colour, but you tell them to take a certain skein of wool and pick out another to match it. Colour-blind persons may pick out, perhaps, a green to match a red. You ask them if those two are alike, and they say that they are, but one is a little darker than the other. If a man has a good colour sense, he will pick out all shades, red and pink, as readily as possible. There are three test colours, but in a rough and ready way a person may be just asked to name certain colours. I see a good many young fellows going into the Army and Navy, and I just take a little disc of certain colours. Perhaps I show a pale red or pink and a pale green, and if he names them readily I pass him. On the other hand, if there were any hesitation I should take the Holmgren's wool test.

3790. What would you call full normal vision ?—That is the last line of letters of Snellen's type, No. 6, at six metres.

3791. What do you say as to the naval test ?—Naval men must have perfect sight. They have to spot lights at great distances.

3792. Lights and flags ?—Yes. Nowadays with fast-going ships it is necessary for sailors to have perfect acuteness of sight.

3793. We insist upon full normal vision for all classes except artisans and stokers. I have here a record of three years' recruiting in London alone. Eleven per cent. of those who were rejected were rejected for defective vision alone. In one year's record of the whole country—that is recruiting for the whole of England, Scotland, and the north of Ireland—the number of rejections for defective vision was only 7 per cent. ?—I repeat there is nothing to show what defective vision means.

3794. We classify the diseases of the eye and everything of that kind under a different head altogether, but that is simply Snellen's test ?—That is set at twenty feet away from the man, and he is asked to read it. If he cannot do so he cannot pass. The Army does not require the same acuteness as the Navy. A candidate for the Army must read the third line at twenty feet with each eye separately, that is $\frac{2}{3}$ Snellen. That is the test.

3795. Would you not think, judging from this fact, that there 11 per cent. were rejected for defective vision in the case of London, whereas only 7 per cent for the whole country, that the inhabitants of towns are liable to it more than people in the country ? I am sorry I have not the difference between the actual country districts and towns ?—I think it is very likely there is a larger proportion of short-sightedness in towns.

3796. That is owing to not using the eye ?—It may or may not be. I take the short-sighted type of eye as belonging to a higher type of person, other things being equal. The more intellectual type of people get into the towns, and there is a larger proportion of shortsightedness. It does not necessarily mean disease of the eye. That is the point—it does not necessarily mean degenerative disease.

3797. (*Colonel Fox.*) Do you not think we may infer that because there are more shortsighted people in towns, shortsightedness is caused by education and the study of books ?—I should not myself say it was caused by that ; I think it is the more intellectual races throughout the world. Whether in town or country there is a larger proportion of shortsightedness in the higher and more intellectual people than in the lower classes. I do not know that there is any proof that shortsightedness is, as it were, exactly a manufactured product. If the eyes are bad, if they are poor eyes, poor structures, then the strain of school work produces not only shortsightedness, but these very degenerative types of eye, which lead to very severe and grave changes at the back of the eye, which is a most alarming condition. What is called progressive shortsightedness in young people is a very grave condition indeed, because it is accompanied by changes at the back of the eye.

3798. Is it not attributable to want of nerve power also ?—No ; it is the poor structure of which the eye is composed.

3799. Have you any remarks to make in connection with the test of sight for recruits entering the Army ?—If you mean would I suggest lowering the standard, I do not think one could exactly do that in view of the range of guns nowadays, but I cannot help thinking that many a man would make a good soldier if he was allowed to wear glasses. Of course it is a point whether the Army people would sanction it, but I do not see any drawback.

3800. He would make an excellent soldier, just as good as another in time of peace, but in time of war there would be a great chance of his losing his glasses ?—A large number of the officers in the Army are shortsighted.

3801. (*Colonel Onslow.*) And the Navy too ?—Yes, but of course they may not have been shortsighted when they entered or perhaps they got through on easy terms. If a man could not read the third line of type I should find out why he could not. If it was simply due to shortsightedness, and the eyes were otherwise healthy and good, I would pass him even if he could only see the large letter, 60 Snellen, and let him have spectacles. Such a man who is only able to see the big letter, if his eye is good, is better off than a man who might be able to read three or four lines lower down who has not a good eye.

3802. Do you not think in time of war that men when they got a little tired of the whole game would voluntarily lose their glasses ?—I suppose they would. That, of course, is one of the risks.

3803. Do not you think a number would by accident lose their glasses and never get them replaced ? That is a serious consideration ?—But if they lose their glasses it would be at the risk of their lives, and men are not likely to do that. I think glasses would be rather in requisition, it would be more a case of appropriating other people's glasses.

3804. If it is a long campaign and men get tired, would they not make that excuse of having lost their glasses ?—I do not think they would. You cannot send a man off because he has not a pair of spectacles. He must take his chance, and if he is short-sighted he loses his glasses at the risk of his life. He would have to pay the penalty. In the South African war I know two or three officers—they were not in the regular army but yeomanry officers—who lost their lives, I believe, because they lost their glasses. One man came to see me before he went out, and I strongly advised

him not to go. I said, "If you lose your glasses you cannot tell a man from a haystack." He could not have recognised you across the table. In a scrimmage I suppose he lost his glasses, and he was killed. I advised him not to go, and he said, "It is a point of honour, I must go." But where a man has only a moderate amount of shortsightedness he might be very easily passed, if he is marked as it were for examination. Such a man might be marked out as one who would make a smart soldier, but as he could not see the required line of letters it should be found out why he could not, and if it was simply that he was a little short-sighted he should be passed.

3805. In these days, when they profess to have an army for war, you do not think it would be a bad thing to have these men?—I should go further than that, and say there are many men who are passed who have extra good sight who would be more likely to fail in action than some of these short-sighted people. For instance, there are many people who have the opposite of shortsightedness—they have over-sighted eyes. They would probably be able to read the smallest type at six metres. Many of these men in the hurry and scurry and excitement of a campaign would have to make such a forcible effort to focus their eyes that in the excitement of action they would never be able to sight their rifle or anything else. Many of these men have in the end worse sight than those who have a moderate amount of shortsightedness. I would not pass a man into the army who had much shortsightedness, but I think there is many a case where a man might well be passed if he is just a little bit below the recognised standard if his eyes are good and healthy. My eyes have had to do as much work as most people's. At eighteen years of age I could not have passed the present army test because I am a little short-sighted. I could now at fifty-four years of age, but at eighteen my shortsightedness would have excluded me with the present test. I can just do it now at fifty-four because my shortsightedness has relaxed a little with age. My eyes are good, I hope.

Sir ALFRED COOPER, F.R.C.S., called; and Examined.

3809. (*Chairman.*) You are vice-president of the Royal College of Surgeons?—Yes.

3810. You represented this country at the Brussels Conference on the subject of venereal disease, did you not?—I did on two occasions.

3811. Were you one of those selected by the College of Surgeons or by the Government itself?—By the College of Surgeons. The first time I represented the Government, as well as the College of Surgeons, but the second time the Government sent their own man.

3812. That last Congress was very recent, was it not?—1902.

3813. You have considered the effect of venereal disease upon physical degeneration a good deal?—Yes.

3814. Of course it has come under your notice that a large number of persons are affected by that disease?—Quite so.

3815. Do you say that the number of persons is increasing relatively to the population or diminishing at the present time?—It is diminishing at the present time.

3816. Are you also prepared to say that the type of syphilitic disease from which people suffer in these days is less severe than it used to be?—It is much less virulent than it was before.

3817. And therefore, I suppose, less disastrous in its consequences to the offspring of such persons?—Quite so.

3818. Will you kindly describe the ravages and complications that ensue from it?—I should place insanity as almost one of the first things—insanity; idiocy; diseases of bones, producing deformity and disfigurement; diseases of the eyes, producing blindness; diseases of the ear producing deafness; diseases of the internal organs, causing defective nutrition and deficient development; diseases of the nervous system, producing insidious forms of paralysis, locomotor ataxy; and it is responsible for a large proportion of the cases of lunacy and idiocy in our asylums.

3819. These are all transmitted diseases?—Yes.

3806. That is hardly a parallel case to a private soldier, as you could have a reserve of glasses?—I have now good eyes, which have served me for the last thirty-four years, and yet they would have rejected me for the army at eighteen, whereas now I could pass the army test, and see infinitely better than many a man who had natural sight at that time.

3807. (*Chairman.*) Your point is, having regard to the difficulty of getting good material for the army, it is a thousand pities to throw away good material merely because there is a certain defect of eyesight which could very easily be got over by the use of glasses?—Yes, if a man is otherwise a good man, and if his eyes can be certified by a competent army surgeon, and if he can be shown to have good healthy eyes that will last, that man although he may have a moderate amount of shortsightedness has better eyes than many persons who have passed the test at seventeen or eighteen years of age—more lasting eyes.

3808. (*Colonel Onslow.*) You would advocate a closer examination?—Yes, for those doubtful cases. At present there is no examination to show why a person is rejected. His defective sight simply means that he cannot see some particular type. You want to know why he cannot. A promising young man might be put aside for further examination by some of the experts in the army.

Note.—Mr. Tweedy subsequently sent the following addendum:—

Referring to the latter part of my examination, in which I suggested that a lower standard of distant vision might be recognised for men who were otherwise fit to be enlisted. While every soldier is theoretically expected to fight, in practise many thousands of soldiers take no part in action, and there are innumerable duties to be performed during peace and even on a campaign which these men might properly perform as efficiently as those who have perfect sight.

3820. Have you paid any special attention to the effect of syphilis in producing lunacy? Of course you are aware that lunacy and idiocy has increased, or is said to have increased, very largely?—Certainly.

3821. Syphilis is admitted to be diminishing, so that it cannot figure very largely among the causes of lunacy?—Perhaps more from the progenitors.

3822. Then there is another point. You are aware that it is stated, and I believe accurately, that there is a larger amount of lunacy in Ireland than in any other part of the British Isles, and yet we are told that the Irish people are much more chaste and constant than any other?—Yes.

3823. In that case the lunacy in Ireland, if it is so prominent, must be due to other causes?—Yes.

3824. There is another prevalent form of venereal disease besides syphilis. Is that also grave in its consequences?—Certainly, gonorrhœa.

3825. That affects the present generation more than the future generation?—Yes.

3826. Will you state what you believe to be the effects of that?—It may be followed by grave and even fatal *sequelæ*, for example: In men, stricture of the urethra, with the consequent disease of the bladder and kidneys; severe and crippling rheumatism; sterility in women; and serious diseases of the female appendages; and in children a severe form of ophthalmia not infrequently destructive to vision.

3827. Have you means of approximately estimating the actual extent of these forms?—No.

3828. Turning to the military aspect of the question. I suppose there is such information as far as the army is concerned?—There is.

3829. You do not think that the figures on that point are altogether to be trusted?—No; for the reasons I have mentioned.

Sir A.
Cooper.

Sir A. Cooper. 3830. You believe it to be a national duty to take every possible means to minimise this source of weakness?—Yes.

3831. Can you indicate what steps you think the nation should take?—Now you come to a very important question. It is remarkable how they have stopped the disease in Germany of late years, the last year or two more especially. The Navy have taken it up more largely than the Army, but the Army is now following the Navy. Here are letters from the admirals of several of the big ships of the Navy.

3832. Do these figures you give us in your *précis* touch syphilis only?—They deal with venereal diseases generally. These are the letters from the Germans and this is the translation of them. (*Documents handed to the Chairman*). The Army and more especially the Navy use these two things—every soldier is given these two things when they are supposed to be going on the loose at all. One is an antiseptic ointment and another is an injection of protdeargol, 5 per cent. (*Handed to the Chairman*).

3833. Every soldier is given these?—Yes; and the men in the Navy.

3834. On joining?—I cannot tell you that. That is what they use. On board every ship they have one of these automatic machines, and they are supposed to use it.

3835-9. (*Colonel Fox*.) It is encouraging immorality?—Yes, it is; that is the worst part of it.

3840. Do you consider that the statistics touching the British Army compare very unfavourably with those of foreign armies?—They do, rather.

3841. At the same time there is a very considerable improvement in the quinquennial period your figures cover?—Very considerable.

3842. I think we heard from Sir William Taylor that the efficiency of the arrangements in India was so great that there was a diminution of syphilis in this country, largely from the fact that there were very many fewer imported cases?—Quite so.

3843-4. You are not prepared to attach too much importance to the value of these statistics?—No. Comparisons between different countries, different armies, and different towns are really valueless by the different conditions prevailing, and until there is an international uniformity in the method of preparing statistics very little reliance can be placed upon the figures.

3845. Can you tell us anything about the opinions that appear to have been prevalent in the Brussels Conference as to prophylactics and so on?—I understood there was some change of opinion as to the value of the system of protection which has been rife abroad?—Yes, a very strong opinion indeed against the regulations.

3846. They thought that free trade would answer better than protection, in this case at any rate?—Yes, much better; they were very decided about that. It appeared from the statistics they had, and from every source, syphilis was less in England, and where there was no regulation, than anywhere else. Fournier himself said that, if anyone wanted to get syphilis, Paris was about the best place to get it. He went so far as that. It is for this reason that many people go there to these improper houses, because they believe that they are licensed and that they will have no chance of catching the disease; whereas there is no sort of control, because a woman will very likely see five, six or seven men in a day, and the first one might give her disease and she might spread it to all the others. He thought it was quite a hot bed of disease. There is probably more of it in France than anywhere else at the present time.

3847. As an alternative against measures of that sort what would you advocate as the best way of tackling the problem?—I heard Mr. Tweedy remark that the principal way of stopping it now was educating the people more to know how to treat it. There is no doubt that there is very much less than there was.

3848. Is it the case that the means of treating it, that is to say, hospital accommodation, is anything like sufficient?—No, it is nothing like sufficient.

3849. Will you just explain what defects you think there are?—As regards measures to be taken to diminish the amount of venereal disease, one of the primary considerations must be to see that the accommodation for the relief of sufferers from such disease is efficient and adequate. Taking the case of London, it may be said without fear of contradiction that the accommodation for the treatment of venereal disease is lamentably inadequate. There is only one special hospital for the relief of such cases—the Lock Hospital—which has two branches, one for females with 135 beds, and one for males with only twenty-seven beds. In some of the general hospitals a limited number of beds is available for these cases, and a considerable proportion of the patients seen in the out-patient departments are suffering from venereal disease, or from its effects, remote or immediate. But the attention bestowed on such cases is utterly disproportionate to their gravity. The patients are not informed of the serious nature of their disease, or of the risks of contagion, or of the necessity for prolonged treatment; their attendance is irregular, and usually ceases with the disappearance of their symptoms. The amount of teaching done on this subject is very limited, so that at the commencement of their career the majority of medical practitioners are only possessed of a very insufficient knowledge of the subject. At the first visit to the hospital, the patient, who is usually completely ignorant of the dangers and consequences of the disease both to himself and to others, should be instructed in the necessity for prolonged treatment and in the importance of his running no risk of communicating disease to others; all possible methods of his spreading the contagion should be pointed out to him; if a married man, the possible result to his wife and to their subsequent progeny should be explained; and, in the case of unmarried men, the necessity of remaining so, till the period necessary for treatment has elapsed, must be emphasised. Not only should there be no obstacles placed in the way of such cases attending in general hospitals, but, on the contrary, every facility and encouragement should be held out to them, and efforts made to gain their trust and confidence at the outset of the treatment. One of the great drawbacks in inducing male patients to attend for a sufficient period is the time that must be occupied by each visit to the hospital, involving the loss of a portion of their day's wages; to counteract this, the out-patient department should be open on certain evenings of the week, when patients could attend after their day's work was over. This has for many years past been done at the London Lock Hospital on three evenings a week, when a large number of patients attend who otherwise would have to go untreated. It is advisable that there should be special departments at general hospitals for the treatment of this class of disease, and all such cases should be relegated to that department; it should be under the charge of someone specially skilled in that branch of professional knowledge; and a course of instruction in that subject should be compulsory for every student. These special departments have been in existence for years past in the majority of European countries and in America, and, further, special wards are set aside for the reception of such cases.

3850. Have you any idea why such methods have not been taken in hospitals up to this date?—Because we have not acknowledged the disease. It has been rather put aside. It has not been acknowledged in the manner it ought to be.

3851. Or is it because the hospital authorities look upon these people who are suffering from these diseases as being properly punished for their sins?—That is it in some instances.

3852. And therefore not fit subjects for treatment?—Yes. I was attached to one of the Lock Hospitals, as surgeon, and I found it was difficult to push it, because it was looked upon as a disagreeable subject, and therefore people did not like to touch it at all.

3853. Surely the risks of the community should have been given weight in considering the treatment of such a disease?—Certainly.

3854. Rather than the position of the individual?—Yes, I think you are quite right.

3855. Do you think there would be any difficulty in prevailing upon the hospital authorities to take the course of action you recommend?—I do not think so.

3856. If the advantages were pointed out to them ?—I think they would take it up. I think it is a very important thing.

3857. I suppose a certain number of men could attend later in the evening ?—Yes.

3858. When are they generally closed ?—About four or five in the afternoon.

3859. In the course of the Brussels Conference this resolution was adopted :—“The Conference requests the various Governments to constitute in each country a commission charged (a) to determine the frequency of venereal diseases among the civil population, apart from temporary variations ; (b) to enquire into the institutions actually in existence for the treatment of venereal diseases, the distribution of hospitals, the number of beds available in different places, and to propose the most efficacious measures for the treatment of these diseases ; (c) to collect opinions as to the best means for preventing and limiting the spread of venereal diseases among the civil population and to formulate conclusions upon the subject.” You were a party to the adoption of that resolution ?—Yes.

3860. Has anything been done to further these objects in this country ?—I do not think there has been.

3861. To whom was it communicated ? Was it sent to the Local Government Board, or to any particular Department ?—I think it was sent to the Local Government Board—it was to the Government at all events.

3862. If, as a result of the inquiry upon which we are engaged, anything in the shape of a Bureau of Public Health is constituted, I presume the functions that this Conference suggest should be discharged by this Commission and might be exercised by such bureau ?—Certainly.

3863. And the whole matter would then be treated from the point of view of the general health of the community, which is perhaps the best point of view from which to treat it ?—Quite so.

3864. At any rate, on the general question touching deterioration, I gather from your evidence that if there is, as we are inclined to think is not yet proved, a general deterioration, it cannot be due to the increase of syphilis ?—No.

3865. Could you say anything on the general question ? Do you believe, from your observation, that there is more what is called deterioration in the lower ranks of society than there used to be ?—No, I should not say there was.

3866. You do not think so ?—No, I do not think so.

3867. Or if there is, in certain quarters, at any rate, counteractive tendencies are probably more potent and likely to become still more so as time goes on ?—I think so.

3868. (*Dr. Tatham.*) You have in your *précis* advised certain measures for the cure rather than for the prevention of syphilis ?—Yes.

3869. With regard to prevention, you know that in England, at any rate at the present time, a man may go and infect several women with syphilis and go scot free. Do you think that it would be just or practicable to make such a person amenable to the law ? That would be a matter of prevention, would it not ?—Yes.

3870. What do you think of it ?—It would be a very good thing if you could carry it not. That is what they do in Russia. I was in St. Petersburg in 1875, and they have greatly checked syphilis there. Directly there is a case it is reported, whether it is a prince or princess, or duke or duchess, or even one of the grand dukes. If one of the grand dukes gets syphilis it would have to be reported, and he would be surrounded by police regulations, and it would be quite impossible for him to pass it on to anybody.

3871. (*Chairman.*) Would you bring it under the Notification of Diseases Act in this country ?—If you could do that it would be a very good thing. I should say, yes, certainly. It is such a fearful disease that I would do everything in the world to stop it.

3872. (*Dr. Tatham.*) You think the suggestion is not an impracticable one ?—I do not think so at all.

3873. (*Mr. Lindsell.*) You think syphilis is decreasing both in quantity and in virulence ?—Yes.

3874. Still, I suppose, you would say that it is one of the chief causes of whatever degeneracy there is ?—Certainly, the most potent.

3875. The most potent of all ?—Yes.

3876. Is hereditary syphilis mainly due to the progenitor being in the primary or secondary stage ?—More commonly in the secondary stage.

3877. Is there any guarantee that a person who has been through the secondary stage, however well cured, may not at any time communicate something to his offspring ? I mean, when once a person has reached the secondary stage, is he a fit person to propagate at all, even though apparently cured ?—Oh, yes ; I should say so, if he has passed through the secondary stage and has undergone treatment for a sufficient period.

3878. There is no harm ?—No. If we prevented him from propagating we should have to stop the population terribly.

3879. This is a prophylactic which is sold by a penny-in-the-slot machine ?—It is an injection, really.

3880. (*Colonel Fox.*) This is for injection ?—Yes, after the operation.

3881. (*Dr. Tatham.*) Do you agree with other surgeons who think that the use of an injection is not altogether a thing which could be trusted to anyone—sometimes it may lead to harmful results ?—Yes.

3882. A careless use of injection, for instance, in the case of nitrate of silver might lead to serious results ?—Yes.

3883. (*Colonel Fox.*) This would be quite harmless ?—Yes.

3884. (*Colonel Onslow.*) I am afraid I am rather going over old ground in reference to the Contagious Diseases Acts, but it is the fact, is it not, that when they were in operation in this country before, they were confined to garrison towns ?—Very much so.

3885. Almost entirely ?—Yes.

3886. I think some towns could adopt them, if they chose ?—Yes.

3887. Do not you think that almost worse than none at all—do not you think that they ought to be in vogue everywhere ?—Yes.

3888. Did it come within your knowledge that after they were abolished in garrison towns the increase in venereal diseases was very enormous in the Army and Navy ?—There is no doubt there was some increase.

3889. I see you say that syphilis generally has decreased, and become a milder disease. That is, I suppose, due entirely to the greater care, the greater knowledge of the medical profession in dealing with it ?—I think so.

3890. I have it on good authority, from naval surgeons, that the type that they have in the home ports—Portsmouth, Plymouth, and Chatham, and so on—is less virulent ?—Yes.

3891. You give statistics in your *précis* regarding the Army. I have here a rough statement of the figures for the Navy for the last year (*The document was handed to the Witness.*) ?—Yes.

3892. They compare very well with those you have given us for the Army ?—They do.

3893. You notice the peculiar fact that at home we have a ratio of 116 per 1,000 ; North America and West Indies, 115 per 1,000, leaving out the decimals ; East Indies, 134—this is what one may expect—China, 141 ; and general—that is, ships travelling about all over the world—136 ; and Australia, 140 ; but in the Mediterranean, where the ships go to some of the very worst ports, from the point of view of the women population, it is only 71. What possible explanation can there be for that ?—I do not know ; it is very extraordinary.

Sir A.
Cooper.

Sir A
Cooper

3894. In China, it is well known, the disease is very bad ?
—Yes. While the Contagious Diseases Act was in force the Government used to pay us so much for half our beds at the Lock Hospital for only female patients. I never have seen such virulent cases as I saw then, sent up from Portsmouth, Woolwich, and other garrison towns.

3895. I take it that in foreign countries, say France, they do not care for these regular houses, but that does not apply, I suppose, to inspection—I mean, to introducing the Contagious Diseases Acts all over the kingdom, and insisting upon the inspection of women, and extending that to the inspection of men who may be reported by women—probably that would be the best way of dealing with it. Would that meet with the same objection that the foreigners are finding ?—I do not know. I do not think they would stand that. They were very decided in their opinions at Brussels, that any regulation of any sort or kind did more harm than good.

3896. Even this regulation of inspection ?—Yes.

3897. I do not mean licensing the houses ?—No, but inspection or police regulation. They were very strong indeed about it.

3898. The only remedy is knowledge and cleanliness ?—Yes.

3899. (*Colonel Fox.*) Am I right in supposing that there is such a law existing, but that at present it is suspended ? There was a time when it was in force, and I remember at Aldershot there was very little venereal disease, but as soon as the Contagious Diseases Act was suspended cases increased. There was not a regular repeal of the Act, was there ?—Yes, I think it was repealed.

3900. The riff-raff from the woods and ditches at once swarmed into the town ; they dared not show themselves before. Then the military hospitals were soon full of cases ?—Yes.

NINTH DAY.

Wednesday, 10th February, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).
Colonel G. M. FOX.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY, (*Secretary*).

Dr. R. J. COLLIE, M.D., called ; and Examined.

Dr. Collie.

3901. (*Chairman.*) Will you kindly state your qualifications to give evidence before this Committee ?—I am an M.D. of Aberdeen University, and have been four years connected with the London School Board.

3902. Has your practice always been in London ?—For the last fourteen years.

3903. And previously to that, where were you ?—I was in Sunderland.

3904. Is your only administrative capacity in connection with the London School Board ?—You are Medical Inspector of the London School Board ?—Yes, and also a medical examiner to the London County Council.

3905. Do you examine employees of the London County Council ?—I examine all their clerks and all their employees also ; and I deal with questions under the Employers' Liability Act.

3906. That has brought you in touch with the condition of health of the masses ?—That is so. I examine all the men who are appointed to the Metropolitan Fire Brigade.

3907. Have you formed any opinion upon the existence of physical deterioration and its causes ?—My view is that there is no widespread deterioration. I have formed the impression that only a section of the community is unfit physically, and that physical infirmity is practically confined to the poorest and lowest strata of the population where children are improperly and insufficiently fed and inadequately housed, and where parents are improvident, idle, and intemperate. Those who are underfed and ill-housed (more especially if they happen to be parturient women or very young infants) must, and always will be, physical degenerates—overcrowding, insanitary environment, early marriages, large families, ignorance of the elementary principles of infant feeding, combine to keep up a steady supply of those who are physically unfit, mentally below the normal, and generally morally debased. The standard of efficiency, intelligence and education, and with it the rate of wages, has increased in the case of the skilled labourer, but the unskilled labourer, who commands at best but a small wage, is destitute when want of work or sickness overtakes him, and too often when the breadwinner has steady work and enjoys good health, a thriftless wife, a sick child, or a large family makes all the difference between bare sufficiency and semi-starvation for the household.

3908. You assign the worst effects to overcrowding of the young, I presume ?—That is so. The effect of overcrowding is keenly felt by the young. Insanitary environment necessarily produces an enfeebled body, and with the poor, an unhealthy body is generally the accompaniment of arrested mental development. They have no individuality—no character. The children of the lower stratum of society are subject to adverse influences even before they are born. The mother (if it be not her first-born or second child) is probably underfed. She lives in a vitiated atmosphere and has little or no opportunity for healthy exercise. Too often she is not sufficiently nourished or robust to suckle her child. Often she does not attempt it, knowing that in a few weeks she must of necessity go to work.

3909. Even those who are not in that case, very often neglect their duty from sheer disinclination ; is not that so ?—That is so ; a large number of them do not suckle their children. For those who cannot suckle, *crèches* (which might be self-supporting) should be established in all poor districts, and could, as Dr. Kerr has suggested when reporting on the Nurseries of the London School Board, be utilised to teach the elder children in the elementary schools the rudiments of infant management and feeding.

3910. That would remedy what you say is one of the causes—the bad condition of the food and the ignorance of elementary principles ?—That argument might be used.

3911. Could that be done on a scale commensurate with the need ?—It would be very difficult. I think not.

3912. It would be a beginning ?—Yes, and it could be done and would have a good effect, but I do not think that it could be done very largely. With the ignorant and the poor, the mere fact of maternity seems to create an impression of omniscience in all matters maternal, and yet the Health Statistics for London for 1902 show that out of every 1,000 children born, 139 died before they reached the anniversary of their birth.

3913. Have you considered what are the principal causes of infant mortality ?—I think want of nursing at the breast and injudicious feeding. I think that that accounts for a very large percentage

3914. Do you think that there is much culpable negligence?—I do not think that it is culpable in a sense: it is ignorance.

3915. And would you say that there is indifference to the prolongation of the lives of the children?—I do not think so. One does come across cases. I think that the maternal love for children is very strong even with the very poor.

3916. Do not you think that infant insurance has made parents very indifferent?—Only amongst the very lowest. I have seen it in Sunderland, but it was almost confined to the criminal classes.

3917. Do you think that the extent of the evil would justify any interference with the right of parents to insure their infant children?—I would not like to answer that, because my experience is not sufficiently large for my opinion to be of value. I used to think it did, but one has got out of that class of practice where one meets such cases.

3918. Do you think that the system of registration of births and deaths of young children should be more strengthened with a view to making the parents more directly responsible where culpable negligence exists?—I think that that would be a good thing.

3919. To require the medical registration of the deaths of all children under a certain age?—The death of every child is supposed to be certified.

3920. Not by a medical man?—No—there are considerable loopholes.

3921. I understand that it is not a portion of the registration laws?—There is a large proportion of the children not certified.

3922. Do you think that that would be useful with a view to checking parental neglect?—Yes.

3923. You think if one or two cases of real culpable negligence were prosecuted it would be an object-lesson, and might do a good deal of good?—I am sure it would.

3924. Now will you go on with what you consider are the principal causes of infant mortality?—A high death-rate implies much sickness, apart from that which has actually raised the death-rate.

3925. That means debilitating effects upon the survivors?—That is so. The majority of infant deaths are the result of want of proper feeding, and there remains a large proportion of those improperly-fed who survive. Later, these enter the struggle for existence with bodies physically deteriorated, and are sadly handicapped in the struggle for existence. Thus the majority of infants of the poor get a false start in life. It is impossible to over-estimate the importance of proper feeding in infancy. Most children are apparently healthy when they are born, and, if they got fair play, would grow up strong—I should say the majority would. Those who are not breast-fed, are as a rule improperly fed either on various proprietary articles or other forms of farinaceous food, and active disabling disease is directly induced. As a matter of fact, these children suffer from a debilitating form of diarrhoea, and the parents do not understand it.

3926. In infants it acts as an irritant?—It acts as a poison—as an irritant. They do not understand, and they generally say it is marasmus; that means that a child has some obscure internal disease; whereas, as a matter of fact, it is defective feeding. The chronic digestive disorders of early infancy (the result of improper feeding) and subsequent defective nutrition, lessen the power of resistance to tubercular infection. Mal-nutrition is the cause of most of the physical, and many of the mental, disabilities of children attending elementary schools.

3927. You say in your *précis* that most children are apparently healthy when they are born, and that accords with what we have heard in evidence from most of the witnesses. You know Dr. Eichholz?—Yes.

3928. I have a letter from Dr. Eichholz, in which he says: "I have to-day interviewed Dr. Sunderland, the Chief Physician to the Royal Maternity Charity, the largest thing of the kind in London, who tells me that the medical officers working for the charity report to him with practical unanimity that from 80 per cent. to 90 per cent. of their new births are healthy. He says that he has similar information from other parts of London. Would that be consistent with your view?—

I am not prepared to dispute it. Perhaps it is so. But he was apparently dealing with the children at the moment of their birth only. For instance—when they have syphilis—many are born as apparently healthy, but many of the degenerative changes commence soon after birth."

Dr. Collie.

3929. So that the appearance of health at birth may be deceptive?—It may be. I cannot help thinking that it is. I discussed this point with Dr. Eichholz.

3930. Then you are not prepared therefore to go so far as he does?—No, it is only surmise.

3931. Have you considered the effects of tea drinking among other elements of defective mal-nutrition?—I consider it most deleterious.

3932. It is given to very young children, we understand?—Yes; the other day I asked, at a mentally defective school, in the case of thirty children, how many had had bread and tea for dinner, and sixteen hands were held up. Tea is a stimulant, it appeases the appetite for the time being, but is not in the least nourishing. They use an inferior tea very strongly infused.

3933. And it has stood for a long time, I suppose. Would you describe the condition of the children that survive?—They are pale—anaemic. They have a half-starved look and have very little resistance to disease, especially zymotic disease. Half starved, I think, describes them to a great extent. Many of those who survive the improper dietary of the first three years of their lives are to be found in the children's wards of our hospitals and infirmaries, suffering from tubercular affections of the hip and other joints, from spinal and from lung disease. I examine the physically defective schools for the London School Board, and I see a large number of these there. Thousands are to be found in attendance at day schools—open-mouthed, stupid-looking children, the result of adenoid overgrowth brought about by improper feeding combined with insufficient fresh air.

3934. Are there any special arrangements for their education?—Yes, we have "Mentally Defective" schools and "Physically Defective" schools.

3935. Is the curriculum in each case adapted so far as it can be?—Yes, very much so. We are very particular about it.

3936. You have something to say about physical occupations?—They have manual work in the afternoon and elementary teaching—reading, writing and arithmetic, in the forenoon. The physically defective are instructed very much as in the elementary schools, but the arrangements are more particularly adapted for their position. Some of them lie on couches, and they all have comfortable chairs. Many of them come with splints.

3937. Is the form of education that they receive adapted to the purpose, or do you think that it wants still further development?—We do not cover anything like the ground, and the London School Board is opening fresh centres every month. There is not a sufficient number. The accommodation for the physically and mentally defective is being constantly increased.

3938. Will you tell us what you have to say about that?—Large numbers of these children are sent to the special classes of the London School Board. While undeniably mentally defective within the meaning of the Elementary Education (Defective and Epileptic Children) Act of 1899, their mental disability is not only preventable, but in many cases is curable. In a large number of instances, after the careful individual attention and mid-day dinner of the special schools, they are returned after from six to eighteen months to the elementary schools with a new lease of mental vigour. These children are functionally mentally defective. Their brains are starved, and naturally fail to re-act to the ordinary methods of elementary teaching. In the absence of proper provision for feeding ill-nourished children, these special schools in London are fulfilling a very useful function, although one (judging from the form of certificate demanded by the Board of Education) hardly intended by the Legislature when it framed the Act of 1899. I ought to explain that the form of certificate that we are asked to give is: "I hereby certify that A—B—is not merely dull and backward, but is mentally defective." Now to all appearance these children are merely dull and backward, but as a matter of fact one finds that the teachers have been endeavouring without any success to instruct them for

Dr. Collie. long periods of time. Only yesterday I asked a teacher if he would be prepared to certify under the Board of Education rules that a certain little lad was not dull and backward but really mentally defective. The teacher said, "Yes." I asked why, and he said, "The boy is ten years of age, he has been in the first standard for three years, and there must be some obscure mental defect at the back of his condition, but I cannot categorically tell you what it is." That is what I mean by saying that many of these children are apparently only dull and backward, but they are really functionally defective. And in a certain proportion of the cases it is the result of semi-starvation.

3939. Under better conditions of feeding, does the brain recover?—Yes, after sixteen or eighteen months they get a fresh start with feeding.

3940. (*Mr. Lindsell.*) You might have a child physically defective but with a perfectly bright intellect?—Quite so. We certify them under the same Act, we certify them simply as physically not mentally defective.

3941. Are they embraced under the same Act?—Under the Elementary Education (Defective and Epileptic Children) Act, 1899.

3942. (*Chairman.*) Do you think enough attention is paid to the preparation of girls for their duties as mothers?—I do not. The "Domestic Subjects" centres of the London School Board are 353 in number, of these 183 are cookery, 142 laundry, and 28 housewifery. The number is being increased. Each centre supplies several schools.

3943. Will you give us your views on the subject?—Every girl should be instructed upon the elementary principles of infant feeding and management, and should undergo a course of housewifery before she leaves school.

3944. Is nothing said about infant feeding and management in the present code?—In the housewifery centre there is the syllabus which embraces this subject. Each school should have a cookery centre attached to it large enough to cook dinners for all underfed children. The elder children should, under supervision, take it in turn to cook the food. The plain everyday cooking which would be the fare of the children is exactly what they ought to know. I only speak of those half starved.

3945. Do you think that it would be possible to work the two into one another, because when Dr. Eichholz was under examination here, and I asked him could not the two be so adjusted as to help one another, he replied he thought you could not get the quantity cooked in the time?—I do not understand.

3946. The supplying of meals to underfed children, and the instruction of the elder children in the elements of cooking?—I think that that could be arranged.

3947. He appeared to think that the amount of food could not be got for the number of children who required it?—There is not a very large proportion of children who are actually half starved; it is only in some districts, and those actually requiring dinners would be comparatively a small proportion to the attendances in those particular schools.

3948. By those requiring, you mean in the sense of being half starved?—Yes.

3949. Would it not be a useful thing in a good many cases if the children could be supplied with food at the schools and the parents paying for it?—In that case I would agree with Dr. Eichholz. It would be very difficult to fit the two things in: if you provide several hundreds it would be out of the question.

3950. But to deal with the underfed alone it would be practicable, you think?—I do think so.

3951. The worst feature of the evil is that they come in the morning with a very inadequate or improper breakfast. Would you propose to give them anything then?—Yes, I certainly should.

3952. Would you say a basin of porridge?—They could not have anything better than porridge and milk.

3953. But how are you going to deal with the question of parental responsibility in a matter of that sort: if they are led to expect a basin of porridge, such little sense of duty as they do have might disappear altogether?—I think that they ought to pay a very small sum.

3954. Do you think that they could do that in most cases?—I think that they could. If they were charged a penny—it must cost them nearly that to feed them at home probably more.

3955. Do you think that it would be possible in the case of those who send their children to school underfed to treat the parents as you would treat them when a child is improperly clothed or dirty—could you not exclude the child from the school, and bring the parent up for neglect?—Yes.

3956. Is that practicable under the existing law?—Yes. I think it could be done with very little pressure, for frequently I have on my own responsibility (apart from my position as an officer of the Board) reported cases to the Society for the Prevention of Cruelty to Children, and an officer is always sent, with the result that in almost every case I find an improvement for a time.

3957. Do you think that one or two prosecutions for not sending the child to school in a case of that sort would have a salutary effect?—I think so.

3958. You think that a school kitchen should be provided in every school under the building rules?—I do emphatically; so that the underfed children should be fed.

3959. That is to say in poor districts?—Only in poor districts; plain food cooking is exactly what the children want to know.

3960. I suppose you would give a good many hours to the cookery lessons, and probably at the later stages of the girl's career at the school?—I think that it ought to be given to older children.

3961. You think that it is of special importance in the case of girls who in the course of a few months will leave the school probably to do domestic work in their own homes?—That is so. As a matter of fact, in the Board Schools we get children beyond fourteen, and, as happens occasionally, they are anxious to have more instruction in housewifery and cookery. We get them beyond the school age of fourteen.

3962. The parents are pleased at that, are they?—Yes, they like it.

3963. (*Colonel Fox.*) Does not this cookery generally affect the better class of girls. The ones you want to get at are the poorer classes, and they do not attend these cookery centres I gather?—I do not know.

3964. The most promising are the ones most advanced in their studies, but the poorer ones do not attend?—I am not aware that any are debarred at any time from any cause except from want of accommodation.

3965. Yes?—If that were so it would be a very serious matter, but I really have nothing officially to do with it.

3966. I understand that the most advanced pupils attend?—Yes; all girls are expected to attend a centre on one half day a week for special instruction in domestic subjects as soon as possible after they have arrived at the age of eleven years, irrespective of the standard or class in which they may be placed in the ordinary schools. The courses of instruction commence at the end of August and the beginning of February, and cover a period of three years.

3967. I do not mean to say as regards age, but the poorer classes that you want do not attend, and I am informed they have to pay?—I think not.

3968. I think they have?—All the elementary education is free in the London School Board.

3969. I am told that the backward children as regards age—those who have not got on in the different standards, owing to their mental capacity, do not attend?—I am not aware of it.

3970. (*Chairman.*) One feature of the School Board system in big towns, which is rather inconsistent with carrying out this scheme of yours, is that such are taught not at the schools themselves, but at the centres?—That is so. My suggestion is that a kitchen should be attached to each school.

3971. You think that would be very much better?—I do not know how it would work practically, but I do think that there would be more chance of the children being fed if there were a kitchen at each school.

3972. In the case of the poorer schools, but it would not matter in the case of the better class of schools?—It would not be wanted in the better class. The sub-committee of the London School Board which looks after the cookery are keenly alive to the teaching of the infant feeding. Last winter four lectures on infant management were delivered to the housewifery teachers, and they were much appreciated.

3973. The teachers themselves are not as well qualified as they might be to give instruction, are they?—That is the feeling, and that is why the lectures were given. Almost in every case a small sum of about one penny (for which a good dinner could be provided) would be willingly paid, and as the teacher, kitchen, etc., are a necessary part of the school equipment, the plan would therefore be practically self-supporting. Voluntary effort would more than cover the expenses of those who could not pay. The plan adopted in Dundee, where the soup supplied is taken with bread brought by the children, would help to take the edge off the eleemosynary aspect of the transaction, the idea that they are being fed by charity. Bad nutrition and normal brain development are incompatible, and, if some such scheme were adopted, we should hear less of mental deficiency, and see fewer undersized children with flabby muscles and bent spines, and the teachers would soon find that the children's attention during lessons would be more concentrated. A check might then be put upon the increasing number of the (somewhat expensive) physically and mentally defective schools.

3974. What further instruction do the young mothers require?—I think, infant feeding and the management of very young children, and what would come generally under housewifery, cleaning and scrubbing, and lastly the vast importance of serving food properly.

3975. They do not know how to select the food, you mean?—I believe they do make an attempt to teach that. Some of the children are sent out to buy provisions in order to get an idea of the value of food stuffs.

3976. Do you think that the sanitary authority might issue leaflets for the guidance of parents in these matters? What is learned at school is very often forgotten. It is done in many places you know?—Yes. The medical officer of Battersea has issued leaflets, but he says they are not read, except by the better class, and those who ought to learn either think that they know or won't trouble to read them. Nor is a sufficient supply of food all. The average working man's wife is lamentably ignorant of the value of the different food-stuffs, and her unintelligent selection, and bad cooking, amount practically to under-feeding, even though the bulk to all appearance be sufficient. The Legislature makes special provision for the education of those who cannot see and hear, and for those who are deficient physically and mentally. Can we reasonably expect a little boy of, say, seven or eight years of age, coming to school without his breakfast, to really benefit from lessons in mental arithmetic or physical drill? Yet under the Elementary Education Acts he is forced to attend school. If he happens to be starved (from whatever cause) surely it is the duty of the State to see that the child has his education given under circumstances in which he is capable of receiving it.

3977. There my suggestion of overcrowding in case of children comes in?—Yes. We feel that then there is the question of uncleanness. Dr. Kerr started a campaign with reference to uncleanness amongst the children. First he introduced a class for the uncleanly, they were put by themselves, and this class is called a dirty class. The parents of the children felt the disgrace of this, and the question is being considered whether or not eventually we shall not exclude those children altogether and start a prosecution of the parents.

3978. Do not you think that the same principle might be meted out to the children who are wilfully underfed?—Certainly.

3979. Could the Society for the Prevention of Cruelty to Children take it up?—There would be so many cases it would be impossible.

3980. But they might take up one or two test cases?—Yes.

3981. Will you go on with the rest of your evidence?—My impression is that no time should be lost, even from an educational point of view, in teaching the rising generation in a simple, practical, forcible way the laws of health, and a beginning might be made by teaching the children in properly warmed and efficiently ventilated class-rooms.

3982. Is that intended as a reflection upon the existing class-rooms?—Yes, it is. Intellectual progress would be more rapid if more frequent intervals of relaxation were instituted. The present lessons are too long and should alternate with brisk physical exercises. The next genera-

tion would have larger lungs, straighter spines, and would probably know more, and make better citizens.

3983. Do you think that there is much change required in that direction?—Yes. I do not think we have a sufficient number of intervals in the school lessons.

3984. (*Colonel Fox.*) In connection with your remark, I may inform you that, under the recommendations of Dr. Kerr, we are impressed with the importance in the new syllabus for physical training—the necessity of having certain intervals in the morning and in the afternoon devoted to exercises which will rouse the circulation of the children, and during those intervals all the windows will have to be opened for ventilation?—I agree with that emphatically. You will see from what I have to say later that I have made that experiment, and I will give you the results of it in one school.

3985. (*Chairman.*) Would you explain your ideas about schools for mentally deficient children?—In the mentally deficient schools of the London School Board, each lesson lasts for half an hour. At the Edinburgh Road Mentally Deficient School I have carried out the following experiment:—For the last four months the head teacher, at my request, has limited each lesson to twenty-five minutes, the last five minutes being devoted to physical exercises, which are performed by the children when standing between their desks. Attention has been particularly directed towards movements which develop lung capacity and increase the circulation. When those short intervals are added to the usual break in the middle of the forenoon, etc., the total amount of the time occupied with physical drill at this school is over two and a half hours per week. A few days ago I examined the school and was impressed with the result. The children, although all mentally deficient, drilled with marked alacrity and precision; indeed, it was in many ways quite as good a performance as I have seen at the ordinary elementary schools. The teachers were unanimous in saying that the children had improved physically and mentally, that they obeyed more promptly, that discipline was more easily maintained, and above all, that, after the short brisk exercises, the attention of the children was more easily maintained than formerly during the lessons. The want of power of concentration is the great drawback in the teaching of our mentally deficient centres, and the teachers pointed out to me that these short breaks in the lessons had distinctly helped them to maintain the children's attention during instruction. So that the experiment has been a marked success.

3986. (*Colonel Fox.*) This means that a more constant supply of blood is sent to the brain for its proper nourishment?—Yes.

3987. (*Chairman.*) You have something to say with regard to the decay of teeth?—One of the many direct effects of imperfect nutrition is the early decay of teeth. Where mal-nutrition is not a factor, the poor lose their teeth through want of proper cleanliness, and from the almost universal rule of extraction when pain ensues. As adult life or middle age is reached, the absence of teeth makes mastication impossible, and indigestion and all its attendant disabilities follow.

3988. Do not the dental hospitals provide them with false teeth?—No. At the dental hospitals the poor are asked to defray half the total cost, and a set of teeth costs a great deal for those people. As was pointed out lately by Sir John Gorst, the duty of a class teacher should not end with teaching. In many districts the school is the only humanising, and the class teacher the only refining influence under which these children are brought. It ought to be the duty of the teacher (and in a very large number of instances this duty is recognised) to take a personal interest in those children who are literally outcasts, whose parents provide no shelter worthy of the name of a home, and whose daily supply of food is insufficient to nourish the body, and allows nothing for growth and development. The educational authority should instruct all teachers to examine and report upon all such children. To such and many others the ordinary physical drill of the schools is inappropriate. For instance, recently I found a lad, who had but a few weeks previously undergone the operation for appendicitis, drilling with his fellows.

3989. Do you think that the teachers should be made responsible to the medical officer for this sort of neglect—

Dr. Collie.

Dr. Collie.

that they should act under the direction of medical inspectors in all cases of defective physique or defective mental equipment?—Certainly. In many doubtful cases the teachers do refer the matter to the school doctor.

3990. You think the medical inspection should be made general?—Yes.

3991. (*Mr. Lindsell.*) Before physical exercise?—Yes.

3992. (*Chairman.*) Have you any observation on this point?—Each school, or group of schools, should have a medical man attached to it, whose duty would be to advise, in consultation with the teacher, what cases are suitable for ordinary physical exercise, and which children should have special attention paid to them. Most of the physical disabilities of children, such as commencing spine disease, glandular swellings, impaired hearing, adenoid overgrowth, lateral curvature, etc., obstruct or retard mental as well as physical growth, and should be noted by the teacher, and be the subject of report and subsequent enquiry. It is not suggested that the medical adviser should treat any illness, but my experience is that parents readily avail themselves of hospital treatment when a medical man indicates the necessity for it, more especially if the class teachers show an active interest in the child. Apart from infectious diseases, mal-nutrition is accountable for nine-tenths of child sickness. School teachers should take an active interest in the neglected children of the schools. Much could also be done by action and co-operation with existing benevolent organisations. Parental responsibility could in many cases be aroused, and more active steps would follow to protect those who are powerless to protect themselves, but the teachers must first themselves be taught.

3993. Assuming that the teacher has the knowledge, I suppose in the first instance it would be sufficient to entrust to him the duty of reporting to the medical inspector the case of any child who on admission appeared to him to be suffering from any physical or mental defect?—That is so.

3994. And the medical officer, I presume, could attend occasionally for the purpose of receiving such reports from the school teacher and examining the child, and then the condition of the child would be reported to the parent, and the parent would be left to take such steps as he liked, or would any pressure be brought upon the parents?—That is exactly my view. It is part of my duty to make notes in the family history books in the mentally defective schools. When I find children suffering from adenoids I note it, and on subsequent visits ask what steps have been taken by the teacher with a view to have the child taken to the hospital by the parent. This alone often has the desired effect.

3995. Is the medical staff sufficient in the London School Board?—In my opinion it is wholly inadequate.

3996. Then, of course, the consideration of cost comes in, and it is very considerable, is it not?—Yes.

3997. What is the cost of the medical department of the London School Board?—I cannot tell you.

3998. What is the cost of the whole system?—I do not know.

3999. You do not know what proportion it bears to the cost of the Budget of the London School Board, do you?—I do not.

4000. Young doctors who have not got much practice could be obtained to do the work at the outset of their careers for a very small sum, could they not?—But it would be better still not to have a young man, but men of experience, and only employ them part of the time.

4001. (*Mr. Lindsell.*) Have you thought of the certifying surgeons?—No, that never occurred to me.

4002. The possibility of working it in with them in the Home Office?—That did not occur to me. I think however that they are already very busy men. Of course they cover the ground.

4003. (*Chairman.*) Well, I suppose the burden of the system would fall upon the doctors who had to inspect the poorer class of schools?—Yes.

4004. The great bulk of the schools contain a class of child that does not make any large demands for medical advice: is that so?—That is so. I think that good men could be got in many districts to pay visits once a week, or what was thought necessary, and the cost would not be very much.

4005. And do you think that it ought to be the duty of every educational authority to have some system of medical inspection of schools?—Most emphatically I do.

4006. I suppose the recent Act would facilitate that now that the educational authority is the sanitary authority in most cases?—Yes. The Royal Commission in Scotland recommended that.

4007. Has the London School Board done anything to promote a knowledge of the laws of health?—The Evening Continuation Schools Committee of the London School Board has quite recently instituted in the evening schools a series of health lectures. A few months ago the Evening Continuation Schools' Committees allowed me to draw up a Syllabus for a course of instruction in what may be termed "Popularised Hygiene." Twenty experimental health classes were opened, and the Committee have given me permission to open sixty more; so that we have opened eighty of those classes taught by fully-qualified men. I have a staff of one hundred and sixty-eight doctors who lecture in those evening continuation schools of the London School Board, and about forty-eight nurses; the nurses teach Home Nursing and the doctors First Aid and Home Hygiene.

4008. This all refers to the teaching of teachers?—No, they are not teachers. They are young people from sixteen years onwards. We have a large number of married men and women.

4009. Would it not have been useful to encourage teachers to go to those classes?—We did issue a notice in the *Gazette* that teachers would find these lectures useful but only a few of them are attending; I believe the view they take is that it is far too elementary for them.

4010. It is the elementary character of the lessons that would make them of such value, is it not?—Quite so.

4011. In order to communicate them to the children?—Yes.

4012. I suppose they thought it was beneath their dignity to attend?—I think so. I hope to open special classes with a somewhat different syllabus, but practically the same teaching.

4013. (*Dr. Tatham.*) You say in one part of your evidence that each school or group of schools should have a medical man attached to it whose duty it should be to advise, etc.?—Yes.

4014. Have you in your mind the establishment in connection with such an appointment as that of a register of sickness amongst school children?—No, that was not in my mind.

4015. Are you aware how much time is lost by school children because of the prevalence of infectious disease?—I do not know the statistics, but it is a very large amount.

4016. Do you think that if such an appointment as you suggest were made, and if the register of sickness were established, that it would probably meet the case, because you would be able to save so much time which is now lost by the children?—Yes, I think that it would go a long way.

4017. With regard to the decay of teeth, you mention that as one of the direct effects of imperfect nutrition. Do you think that it is practicable amongst the children of the poorer classes to insist upon the cleaning of the teeth, or the use of a tooth brush?—No, I think not. If you cannot get them to feed their children, I do not think you will get them to clean their teeth.

4018. How do you propose that the decay of teeth in that case could be prevented?—In a roundabout way, by teaching the children the value of it and when they become mothers, the hope is that they will see that their children's teeth are looked after.

4019. With regard to overpressure in schools—does educational overpressure in schools, in your experience, exist to any great extent?—I have never noticed it. I think that the methods in the infant schools are not sometimes very judicious. I think that they allow the children to do too fine work; to give them too precise work to do, and they are not careful in keeping the work far enough from them, and I think if there is overpressure, it is in the infant departments. But I have not noticed the effects of overpressure in the children. My impression is, that most children at school are very happy.

4020. Have you any reason to believe that tuberculosis is on the increase amongst children of school age?—I have no reason to believe it; but I often think that those children suffering from pediculosis, and who eventually get their heads into a very disagreeable condition, are

necessarily irritated so that they open sores, and that tubercular infection gets into the open wound and affects the glands. There is one prominent hospital surgeon who tells me that a very large number of children who attend the hospitals have tubercular glands, which he believes is the result of direct infection of tuberculosis in this way.

4021. And you think that much harm results to the children on that account?—Undoubtedly.

4022. I mean in a large proportion of cases?—I do not know sufficient of it. I have not enough cases before my mind to say definitely; but theoretically, I can quite see that it would materially affect the health of the children.

4023. Do you think that the aggregation of children in school for a considerable number of hours together would increase tuberculosis amongst them, or do you not?—I do not; I do not see why it should at all, if the school-rooms are ventilated.

4024. Do you think that the ventilation of schools is sufficiently good to obviate the risk?—I think it is not.

4025. You think that could be improved?—There is very much need for improvement, and that is one of the many things that those medical men who would inspect the schools would have an eye to. I do not know why, but teachers do not look after the ventilation.

4026. You consider that a very important point?—It is an absolutely important point to my mind.

4027. Is syphilis on the increase amongst children?—I do not think so. There is not a very considerable amount of it. It shows itself about the ages of twelve and fourteen, and is found largely in the blind schools of the Board.

4028. Is that where you notice it?—Yes, in the blind schools. Then I think syphilis is not so severe a disease as it was; and it may be present causing only mal-nutrition without having the definite disabilities of eroding bones and so forth, and still it may be there in an obscure way.

4029. Have you any experience of the work of female health visitors amongst the poor?—No I have not.

4030. You do not know anything about the Ladies' Public Health Society of Manchester, which employs a large number of female health visitors on its work?—I know of its existence, but do not know their work.

4031. Do you think the general extension of the system would be advisable?—Yes, I think that anything that brings home health teaching to the poor is of great value.

4032. Do you think that the cost of the general establishment of a system of health visiting amongst the poor would be desirable in the interest of the poor?—I do think so. As far as the educational authorities are concerned we would recoup ourselves as there would be better attendance at school.

4033. (*Mr. Lindsell.*) You state in your notes of evidence that you have formed the impression that physical unfitness is confined to a section of the community?—Yes.

4034. You base that upon a knowledge of the average working man and woman, and Health Statistics?—Yes.

4035. You know, of course, nearly all the schools both of the lowest strata and of the better class?—Yes.

4036. Does the general condition of children of these schools bear out the opinion you there form?—Yes, it does.

4037. That given a school where the parents are in receipt of good wages, and live in fairly healthy surroundings, although in a town, the children are as a rule in fairly good condition?—Yes, I think so.

4038. Whereas, if you go to the very crowded and poverty-stricken regions the children in the school are the reverse?—That is so.

4039. I suppose if, as it is an admitted fact, that the persons who present themselves for recruiting in the Army, are found to be in such large numbers physically degenerate and unfit, it follows that they must be drawn mainly from those very poorest strata of the society?—That is my opinion—that the lowest stratum is tapped now, and has been for a long time.

4040. And that fact, rather than any national physical degeneracy, is the cause of the unsatisfactory condition of modern recruiting?—That is my impression.

4041. Among the causes of this unsatisfactory condition in the lower strata you attribute to a very large extent the unsatisfactory conditions of the food?—Yes, I do.

4042. Do you think that that condition is confined to the poorest of the population or is there not, going into the lower strata of the working class population, a lamentable ignorance in England of the proper conditions of good food and so on?—Yes. I think they are very improvident; they are extravagant; they could live very much more cheaply.

4043. And the materials that they use are not satisfactory?—No, they are not.

4044. You attribute the falling off that there is in this respect, mainly to the enormous facilities for getting tinned meats and other foods now compared to what there used to be?—Yes, and especially tinned milk.

4045. So far as this is due to bad feeding—not so much deficient feeding, but bad feeding—it would be a very difficult matter to induce improvement by legislative action of any sort, would it not?—I should think it would be impossible. The only way, to my mind, would be to teach the children for the benefit of the next generation.

4046. So far as it is due, of course, to overcrowding and insanitary conditions, that is a matter for the sanitary authorities; and even in the worst localities, considerable improvement is steadily being effected in that direction, is not that so?—Yes. There is the question of whether or not schools could not be put in the outskirts, and the children go out by tram-cars and so forth, that is a question that might be considered; but it is a large one.

4047. You think that a good deal might be done by better teaching to improve the maternal instinct in girls and so on; that they could be taught what a good mother and a good wife ought to be, while they are still at school?—I do think so.

4048. Of course, as far as extreme infancy is concerned, that is not a matter so much for the care of the educational authorities as for the care of the sanitary authority?—That is so.

4049. It would not be part of the duty of any educational authority, whether in the future or as it exists at present, to undertake the care of children up to, say, the age of three?—No.

4050. The establishment of those crèches you spoke of would not be a part of their duty at any rate?—No I do not think that it would.

4051. You rather suggest that the School Board should take it up?—Well, it did not occur to me except that inasmuch as it would be material for teaching the children.

4052. Yes, you might have school crèches you think?—Yes; and these crèches might be utilised.

4053. As part of the apparatus?—As part of the plant.

4054. When we come to the children who survive the first three years of their lives, you say that now the London School Board is strongly taking up the exercise of the powers given them under the Defective Children's Act?—Yes.

4055. One of the difficulties that seems to strike you is the question of drawing the exact line between a merely dull child and a mentally defective one?—Yes.

4056. But you are inclined to think that where a child is found to be consistently dull in school for some time, it might be fairly regarded that that dullness is due to some mental defect?—Yes.

4057. And might therefore be treated under this Act?—That is my view.

4058. When I was dealing with evidence that I had before me on another Committee, their attention was attracted a great deal, not merely to any defect in the child, but to the fact that it was probably made to work before it went to school. The children come to school tired already by overwork, and possibly want of food. What is your view?—The children that I have to report upon are all aged about seven.

4059. And therefore too young to be employed?—Yes.

4060. Have you noticed any improvement since the passing of the Employment of Children Act, as to the con-

Dr. Collie. dition in which children come to school?—No, I have not noticed it.

4061. It has hardly had time to be noticed?—Quite so.

4062-3. You mention that physically defective children cannot be dealt with under the Defective and Epileptic Children Act?—They are dealt with under the Elementary Education (Defective and Epileptic Children) Act 1899.

4064. Do you know the Orthopædic Hospital of London?—Yes.

4065. Are you aware that the School Board made an attempt to deal with the children there as part of a Board School?—A most excellent idea.

4066. And it is at work now?—I have not been there yet.

4067. Are there any other forms of special schools which might with advantage be adopted. Dr. Eichholz mentioned schools of industry, some special centres for industry?—My impression is that we are wasting a lot of our energy on these mentally defective children—to try and teach those children reading, writing, and arithmetic, and that sort of education is futile. I think we should teach them to use their hands—that is my impression. Their education—except for what mental development it necessarily brings with it—the education *per se* is of very little value.

4068. That, of course, is a matter rather for the local authority to consider in the curriculum—it is perfectly open to the local authority, you know?—To give manual instruction?

4069. Yes?—It is.

4070. Yes, especially for those schools who adopt the curricula of the particular school which those children are attending?—Quite so.

4071. And of course, you know, as far as the Board of Education is concerned, the code now gives full facilities for a local authority or school authority to give those special courses in housewifery and hygiene, and so on?—To children or to teachers?

4072. To children?—That is so.

4073. Are they being availed of by the London School Board?—We have 28 housewifery centres.

4074. And are they attended by children in the elementary schools?—Yes, by 45,000 children.

4075. Apart from the evening schools?—Apart from them.

4076. You cannot begin too young to train them in those subjects, can you?—I think you can. They will get more good from it at the ages of thirteen and fourteen.

4077. But you cannot make them come after they are fourteen?—Thirteen, I mean.

4078. You would make it the last year of their school life?—If you start too young they forget what you have taught them. If you instruct them in housewifery between eight and nine, they forget it when they come to use it, and I think the later you teach them this in their school life the better.

4079. It would give them some inclination to go on in the continuation schools if they had instruction in the last stage of their work in school life?—I most emphatically agree with it being taught.

4080. With regard to cookery you will agree that the essential thing in teaching in these cookery centres is that it should be absolutely practical?—Of course.

4081. That what the girls should learn is not the theory of cookery, and to make specialised dishes, but to be able to keep a comfortable home when they grow up?—That is so.

4082. Do you notice any deficiencies in the present system with that end in view?—I do not know it sufficiently well to criticise it.

4083. But you have an idea that those cookery schools might be worked in with the notion of providing food at the schools for children?—In the comparatively few schools that it would be necessary for the half starved children.

4084. (*Chairman.*) When you say the comparatively few schools, I think it was stated here that as many as 33

per cent. of the children of London schools come to school under-fed?—Then it is larger than I thought, if that is correct.

4085. (*Mr. Lindsell.*) There might be that percentage in particular districts?—I was really thinking that the kitchen might be put in poor schools. Centres might supply those schools where there were only a few underfed children.

4086. (*Chairman.*) Dr. Eichholz said that about 33 per cent. of the children in three of the winter months would require feeding—that is, one-third?—Quite so.

4087. (*Mr. Lindsell.*) But you would localise this 33 per cent?—Yes, they would be all in the East End.

4088. And perhaps Battersea?—Yes, Battersea, and one school in Chelsea, Notting Dale—I am wrong in saying that you should localise it to the East End. They are really in those other places, too. It might be of assistance to you if I give you those statistics. With regard to the new Anerley Blind Schools. There are fifty-three children, and of those, thirty-eight are resident pupils and fifteen are day scholars, and the point is the increase of weight within a year of those children going into school. The comparison given there is not good, inasmuch as the day scholars receive dinner and tea, otherwise we would have got a very good comparison of how a child, properly fed, compares with one improperly fed. Even with the allowance by the local committee of dinner and tea, there is a marked difference in the increase of weight within a year. The child at fourteen years of age normally increases eleven pounds. The thirty-eight resident pupils gained on an average twelve pounds in the year, and the children of this class do not as a rule increase at a normal rate. All the fifteen day scholars have gained nine and a half pounds. The greatest gain amongst the resident pupils was one lad, aged fourteen, who gained twenty-three pounds in one year. All children put on weight at a very considerable rate when properly fed.

4089. I think that this is rather in your mind, that these kitchens should be open to particular schools as a part of a school restaurant, irrespective of its educational value?—Primarily the restaurant idea is in my mind, and that they should be used also for teaching purposes.

4090. But your primary idea is that there should be attached to the school a means whereby food at the school should be supplied to the scholars?—That is so.

4091. And you are in favour of making it, if possible, self-supporting; if not, that there should be a payment?—I think so. There ought to be a payment.

4092. In the case of the absolutely destitute, it might be met by some charitable agency?—Yes.

4093. And the children might be supplied with a ticket supplied by the charitable agency instead of the penny paid?—That would be an excellent idea.

4094. That would avoid the difficulty which always surrounds these things, of weakening the sense of parental duty?—Yes, that is so.

4095. There is always a danger that parents who can afford to keep their own children should take advantage of such a thing?—That would inevitably follow.

4096. You seem to lay great stress upon the want of good ventilation, and you seem to rather imply that the schools are not so well ventilated as they should be. Do you attribute that to the defect of planning or to the want of attention to the question on the part of the teachers?—To both—chiefly the planning.

4097. Of course, the London School Board is supposed to have the best architectural advice. Is not that so?—That is so.

4098. And the same thing may be said of school boards in large towns?—Yes. I think it is that no good method has been discovered, and I do not think that anyone is to blame.

4099. You have read the latest edition of the building rules brought out by the Board of Education, have you not?—No, I have not seen them.

4100. You could not express an opinion as to whether the rules for ventilation there are sufficient or not?—No.

4101. (*Chairman.*) You think that better mechanical ventilation is necessary?—In a few schools it is very defective—in Deal Street, for instance.

4102. (*Mr. Lindsell.*) Is there a want of appreciation of plenty of air amongst some classes of society?—I am quite sure that the lower classes do not appreciate it.

4103. They like to be warm, and prefer the warmth to having fresh air?—In their homes it is the only way to be warm.

4104. Now, as regards this question of recreative intervals, or physical exercise intervals. Do you consider, except in the case of physically defective children who require special treatment, that in an ordinary school it would be conducive to better health, or to the discipline of the school, to have more drilling intervals than one an hour. You see at present, in a meeting of more than two hours, a quarter of an hour is allowed to be reckoned as an interval for recreation; and in a meeting of two hours, ten minutes. Is that insufficient?—I think that once an hour there should be a break of some sort.

4105. That is practically what is allowed in the Code at the present time, and that irrespective of physical instruction as part of the school curriculum?—I did not understand that.

4106. At present they are bound to give ten minutes at least in a meeting of two hours, and more if the meeting is longer. But that does not include any time which may be set apart for the physical training. It is part of the regulation school relaxation, and would be irrespective of ten minutes' relaxation altogether?—Yes, but my point is that it should not be accumulated, but at the end of every hour a distinct break, not necessarily in the hall, but physical drill as they stand, lasting say five minutes, to expand the lungs and get the blood to circulate better.

4107. (*Colonel Fox.*) I suppose you mean that it should be done between the desks to arouse the circulation, and to get rid of the fidgets that the children have when they are kept at work too long?—Yes.

4108. I have tried it in a great number of schools, and it is surprising how it rouses up the children who were apparently dull and stupid and listless?—Yes; I made an experiment in Edinburgh Road to have these exercises every half-hour, because the mentally defective children only work half-an-hour at a time, and I have elicited from the teachers that the children can give much better attention to their lessons afterwards.

4109. (*Mr. Lindsell.*) I quite admit, in the case of the mentally defective, that that special provision is required; but in the ordinary public elementary schools is it your impression that they are not given enough of this sort of thing at present?—It is.

4110. You think that ten minutes' relaxation in the middle of the physical instruction may be given besides?—That could be given probably at the end of the lessons or the beginning of it. It does not always come in the middle. My idea is that at the end of every hour the children want to alter their posture, and for the sake of revivifying their brains, and of expanding their lungs, those drill exercises should be given for a few minutes every hour, and that will materially improve their work.

4111. (*Colonel Fox.*) We divide the physical training into two parts; the one, which is supposed to be half an hour at a time, in the playground, we call educational and disciplinary, and the other, which consists of five minutes work between the desks during school hours for the purpose of rousing the circulation, we call nutritive exercises?—They are nutritive.

4112. And those are for short periods to shake off the long periods of mental strain?—Quite so.

4113. (*Mr. Lindsell.*) As regards the teachers it must be recognised that a very great deal of the influence for good on the part of the teachers must depend upon their personal influence?—Yes.

4114. And that you cannot lay down any express rule as to what they would do with regard to influence over children outside school hours?—It would be very difficult to make it part of their duty.

4115. It struck me very much that at any rate teachers who gave evidence before us were manifesting very great interest both in the outside life of the children of the school and in their future career?—Well, the ordinary elementary school teacher is expected to assist the children in this way.

4116. You would agree that it would be impossible in those schools to place any duties on the teachers

to make it any part of the condition of their employment?—It would be impossible.

4117. You would not be in favour of it?—It would be impossible.

4118. Owing to strong pressure it is now an article of the code that the teachers should not be required to undertake any duties outside the school hours?—Yes.

4119. That is a concession obtained by the teachers themselves?—I think it would be impossible to turn the teachers into charity organization inspectors.

4120. Now, with regard to the medical examination of schools, at present how far is that done at all by the medical inspectors of the London School Board?—I think Dr. Kerr inspects a school every afternoon. Recently six ophthalmological surgeons were asked to systematically report upon the schools; then there is the work I do of inspecting the mentally deficient children three afternoons a week.

4121. You do not have anything to do with the ordinary school?—No, except that I go in occasionally to examine the children. Seeing so many mentally defective children, one has occasionally to correct one's standard. I am expected to go occasionally into those schools, but it is a small part of my duty.

4122. Would you think that the same man could be entrusted to go into the question of the teeth, and eyesight, and general physical condition?—I think the same man could be entrusted with it. Very often the question of eyesight is a special one, but most qualified men would be able to do the whole.

4123. Do you think there would be any difficulty in getting over the objection of parents to having their children physically examined?—I do not. I think if it were done judiciously and with common sense you can always get these people to agree to it; they are quite willing to have anything done when it is shown to them that we are taking interest in the children. There will always be some few who object, of course.

4124. It would require a very large staff of surgeons, would it not?—You refer to the full statistics as to what is the height, etc.

4125. That is a further question still. But merely, I mean, to look over children to see whether they have got spine disease, glandular swellings, impaired hearing, adenoid overgrowth, and those sort of symptoms?—No. I do not think a very large staff would be required. One medical man would have under his care a group of schools, and the teachers would assist. Those diseases are easily diagnosed, in fact the teachers would diagnose them, and bring forward the cases to the doctor who would examine them, and that would be all that he would have to do, to point out whether the child had this disease or not, and whether the parents' attention should be drawn to it.

4126. There would be no attempt at treatment on the part of the inspecting doctor himself?—That would be illegal.

4127. Now with regard to these evening continuation classes, you seemed to consider that much useful work has been done in the teaching of hygiene?—Yes.

4128. Has cookery been dealt with in the same way?—We have 5,562 scholars attending 178 evening continuation schools of cookery.

4129. At present, I think there is a little difficulty about the establishment of these classes as to whether they are legal altogether?—I have not found it so.

4130. I think the County Council have power to authorise the continuance of them, but it is rather difficult to establish new classes and they only legalise those already in existence?—My committee have instituted the health classes since the Cockerton judgment.

4131. Is that the School Board or the London County Council?—The London School Board. It is part of the teaching of the evening continuation schools.

4132. Yes; in the school already allowed but not a new institution?—No.

4133. When we have it under one authority, all difficulties of that sort will entirely disappear?—Yes, I hope to have them instituted at the Polytechnics.

Dr. Collie.

Dr. Collie.

4134. (*Colonel Onslow.*) With regard to those hygienic classes which you spoke of, what class of people attend them. You told us about young men and women—but what class?—They are mostly the poorer shop assistants and seamstresses, and that class of person.

4135. I suppose it does not touch quite the very lowest, does it?—No, it does not.

4136. Who really so very much want instruction?—No, it does not touch them—you cannot get the loafers.

4137. Do I understand that it is under some authority?—It is under the London School Board.

4138. For instance, as to the medical inspection of schools, would not every medical practitioner be an authority to a great extent on the matter of teeth and eyesight and all those things—it would not require a specialist, would it?—I think you would not require a specialist.

4139. If he found anything beyond his powers, just as one goes to one's doctor, who says, "You ought to see an oculist," he would be able to refer you to someone else, would he not?—Yes; the chief medical officer of the Board.

4140. It would not require a large number of doctors then?—I think not.

4141. It would not be necessary for a medical officer to inspect the school more than once a month, or once a week, or once a fortnight; or at what interval would it be necessary?—It would be difficult to say off-hand, but not more than once a fortnight or once a month.

4142. The teachers would be on the look out for the ordinary indications of sickness, and would inform the medical man, would they not?—Yes; they would send the children home.

4143. Would lady doctors be useful for that purpose?—Yes, they would be useful.

4144. For examining girls?—I really do not think it is necessary to specialise because of the sex.

4145. But would it not be possible to bring also into it the anthropological statistics?—Yes.

4146. The idea that we have had before us is that it is very necessary that we should endeavour to get some statistics regarding the physique so as to tell whether disease is going up or down?—Yes.

4147. Would not these medical officers be able to deal with that question?—Yes; but it would involve a very much longer amount of time. You cannot take these statistics at a school without expending a very considerable amount of time.

4148. But assuming that the boys and girls attendance at the school is constant, say in the month of January, and the medical man examined as many as he could and gradually went through them, in three months he might examine the whole lot?—Yes.

4149. And take the measurements?—Yes.

4150. He would have no more to do with them, except new ones coming in, until the following year?—That is so.

4151. That would be possible?—Yes, that would be possible;

4152. To work the two together?—Yes.

4153. The instructions to the school children about cooking and maternal duties and so on, must interfere, to a certain extent, in the case of girls leaving school at so early an age, with other instructions, so that it would be difficult at present to increase the amount of instruction in household duties, would it not?—We have only 45,000 children attending domestic subjects, and I suggest that every child should be taught.

4154. I understand that these girls have to leave at fourteen?—Yes.

4155. Would it not be better for them to remain another year?—Some of them do voluntarily.

4156. With a boy it is more necessary that he should get out to earn some wages earlier; is it not so?—Yes.

4157. But it seems to me that even fifteen is young for a girl to go out to work?—Very young.

4158. Would not an alteration of the law be advisable?—Personally, I would keep them longer at school.

4159. You examine the employees for the London County Council?—Yes.

4160. I would like very much to know what are the defects most common that you find they suffer from?—I find very few defects. They are generally very healthy.

4161. What class do you deal with—are they of the actual labouring class?—A few. I examine them all, from the Technical Instruction Board's teachers and inspectors down to, occasionally, some of the working men when they want to join the County Council's Superannuation Fund.

4162. They are really of a superior class then?—Yes.

4163. The London Fire Brigade are some of the finest specimens of men, are they not?—Yes, as a rule; they are sailors. The only thing I have to reject firemen for is rupture and varicose veins, and occasionally for heart disease.

4164. You have no common defect with them?—No.

4165. You were mentioning just now, with reference to the strata from which the majority of the recruits to the army come, that they have touched the lowest ebb, or gone down to the lowest strata?—That is so.

4166. I can say that that is not the case with the naval recruiting, mainly from the very fact that first of all they come from the seaman class; and the boys are of respectable parents. They have to be vouched for with good characters and you can trace their history back; and it is seldom that we take any one who might come from the lowest stratum. The stokers and marines come nearer to the lower class, but for years past we have insisted upon a long record of character prior to their joining, and they cannot be of an inferior class; in exceptional cases one may have been let in with a false character, but the very large proportion of the navy are skilled artisans, and yet we have an enormous number of rejections for exactly the same reasons. How do you account for that?—I cannot account for it.

4167. I maintain that there is a physical deterioration not only in the lower strata but in the other strata?—I cannot account for it.

4168. Is not a great deal of that owing to the want of care of mothers in bringing up their children, not only in that strata but in all classes, in proper feeding, for instance?—My impression has been always that it is only the lowest class that is degenerating; the type of men I get for the fire brigade are not affected by degeneracy.

4169. But they have gone through the mill?—They have.

4170. You do not get the young from fifteen up to nineteen and twenty?—No.

4171. By statistics of the navy we learn that the artificers, who are skilled artisans, must have been at work for three years at their trade as apprentices, and they have as bad a record as anything?—There is one thing; the type of man who wishes to go to sea and the type of man who joins the army, because he can do nothing else, is very different. They drift into the army.

4172. But at the same time there are three or four strata who all seem to have the same similar defects, principally teeth, eyesight, varicose veins, and so on, and particularly matters that seem to show bad nutrition. One cause you alluded to here is that the mothers who cannot suckle their children, and who feed their children improperly, use a great deal of proprietary articles in their food. Is not that so?—Yes.

4173. Would not it be possible to have some check upon those proprietary articles, either by means of taxing or an inspection by analysis?—That would be excellent.

4174. There is practically none at present?—Anyone can advertise theirs as the best; and there is a class of person who believes whatever he sees in print. They feed their children upon those things. If anything could be done in that line it might be useful.

4175. Would you extend that to the sale of those tinned products—tinned fish and lobster, for instance?—Yes, and tinned milk especially.

4176. You would have constant inspection of them?—Yes.

4177. I suppose sanitary authorities can inspect?—Only if it is suspected of being bad.

4178. (*Chairman.*) With regard to these patent foods, cannot some of them be dealt with by the food and drugs Act if they were found to be actually deleterious?—I do not think that they are deleterious in themselves, but only deleterious to the special cases in which they are given. They make excellent food for an invalid, and I sometimes recommend them, but I never dream of feeding infants with them.

4179. (*Colonel Fox.*) Are there not a great many non-nutritious tinned foods?—They are not nutritious to infants. Most of them are made from wheaten flour and oatmeal. The point is this: Under six months of age gastric and other juices do not convert farinaceous food, and therefore, if you put farinaceous food into a stomach that cannot digest it, it acts as an irritant. After six or nine months it is really a food, because it may be converted by the various juices in the stomach and made use of in the animal economy.

4180. Am I to understand that in a child up to six months of age the ordinary processes of changing the starches into sugar do not go on?—They do not.

4181. You said just now that you attach great importance to the training of girls between the ages of thirteen and fourteen, not only in the art of choosing proper food, but in the knowledge of how to cook it, in order that they may, when they become mothers, we will say in four years' time, know how to bring up their children worthily, and how to nourish them?—Yes.

4182. Thus producing a better and stronger race?—Yes.

4183. But do you not think that the teachers who have to deal with them—1,000 teachers go to the training college—ought to be better trained physically, both male and female?—I do.

4184. That they ought to be taught simple hygiene at the training college, and everything else that is necessary in the way of health?—Yes.

4185. In addition to learning the art of physical training which is required of them when they arrive in the schools, they would also have greater mental vigour on account of their physical power being greater—is that not so?—Yes.

4186. And more vitality, and greater power of imparting the knowledge they possess to the children?—Yes.

4187. A great many teachers, both male and female, are below par as regards their physical condition—is not that so?—Yes.

4188. And they become rather slack, and have not the power of imparting the knowledge that they possess?—That is so.

4189. Do you think they would have a much greater power of imparting knowledge if they had healthier bodies and in that way healthier minds?—I am sure they would do their work better.

4190. My point is that this should be done for them at the training college?—They ought to have the theory as well as the practice of it.

4191. (*Chairman.*) With regard to the teaching of girls in the latter part of their school life, do not you think that during the last years of a girl's school life, a great many of the literary subjects might be put in the background, and attention concentrated upon those branches of instruction which would tend to make her useful to her mother when she comes back to her home, in the way of attending to the younger children, and rendering her better equipped when she becomes the head of a household herself?—Most emphatically I think so.

4192. And you might go further and institute a system of half-time attendance at fifteen when the children may be employed practically in their homes half the day in household work, and half the day in school, improving themselves in such subjects at the same time?—Do you mean to extend the age for school attendance?

4193. Yes, to fifteen. Those up to fifteen might attend half-time?—In the case of girls only?

4194. Girls only, with the view of improving them in household management?—Yes. I think that would be an excellent thing. I think that they would get more instruction and be able to apply it better.

4195. They would be able to apply the instruction at the same time that they were receiving it?—Yes.

4196. With regard to eyesight, would it not be easy for teachers to ascertain the ordinary defects of sight by the use of Snellen's type, and colour-blindness might be detected even more easily?—Yes.

4197. So that defects might be detected in that way?—The teachers do that now, and the ophthalmic surgeons simply go round and check it off, and see it done properly.

4198. Have you considered the deleterious effects of cigarette smoking among boys at all?—I think it is very deleterious. I have added "cigarette smoking" to the syllabus for lecturers to point out the evil effects of smoking at all, and cigarette smoking especially.

4199. Have you ascertained what the effects are?—It produces mal-nutrition and stunts the growth.

4200. Now with regard to the very young children, and the difficulty of obtaining suitable nourishment, I presume the milk question is at the bottom of it?—Yes.

4201. From your knowledge of the classes we have been discussing, do many of the children get milk? Is there an opportunity of their getting it, even if their parents were willing to obtain the milk?—In their homes?

4202. Yes?—I do not think that they get nearly enough milk.

4203. Is that due to ignorance or to disinclination to get it, or to the physical difficulty of getting it?—I think it is the price. Milk is dear for the poor: it is not the difficulty of getting it.

4204. Do you know any London boroughs besides Battersea where an attempt has been made to organise a milk supply for the poor?—Last year, when I was on the Borough Council of Paddington I started the subject and it is under consideration.

4205. We have heard of several provincial towns where it has been done?—I do not know, but I think there is another borough besides Battersea.

4206. If it could be started upon a sufficient scale do you think that it would become self-supporting?—The medical officer at Battersea tells me that it could be made self-supporting.

4207. And at the same time the milk can be placed in the hands of the parents at a price which they are prepared to pay?—Yes, you would get it cheaper and better in that way.

4208. And all that is required is organisation and not any eleemosynary treatment of the problem?—No, I think that a proper milk supply would be the explanation to a very great extent of the improper feeding of infants.

4209. Because it touches the first six very sensitive months of their lives?—Yes. From the statistics of Dr. McCleary, it would appear that he has already reduced the death-rate very largely in Battersea.

4210. Do you think that there is a sufficient number of cases of growing and wilful neglect by mothers of their children in this stratum of society to justify the State in taking them from the care of their parents, and making them liable for their maintenance in either public nurseries or homes of a special type?—I would not like to take the responsibility of answering that question, but I will say that I have seen many cases where parents are neglectful of their children, and that it would be better, and in fact it would be only fair for the State to remove them from their custody.

4211. Would you agree with a view to the enforcement of parental duty that such an obligation should be undertaken by the State in the interests of society?—Undoubtedly.

4212. And that the local authority should be empowered to obtain a suitable contribution from the parent?—Yes; and the effect of the officer of the law—say, a policeman in uniform, calling upon them for a small sum—would have a very remedial effect upon them, and would, in a measure, prevent a recurrence of the offence. The effect of a man calling upon them from the Education authority, especially in uniform, would degrade them in the sight of their neighbours?

4213. And it would have a similar effect upon any neighbours that might be inclined to act in similar ways?—Yes, and certainly upon the delinquent not to repeat the offence.

Dr. Collie.

Dr. Collie. 4214. (*Dr. Tatham.*) From a remark which fell from you just now, I am induced to ask whether you have any definite experience of the differences to be found in the schools according as they are in the country or in the town ?—No.

4215. You have no personal experience of the country ?—No.

4216. Because you spoke just now, as I thought, appreciatively of the suggestion that schools should be taken to the country, and by cheap means of transit it would be possible for the children to attend somewhere outside the towns ?—It is simply on broad hygienic grounds that I consider the country is very much better. My mind goes to a very healthy Scotch school on Deeside, where the children are very much healthier than the children here.

4217. I thought probably you had some personal

experience ?—Not beyond what I have stated. It does not require very much personal experience of a school to enable one to say that a child would be very much healthier living at Highgate or Streatham Hill than at Hackney Wick or Stepney.

4218. Then you make the statement on broad common-sense ideas ?—Yes.

4219. (*Chairman.*) Have you anything more to say ?—I have here an interim report on the hygiene classes. Here are statistics with regard to nourishment in the school at Anerley. The trouble is that the numbers are so very small, but it shows a very marked improvement in the health from proper feeding. (*Handing in the same.*)

4220. These are very interesting facts to have. This is one of the defective schools, I suppose ?—No ; the Anerley Deaf Schools.

The Rev. W. E. EDWARDS REES, M.A., called ; and Examined.

Mr. Rees. 4221. (*Chairman.*) You are a member of the Salford Education Committee, are you not ?—Yes, and I am the Chairman of their Anthropometric Sub-Committee.

4222. That is the committee under the new Education Act ?—Yes.

4223. You have been in that part of the world for a long time ?—In Salford itself six years, and eight months ; in Lancashire ten years. I was vicar of a pleasant suburban parish before I came to Salford, so that previous experience scarcely counts.

4224. You have had, therefore, very considerable opportunities to estimate the general conditions affecting English physique ?—Yes.

4225. Could you state what they are ?—Do you mean the conditions special to Salford ?

4226. No, the general conditions ?—I should say that the most potent influence at work is the condition of the air. There is very little sunlight—only some two-fifths of what there might be under other conditions, and there are a great many deleterious elements in the air.

4227. Which are specially destructive to teeth, I understand ?—Yes, and to metal and brass goods, for instance. That is the worst condition. There are other conditions. For example, here is one. There is a great deal of female factory labour still, and the Manchester woman does not turn very readily to domesticity, and, consequently, when she gets married, as a rule her domestic skill is decidedly below par.

4228. She is unsettled by factory work early in life. I suppose ?—Yes. It is not her *métier* at all. She does not like domestic service.

4229. Is the number of women in factories increasing in proportion to the population at large ?—No, perhaps they are not increasing. I should say that there is no very material difference in proportion between now and fifty years ago.

4230. I suppose the conditions in which they work have very considerably improved ?—They are better.

4231. So that that would be among the ameliorating agencies ?—Yes, but you are only now beginning to feel the effects.

4232. The adult classes at the present time are suffering from bad conditions of the past still ?—Yes.

4233. But that all makes for improvement in the immediate future ?—No, I do not think so. I am perhaps going too fast, but it does not appear to me that you may reasonably look for improvement until you deal with the causes which are operating now, some of them more strongly than ever,

4234. What causes ?—The pollution of the air, for instance, is worse than ever. You have stopped not all, but some of the most flagrant abuses, but the amount of abuse is greater than ever it was ; and if I might explain a little more in detail, I may say that there are people in Manchester who systematically pollute the air, and systematically pay the fine—the ridiculous fine that is imposed : it is a mere bagatelle. It is much cheaper to pay the fine than to put up new plant. There are people in my parish, for example, who at almost any time in any day, if anyone cared to visit the neighbourhood,

may be seen pouring thick volumes of black smoke into the air.

4235. How often are they liable to fines ?—Very frequently. I think there is no limit to the number of times that people may be fined.

4236. Can you specify the parish ?—I can. My parish is St. Thomas's, Pendleton ; it was at one time a residential parish, and still is to some extent.

4237. To a diminishing extent, from what you describe, I suppose ?—Yes.

4238. What effect does that have upon the physical condition of the people ?—Well, that I think is a physiological question, is it not ?

4239. Yes ?—I should trace much of the anæmia to the deprivation of sunlight and to the lessening of the vivifying qualities of the air ; and I should also say that the majority of the people of the working classes in such neighbourhoods are generally tending to be below par in the matter of vitality.

4240. But you are prepared to testify to a general improvement of vital statistics, are you not ?—Yes, of vital statistics, but I attach very little importance to that, because, as I point out in my *présents*, it is simply raising an inferior limit.

4241. At the same time infant mortality remains as great as ever, you think ?—Its average is slightly larger than it has ever been. It shows a diminution in the last year.

4242. Some Lancashire towns are particularly bad in that respect ?—Not nearly so bad as Leicester, for instance ; but they are bad enough. The infantile mortality is about double what it is in the open country—it is about 180 per thousand.

4243. Do you think that is due to general causes affecting the health of the children, or is it due to parental neglect ?—It is directly due to parental neglect and indirectly to want of stamina in the parents.

4244. Which is inherited to some large extent, I suppose ?—To a great extent.

4245. Do you think that there is any progressive deterioration of the type in Lancashire ?—There is a great conflict of opinion upon that. I have studied the question with some care, but I should not be prepared to give a definite opinion upon that point. I am inclined to think it is progressive, and there are people, for instance, most medical officers of health, who maintain that in the last thirty years, if anything, there has been a great improvement.

4246. What do you think to be the best accredited test of physique ?—I hold that it is the anthropometric test of weight and height taken together.

4247. And other physical character general ?—As a rough test ; I should not go into other tests.

4248. You are of opinion that it is enough to take height and weight, but is not there some fixed correspondence between height and weight so that height and weight are not necessary ?—I think that correspondence could be worked out, and that it would vary with different races. The type in Manchester, for example, the male ought to be 5 feet 7½ inches in height and about 154 lbs. in weight, but it is very far from reaching that in the majority of the working men.

4249. The failure of weight is proportionate to the height—you find the same correspondence, do not you, as a general rule?—The failure in weight baffles one to a great extent. For instance, the failure in weight is greater than in height in school children in inferior districts, but is very unequally so. For instance in one of the schools where one expected to find a considerable falling off in weight there is not so much as one anticipated, but there is the usual falling off in height.

4250. What general conclusions would you draw from such anthropometric values of the English people as are available?—That we fail to participate in the general movement in the right direction; that while the continental people generally—all except the French in the last few years—are improving the type, we are not improving the type.

4251. We are in certain classes surely?—Yes, but they only represent 8 per cent. or 9 per cent. of the population.

4252. When you say that those industrial classes show deterioration, do you take the army at all as an example of the condition of the industrial classes?—On that point there is conflicting evidence.

4253. We have had some evidence in this room to prove it?—One can only go upon the dictum of experienced army medical officers, and they, or some of them, hold that the Tommy Atkins recruit is just an average type of his class.

4254. Yes, the slum class?—Of the class from which he is drawn, 50 per cent. of our people. But 35 or 40 per cent. of our people live in slums.

4255. You admit that the slum population is smaller than it used to be?—No, I do not: it is much larger.

4256. We have had evidence as to the progress in the great towns in clearing slums?—And that is perfectly true, but the area of closely packed houses is increasing, and for all practical purposes a great many streets in Manchester which the medical officer of health would not classify as slums, for our present purposes are slums, because they are too narrow and too sunless.

4257. We were told in this room not long ago that all the back to back dwellings in Liverpool were entirely extirpated—all the cellar dwellings, and these conditions are more favourable for bringing more sunlight and air to those places, are they not?—Yes, but there are 170,000 people in Salford who live in streets which do not exceed thirty-six feet in width, and this solid area of streets is very little broken up by open spaces. Now there is plenty of testimony to show (I have some here), that you cannot breed a vigorous race in such a place—you cannot do it. You may have pure water, but you have neglected the purity of the air.

4258. Quite so, but then surely the conditions of the past were just as adverse?—No, for this reason. Take sixty years ago, when the last Royal Commission investigated the conditions of Manchester and Salford. There were then only 40,000 or 50,000 living under such conditions in Salford. It is true that perhaps 10,000 out of 40,000 were living in worse conditions than any you may select out of the 170,000 of to-day, but then the average is no higher to-day than then, and the number of people submitted to the deteriorative conditions which I have mentioned is very much larger.

4259. That arises from general causes, what you call the urbanisation of people?—Yes.

4260. I have a statement on the authority of Dr. Niven in which he says that “during 1891 to 1901 the number of one-roomed tenements in Lancashire, containing more than two persons, decreased from 5,007 to 4,256; the number of two-roomed tenements, containing more than four persons, from 16,004 to 10,227; and the number of three-roomed tenements, containing more than six persons, from 8,704 to 6,437.” Surely that is a marked diminution in the condition of overcrowding which would have an effect?—But I would point out that all that may be perfectly true. In ten years you have a diminution of two-roomed tenements to the number of 1,000, but in those ten years you would have massed together 20,000 tenements, shall we say, averaging four rooms—20,000 houses inhabited by people who formerly lived in the country, or at any rate lived under better conditions; 20,000 more

families submitted to deprivation of sunlight and air, which I have mentioned, and though you have filmed the ulcerous places very nicely by improving 1,000 of the houses, you have put up 20,000 more.

4261. But those 20,000 have probably been built more under modern conditions—under building regulations of a more sanitary character than in the past?—That is quite true, but the streets in Salford and Manchester—(those covered by the curtain of cloud that over hangs—this is the material point)—are still commonly not over thirty-six feet in width. I mean the new ones. Now a German municipal authority will insist upon sixty feet at least, and in Cardiff it is the same, to take an example of an English town, which shows good results.

4262. When you say in your memorandum that the statistics of the industrial classes show deterioration, what proof have you of that?—The proof that I have of that is such as this. I have questioned police superintendents and they tell me that they cannot get men in the Manchester area big enough.

4263. That is not the case here in London?—Is it not? Well, it is in Manchester. I have questioned scores of policemen themselves. I find one man is born in Derbyshire, another in Westmoreland, and it is very rare indeed to find one born and bred in the urban area of Manchester and Salford. Then as to the volunteers—Well, you know better than I do that the standard of the volunteers has been lowered repeatedly in recent years and that even so there is a difficulty in manning the battalions. There is a piece of evidence of Mr. Trippel's, who will probably be here to give evidence; he mentions a case in which out of thirty-one young men who offered themselves on a recent occasion in Birmingham, for example, twenty of them were rejected as being not up to the standard.

4264. That is for volunteers?—It is very difficult to get precise information, because, naturally, the volunteer officers have a certain *esprit de corps*, and they are a bit jealous about washing their dirty linen in public, but when pressed they admit that it is difficult to get the right sort of men in Manchester and Salford, and when they have got them they do not always retain them if they work them too hard.

4265. (Colonel Fox.) As regards the London police force, some of the best of them are enlisted from the Guards, and a great many of them from the navy?—Yes.

4266. (Chairman.) You consider that the Manchester area is an especially suitable one for inquiry?—Yes, because as I point out, it is the type of an industrial community, which is becoming more and more the type of English communities. As I pointed out, you have in Manchester all the effects of the amelioration that you may expect from your present system. You have a splendid water supply. You have admirable drainage, and you have execrable air for the people to breathe.

4267. That is due to setting at defiance the laws on the subject?—Not so much the violation of the laws, but the public conscience is not awakened to the keeping of the air pure.

4268. You say that in Manchester and manufacturing towns they are in the habit of throwing foul vapour into the atmosphere?—That is true.

4269. In direct contravention of the laws on the subject?—That is so.

4270. We have not got the full benefit of the ameliorating agencies in Manchester, you think?—That is also true.

4271. And that is touching the point where you say degenerative effects come in most prominently?—That is true. I am anxious to make this point clear. The reason why the laws are not enforced to their full extent is that the conscience of the community itself is not awake to the danger of the pollution. People do not care to be hard on manufacturers, they do not realise what a tremendous evil they are inflicting upon the community. If they dealt with the drains in the same way—I mean, if the same sort of effect were produced underground which is produced overhead, the conscience of the community would demand very drastic penalties at once. But we are not, as a people, alive to the evil, as other peoples are; and in industrial communities like Manchester we are less alert than you are in London to the necessity of keeping the air pure.

Mr. Rees.

4272. I thought it was an elementary fact, and that anybody would have appreciated it ?—But they do not.

4273. (Colonel Fox.) The mischief is that there is dense smoke and it is dreadful ?—Yes.

4274. And that is because the law is not enforced ?—Because the law is too cavalier in its treatment of an offence of that kind.

4275. I have often heard that those manufacturers who are fined, go on repeating the offence ?—Yes.

4276. (Chairman.) But if the maximum penalty is repeated at sufficiently frequent intervals it would have some effect upon them, surely ?—I forget what the penalty is, but it is not serious enough to make it a real deterrent.

4277. It might be made so, though, might it not ?—Yes.

4278. Would that involve the necessity of the manufacturer altering his plant ?—There is conflicting testimony upon that, but most experts say that it would not involve the manufacturer in any serious expense.

4279. But they do not take the trouble ?—At any rate they succeed in Germany.

4280. (Colonel Fox.) I remember going to Solingen, the Sheffield of Germany, and I expected to find a second Sheffield, but I found no smoke, and every house was painted white, with green shutters, because the laws were in force against noxious vapours ?—Yes, and the German has seen what we have not seen. We saw the necessity, before any other people, of making the drainage right : other continental peoples generally have seen the necessity of keeping the air pure before we did—we have not yet seen it. Perhaps I might say that the difficulty is not likely to be speedily remedied, because the people who would cry out about it are going away from it—the manufacturers themselves are clearing out.

4281. (Chairman.) At the same time you will admit that the remedy is one of easy and not of expensive application ?—I think one might fairly say so.

4282. Is that in your opinion the main cause of the deterioration of the races in Manchester ?—I should call that the main cause. There is another cause which I mentioned. It is the cause which is most easily dealt with ; the other cause is want of physical training.

4283. And of proper nutrition, I suppose ?—Well, yes ; but I attach more value to the lack of physical training than I do to the other. For this reason ; after all has been said, our people are as well nourished as any other people. There are great deficiencies certainly, but, after all, the Manchester working classes are better fed than the working classes of, shall I say, Düsseldorf.

4284. Is that so ?—I think so.

4285. It may be that the material which is available is superior, but the question is whether the parent, the housewife, has the same talent for the selection and preparation of food as the housewife in Düsseldorf ?—No ; I do not think that the Manchester women would have that. That is admitted.

4286. That is the point. It is more the selective capacity of the housewife than wages and domestic resources ?—That is so. But I think the whole discussion of this subject will go wrong if it attaches supreme importance to food, because one could quote example after example of splendid races who are most inadequately fed. That has been long ago recognised by anthropologists.

4287. But the probability is that the food that they do get is of a proper kind ?—It is this way, three pints of food per diem to 24,000 pints of air ; and, after all has been said, Brocca and Gould must have been right when they attached the first importance to the air. I am anxious to make that point, because medical officers of health in England, not elsewhere, are almost unanimously in favour of pressing the food question to the fore.

4288. You think that they overlook the other ?—I am sure they do.

4289. Do you think the comparison of physique of school children in Manchester with any other towns would be to the disadvantage of Manchester ?—Certainly.

4290. You think Manchester is specially bad, even among the towns of Lancashire ?—Well, one expected to find the other towns in Lancashire better than Man-

chester, but the only town in which the school children have been tested is Rochdale, and that is even worse if anything—slightly worse.

4291. That is very near to Manchester ?—It is twelve or thirteen miles away.

4292. (Mr. Lindsell.) Are the smoke conditions the same ?—They are nearly as bad, not quite so bad.

4293. (Dr. Tatham.) It is a smaller town ?—Yes. But nowhere in South Lancashire have you really air—it is all town.

4294. (Chairman.) And these comparisons show to great disadvantage compared with the best types, you think ?—Yes. I have summarised them for you in these statistics. And you see, if you compare school boys at eight, ten, and thirteen, which are good ages to compare, you have the singular thing that up to eight the Salford school boy is only an inch shorter than a public school boy, so that you have an argument against pressing the point about early nutrition too much.

4295. You think that it shows that at eight years old they are not so backward as they are when they get older ?—That is so.

4296. (Colonel Fox.) Are the statistics of which you speak those taken by Dr. Roberts ?—Yes, partly.

4297. He weighed the boys in their clothes, and the other boys are not weighed in their clothes ?—But if you take Mr. Vines's or Dr. Almond's, or the figures given in the Scottish Report, you will find that they show improvement in the public school boys in the last twenty or thirty years. I think that fact is incontrovertible. They show a decided improvement. The point I was dwelling upon at the moment was this, that at eight years of age the slum Board school boy of Salford is only an inch, or an inch and a half, less in height, and perhaps six or seven lbs.—I can give you the exact figures—less in weight than the Marlborough boy, for instance. But, when the lads pass beyond eight years of age, the disparity becomes more and more marked, and the inference I would draw from that is this, that up to eight years of age, though the other boy has been very much better fed and better cared for, the Salford boy has held his own, and if he has held his own you must not attach too much importance to early nutrition, as people are very apt to do. No doubt, early nutrition is very important, but it is not all important. If it had the importance they are disposed to assign to it, you would expect the boy at eight years to be even worse in comparison with the other boy at eight, than he is at thirteen compared with the other boy at thirteen.

4298. Have you had any experience of the Jew population ?—No ; I should be inclined to doubt Dr. Hall's, of Leeds, results ; and, so far as they are sound, there is one factor which I think he has omitted, namely, that the Jewish is a sub-tropical race and they mature more quickly. At thirteen you would expect a Jew boy to be more advanced than an English boy, just as you find the English boy relatively more advanced than the Norwegian boy.

4299. You would account for the two inches in height, and 7 lbs. more in the weight, by race more than anything else ?—You will find that the Jewish girl attains the age of puberty earlier than the English girl, and so with the boy.

4300. But we gather that the Jewish children do not get the same amount of air, and that they are more closely packed than the English children, so that is opposed to your argument ?—I account for that by pointing out that the comparisons are not *in pari materia*.

4301. You are not trying to prove the point ?—No, I have weighed the point. I say that is a point which needs investigation, but it will be found that the Jewish boy matures quicker ; he is a man at seventeen, and the English boy is not a man at seventeen.

4302. Is it your experience when the Jewish boy has arrived at man's estate that he is not superior to the English ?—He is not at all. You will find a Bengali girl is bigger than an English girl at twelve, but not at eighteen ; and it would be a very fallacious inference to draw from that to say that the Bengali girl is a superior animal to the English girl.

4303. (Chairman.) Do not you attach any value to the superior nutrition of the Jewish child ?—Yes, but not so much as Dr. Hall makes out.

4304. (*Colonel Fox.*) Do you admit that they are better fed and better looked after?—I tried to investigate the case, but I am rather astonished at Dr. Hall's dexterity. In Salford we find a sentiment against the examination of Jewish children, and we have not been able to do it.

4305. (*Chairman.*) The Jewish population is very much larger in Leeds than any other part of England, save Stepney, I think?—Yes. We have not examined any Jewish children, but we have to fight against that sentiment.

4306. (*Colonel Fox.*) Has it come to your knowledge that the Jewish mothers are more thrifty?—Yes.

4307. And they have better knowledge of how to feed their children?—I think they have better knowledge, but I speak from hearsay, merely from inquiries I have made in my own parish.

4308. And that same fact is recognised in London?—I see. Well I should say that that is perhaps so from the few Jewish families that I know; there are not a great number in my neighbourhood, but certainly they are well nourished, and I have noticed that at thirteen to fourteen they are heavier, plumper and better developed than English children; but they are not so five or six years later.

4309. (*Chairman.*) When you say there is not a healthy conviction of the evil, no public conscience in the matter of the air in Manchester and its neighbourhood, may I ask what the Manchester and Salford Sanitary Association have been doing for the last few years?—They have been working hard at the question, too.

4310. And not producing much effect?—I am a member of the Executive Committee, and I may say that they are regarded a little as faddists; that is not the fault of the Association, but of the Manchester people.

4311. They have to trim their sails to popular prejudice?—They are regarded as crotchet mongers, disturbers of the peace, and so on.

4312. Have you enjoyed that character yourself?—No.

4313. You do not enjoy that character?—No, I think not. At any rate, the proof of the pudding is in the eating; if inquiry were made, I do not think you would find that I do.

4314. You do not share the suspicions under which the society apparently suffers in the estimation of your fellow-townsmen?—I do not think so. I remember that the Manchester newspapers jeered at me some three or four years ago when I proposed to anthropometrically measure the children, but they are entirely of a different opinion now.

4315. They are?—Yes; they now talk of the magnificent work done by the Salford School Board.

4316. Do you see any prospect of local opinion dealing with this air-pollution nuisance adequately?—I do not think so—not within a reasonable time.

4317. Does not that point to some defect in the operations of this Society, that, what you call the principal cause of physical degeneration, has not been touched by its propaganda?—They are shouting to the void, to people who will not listen—partly because they have got a character for being faddists, and that is partly due to one or two of the prominent members being in advance of their time. If the Manchester manufacturers' conscience were touched in the Manchester area, you would find a very different state of things in a very short time.

4318. What opinion have you formed as to the contributory causes?—I mentioned the two principal causes—the pollution of the air, and the lack of physical training. I hope you have taken note of the fact which I now point out—and I have a good deal of testimony to support me—the Manchester children are losing the instinct of play.

4319. From want of places, or is it from want of encouragement?—There is no space to play in.

4320-1. Have not the Manchester schools playgrounds?—But they are not open except for a few minutes every day.

4322. (*Chairman.*) Have not you got any open spaces in Manchester?—We have, but not anything like Ennals.

4323. Could they be obtained in the vicinity?—I cannot obtain a cricket pitch for my lads for love or a reasonable sum of money.

4324. (*Colonel Fox.*) The school you are speaking of is a Voluntary school, is it not?—We have five Voluntary schools in my parish.

4325. As a rule Voluntary schools are very badly off?—We have five playgrounds: we are better off than the average of Provided Schools, it so happens, in my parish. They were provided, most of them, when land was cheaper, long ago. You come up against the land question whenever you deal with this matter.

4326. When you say "land," do you mean the rating question?—I think so—it is the land monopoly—the question of the unearned increment.

4327-8. Is the unoccupied land mostly in a few hands?—Yes, in our neighbourhood it is largely in the hands of one gentleman who does not even live in the neighbourhood, and does not, so far as I am aware, contribute a sovereign to the benefit of any philanthropic movement that is being carried on in the neighbourhood.

4329. (*Colonel Fox.*) You attribute the want of physical training in your district to the lack of playgrounds and of drill halls—I should say that we English people in this matter, as it has been our history in other matters, depend upon chance for what other nations look to system to do. Consequently we allow our children—or have allowed them until quite recently—to depend upon national instinct for games, forgetting firstly that in these large towns there is no opportunity, no space for games to be played; and forgetting, secondly, that though a large minority possibly of the children will play games anyhow, in any conditions, another large section—and they, perhaps, the children most in need of games or training, will decline on marbles; marbles is a great resource.

4330. The weakly and the timid ones, you mean?—Yes, consequently you may tinker with the question if you like, but there will be no remedy until the question is taken up whole heartedly, and not only as to the case of the air, but to compel every boy to undergo a certain physical training.

4331. Have they not started that?—Yes, they have, but there is plenty of testimony to show that after thirteen or fourteen the boys deteriorate when they leave school.

4332. They have already started physical training in elementary schools—have the boys benefited?—Undoubtedly.

4333. Would you like to see more of it?—Personally, I should like to see them trained for three hours a week.

4334. What you are complaining of is not so much of the elementary schools, although you would like to see that time increased, as of the continuation schools?—I want to see the children when they leave the schools, between fourteen and eighteen, submitted to a healthy drill exercise, willy-nilly.

4335. The boys' breakfasts are good things?—They are admirable, but they are only touching about 6 per cent. of the boy population.

4336. How do you propose to do it—by private enterprise?—No, I should call in the agency of the State. The Lancashire working man is not afraid of conscription for example—he is not afraid of a modified conscription. Some people seem to think that conscription would be very unwelcome to the working man, but it is not so. It might be unwelcome to a large number of them, but, for example, the great majority of those who are advanced thinkers would accept this modified conscription very readily.

4337. (*Chairman.*) For home service?—I think so. I have tested the question. I have addressed audiences of working men, and I have always found them in favour of it. I do not think it is due to my persuasive eloquence.

4338. You attach some importance to that latter, do you not?—No, but, I find an overwhelming number in favour of some form of training, and that training will have to come.

4339. (*Colonel Fox.*) As a means of improving the physique of the nation?—Yes. I do not now enter into the question of national defence.

4340. But as a means of improving the physique of the nation?—Yes, and inculcating habits of order, and precision, and cleanliness.

4341. Which is so badly wanted in this country?—Yes, anything in the shape of barrack conscription would be hopeless—it would not have any chance.

Mr. Rees. 4342. (*Chairman.*) You were about to tell us what were the contributing causes, you think that they are of minor importance?—Drink, for example, is a contributory cause.

4343. Do you think that is diminishing?—"Drink," says Mr. Charles Russell, who knows more of Manchester lads (after school age) than anyone else, "drink is not a frequent cause of degeneration," and at any rate we must remember that drink was a much more fertile cause in past generations. In 1740 we drank nearly six times as much as we do to-day.

4344. Was not the drinking mostly confined to the upper classes, then?—The others drank, too.

4345. (*Colonel Fox.*) Have you considered this, that the individual does not drink so much, but that there are more people who drink now?—I do not think that that is so. I think there are more women who drink now. So far as drink is a differentiating cause it is the drinking of women.

4346. Do you think it is not the case that more people drink now?—No, because there are fewer men who drink. There are a very large number of teetotallers.

4347. I have heard it frequently stated that the majority of people do not drink so much, but there are more people who drink?—I do not think that is true, unless you include women—there are perhaps many more women who drink.

4348. (*Chairman.*) That affects the offspring both directly and indirectly, does it not?—Yes.

4349. She brings the child into the world deteriorated, too?—I should say that the effect is more indirect than direct. It leads her to neglect her household.

4350. (*Colonel Fox.*) Have you a remedy for this evil?—No; I am afraid that any remedy that I would suggest would carry us on into another line entirely. I should like to see, personally, the drink question dealt with in a large way.

4351. You think that the conversion of public-houses, as they now exist, simply beer halls, into restaurants would be the means of preventing those evils?—I do not think so. I can only hope that it will have some effect in the distant future. I must not regard that as a practical remedy. I would rather go in the way of having a high licence as an immediate remedy, and I would license the man as well as the house.

4352. Have you considered what has been done for cabmen's shelters?—Yes.

4353. You rarely come across a drunken cabman, whereas when there was no place to go to but a beer-house, it was a very common thing to see a drunken cabman?—Yes.

4354. In the shelters, they can get eatables and they can drink anything they like, and have tea and coffee. If that has done good in the case of cabmen, surely this form of restaurant, which Earl Grey has started in the shape of the Public-house Trust Company, would be useful?—I am entirely in favour of any agency of that kind.

4355. You think that does not count. It may be after we are dead and gone?—I recognise the solution of the drink evil as practically coming in different ways, I should like to see the reduction of licences, and I should give all my support to public-house trusts, and I should like to see the experiment of municipalisation tried in two or three municipalities.

4356. (*Chairman.*) Would you enumerate what the principal remedies are that you think should be applied to the present condition of things?—Well, universal training. I should begin by fixing two hours per week of physical exercises in all elementary schools. I do not regard two hours a week as sufficient, but I should begin with two hours a week. I should raise the hour which is now prescribed by the Code to two hours to begin with. But I should like to see it three or four hours a week. I should like to see an organised use of the parks made in half holidays.

4357. (*Colonel Fox.*) That, I conclude, is for the recreation of the children?—Yes.

4358. How would you control the recreation?—I should require the teachers to do so.

4359. The teachers have their day's work, and they want, like all of us, to go to their homes for a little rest?—I know, but I should meet that in this way. I should not

require the same classes to go to the parks on the same afternoon. I should not tumble all the children of Salford into the two or three parks available in the same afternoon, but I should have an alternative use of the parks, and of course of the teachers, too.

4360. You mean to say that you would strike the children off their class work, and march them down to the parks?—Yes. We are too keen on merely giving them a certain minimum of book learning. We are altogether wrong in that point, in my opinion. The great majority of them will never profit much by the book learning, but all would profit by the physical training and the habits of discipline that you inculcate. Then it would mean shortening the curriculum, being a little less ambitious than we are now, when you aim at bringing every child in elementary schools up to a certain standard of literary accomplishment. I do not think that the loss would be material, because the children would gain in alertness somewhat.

4361. It would give their brains a chance of growing I suppose?—But even if there were a loss, I should be prepared to accept the loss. Then I should compel boys, at any rate, to undergo a system of physical training, and if a system of summer games could be combined with it I should rejoice; but I am now advocating a remedy which the people of this country would accept. I think that compulsory continuation classes, with a certain elasticity in them, would be of immense advantage. At present no form of physical training can even earn a grant in a continuation school—you cannot even get a grant for it.

4362. You said just now that all boys ought to undergo a course of physical training, but is not it equally necessary for the girls?—Quite so.

4363-4. Even more so for the hopes of future generations?—But I am dealing with what I can get carried into effect. I should compel every child up to the age of seventeen, unless he was being otherwise educated, to attend continuation classes on three evenings in the week; and on two of those evenings, or one at any rate, I should make physical training the main feature of the work done on that evening, or two evenings if it were thought practicable, and I should include swimming.

4365. Now you know that a vast number of boys are messenger boys and telegraph boys, and bring grist to the mill, and they take money home—that is why they are sent to work—have you considered what would be the effect of stopping those boys from doing this work. Would it not be most unpopular?—Not every evening in the week, but three evenings in the week they would be available for the service of their employers. The other three evenings in the week they might be withdrawn at seven o'clock to attend their continuation classes. But I think that would be perhaps a feature that ought to be reckoned with. It would cause some little dislocation at first, but the gain in the energy of labour that would result on a national scale would more than compensate the loss that you inflicted upon individual employers. If you are to deal with this question at all, you must tread on some corns.

4366. (*Chairman.*) What kind of lessons would you have?—I should have obligatory lessons on the simple principles of hygiene. It seems very strange that there should be no such lessons obligatory in the Code. It seems marvellous that, for girls at any rate—it is amazing, if you will permit me to say so—that hygiene and cookery are not universally taught.

4367. You mean household management generally?—Yes, it should be regarded as the *pièce de résistance* in the girl's curriculum for the fourth, fifth and sixth standard.

4368. That includes the management and feeding of children?—Yes, you want a reconstruction of the Code, so far as it applies to the girls.

4369. Particularly at the later stages of their school life?—I should not pretend to have such subjects until the fourth standard is reached.

4370. Then the last two years you would concentrate them rather to the subordination of other subjects?—Yes, I would give up nearly half their time in the last two or three years of their school life to these subjects.

4371. Have you thought of encouraging girls attending two or three years longer, in order that these subjects could be applied in the home?—It would not work.

4372. Perhaps there is too much factory labour?—There is too much demand for child labour.

4373-4. (*Mr. Lindsell.*) Surely the local authority could make it compulsory?—Now they can, but the members of the educational authority would probably welcome such an insistence as that. But the difficulty is this: that they would be afraid of possibly an increase in the rates, and afraid possibly of incurring a great deal of censure, and they would hesitate to do it, and where they did it would be in a very tentative and half-hearted way. But if the Board of Education were to suggest that it should be compulsory they would accept the lead, as they always do. The action of the Board of Education would make a conscience for them in the matter.

4375. But might there be places where it would not be desirable or possible to have it?—I cannot conceive such places.

4376. Do not you think if the power were given to the local authorities to exercise their discretion that they would avail themselves of the power?—I suppose you would have to do it in that way. After the recent new departure you can only recommend to them.

4377. There is an Education Committee in Salford; why do not they make it a condition of the curriculum?—I have been very anxious to do it, and I think we could carry the point easily enough if it were not for the feeling with which many members of the Education Authority greet a new thing, they are always afraid of something new; I mean to say it takes some time. They want to walk round the subject a bit, don't you know. I have no doubt one could carry it here and there. In fact, perhaps, a great many educational authorities would be willing to take up that attitude, but the point is this, if you want it done expeditiously and thoroughly you want a direction from headquarters. A great many educational authorities would not move for the next thirty years.

4378. (*Colonel Fox.*) But is it not a case of such importance that you ought not to fear treading upon their corns?—That is true. We can do it in Salford, and we shall do presently whether we get direction or not. We are doing it now, but it is not obligatory. But the point is this: that for one Education Authority that made a move forward there would be ten others who would be content to mark time, whereas, if action were taken on the part of the Board of Education it would accelerate the movement. The next point I have down in my memorandum is the inclusion of cookery as an obligatory subject. Well, I think the only obstacle to that is that in many of the voluntary schools, most of them, there is no apparatus. In perhaps the majority of the board schools, too, there is none, but we in Salford are already considering the policy, and we are going to give effect to it.

4379. (*Chairman.*) Have you school kitchens in those schools?—Yes, in a very large number of schools.

4380. (*Colonel Fox.*) Are you considering the question of restaurants?—No, but obligatory lessons in cookery.

4381. I mean where they can buy food at a very nominal sum?—We have toyed with the idea.

4382. Do you think those would be self-supporting restaurants?—Well, it is difficult to revolutionize the system in a moment.

4383. (*Chairman.*) Do you think a scheme of girls' cookery could be worked into a system for feeding those who come to school underfed or who are willing to pay for food?—The teachers themselves eat the food cooked now.

4384. But that is on a very small scale. The question is whether it could be done on a big enough scale to make the two things interact?—Yes, I think so. But in Salford and Manchester the children who come underfed to school are few. They are only two per cent. of the whole.

4385. We find in London that it is 33 per cent. during some months of the year?—It is only two per cent. in Salford. We have instituted a system of free breakfasts for those who need it during the winter. We find that out of 42,000 only 800 children need them, and many of them only need them temporarily, from the father being temporarily out of work or some other temporary cause.

4386. That points to the industrial conditions of this area being extremely good?—It brings you back to my contention that it is not a feeding question so far as Salford and Manchester are concerned.

4387. It may be misdirected feeding. It is not inability to feed children properly, but it may be misdirected energy?—Yes.

4388. Or ignorance?—Yes, there is misdirection, I know, and, as I have already said, I am sure there is misdirection, and a very great deal of it.

4389. And then you wish to correct it by those means?—But there, again, I have to say this: I have made enquiries amongst the local grocers, who are unanimous in testifying to this, that the working classes eat more oatmeal and more brown bread than they did twenty years ago. There are many more customers for the better class of food than there were twenty years ago.

4390. Is the milk supply good?—Yes, and the quantity of milk in the Manchester area is increasing more rapidly than pro rata of the population.

4391. Has this slum population got access to a proper milk supply?—There is no lack of the supply of milk in the Manchester area.

4392. (*Colonel Fox.*) Is it milk of good quality?—Yes, and cheap. The Co-operative Society at Pendleton, for example, has, I think I am right in saying—I am speaking off the book—about seven thousand members in Pendleton itself; that is to say, about 10 per cent. of the population are members of the Pendleton Society. The society sell milk at 2½d. per quart, and good milk, too.

4393. What would be sufficient for a baby?—At what age?

4394. An infant in arms?—A pint and a half per day. That is a medical man's question, but that is my judgment.

4395. We have heard at well regulated schools that it costs 2½d. for an infant per diem?—It would not in Salford. Give each infant a pint and a quarter; that is, three halfpence.

4396. How is it that a Salford baby can be fed for that?—Because the milk is cheaper. It is well organised. All other agricultural produce brought into Manchester is dearer than in other places, but the milk in Manchester is cheaper than in most places because the dairy system is well organised.

4397. (*Chairman.*) It is not organised municipally?—No, not yet.

4398. It is in Liverpool to a certain extent?—Yes, and in St. Helens.

4399. (*Colonel Fox.*) It is on account of the proper organisation that the milk is cheaper?—That is my evidence, but the remarkable thing about it is, you probably know, that the farmer would be glad to get something like 1d. per quart *in loco*. There is an enormous field for cheapening the milk supply by proper organisation—an enormous field. There is no reason why milk should not be sold at 2d. per quart.

4400. (*Chairman.*) And the supply comes pure?—Yes. There are two prices. I pay, for example, 3½d. per quart for my milk. I do not think that it is any better, and I have frequently examined the milk, than can be obtained in back streets; in fact, it is the same milk to all intents and purposes. But they make those who are better off pay a little more for a little extra civility, I suppose.

4401. (*Colonel Fox.*) Is it sent out in bottles?—Yes, in bottles—sterilised, but it is usually sold in the ordinary way from cans. There is a very excellent dépôt for sterilised milk at Old Trafford; it is a suburb of Manchester which adjoins Salford, and they send sterilised milk everywhere.

4402. (*Chairman.*) Have you anything further to say?—I believe that the Co-operative Society of Pendleton are now embarking, I do not say that it is so positively yet, but they are about to embark upon a scheme of sterilisation. I have got as far as the opening of play-grounds of schools in summer evenings and on holidays. That is most important in my judgment.

4403. But there are not enough to be of much use, you think?—There are sufficient in our neighbourhood to

Mr. Rees. be of very great use. I believe there are sufficient to supply about half our needs if they were opened.

4404. That is for the people in whose custody they are ?—Yes, only the caretakers must be paid, and I do not think that the Education Authorities could pay caretakers without being surcharged.

4405. (*Mr. Lindsell.*) You are aware that the Municipal Authority could ?—Yes, I suppose it could.

4406. Under the Public Health Act ?—But you will be kind enough to remember that many Municipal Authorities as yet look with suspicion upon a progressive policy initiated by the Educational Authority.

4407. They might initiate it themselves.—Yes.

4408-9. (*Chairman.*) They are one and the same thing ?—As people say in Lancashire they will need some shifting. Next I come to the prohibition of the sale of tobacco to young people.

4410. Is not there a further thing to be done, ought not the sale of cigarettes to be prohibited in all shops like sweet shops and other shops frequented by the young ; that is where the great temptation comes in ?—Yes.

4411. It is a great temptation to the boys when there is tobacco to be sold over the counter ?—That is true. I did not think of it when drawing up my *précis*, but you would have to decline giving tobacconists' licences to shops in which sweets are sold.

4422. You could get the Inland Revenue to ask what their occupation was, and if it was discovered that they were selling sweets or toys that children were in the habit of buying, it ought to be declined ?—That is quite right. That is quite my view. I need not detain the Committee on that subject. My next subject is that of further and more complete medical inspection of schools. That is not my own recommendation so much as that of the medical members of the committee over which I preside.

4413. We have received a great deal of evidence on that, and we think that something of the sort should be done ?—I quite assent to it, but it is not a question to which I have given special attention. Then my next subject is, the provision of swimming baths in the basement of a certain proportion of all new schools. That proportion would vary much according to the area. In some districts very little provision would be needed, in others, as in Salford, considerable provision of that kind would be desirable. It depends very much upon the locality, whether there is a good clear river running through it, and whether it faces on the seashore, and what provision has already been made in the way of municipal baths.

4414. Have not baths and wash-houses been adopted to a large extent in Manchester and Salford ?—Yes, and we encourage our boys to swim, and give them prizes. In fact, you will find that the report of one of our schools shows that in point of physique we do very well indeed. It is quite up to the Roberts' average for English boys—the Grecian Street school. This modern boys' school is in good working order. A great deal of importance is attached in it to the systematic teaching of swimming. But we have not yet been able to encourage the girls to swim also, because it implies a mistress to teach them. The teachers cannot swim themselves in the great majority of cases, and there, again, we have been baffled up till now by the expense involved in getting special teachers.

4415. (*Mr. Lindsell.*) You are aware, of course, that in a great many schools boards they supply swimming baths in connection with their schools ?—Yes.

4416. And since the passing of this Act it has been held as a function of the Education Authority to supply swimming baths ?—Yes.

4417. There is nothing to prevent this last recommendation being carried out ?—The difficulty is, how to enforce it. There is a practical difficulty, the difficulty of enforcing a regulation of that kind.

4418. The difficulty, I find, is to check them in multiplying them unnecessarily in some areas ?—I wish that were my experience. Then, finally, I have a recommendation which I did not insert in my *précis*. It is most desirable that the early closing of shops should be enforced. One of the great contributory causes of physical deterioration, which I ought to have mentioned earlier, is the fact

that the children do not get enough sleep—they are up too late. They participate in the life of the street too late at night. There are, of course, as you know, social grades among the working classes : now the working class aristocracy send their children to bed, in the majority of cases, at reasonable hours, but the lower social grades in the working classes do not much mind that, do not attend much to it, and do not realise the importance of it.

4419. If the children were sent to bed they would not sleep, because the houses are small and over-crowded, and the atmosphere is full of noise and so on ?—That is a difficulty ; but people in a working class district get accustomed to noise, and they sleep in conditions which you would find it impossible to sleep in. It is asking a great deal to enforce an early closing Act of that kind. One general observation I ought to make on this point : people who consider the working class as a whole are apt to make the great mistake of thinking of them as being more or less homogeneous. There is as great a social gulf fixed between some working class neighbourhoods in my own parish, and some others, in fact a much greater social gulf fixed than between my own social plane and what shall I say ?—the Duke of Devonshire's ; people who do not know the working classes intimately are apt to forget that. That is why a great deal of what I have said applies—most of what I have said applies—really to the lower grades of the working class communities. But, unfortunately, they form in industrial towns the great majority.

4420. (*Chairman.*) What average wage would those people have, would it be under 30s. ?—Well, I should rank people who either earn a small wage, or earn a bigger wage irregularly and precariously, in that class. The carpenter, the joiner, the turner and planer, or the lithographic printer is an aristocrat ; but the dock labourer, and the casual labourer is not, of course.

4421. He is the lowest in the scale ?—Yes.

4422. (*Colonel Fox.*) Are you aware that the man employed in clerical work, or the shop-keeper, looks down upon the skilled artisan ?—Not so much in Manchester as in London.

4423. That is so in London ?—Yes.

4424. For several reasons ; because they do not soil their hands for one thing ?—That feeling is fast disappearing in Manchester : I have a large class of working men. They nearly all belong to the aristocracy of labour. There are commercial travellers among them, clerks, lithographic printers, joiners, cabinet makers, grocers' assistants and down to colliers, but there is no sense of social division between the clerk and a pattern-maker, for example. If there is, the patternmaker is as often as not the superior being.

4425. That is not so in London. The skilled artisan, who is really a better man, is looked down upon ?—He is by far the better man. Now we have got beyond that, to a great extent. We have disabused ourselves of the prejudice in Manchester to a great extent. I may say that a friend of mine who is a solicitor in Manchester tells me that if he advertised for an office boy twelve or fifteen years ago the next morning he would have a street full of applicants. If he advertises now he might get one or two replies to his advertisement, and it is very difficult to get office boys in Manchester.

4426. For the reason that they get situations as messenger boys and telegraph boys ?—No, but the ideal of the Manchester boy, the parents of the working class boy, is to make their sons into artificers, craftsmen, and so on. They do not care for the messenger boy opening. The messenger boy is on a lower social grade because they recognise, and they are coming to recognise it more and more, that the work of an errand boy lands a boy at seventeen in a *cul de sac*. There is no future for him, and I have done my best to enlighten them upon that point.

4427. (*Dr. Tatham.*) I am very much interested in what you have said in respect to a part of Manchester in which you live, because I know it pretty well myself. With regard to the public parks that you speak of, in your district you are better supplied, are you not, with public parks ?—Yes, in my own parish we are. We have Sedley and Buile Hill Park within 400 yards of us. But all the same we cannot get a cricket pitch. There are some cricket pitches but they are at a prohibitive price. There are not many.

4428. Not even in the vicinity of Seedley Park?—That is in my parish. You have Barr Hill fields, they are all taken up and they are very inferior, and the prices are high. You pay £10 for a pitch.

4429. It is a question of high prices which you cannot afford?—The boys cannot, the men do in some instances.

4430. The Manchester artisans are quite capable of paying anything they wish for themselves, I suppose?—Yes, but the boys who need it most cannot get access to a cricket pitch.

4431. Am I correct in saying that in Manchester, more probably than in most places, young fellows earn a good deal of money at an early period of life, say at seventeen and eighteen?—That is so. But it is not so much so as it used to be. A man goes into cotton weaving where he can earn a man's wage comparatively early. But it is not so in the trades. It is not so much done as it is sometimes thought to be.

4432. Many years ago that was the case?—Yes, but it is not so much there now.

4433. You spoke of the tendency of young men to become artificers of various kinds. Is that becoming an increased tendency now as compared with the past?—Yes, and it has been increasingly difficult. The Trades Unions are very exclusive; they are in their own way as exclusive as the House of Lords. They do not give a wide welcome to intruders into their preserves. Many years ago the tendency, at least at the time when the cotton trade was probably more prosperous than it has been lately, was for the young men at the age you speak of to get into the various warehouses or become clerks in offices.

4434. Yes?—They are not quite so eager for that as they used to be.

4435. There is a tendency towards the artificer class of work, is there?—Yes, a decided tendency.

4436. With regard to swimming baths, did I understand you to say that there are no public municipal facilities?—For baths in Salford, yes there are, and we use them; it is those that we use, and I am very happy to remember that the Salford Corporation encourages the bathing of school children. I am speaking again without my book, but I think that the charge is a halfpenny for a swimming bath for a schoolboy or girl accompanied by its teacher, and consequently classes are taken regularly.

4437. They have not got to the extent of making them perfectly free?—No.

4438. Have they done so in Manchester?—No, I think not.

4439. Then you made the statement that in your experience young children were losing the love of playing?—Yes.

4440. Do you mean because of the circumstances in which the children are brought up?—Yes.

4441. They have not the opportunity of following their instinct?—Yes, the desuetude produces a loss of taste. It is the same law that operates always; they are losing it primarily for want of opportunity, but it is becoming, and I think very many trustworthy observers agree, a settled apathy to play.

4442. And you think in that respect things are getting worse in Salford?—I believe so.

4443. With regard to the question of physical deterioration, I should like to ask you whether you think from your own experience that there is evidence in your own parish of progressive physical deterioration in any part of the community?—I do not think there is clear evidence of progressive physical deterioration. The physical unfitness—I will not use deterioration—is perhaps not greater than it was fifty years ago when old Douglas, as he was called, penned the children in hundreds in the mill—you remember the circumstances perhaps. But the point is this, that for one child who lived in Salford in old Douglas's time there are fifteen who live in Salford now. The area of the operation of the cases has been greatly extended. They may not operate more detrimentally now than they did but they operate over a wider area, and they affect a much larger percentage of our people. May I say upon that point I have the figures that I have here collated which were intended to supplement those I have included in my *précis*—I have them now ready. I think those ought to be included (*handing in the same*).

4444. (*Chairman.*) Yes, kindly let us have them?—They are more significant than the other, I think. They show the falling away from the normal very much more than the others do.

4445. (*Dr. Tatham.*) And you said too, although you had no evidence to show it, that up to the age of thirteen there is not any marked deterioration amongst the people, but after that age, from fourteen to eighteen, you notice a very marked deterioration?—I am afraid I did not intend to say that—what I intended to say was that up to eight the child in the slum school holds his own with the child in the Manchester grammar school or any middle-class school, or very nearly holds his own on an average, but when he becomes four or five years older, at thirteen, then the boy is not as good as the grammar school boy would be. Now the deteriorating influences do not show strongly until the approach of thirteen. He is, as these last figures show you, 4 ft. 5½ in. in height, whereas he ought to be 4 ft. 9 in. in height. He has lost more than 3 inches and 17 lbs. in weight as compared with the normal boy. You may put it like this. Fifteen thousand of our Salford school children, that is about one-third of them roughly speaking, will be, when they reach thirteen, 7½ in. shorter than the Rugby boy at thirteen, and 33 lbs. lighter. It will take three boys from Salford and from that type of school to make two Rugby boys. The figures are there, I have original measurements.

4446. (*Colonel Fox.*) Is that for the corresponding number of public school boys, 15,000?—Oh, no. Take the average boy, the type of boy, the mean boy. There are 42,000 school children in Salford, and 15,000 of them are in the type of school which I have classified as being in the poor working class quarter; 15,000 more are in a medium sort of quarter, and about 10,000 are in a better quarter. Now take the lowest quarter here, they are here, as a sample. Here are some measurements which we have taken quite recently. At thirteen the John Street schoolboy is 4 feet 5¾ inches in height. The figures are better given in that *précis* of mine because I include all other results there. He is only 65 lbs. in weight. Now if he was at Rugby or a Rugby boy he would be more than 5 feet in height, but I am speaking from memory. At Rugby at thirteen he would be 5 feet 1-6 inches in height, that is 8 inches taller and 98 lbs. in weight, that is 33 lbs. heavier. Take the medium type of school:—In a medium type of school the boy will be at thirteen, 4 feet 7-76 inches in height; that is 2 inches taller than a slum boy but still 6 inches shorter than the Rugby boy and an inch shorter than the boy of the artisan class ought to be according to Roberts—4 feet 7-6 inches in height, 68¾ lbs. in weight, that is to say, an inch shorter than he ought to be according to Roberts, and about 8 lbs. lighter. He is 1½ inch shorter than the London School Board boy according to the Scottish Commission Report. In the best type of Board School in Salford he is 4 feet 9-3 inches in height, 79½ lbs. in weight. If you compare these figures you will find that he is just an average boy. Our best type of boy reaches the average of the artisan class of England as given by the British Association Anthropometric Committee's Report thirty-one years ago—and he is also just equal to the London School Board average boy. The London School Board's average boy appears to be normal, just what the British Association figures would require him to be. Our best type of school only just touches that level.

4447. (*Dr. Tatham.*) Are the boys that retain this standard country-bred boys or Salford-bred?—They are bred in Lower Broughton and in the Langworthy Road district the best part of Pendleton.

4448. You spoke just now of the evil effect of air pollution in Salford. You also said, what one knows to be true, that the water supply of Salford and Manchester, and the district, is probably the best in England?—That is so.

4449. Certainly quite equal to the best?—Yes, and plentiful.

4450. I understood you to say that the Corporation of Salford have been very active indeed in many branches in improving drainage and other sanitary conditions of health?—They have.

4451. But do you think in the matter of air pollution they are a little lagging behind?—I am certain of it.

Mr. Rees.

4452. Would not it be in the power of public bodies, like those you represent, to bring some pressure to bear upon the Sanitary Authorities; they are all powerful in the matter, and, as you say justly, they have the power to abate the smoke nuisance absolutely?—It is difficult to make any bird foul its own nest, and these people have a tenderness for the manufacturers. They are not large-minded enough to see that an evil is being done which cannot readily be compensated. They know that if they enforced the law quite strictly, they would need more inspectors—they have too few—and they would set their faces against it, and, besides, I think they would listen to the pleas of the manufacturers that they were damaging trade with their absurd experiments. That is what the manufacturers would in some cases say. One firm put it this way: “Well, if we were to do what you ask us to do, we must put in a new furnace, and it will cost us some £3,000. If you are going to enforce that we shall have to reconsider our position.” That is the way the thing works

4453. To put it plainly, I suppose it comes to this, that until public opinion is strong enough to influence the civic authorities, you think that it is hopeless to hope for an improvement of the Manchester and Salford atmosphere?—I think so. Only I think that public influence might be educated, perhaps by an enactment, or by a permissive law, it might be, fixing higher penalties for infringement. The penalties are very low, and I think it is 5s. and costs for the first offence, and I believe it never exceeds £5. I am again on a subject, the details of which I am not intimately acquainted with, but I think that is the case, and they do not mind such a fine and costs.

4454. (*Chairman.*) But a prosecution once a week, followed by a fine of £5, would be something, and you could fine them every day?—The greatest offenders I know, I think I have pointed out, have been offending time after time, and I think they have been fined twice—they have offended twice every day.

4455-6. (*Colonel Onslow.*) You have a Smoke Abatement Association to deal with that, have not you?—Yes, but it is not very active. They are all more or less engaged in smoke making; they do not realise what they do. I am glad to have an opportunity of saying something on that point.

4457. (*Dr. Tatham.*) We had evidence from Dr. Eichholz a few days ago, and in the course of some very valuable information which he gave the Committee he made this remark. The children of the poorer population “appear to be of unusually low stature at the limit of school age in Manchester and Salford. This is in accordance with an old established anthropological fact as regards South Lancashire, and is not a new fact in the way of degeneracy. The school population in the poorer parts of Leeds appears to be of a sounder type than the poorer populations of London, Manchester and Salford.” Would that be in accordance with your experience?—I must say that Dr. Eichholz took a more roseate view of their condition than the teachers took. But as for the anthropological fact there is no doubt a large Celtic substratum in the Lancashire population, but I am afraid that the inference from anthropological fact is to be regarded with suspicion, because the averages of the children in Lancashire are even below the Welsh averages, for example in the lower parts of Manchester and Salford. But the point is this: If you travel out of Lancashire into Halifax—I have some Halifax figures here—you will find that the children are no better; they are not a bit better than ours, for instance, in the West Riding. I mean, for instance, the Halifax boy at ten may be, if he is in a slum school, 4 feet 2·7 inches in height, in a better type of school 4 feet 3½ inches. Now that corresponds pretty closely with our average Salford school boy; in other words the Halifax children are no better than our own. Our best type of boy is slightly better than the best type of boy in Halifax at ten years of age. So that I do not think that Dr. Eichholz’s view will hold. You do not find support for it when you travel out of Lancashire into Yorkshire. I may say also that our averages correspond pretty closely with those of Edinburgh. Our averages, as I point out, are below the normal: so are the Edinburgh averages. It will not, therefore, do to say that it is racial. It is not racial in Edinburgh and in Halifax.

4458. (*Chairman.*) There is a racial cause in Edinburgh as compared with Aberdeen for instance, is there not?—Yes, but the Celtic element which Dr. Eichholz speaks of is not present in Edinburgh.

4459. No, I do not think it is.—He talks about the anthropometric and the historic inferiority of the South Lancashire people because of the Welsh element, but it is not so. You find the same inferiority in other manufacturing towns, Halifax, and according to Dr. Hall, Leeds. Dr. Eichholz’s statement is in direct contradiction to Dr. Hall, because Dr. Hall finds the Leeds children no better than ours. I have his figures here somewhere. The poor district Board School boy of Leeds averages 3 inches in stature, and 2 lbs. less in weight, than the factory lad thirty years ago. I doubt the accuracy of this statement. But still it must be accepted as proving inferiority. It is worth as much as some other statements on the question because it is made by a man who lives on the spot, and who has done a great deal of measuring. The Leeds average according to Dr. Hall in all classes of school is 4 feet 5·7 inches in height at twelve.

4460. And 77 lbs. in weight; that is the average?—I beg your pardon, according to Dr. Hall that is the best type of Leeds school. Now that best type of Leeds school shows you slight superiority as compared with our best type of school. It is 2 lbs. in weight, and ¾ inch in height. The average, according to Dr. Hall, in Leeds at thirteen is 4 feet 5·7 inches in height; that is positively below our average, and the average weight is 72·2 lbs. It is 4 lbs. better than our average. In other words, the Leeds average is no better than our own. In weight the Leeds boy is slightly heavier, and, in inches slightly shorter.

4461. I have no doubt the important comparative figures you have given us you will allow to be printed in our Report?—If there is anything I can do—I have collected much material of all sorts, from all sources, though it is not all readily available, but if I were making a written statement I could tabulate it, and anything I can do in the way of supplying figures I shall do.

4462. Your evidence will be submitted to you in proof, and anything that you feel disposed to add in the way of comparative figures the Committee would be glad to have? I shall be very glad to have any opportunity of that kind because I am concerned in endeavouring to awaken the public mind as to the facts of the case.

4463. (*Mr. Lindsell.*) With regard to the anthropometrical record, you are keeping a very regular one now?—Yes.

4464. How far do they go back?—Two years ago only, when we started. The Manchester Grammar School figures go back twenty-three years, but they are not ours.

4465. Only the grammar school?—Yes. They show an average type of boy inferior to the public school boy, speaking generally, by 2 inches in height and about 10 pounds in weight, but quite equal or slightly above the Roberts normal for the average English boy.

4466. Would you be prepared to say that, given all conditions of water, drainage and air to be as satisfactory as they could, there is no necessary connection between urban life and physical unfitness. Is it the nature of things which remedies can only palliate, and not altogether remove?—You are aware that anthropologists say that the townsmen in Belgium are better than the rurals, and Dr. Gould points out that Londoners are on the average 1½ inches taller than the men of Hertfordshire. But the general rule is a distinct inferiority when you come to towns. For instance, Ayrshire rurals, according to the British Association report, are 4·15 inches taller and 36 pounds heavier than natives of Glasgow. Dr. Beddoe points out that the men of Exeter are 1½ inches shorter and 15 pounds lighter than the men of South Devon in their neighbourhood. Natives of Newcastle in the Northumberland Infantry Militia average 5 feet 6·2 inches in height. The natives of Alnwick and Morpeth average 5 feet 7·19 inches. The rurals average from 5 feet 8½ inches to 5 feet 10 inches in height in the same regiment. That is, according to Dr. Beddoe. The cutlers of Sheffield are below the average of the cutlers of the villages; the men of Bristol are below the average of the

rural inhabitants of Somersetshire; Flamborough fishers, according to the British Association Anthropometric Committee, are 2·9 inches taller and 24·3 pounds heavier than the artisans of Sheffield, and so on. Town life has two very deteriorative physiological effects. It interferes with the physical development of women; it develops heads, it develops crania without developing the pelvis correspondingly. I need not labour that point. And secondly, you have what the Registrar General reports as a steady increase of still births. They have increased 300 per cent. in the last thirty years, and among those who survive of course you must have a larger number of weaklings brought to birth in towns than in the country. But having said so much as that, I might say that, after considering all the evidence that I have been able to get, I am convinced that the inhabitants of a good town, of a garden city for instance, would positively be better than the inhabitants of the country physically.

4467. Therefore you do not despair of the urban life?—No.

4468. Provided that the conditions were all as good as they could be made?—Yes.

4469. It is not an absolute necessity that urban life should be worse?—Urban life needs many precautions. It needs an attitude of vigilance, which rural life does not require. It is a more difficult attitude; it is a more difficult pose, from the point of view of physique, than life in the country. But being more difficult it is not an impossible one—it is not impossible to secure superiority.

4470. There are more incentives for things that are bad for the race in all ways?—Yes.

4471. With regard to this pollution of the air, do you think that it is worse in Manchester and Salford than elsewhere in those other towns, such as Leeds and Halifax?—I lived at Halifax for a time. I was a schoolmaster in the immediate neighbourhood, and I am bound to say that the air of Manchester is very decidedly worse.

4472. In places like Halifax people can get much quicker to the very fine moorland country, and they cannot do so in Manchester for they would have to go miles to do it?—Yes.

4473. With regard to your view that football probably occupies too high a place in the minds of the working classes, is that a mere gambling instinct?—The instinct that takes a man to see a football match is not the playing instinct. It is not the spontaneous outputting of energy in playing, it is the love of excitement and speculation on the chance.

4474. Do not you think that they go to improve their own play for the next local game?—No, I think that it is the love of excitement.

4475. Are not there football matches in every place now?—There are. But, as I say, they again only affect the small proportion of the youth. I should suppose that in my parish, which is, perhaps, a better place than the average Lancashire town parish, not one youth in ten belongs to a football club. I might say not more than one in ten, at any rate.

4476. Are there any opportunities for carrying on football in connection with the schools?—Yes, we have recently organised a football club in one of the schools, but the difficulty has been to find places to play on. A club has very kindly placed its field at the disposal of a certain league of clubs which has been formed in Salford in connection with elementary schools to play football matches, and it has been very kind of them: but the practice games have to be played in the restricted area of the school playground.

4477. I think I heard you say that you thought that too much importance, perhaps, is attached to the food problem?—No, not too much importance—too much relative importance. What I am anxious to guard against is this: the tendency that betrays itself among people who consider this question and fasten upon the food question as being the primary—the all important one—whereas I am sure it is the fact that it is secondary to the other two I have mentioned.

4478. Perhaps in Salford you have not a large number of children who go to school without breakfast?—As I pointed out, we have only 2 per cent.

4479. That is very different from London?—But your average boy in London is bigger; as a set-off, you have better air than ourselves. You think that your London air is bad, but I think it is superb as compared with ours.

4480. You think that the food problem is of greater relative importance before children reach school age?—Yes.

4481. The feeding of the infant is more important relatively than the feeding of the child of ten?—That is true.

4482. Now as to the remedies. You seem to think that considerable extension of the compulsory education of the youth is desirable—I mean you would extend the present compulsion, which, of course, is strictly speaking reading, writing, and arithmetic?—Yes, I think the extension is inevitable.

4483. Would you raise the compulsory school age at one bound for school purposes from fourteen to seventeen?—Yes.

4484. Because if you make the compulsory attendance of physical training extend to seventeen you at once extend the principle of compulsory education up to seventeen?—I think so. I am not afraid of it.

4485. You would be glad to see an Act of Parliament which enforced attendance at evening continuation schools from the existing school age for elementary schools up to an age approaching the limit of secondary education?—That is so.

4486. And gradually approaching compulsory secondary education?—No. So far as evening continuation schools are concerned I should use that compulsion, and if it were thought too much to expect the child to undergo a four years' evening continuation period at once, I should begin with an instalment, and compel the child to attend continuation classes to the age of sixteen. Continuation classes, as you probably know, are absolute failures at present. The people who are on the inside know that they are failures. You cannot enforce discipline. If you do the members tail off. They impose upon people, who think they are doing something, but they are not doing much. One of the great drawbacks is, that there is a hiatus between the school age and the age at which a lad very often begins to attend continuation classes. That fatal hiatus we want to bridge over.

4487. There is pressure being brought to bear of a more drastic nature to bring all education together and co-ordinate it more under one authority than before?—Yes; but the very lads who ought to go to continuation classes are the lads who do not go. When I want to prepare lads for Confirmation, I find that they are all attending continuation classes.

4488. It might be done in this way, that unless a lad at the end of compulsory school age could obtain some sort of leaving certificate, he would be bound to go on with continuation schools until he did?—That is an excellent suggestion, if you gild the pill in that way it would be swallowed. It would then appear that you would have a great solicitude for education as designed to give every lad his chance.

4489. Then you propose to extend the obligatory curriculum to lessons in hygiene and feeding and cookery?—Yes.

4490. You will be putting rather a heavy burden upon the girls as compared with the boys, will not you?—No.

4491. The girl has to obtain exemption for the right to be employed and will have to pass under the future Board of Education bye-laws and satisfy the same conditions as the boy?—That is a mistake. I would knock off some of her arithmetic; she cannot learn too much, of course; but we now insist on more than is absolutely necessary.

4492. You would like to see as a condition of employment proficiency in some of the other subjects substituted for the existing proficiency tests?—Yes. I should not vex girls with so much arithmetic.

4493. Now, again, you are on the School Committee of the Local Authority; you probably will have the making of new bye-laws to take the place of the School Board; that is a point you can bring before the Committee?—I know. In five years, perhaps, these views of mine might prevail in Salford.

Mr. Rees.

4494. In a rural district that I know of, one of the new local authorities has made a difference entirely for girls as to the condition for taking a certificate in these very subjects ?—That is excellent.

4495. You can do it yourself ?—It would be admirable if you gave them a lead, and held up the mirror.

4496. You will see these bye-laws commented upon as an experiment in a good direction. I mean anything like undue pressure from the central authority upon the local authority in these things would be likely to do more harm than good. I suppose you have formed a very strong opinion upon the pernicious extent of smoking amongst the youngsters ?—A very strong one.

4497. Have you any complaints in Salford of further evils arising from the sweet shops, about the practical encouragement to gambling by these slot machines ?—I have heard of it, but I have not come into contact with it.

4498. Now about swimming baths. You know, of course, that all these things enormously add to the rates ?—Yes I do.

4499. What is your opinion of the view that is now adopted, that the provision of the swimming bath hardly comes within the scope of the Education Authority in view of the great powers that the municipal authorities possess under the Washhouses Act ?—Well, I have no opinion to offer upon the legal question, but I think it is a pity that the Educational Authority may not deal with school swimming baths.

4500. When they are building large new schools, and think a swimming bath desirable, they can go to their own Council of which they are the Committee and say, we think that it is very expedient that we should have a swimming bath, will you do that part of the work under the Washhouses Act ?—Yes, a swimming bath in a place like Salford would be necessary, perhaps in one school out of every four.

4501. Is that another compulsory subject that you would recommend ?—Yes, I should make swimming compulsory. It is compulsory at a public school, and why not at the workmen's public school ?

4502. It is only compulsory if you want to be a boating man ?—Yes, at some public schools but not all ; I would sacrifice a little parsing and analysis for it in elementary schools.

4503. (*Colonel Onslow.*) About this compulsory physical training up to the age of seventeen ; you do not mean military training, do you ? You mean physical drill, not necessarily military drill ?—I am not afraid of the use of a rifle.

4504. But you have to bear in mind, have you not, the very strong feeling there is against what is called the spirit of militarism amongst a certain section of people ?—I think

that they need educating, and a great many of the socialistic English leaders of the working men think so too. Nothing would tend to suppress the jingo spirit more than the training, and nothing would tend to promote peace more.

4505. Anyone who knows realises that ; but a very large number of the lower orders particularly have a great horror of anything military ?—I think, personally, if you will forgive me saying so, that is an exaggeration of the facts.

4506. I was surprised to hear you say that in Lancashire, amongst the working classes, they appear to be prepared for conscription ?—Not for barrack room conscription.

4507. But for a sort of general training ?—Yes.

4508. But that sort of training, or anything like that, would not that counteract the disinclination for children to play. You say that children are losing their inclination for playing ?—Yes.

4509. If they went in for more physical exercise, that would make them more active, would it not ?—Yes, it would counteract that disinclination for playing.

4510. Would not you think that going to football matches would tend to a desire to partake in the game ?—No.

4511. If they were trained physically they would feel the necessity for using their physical energies ?—In a great many cases they would.

4512. I should like to know about those weights. Were those weights taken in the natural nude body or with the clothes on ?—The first batch were taken in the nude, and the second batch was taken with a pair of trousers on and shirt, for which some allowance was made.

4513. And then the chest measurements would be taken ?—The chest measurements are made on the inflated chest.

4514. How were they taken ?—Over the nipples and shoulder blades, except where there is a distinct "winging" of the shoulder blades.

4515. There is very great difference in the chest measurements, by their being taken in different ways you know. You said you have asked several grocers, and they find there is a greater demand for such healthy things as brown bread ?—Brown bread and rolled oats.

4516. Did you find that they were customers of the lowest class who asked for those things ?—No, it is only the aristocracy of labour who purchase those things.

4517. Not people from the slum parts ?—No ; but still the demand is greater.

4518. Generally in most cities in Scotland porridge is going out of fashion ; have you heard that ?—I am sorry to say I have heard it. Lord Meath traces the decay of the people of the North of Scotland to the abandonment of porridge.

TENTH DAY.

Monday, 15th February, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.

Mr. J. G. LEGGE.

Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.

Mr. JOHN STRUTHERS.

Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary.*)

Mrs. JOSCELINE BAGOT, called; and Examined.

4519. (*Chairman.*) You are the wife of the Member of Parliament for the Kendal Division of Westmorland?—Yes.

4520. You have had experience of dealing with the physical training of boys, have you not?—I have had experience for the last nine years of the physical training of boys.

4521. Mainly in London, I believe?—Yes.

4522. But you know something of the condition of boys in the country as well?—I have had a lifelong experience of boys in town and country, though not of the physical training of boys.

4523. Will you explain for the information of the Committee the way you have got hold of these boys, and the treatment?—Certainly. In the first place, I re-organised a club which had fallen to pieces.

4524. Is it a parochial organisation?—Yes, but I had no assistance at all from the clergymen or anybody at all. The first thing I did was to find good apparatus for the gymnasium and the providing of an instructor, and I had also to provide myself with a working-man secretary, who has worked under me entirely. Then, the club developed from various causes. In the first place, the secretary used to go to the Board Schools and get hold of boys who had a tendency and a liking for gymnastics, and they joined and they brought their friends, and gradually the number increased.

4525. Are the boys of the slum class or of the superior class?—They are of both. To continue. The Secretary also used to get a great many boys of the slum class by going to the corners of streets where they were practically in gangs, and they called themselves cliques. He used to get hold of their leader; if he got hold of their leader he usually got them all.

4526. They have recognised leaders, then?—Yes.

4527. Are they predatory, are they engaged in thieving?—Not by any means.

4528. Are not some of them?—What these boys really like is fighting, so that we get them into the club and have them trained in boxing. We get some assistants, in the way of working-men assistants, purely, who have taught them the art of boxing, and they learn to do it properly. But there was never anything like real fighting there. Then we also attracted more boys by displays, as they call them, by competitions in gymnastics. Many of them compete and the displays get reported in the local weeklies. This attracts those lads, and keeps us well supplied with members.

4529. What number have you in each year?—The actual number is between 80 and 100, but those engaged in gymnastic training are not so many as in boxing.

4530. They do not all undergo this training?—It is by no means compulsory; it is entirely voluntary, that is the whole point of it.

4531. What kind of training is it?—It is gymnastic, wrestling and boxing, and it results in a great many loafers coming in.

4532. Is there any recognised system of gymnastics?—Yes, we have a paid instructor. That I have always insisted upon, and they go through a regular course.

They have certain apparatus, parallel bars, and horizontal bars, and rings, and a vaulting horse. Most of them go in for all, but they are not forced to do so.

4533. You insist upon personal cleanliness amongst the members of the club, I suppose?—They insist upon it themselves.

4534. And you have a certain amount of drill?—No, only what I have described.

4535. I suppose they are rather rough material to deal with?—The boxing element is the roughest, and the gymnastic element is quite distinct from the boxing element, that is very peculiar.

4536. How many years are they under your superintendence?—Sometimes they only remain a month, but I have got a lot of married men who cling to it very much. We used to have more younger boys than we have now, we have really very little room, and we have them now from about sixteen to twenty-two years of age.

4537. Have you noticed in the course of the time that you have given attention to this matter, any change in the physique for the better or the worse of the boys from the time they come to you?—I notice a most distinct change.

4538. For the better?—For the better.

4539. When they come to you they are very raw material, I suppose, do you think that the raw material that you have dealt with for the last eight or nine years has improved in physique, or are they inferior to what they were?—I cannot say; I do not think that there has come about any marked difference.

4540. You think there is no difference one way or the other?—I cannot say that I have noticed it, they are mostly very small in stature.

4541. That is in the North of London?—It is. This club is in Lisson Grove, and they are mostly very undeveloped and puny altogether when they come to me.

4542. Are they, most of them, Londoners?—They are all Londoners.

4543. Have you any idea as to whether they are descendants of people who have lived in London any number of generations?—I could not say the number of generations that they have lived in London.

4544. They would be confirmed Cockneys at any rate, would not they?—Yes.

4545. To what do you attribute their puniness?—To their antecedents as children entirely, and also to the surroundings in which they live.

4546. Would you say what you have to tell us upon that point?—Well, as children, of course, the trouble is that they get no rest at night to speak of—only a few hours. The children in my particular part are playing until twelve o'clock at night from about the age of four years.

4547. That is when their parents go to bed?—Yes; they never think of going earlier—the living rooms they have are so few, it is a very rare thing for any family to have more than one room.

4548. This neighbourhood is composed principally of single-roomed tenements?—Yes, with rare exceptions.

Mrs. Bagot.

Mrs. Bagot.

4549. How many inhabitants are there in a single room?—It depends upon the size of the family.

4550. Is there any limit in the size of the families allowed in those tenements?—No; I should be sorry to pledge myself, because I do not work in the houses. I work entirely in the club.

4551. And the boys and girls will spend their time in the street until they go to bed?—Yes, the place is alive with them at night. I knew somebody who lived in these places for some years, and he said that he could not sleep at night, the noise was so great, particularly in summer, because many of them sleep in the street then.

4552. You mean they lie on the steps?—Yes. Their rooms are so hot, you know; they are overcrowded. This person said that the night was awful.

4553. They are badly fed too, I suppose?—The feeding is wretched.

4554. Is that from necessity: are the parents earning very poor wages, or what is the cause of it?—I think that a great many of them are poor. Few of them do much cooking; they get all their food at fried fish shops.

4555. Is that the staple food?—Eels are a tremendous thing with them; they get bad fried fish, things off barrows and ices.

4556. Everything that is polluted?—Much is unfresh and nasty.

4557. Have you made any investigation into the actual physical condition of the people; have you taken measurements?—No, but the change is so perfectly apparent that there is no need to do it.

4558. Do you not think that it would be interesting to have them, to show whether improvement is made in the course of a few months, or not, as the case may be?—I think it would. I have very few helpers and one has to do everything one's self.

4559. I suppose there would be room for fifty of these clubs in that place?—Yes, in that part of London.

4560. There is a large proportion that you cannot touch, I suppose. Do you know Mr. Douglas Eyre, who is a leading man in connection with clubs, and he said that a small part only was touched by the voluntary agencies?—Certainly, it is very small indeed, but the difficulty is that they are such loafers we have to deal with. They may come to my club and like it very much, and the next night they have gone somewhere else. It is the London disposition for change.

4561. Is that due to the parents shifting about?—Well if they make wages, a good many of them go to Music Halls.

4562. They want a change for their mind and body?—Yes.

4563. Do you consider any great moral change has been effected as the result of this club. Does it cultivate habits of application and materially assist to make the lads better citizens at the end of the course?—Certainly, there is not a doubt about it. They improve in their deportment and in their energy.

4564. Does it develop character as well as physique?—Yes. Their whole character is quite changed.

4565. And do they become self-respecting?—Absolutely, and the language improves in the club. I can only speak of the club itself. There is no such thing as bad language in the club. The members check it themselves.

4566. When these juvenile boxers get outside, does not it lead them to be rather dangerous?—No, they are less dangerous than before. They would not care to fight unless they found a man who could defend himself.

4567. It inspires them with a certain amount of chivalry then?—Yes.

4568. Do you take any trouble to keep in touch with these people, or do they report themselves?—I do. I have known a lot of them for years.

4569. Do many of them enlist?—Yes. That is one of the things I have noticed most, that as they improve the men have gone into the army when they have lost employment.

4570. It is not their first idea?—No. It is on the loss of employment they turn to the army. One reason of that is very clear, as far as I can make out. In the army, what

is a great terror to the recruit is the gymnastic training—they are frightened of it; when they have had a certain amount of training in our Club they do not fear it at all. We always find that they pass the test quite easily.

4571. A great many of the idlers who go to the recruiting sergeant, would shrink from any physical training, I suppose?—They would. I do not believe that these men would go into the army if they did not like the idea of it. I think a London boy is always sharp and considers before doing anything.

4572. You mean he looks before he leaps?—I am sure of it.

4573. Unless he is led to it through sheer desperation?—Yes. But I have known men leave very good situations to go into the army.

4574. Do you think that the improved conditions of military service are beginning to tell upon the military instincts of this class?—I do not think that they realise that the conditions have improved. I have noticed men going into the army.

4575. The children are not from parents who live by casual labour?—Some are. I have a great many of the lower labouring class, belonging to the boxing element entirely.

4576. They may be the children of casual labourers?—Some may be. The better element, the gymnastic element, belongs to the respectable working class, and they live under quite different conditions.

4577. Do they object to associate with the rougher class?—No, that is very striking. You can see very little of that kind of thing. But we bring them up with the idea that they are to improve their fellows, and that has been a great idea throughout, and these boys encourage that sort of thing. I only started with the rougher element, and I have always stuck to it, that they must form a part of the club.

4579. (*Colonel Fox.*) You say that these ragamuffins are afraid of the ordeal in the way of gymnastics in the army?—So I am told.

4580. You consider that your gymnastics give them more confidence in going up for enlistment?—Yes, I do.

4581. Of course, it is quite new to me that these boys are afraid of the terrible ordeal of gymnastic training?—Yes, they do not like the idea of it very much.

4582. Because it is very popular to-day at the dépôt, and they prefer it to any kind of drill?—They used to fear it, there is no doubt of that.

4583. And these gymnastic exercises take out of their minds the fear of the ordeal they imagine they have to go through?—That is so.

4584. (*Chairman.*) Do you know something of the Church Army Labour Homes?—Yes, I do, one particularly for youths.

4585. Is that in the same part of London?—In Notting Hill.

4586. On what system do they deal with lads and young people there?—On the gymnastic system.

4587. They are supposed, are they not, to get hold of boys that have left school?—The boys they get hold of are chiefly first offenders and vagrants, and destitute boys of the very lowest class.

4588. Have you seen their system in operation?—Oh, yes. I know the labour they do is very monotonous. It is principally wood chopping and laundry work. Their life is very monotonous, so I suggested a gymnasium and started it, and got a little help outside, and I have got as an instructor one of the leading members of my club as a volunteer, and he has instructed them ever since it began.

4589. I suppose physically those boys are even worse than the material you handle in your club?—Physically I do not think they are very much inferior, but as regards mental dullness and independence of manner, and certainly expression of faces, they are very inferior. I notice a great difference.

4590. Are they what you call defective mentally to any extent?—On the whole they are. I should call many almost mentally deficient. That is the reason of their want of success in life.

4591. Have you formed any opinion as to what that depressed condition is due to? Is it hereditary causes, or what is it due to?—I do not know their antecedents sufficiently, and therefore I could not say.

4592. Do you think from what you know that alcohol has much to say to the depressed condition of the physique of these boys?—I have not any doubt about it.

4593. You would attribute it to that from what you have seen?—I should like to say a word about that. I have not the slightest doubt about it. That really is the chief cause. When I mentioned food I did not mention drink, but I am quite sure that they are affected by that. Throughout childhood they are subject to its influence. The whole atmosphere reeks of drink. Drink makes them very deficient in physique, and that is where the gymnastic exercises tell more than anything.

4594. You mean in diminishing the taste for drink?—Yes, the taste for drink, because it is impossible for a man to be a good gymnast and athlete if he drinks, and they know it. It is an obstacle to attaining proficiency in the gymnasium, and that is one reason that I am enthusiastic about gymnastic training.

4595. How long does it take to diminish the taste for drink?—If they do gymnastics they drop it. If I lose a member it is simply because the member has taken to drink, not necessarily to any extent, but he finds that his muscles and powers for gymnastics are gone, and he disappears.

4596. Do many of those men who come under your influence fall out of the ranks and go to the bad—about what percentage?—A great many disappear. Whether they go to the bad one has to guess.

4597. In many cases the tendencies of early youth are too strong?—Yes, but on the whole we keep them in touch, and a good many of them we know. I do not think on the whole that many go to the bad, that is, youths belonging to the club. They cling to and occasionally visit the club, but it is impossible to keep them all right.

4598. And you are satisfied that those agencies are the best means by which superior influences can be brought to bear on the young between school age and adolescence?—Yes, certainly. One of the difficulties is in the older working boys, who have never done anything of the sort before; they shrink very much to expose their weakness and ignorance, and therefore hesitate to take to gymnastics. I find if they have done something of the sort as boys, which is, of course, rare, and if they have had any training in school they would take it up much more readily.

4599. You consider that there should be much more help given in the future towards bringing to bear a consecutive system of gymnastic training in schools, and you think it would introduce a great improvement?—It would be a great gain to us.

4600. The standing difficulty is the funds, I suppose, and the question of getting people who are interested in the work?—Entirely.

4601. And that is the obstacle to its expansion?—Yes, that is the whole obstacle. I cannot get anybody to work regularly, and never will.

4602. Would you suggest a State subvention—would that be useful if the club could be carried on, as an evening continuation school of a physical type, for instance?—Yes. They would take it up, and an enormous amount of what is given in evening continuation schools of the mental type might be co-operated with.

4603. They do introduce gymnastics, you know?—I believe they do.

4604. There is no reason why you should not have schools of gymnastics?—Not the least.

4605. Is there anything more you wish to say upon this point?—May I say a word about deportment, because I hold that those who are training are absolutely different in their ordinary deportment to the others; they throw out their chests naturally, and hold their heads up.

4606. Do they breathe through their noses?—We do not teach them that. We notice a great improvement in their manners. When they first arrive at the club they push past one, but very soon they never think of passing one without shaking hands or smiling, and they are quite

different very soon. That improvement in manners, of course, lasts; and their appearance changes. You may say that it is not due necessarily to gymnastics, but I think that that change in their deportment improves their manners, and it must follow that it is from the gymnastics.

4607. (*Mr. Lindsell.*) The work which you carry on in your club is entirely gratuitous?—No.

4608. You make no sort of charge, do you?—Yes; every member pays a penny a week. Of course, that does not cover expenses, but it is good for their self-respect, and they appreciate it more for paying.

4609. Have you noticed in the course of your experience any improvement in the general health of the young men who come under your guidance?—I do not think I have noticed any special change. I very seldom hear of them being ill at all—very rarely.

4610. That would scarcely come about unless their health were fairly good?—I should hear about them if their health was bad, and then I should go round to visit them. But on the whole they do keep well; whether it is due to training I cannot say.

4611. In the course of the work among people of this class, do you make a practice of visiting the families of those who come to you?—No; I do not go unless a boy is ill, or has hurt himself, and then I go at once. I do not go regularly round to families—I have not time.

4612. Have you lady assistants to help you?—No, I have never had any help at all. One man volunteered to help, but he left directly he found that it was not entirely religious.

4613. (*Chairman.*) Was he a clergyman?—No, I do not remember where he sprung from, but I did all that I could to keep him, as he might have done excellent work.

4614-15. (*Mr. Lindsell.*) Have you any assistance from the municipal authorities?—The only thing we have is this: we pay rent for our room, it is a mission hall belonging to the parish.

4616. Have the municipal authorities established anything in the way of swimming baths?—I believe they have in Marylebone; there is a large bath, I believe, belonging to the municipality. They have a very large gymnasium. I do not know on what principle it is carried on.

4617. Do you know whether the establishments are free?—I do not know. I know that my men go in and compete in their competitions and win a good many of their medals.

4618. Would you attach great importance to the facilities for swimming on a large scale?—Yes, I think that swimming is very important in the summer. It is almost the only thing they can do in the athletic way in London. I have got a list of the trades that these people pursue, if you would like to have it. (*Handing in the same.*)

4619. (*Chairman.*) Those are the trades of the parents? No, the actual members. I have very few boys; they are all in work, they are all of working age.

4620. What is the average age?—About twenty.

4621. (*Dr. Tatham.*) Speaking generally, do the boys that come to you belong to any particular grade or occupation?—Half of them belong to the labour grade, and the other half more to shops; we have a few van-guards, and railwaymen and postmen; in fact every occupation. I cannot say anything specially. We have a fair number of costers. But that list is representative of all the trades.

4622. And I suppose a great many are of no trade at all?—We have generally a few of the unemployed, but not very many, because they cannot pay their penny. A well known member out of work is sometimes a little in arrear with his subscription.

4623. Do the unemployed, when they come to you, if they ever come to you, remain as long as those who follow any particular trade?—No, certainly not, they get tired of it.

4624. They are not satisfactory candidates?—No, they are not. Of course, we lose more owing to the early

Mrs. Bagot.

Mrs. Bagot. marriages of these boys, and another reason is the walking out. We lose a fearful number because they walk out at a very early age.

4625-6. What do you mean ?—They walk out with their young ladies.

4627. And they neglect the club ?—Yes.

4628. Are you aware that the age at which these young men marry is much later than it was some years ago ?—I should think that it was not. Our average age is from twenty to twenty-three for marrying, that is not very young for them.

4629. That is very high ?—Yes : I have to judge of this by my club chiefly ; but I should say on the whole they represent the lower class and that is a fair age, from twenty to twenty-three. They marry on nothing, you know.

4630. (*Mr. Lindsell.*) Where is this club ?—At Lisson Grove.

4631. Is that in Marylebone ?—Yes.

4632. Have you any downward limit of age ?—We should not have any under fifteen.

4633. And that is out of the school age ?—Yes ; we used to have school boys.

4634. Have you any in employment, if they are lucky enough to find employment ?—Yes. We have not room in our quarters, which are limited, there is such a demand now, and we keep the small ones out. We used to take them, but now they are all working-men that we have.

4635. And the social grade spreads over a very large area, some earning very good wages, and some only casual workers ?—Some are only casual workers, perhaps they get a day or two's work in the week.

4636. You do not find any difficulty in getting the different classes to amalgamate ?—No, I have not allowed "class distinction" to operate—it is understood.

4637. (*Mr. Legge.*) I take it that this club is mainly composed of youths from the unskilled labour class rather than the skilled ?—Yes, chiefly, I should say ; there are some skilled.

4638. Most of them are not what one calls skilled, though some of them are ?—Some of them are, some of them are postmen and van-men.

4639. Those are not skilled labourers in the sense that a fitter is, or a man in railway works ?—No. This gives you an idea of the men who come under the training.

4640. At what age do you get them to come into the club ?—Never before fifteen.

4641. So that when you get them they are a sort of survival of the fittest, probably, physically ?—Yes.

4642. And therefore you cannot throw much light upon the problem which has shown itself as important to us, whether gymnastics as a matter of fact are of any use in developing a poorly nourished class.

4643. (*Chairman.*) But I understood you to say they were most poorly nourished ?—Yes.

4644. (*Mr. Legge.*) If they come to you at fifteen and they are fit to go through gymnastics, they are a survival of the fittest of their class, are they not ?—But a certain proportion do not take to gymnastics—they are not fit to do it.

4645. What food do you provide at the club ?—None—we have not room.

4646. They cannot get, say, a basin of soup or a cup of coffee ?—Well, that I hope to do for them in time if I enlarge the club.

4647. You could not run a stall in connection with it in the street outside ?—If they need food there are so many shops all round that they can run out and get it.

4648. Is this an independent club, or is it associated with any other ?—No, We are not associated with any others—we have been lately asked to join with the Athletic National Society.

4649. Do you know anything about the Twentieth Century League ?—No, I do not.

4650. Have you had no communication with them ?—No.

4651. But that was started two or three years ago with

a very flourishing meeting at the Mansion House with all sorts of people on the platform, and its object is to harmonise all such efforts as yours, and to assist them ?—Yes.

4652. And not to interfere with their independence, but to give them the weight and influence that is gained by combination ?—I do not know of it.

4653. You know nothing at all about it ?—No.

4654. (*Colonel Onslow.*) Those boys are not exactly the very lowest Hooligan class.—Some of them are, many of the boxing element are pure Hooligans.

4655. I should have thought from that list that you have handed in that they are hardly the pure Hooligans?—We have some good specimens of Hooligans.

4656. How do you manage your instruction ?—I pay an instructor a sum weekly. He is well paid ; I cannot get an instructor under 6s. a night, and these boys very often turn into instructors themselves. I find they always turn their knowledge to account afterwards.

4657. Does the clergyman of the parish help you at all ?—The clergyman looks in now and again, but up to quite lately we never used to see him.

4658. You have not assistants ?—I have no assistant except the working-man secretary, who is invaluable.

4659. Do you find that those very young ones come in smoking much ?—A great deal, but not much during practice—practically none.

4660. Have you noticed anything of the effects of smoking in youth ?—No, I cannot say I have. I know the little tiny boys smoke, in fact everybody is smoking.

4661. Do they think that smoking affects their capabilities in gymnastic work ?—I find on the whole the loafers who hang around are the ones who smoke, while those who do gymnastics smoke less.

4662. (*Mr. Struthers.*) Do you allow smoking in the club room ?—To a certain extent.

4663. You do not forbid it ?—I think there is a rule which forbids it during practice, but I am not quite certain.

4664. Those who are not taking part in the performance may smoke if they like ?—Yes.

4665. I suppose your numbers vary from time to time ?—Yes, about eighty is the average.

4666. From the very lowest to the fairly respectable, you have them, I suppose ?—Yes, because we have a very wide division between the gymnastic element and the boxers. We encourage everybody to take up gymnastics, but the lower in calibre they are, the less they are inclined.

4667. What proportion of them would belong to the boxer class of society ; would you say a quarter ?—No.

4668. Would you say one-tenth ?—Nearly half.

4669. You described the condition in which people in the district live ; that is to say, the difficulty from living in one room and their getting insufficient sleep ?—Yes.

4670. And their food is also very unsatisfactory ?—Very unsatisfactory.

4671. The lower class which you have, do they live under those conditions of insufficient sleep and bad food ?—The lower class do.

4672. Then you said that they improved ?—Yes.

4673. Does that apply to the lower class also ?—I think that it applies to the boxing lower class.

4674. Not the physique ?—Perhaps it does to a little extent, but it is more marked in the gymnastic work, you actually see their physique develop.

4675. There is no change in the manner of living or the character of the food they get ?—No.

4676. Most of those lads, apparently, are occupied all day in fairly heavy work ?—Yes.

4677. How often is the place open ?—Twice a week.

4678. And they come on evenings of their own choice ?—It is only open on Tuesdays and Fridays. We could only get the room for those days.

4679. And they must come on those two days in the week, or not at all?—Yes.

4680. After a long day's work do you find that there is any reluctance to come?—In some cases there is. It does a little depend upon the work. But still there are a great many who are at very hard work and they are very keen upon it. I notice the ones working in a bad atmosphere, and in restricted surroundings find it a great relief to come and take these exercises. They seem to have a longing for it, but the ones running about, like railway men, are not so keen on the exercises—they are tired.

4681. The other people are not so tired, the people in bad atmosphere?—No, those in restricted surroundings and bad atmosphere, I notice, are keen at gymnastics.

4682. Are they equally fit—they may have a great desire to do gymnastics and yet not be in a condition owing to the bad atmosphere they have been working in?—I cannot say that I have noticed it.

4683. I suppose that most of them have been through denominational or Board Schools before they come to you?—Yes.

4684. Of course, for a good many years in London schools there has been no gymnastics but drill and physical exercises, and that has been a systematic part of the course in every Board School. You know that?—Yes.

4685. You have not noticed the effect of that on your members when they joined?—I do not think that it has had a very marked result.

4686. There must be a little interval between the time they leave school, and the time when they come to you?—That is quite true. Of course, when they do give up any exercises they quickly fall back. I notice it in the summer months.

4687. Do not you think club work is specially wanted in the younger lads, younger than you are speaking of, in the interval between their leaving school and getting such employment as most of them have?—Yes, I think that it is needed.

4688. But you cannot get them?—I do not say that I cannot get them. I do not try. I have no room. I must deal with the older ones first.

4689. You may have a greater difficulty in getting them at that age in that case?—I think it would be so. Quite nine years ago I did take the small boys, chiefly, and I used not to have organised gymnastics but games for them.

4690. Can you give us any special reason for those boys being disinclined to come to you? Is it their sense of relief from being at school?—Yes.

4691. They want to feel that they are free from restraint for a period, is not that it?—Yes.

4692. They want to have a sort of fling?—Well, they won't stay long at anything.

4693. There is no religious association connected with this club?—It is supposed to be under the church.

4694. But there is no service in connection with it?—Well, they have got a new clergyman and he has been trying to get round the men to go.

4695. Do you think that that will have a good effect, the clergyman to induce them to go to the services?—For the most part they do not like it; they are mostly rather irreligious, and they object to it. He has tried, I know, but it is very hard work. At least he could not get anything from them, and they laughed at every effort he made. I asked them to go to church, but I have not heard that they ever went.

4696. I was wondering whether, in your opinion, the mere fact of endeavouring to get them to church, or to put these views before them would not rather deter men from joining the club?—I think it might.

4697. (*Colonel Fox.*) In connection with that remark you made as to the good effect upon the boys that these gymnastics have, does it give them a more manly spirit and habits of cleanliness; and if so, might not you look upon that as a step towards religion?—Yes, I do; it improves their standards.

4698. In fact, it is the thin end of the wedge?—I am certain of it. I will say as far as the actual church work is concerned, that some of our older members who have grown up, and raised themselves, do belong to this church. The time I first get them is at their very lowest state.

4699. If you tried to rush them into what is commonly called religion, do you think it would have a very bad effect, the change being too sudden for them?—It would be too sudden for them certainly.

4700. As regards boxing, you were saying that instead of causing them to be quarrelsome, it rather makes them less pugnacious?—Very much so.

4701. Because it inculcates a spirit of manliness and self-control—a manly spirit?—Yes, the best boxer is the man who is most calm and collected under attack.

4702. As to those instructors, what are they. Are they military men or civilians?—We had military men to start with, and now we have civilians who teach us gymnastics under the German gymnastic system. I believe it is more elastic than the army system, and they like it better. There is more variety in it, and we have to humour our men, and have constant change for them.

4703. Was he an old-fashioned drill sergeant, or a gymnastic instructor, the man you got from the army?—One was a gymnastic instructor, I have always been in favour of gymnastic instructors.

4704. Because I must tell you that they vary very much, the modern gymnastic instructor would have given them very great variety; the older instructor would have been rather monotonous in his training?—I tried to get a drill sergeant for the young ones, and that is what we saw; they found drilling irksome.

4705. The old-fashion sergeant with Peninsular ideas does not go down with the boys?—No, he does not.

4706. We have heard from a witness that some of the older boys become, eventually, instructors themselves?—Yes. I have many instances of this.

4707. Do not you think if we had some kind of central school in London, where these young men with a natural aptitude for training or athleticism could go and be properly trained at a very small fee that it would have a very good effect amongst the young men, not only in encouraging the promising ones to become instructors, but to get them at a very much lower charge?—I do, indeed.

4708. You think that is badly wanted?—Yes. It is an absurd price to have to pay 6s. a night for an instructor. You ought to get them for much less.

4709. Many of your young men properly trained could do the work at a very low charge. Many of them would be glad to take 1s. per night?—Why, certainly. It would mean a lot to them in addition to their work.

4710. I forget what the average age is of your young men?—From sixteen to twenty-two.

4711. You do not get the messenger boys or telegraph boys?—A few telegraph boys.

4712. They are generally working-men. They are working-men who get short jobs. Do you think they come to your club to improve their physique, or simply for the sake of amusement?—I think, on the whole, amusement is their idea. I have known some go absolutely to improve their physique. For instance, I had one man who had tried to get into the Police Force, and he was two inches too narrow in the chest, and he worked for a month until he got the right size. Whether he was accepted or not I have not heard, but he certainly broadened out tremendously.

4713. Have you thought that the habit of drink amongst those young men is caused by the natural habit of loafing, especially about the public houses?—Yes, I think that is so.

4714. They are badly fed, and they have a craving for something?—They want a stimulant.

4715. To buck them up as they call it?—Yes.

4716. Then you find gymnastics help to put them into a more healthy condition?—Of course.

4717. And they rather aid to diminish the wear and tear, and they get to know that drink is bad for them?—Certainly, they find out what makes them strong. The thing is to make them stronger, and then they do not rely upon the stimulant for their weary bodies and nerves.

4718. They want food rather than drink?—They do.

4719. (*Chairman.*) You know something of rural lads. Are you of opinion that the physique of lads of the rural districts of this age is very superior to that of the town lads?—Yes.

Mrs. Bagot.

Mrs. Bagot. 4720. In every respect?—Yes, some are short, but all are broader.

4721. In your part is the child of a big race to start with?—On the whole I think it is.

4722. With regard to the question of central associations, would you have any objections to being co-ordinated with some organisation?—Not in the least if they would let us carry out our own methods.

4723. You have no jealousy about them?—No, but we have never been sought out.

4724. If they took the matter in hand with the view to promoting local clubs and bringing them up to

some standard of excellence, would you be in favour of them?—Yes, if they were not too rigid in their methods.

4725. And that would attract public sympathy to them and make it easier perhaps to get funds?—Yes.

4726. (*Mr. Struthers.*) I suppose the value of these clubs depends very largely upon the attendance being voluntary?—Entirely.

4727. It would not do; it would be no use, in fact, to try to compel attendance?—It would absolutely fail; that is the whole key to our success, that there is no compulsion.

Mr. RALPH F. NEVILLE, K.C., called; and Examined.

Mr. Neville. 4728. (*Chairman.*) Can you tell us what aspect of physical degeneration first attracted your attention to the subject?—I practised what they call locally in Liverpool for eight years, and when I went down I saw a great contrast between the operatives from manufacturing districts and men and women coming from agricultural districts; it was very marked. I was startled by the appearance of the former, and it was some time before I came across the true Lancashire race. The agricultural parts of the county of Lancashire certainly produce as fine a lot of men as any county in England, and the contrast between them and the men of the manufacturing districts was most startling.

4729. From your observation would you say that the contrast is more startling than it was ten or twenty years ago?—I could not say that. I have seen less of it in the last ten or twenty years.

4730. What do you take then to be the principal causes of this great physical difference that you have observed?—I should think that the main cause was the difference in the life. In the one case the people spend the most of their time in the mills in a damp atmosphere and under conditions probably not very healthy, although they are quite as healthy as they possibly can be made, and they come to those mills from cottages which are situated in overcrowded districts where the streets are too close together. Another reason is the difficulty of the working classes, even those who are not poor people in the ordinary sense, getting milk for the children. It may not be true to-day, but at the time that I knew more about it the children got no milk at all.

4731. Fresh air and proper food are the desiderata, you think?—Yes.

4732. You know a gentleman of the name of Mr. Rees of Salford?—I have not met him.

4733. He was a witness here, and he laid great stress on the pollution of the atmosphere from noxious vapours, and he believed that had more to do in the way of stopping the development of the physique of the poorer classes than anything else. Have you heard that opinion currently stated at all?—No, I do not think so. The chief noxious vapours in that part of the world are the products of combustion, sulphur and carbon.

4734. He stated that the manufacturers of Manchester and Salford were entirely regardless of their obligations under the law not to emit noxious vapours from their factories, and that the local authorities winked at it: they now and again prosecuted, but the fine was paid and the offence was repeated, and so on, the fine being so very small; and he said that it was a habitual disregard of the provisions of the law which might not in themselves be insufficiently rigorous, but he regarded the poor condition of the urban classes in Lancashire as largely due to this cause. What would you say?—It may be so, of course, but I should say from ordinary observation that the smoke in Manchester is a good deal less than in London, and in the districts around Manchester less again, because to a certain extent they are spread about.

4735. Is not factory smoke much worse than household smoke?—I cannot say.

4736. There are a great many noxious ingredients in the factory smoke, are there not?—It is quite possible, but I do not know enough to give you an answer to be of any value.

4737. What, from the physical point of view, is the most

desirable condition for the great bulk of the people?—The most desirable condition is what we cannot get for them, and that is open air to work in, but if we cannot do that we ought to try to get them open air when they are not at work as long as possible.

4738. How do you think that those adverse conditions can be best met?—The idea I am in favour of, to give an example, is this. I am associated with my coadjutors in seeing if it is not possible to organise what is undoubtedly progressing, and that is a decentralisation of manufactures. Several trades have shown a marked tendency to leave London in the last few years, notably the printing and the boot trades.

4739. You think that there are conditions favourable to the redistribution of the industrial toiler?—I think so. Of course, the position of manufacturers in great centres in London makes it difficult if they want to enlarge their works, and they would have to do so at very great cost. And the housing of their workpeople is a matter of constant difficulty, and it seems to me that the conditions which originally prevailed in great centres have been so modified that their true interests would be to get out of those centres.

4740. Are these manufacturers awake to their true interests: are they doing anything in that direction?—The printing trade has gone out to a very large extent. The boot trade has gone out to a very considerable extent, and there has been a distinct movement into the country from London during the last few years, to say nothing of large towns such as Birmingham and Liverpool, of which, notably, Mr. Cadbury and the Messrs. Lever are prominent examples.

4741. But that does not represent a general tendency?—No, there is no tendency outside our movement, as far as I know, to have an organised exodus. The instances I have referred to are of individual manufacturers who have put forth efforts of their own, and in their own interests have gone outside.

4742. Do you think that any amendment of the law of rating is necessary to encourage this movement. It has been suggested that if the sites instead of the buildings were rated that that would necessarily lead to the removing out of the great centres of population of industrial establishments from their midst?—I have not thought of that, but it is obvious that it would stimulate the movement to a very great extent, because one of the matters which really would induce manufacturers to go into the country is the low rates which would be paid. That is, of course, assuming the rating to be on the same principle as it is at present. You get lower rates because the expense of rural districts would be small, and they would not have to raise so much to meet their expenses.

4743. Will you tell us how you think a scheme of the sort you have in view should be organised?—I think you know, for the last year or two, I have been interested in the Garden City Association, and am now chairman of the first Garden City, Limited, which is a company promoted for the purpose of endeavouring to establish industrial settlements in the country. We have now obtained a site, and we hope to be able to get a population. We have had a good many applications at the present time, although we are not ready to part with our land at present, but we shall be able to get a considerable number when we do start.

4744. (*Chairman.*) Are you going to deal with the manufacturer directly, are you going to eliminate the middle-

man?—We are going to act as a Land Development Company would do. Not to attempt to build, but leave that to private enterprise, and let the land directly to the manufacturer. It may be that the middleman may creep in, that we cannot help. As far as I can see, we cannot impose any condition of that sort, but any manufacturers that want to move we desire to attract.

4745. If the middleman came in he might reproduce some of the evils you are trying to avoid?—No, I think not. The main thing is to put an agricultural belt round the town and to limit the town to a certain size. We get our site: a certain proportion, a due proportion to build upon, but beyond that there will be no buildings at all. If you want to expand you must go over the zone and start away from the town. We think by that means the vitiation of the air will be rendered impossible.

4746. How will you prevent more than a greater number being on that area?—We must rely upon the general law for that. We shall let our land for cottages and stipulate how they are to be built, and we shall let land for factories on similar terms. So that as far as the buildings are concerned we can prevent an increase in the number of the buildings. But with regard to the overcrowding of those buildings we must look to the general law.

4747. Until you have organised a community of your own, you will not be able to apply those rules. You have taken a place near Hitchin, have you not?—Yes, we are in that rural sanitary district.

4748. In the course of time it will become a municipality under your own superintendence and supervision. I suppose?—Our point is that we shall be always the owners of the land, and, therefore, we can prevent building except in those parts which are set out for building, and we can prevent alteration of the buildings so as to increase the density of the population in that sense.

4749. You will not be able to make bye-laws?—But we can get covenants. We shall lease for 99 or 999 years, and the lease will be subject to restrictive covenants, and they will last as long as the leases will last.

4750. Will that be practicable?—It is done over and over again in the case of private development of estates for gain; of course, it is very important with a residential estate that you should have plenty of open space.

4751. But, in applying that to the poorer class, is it so very easy?—You do not take the covenants from the poor people, but from people who are in possession of land, and the remedy is by injunction. It is not a question of damages, but to prevent the land being applied inconsistently with the covenants.

4752. You think that can be done?—I can speak of that as a lawyer, and I do not think there is any difficulty about that at all.

4753. You would leave to those living within the zone, land for tillage attached to every house if practicable?—Yes, our notion is that. Of course, it is not absolutely fixed in the case of the cottages, but it is somewhere from six to eight cottages to the acre.

4754. Within the zone?—Yes, so that each cottage has its ground. The only thing to consider there is, if we wanted to have a town of considerable population we must not struggle for too much or we lose the facilities of transit and that kind of thing. But either by way of allotments within immediate reach of the cottages or gardens, we mean them all to have a little bit of land sufficient to interest them.

4755. What is the area of this proposed scheme?—3800 acres—a little over—according to our plan the buildings cover about 800 acres.

4756. Perhaps it would be useful to let us know what are the essential features of the scheme and the advantages you expect to flow from its adoption?—The essential features are these (1) The acquirement of sites for industrial settlements at agricultural prices: (2) The scientific planning of the sites by experts: (3) The concerted migration of population: (4) The limitation of the area and population of the settlements.

4757. Can you tell me what the “concerted migration of population” means?—Only this; that we do the concerting. We get applications and enquiries from manufacturers and we act as the organising company, and we provide sidings and lay out the land or part of the land for factory sites and offer them to any manufacturers. We

think that we can attract them better than those who have nothing to offer except simply bare fields. We relieve the prospective buyers from a good many expenses. I have given you the fourth as to limitation of the area and population of the settlements. Now we come to No. 5, the maintenance of a belt of agricultural land around them and (6) application of the increments in the value of the land for the benefit of the population.

4758. Is that after you have taken the five per cent.?—Yes, there is a limited dividend of five per cent. Then we come to some of the advantages which may be expected to accrue from industrial settlements so organised. 1. Conditions of life for the artisan and townsman, consistent with sound health for himself, his wife and his children. 2. Cheapness, efficiency and sightliness resulting from the scientific laying out of the town as a whole from the outset. In connection with this head may be grouped: (a) the supply of light, water, power and heat; (b) facility of transit and communication; (c) disposal of sewage. 3. The reduction of rates, by the application of the increment in the value of the lands, so far as it can be secured for the benefit of the inhabitants. 4. Bringing a market to the farmers of the agricultural land, and incidentally, (a) increasing the amount of labour employed upon the land by the extension of small culture. May I pause there to say that I attach an enormous deal of importance to that. It seems to me that this is the only scheme that I have come across, if it were carried out, which does offer a prospect of largely increasing the amount of labour employed upon the land. Of course, we all know the enormous amount of small produce imported into the country at the present time and that is largely in consequence of the railway rates, the cost of handling and the difficulty of getting the produce to the market. If you could distribute the population you would very largely increase small culture, and that means more hands on the land than there are at present. (b) Affording the agricultural labourer the advantages of town life.

4759. Have you already got in touch with any manufacturers who are likely to take up this land?—We have got one or two who will certainly go.

4760. Will you be in a position to arrange for their removal?—In a few months. We have got our plans out.

4761. For laying out this land?—Yes the site, and we are now in negotiation with the railway to enable each manufacturer to get a siding to his own works.

4762. These three thousand acres are on the line of the Great Northern?—The Great Northern runs right through them.

4763. So that you have a siding on either side?—Yes.

4764. Are they disposed to assist you?—Very much. They have taken it up wonderfully and have given us every possible assistance and support.

4765. Have you seen Lord Allerton?—I have not seen him but they sent several of the directors and a manager to visit this place, and they have gone out of their way to encourage and assist us.

4766. Is it from London you invite the manufacturer?—From anywhere. But London is the place where the tendency to emigrate is at work.

4767. What agency are you employing to get hold of them?—Chiefly through personal canvassing. We are hardly in a position to advertise until we are in a position to close with the manufacturer. What we felt was that a single mistake at the outset, such as the letting a piece of land in the wrong place, might injure immensely our whole scheme, and we have determined to have the whole thing planned out in the first instance.

4768. Have you opened a bureau of information?—We have not worked it out yet. Of course, we have got things in readiness and we shall have to advertise. The Press have been very good to us and have given us hundreds of pounds of advertisement free.

4769. Of course, you look to this garden city scheme to deal effectually with the problem of over-crowding?—Yes, the important thing is to get on the right track, and if you do that to trust to time to reap the full advantage from it.

Mr. Neville.

Mr. Neville.

4770. But, I think, if you do not mind going on, it would be as well to give us the heads of your memorandum because it is interesting and will be useful?—May I proceed with the problem of over-crowding?

4771. Yes.—(a) The provision of a minimum space, say one tenth an acre for each family; (b) covenants against over-crowding; (c) provision of an agricultural belt around the town; (d) Reasonable measures to prevent smoke—Mond gas to generate electricity, etc.; (e) in a town, surrounded by its own agricultural estate on which intensive culture would prevail, fresh fruit, vegetables and milk would be cheap and abundant.

4772. To whom do you propose to let this agricultural land in this zone. Would each manufacturer have a farm?—No. The farmers would stop, and I do not think they will go except by their being driven out by land being wanted for building. We have one farm falling in in September, and we propose to cut that up into small holdings, if possible. We have had several applications for it.

4773. What size of holdings would you have?—We have not worked it out yet.

4774. What character of land is it. Is it favourable to "petite culture"?—I am not much of an agriculturalist, but it is very good land. We had Rider Haggard down there the other day and he came down a great sceptic, but went away converted, and he said we had made an admirable bargain and it was excellent land. We saw that the conditions of working life would be improved because the factories or workshops would occupy much larger sites in proportion to the number of workers than is at all usual in or near our crowded cities. There seems no difference of opinion that where land is cheap it is in the interest of the manufacturer to have one storied buildings, and that the tall factory is almost always the result of the dearth of the land. Then each factory or workshop would be secured against interference with light and air by neighbouring factories, and, consequently, the operatives being housed near their work would save time and money now spent in going to and from work, and would not, during a considerable part of the day, breathe the vitiated air of a railway carriage, and they could spend the time otherwise spent in travel in their gardens or allotments, and thus add to their food supplies.

4775. You think that this scheme might be made the model for State enterprise?—That is our idea—you could not go on indefinitely with this matter by private enterprise, it would be impossible; first of all, because you would not get the sites at a reasonable price again. We have had enormous difficulty ourselves in this case—but, the thing started, the idea taking on, the price would be prohibitive—in other words, you want the Lands Clauses Consolidation Act to help you ultimately if this is to be as big a thing as we hope that it will be.

4776. Do you not think it would be a risk to embark upon it upon a large scale?—What I propose would not involve any risk on the part of the State, it would be simply the legalisation of the action of private companies.

4777. You would not go further than that?—That is all I propose. It will be worked in that way much as the liquor traffic is worked in Norway at the present time.

4778. You only want the State for benevolent assistance?—Yes, for benevolent assistance.

4779. (*Dr. Tatham.*) Does the project of the Garden City Association bear any likeness at all to Dr. Richardson's proposal for "The City of Health"?—Well, I do not know that it does, because in his case it was chiefly architectural. It was from the point of view of men going to build a town—our point of view is that of the people who are going to lay out a town. We shall not be masters of the building of the town to the extent that you should be in order to carry out Dr. Richardson's ideas—I should like to do it, but you would want many millions of capital, and it would be a very much bigger undertaking.

4780. You spoke just now of your wish to rely upon the general law to prevent the overcrowding of houses in the area and also of people in the houses. Do you think that the general law is at present sufficiently strong to

prevent this, supposing it were properly carried out. I refer to the Public Health and Housing Acts?—As it is carried out, certainly not, but if it is not it ought to be. That is a matter which I think the general law ought to take in hand rather than the individual land owner. It seems to me to be very inconvenient for the land owner to attempt to regulate the number of inhabitants—that is a matter rather for the local authority.

4781. If the locality does not do it?—The necessary limitations are applicable to the whole country. Beyond a certain point overcrowding ought not to be allowed.

4782. The law is strong enough if the authorities would put it in force, is it not?—Speaking generally one may say that it is not put in force, and that overcrowding undoubtedly under the eyes of the law, does take place, and in the country almost as much as in the towns.

4783. Do you think the immigration of aliens is damaging the population in our great towns?—I think it is terribly in the sense that it is reducing the wages in certain trades below the possibility of reasonable existence.

4784. Is that specially the case in Liverpool?—I do not think it is felt anywhere as it is in the east of London—that is my impression. I do not know that in Liverpool the slop trades are carried on to anything like the same extent as they are in London. I may be wrong, but my connection with Liverpool was some years ago and I am not in touch with the condition of the town, but I do not think that the alien element had much to do with it there. The Irish are there in large numbers, but you do not mean them?

4785. No. But in respect of the East End of London you have no doubt that it is having a very bad effect?—I have not the smallest doubt that it is a terrible thing.

4786. (*Mr. Lindsell.*) As I understand, you have 3,800 acres?—Yes.

4787. In the parishes of Ridgeworth, Baldock, Norton, and Rodwell?—I think so. I only mean that you have given the parishes, but whether you have given them all or not I do not know.

4788. A great deal of that soil, is, as perhaps you know, not of very high agricultural value?—I think that is very likely. I know that the return is small: that the rents are low.

4789. If it is not suitable for agriculture at all, it is not suitable for market gardening particularly?—Well, I am rather surprised to hear you say that because the reports are rather to the contrary.

4790. Do you know the district?—I do not know that part of the country nearer than Cambridge.

4791. The experience of the Bedfordshire agriculturists on this question of petty culture on growing for the market, is that it depends almost entirely upon the facilities offered by the soil itself, and they say that you can only do it on a light loamy soil which is further down the Great Northern line; and that this is almost impracticable land, and only suitable for corn growing, and that sort of thing. But your idea is that this land would be entirely for the needs of the local market?—I should not wish to influence it, but that would be the natural outcome, that the near market would afford a more profitable means of selling your produce than the more distant one. But our idea is not to restrict the ordinary way of farming, but let the farmer farm as he pleases, and so far as he can he will supply the local market.

4792. But your idea is to get small culture?—We are proposing to cut one farm up, not because we have this in view, but because the man wants to leave part of the farm, and we thought it a good plan to experiment with, stimulating small culture.

4793. You have 800 acres for building entirely?—That is about right.

4794. And the rest is the agricultural zone?—Yes.

4795. And that will have to be a sort of central position?—Yes, we have got a fair belt all round; we cannot get it as we like.

4796. On that part you propose to put the factories within this particular area—the outer part?—Yes, on one side, with the cottages and residential places on the other side.

4797. On these 800 acres?—Yes.

4798. According to your plan that is about forty persons to the acre?—Yes. I think that it is.

4799. It would be at least forty persons to the acre?—Yes.

4800. But if the residential houses were built there under your scheme, you would have to give larger sites. You could not use the 800 acres in that way?—No, a man wanted fifteen acres of land in connection with his house, we should not mind his going outside if he put up no more buildings.

4801. You would allow residential buildings to be put up all over the 3800 acres?—Not if it was in small plots, not if it turned out that they wanted them for small cottages. In the case of the fifteen acres with the house we should not mind that because that would leave it substantially open.

4802. Are these market gardeners to live on the 800 acres?—No. They are to live outside. We have had several applications I may say from people, and one man asked for ten acres and another for five acres for small culture.

4803. Are they local men?—I think they are from Bedford. I am not quite sure. Of course, I ought to say the details of the thing I do not work myself. But I will give you the best information I can.

4804. How about the factories. How will you grapple with the question of smoke. Is the idea to use electrical power?—Yes. Electrical power.

4805. Then you must generate that?—Yes.

4806. You want large generating stations and you have water power there?—We have no water power there.

4807. Have you got a good water supply?—Yes. Very good. We are advised by Mr. Straughan, the eminent water engineer, on the matter of water supply.

4808. Is it the idea that the company will get the administration of this into their own hands; there will be a District Council, I suppose?—We are subject to the local authorities. We cannot help ourselves. The idea was, and is, that when the town is big enough, if it likes to take the property, it must be on the terms that it cannot be applied otherwise than in accordance with the original idea, a limited population and the agricultural belt. Those are the two vital points.

4809. And if this can be satisfactorily worked out you have taken a considerable step towards solving the problem of overcrowding in towns?—That is what we feel.

4810. (*Chairman.*) Can you work on a scale sufficient to solve that problem?—I think so. It cannot be done in a minute, but the advantages in such a town as ours if we are fairly successful in its management will be seen to be very great.

4811. It will prove a gigantic advertisement to the scheme you think?—We feel that is all that we can do, but in that I think we shall succeed if we go on as we are doing.

4812. (*Mr. Lindsell.*) The ground difficulty is if the land is not suited to small holdings?—Well, then, to that extent it will fail, you will not increase the amount of labour maintained by that agricultural land; but it will not prevent the industrial labourer getting conditions of life infinitely better than he can get in a big town.

4813. It would be better if the agricultural land were better suited to small culture?—I would rather that both parts of the scheme succeeded, but, of course, I hope you have got a too unfavourable opinion of the character of the land.

4814. I know that part of the country very well. A large manufacturer, I suppose, would employ from about 200 hands very likely?—Yes, I suppose so, but that means 1,000 people.

4815. So that there will have to be some limit not merely to the houses but the number of manufacturers allowed on the ground?—Yes, but if the settlements extended in groups that difficulty would be superseded, because you could transfer labour without any difficulty.

4816. If this is a success the price of land will at once

go up?—That is a difficulty, but still there is a pretty considerable margin. *Mr. Neville.*

4817. But only the bad original land you will be able to get. The success seems more to be in getting pretty good land to supply yourself with all your wants within the ringed fence?—It would be much better, but that does not affect to any vital extent the benefit to the artisan of living in the country and having the benefit of country air close to home. You see, take the man employed in an industry in London, he is at work for eight hours in the workshop and he has to get out from and back to his home. His time is taken up in work and getting to and from his work.

4818. The advantage of the better air in the suburbs is considerably discounted by the going to and fro, you think?—Yes. In our garden city he gets from work to his allotment or garden to till it in a very few minutes daily. The extent to which a little land attracts is very wonderful. Where there are gardens and small allotments even the agricultural labourer who is at work during the day will work on a Sunday and in the evenings on his own allotment.

4819. Oh yes, where you could get the regular garden land you can get twenty applicants for every bit of ground you have?—I suppose the success of petty culture in France depends very little upon the original character of the soil.

4820. But the French small cultivator lives in a very much more abstemious way than our labourer does?—I mean intensive culture is round Paris, and they have three or four crops in the year, and there the soil is absolutely artificial, and they do not depend upon the natural soil at all.

4821. (*Mr. Legge.*) To follow up a remark of the Chairman and to try to get some idea of the size of this experiment, I suppose you have got some idea of the population that you will be ultimately able to house on this estate?—25,000 to 30,000 people was the original idea, 6,000 acres and 32,000 inhabitants. We could not get the acres and we had to cut our cloth accordingly, and we shall reduce the number of population in consequence.

4822. Can you think, at this moment, of any manufacturing town of any importance with about that population. Do you know Luton at all?—Only by passing it in the train.

4823. I passed through it and I thought perhaps that would be 25,000 or 30,000?—Of course, you know, abroad manufacture is enormously more widely distributed than it is with us, and there my impression is that you can find plenty of towns of 10,000, 20,000, and 30,000 inhabitants where they have manufactures.

4824. (*Chairman.*) But not under rigorous laws. Supposing the population of this place has increased up to your limit, and one of the manufacturers wants to increase his plant and extend his industrial establishment to an extent that would probably mean the employment of another 200 or 300, he runs his head against your ring fence, does he not?—I do not think that he does. We only put him outside, he draws his labour from much greater distances at the present time.

4825. Your idea is that he would have to get the labour outside the belt?—Yes.

4826. Would you facilitate his labour coming in by trams?—If you have a complete scheme of those towns grouped in connection with one another, the main thing would be to facilitate the communication so as to turn them into one community for social and practical purposes.

4827. That is looking very far ahead?—We must make a start.

4828. (*Mr. Legge.*) You think that all that is in favour of your scheme, that no man could build up on one spot a huge concern, he must place it outside?—I rather thought the Chairman's remark was addressed to this, that, although he might have room to increase his factory, he would not have the accommodation for his workpeople, in case you were full up he would have to go outside.

4829. (*Chairman.*) I thought it might operate against any manufacturer who looks forward to increase his business coming to you, for the reason that he would have to go outside if he reached the limit of the hands permitted?—I do not think we shall have to do that. It is conceivable

Mr. Neville. when you get up to 25,000, to the last few thousands of population, that that might be so, but I do not think that it is a difficulty at present.

4830. (*Mr. Legge.*) It is, we see, a very considerable experiment, and different from those experiments that you spoke of, Cadbury and the Sunlight people?—They are instances of a single manufacturer paying all the expenses himself.

4831. You will be anxious to bring your influence on the Government itself to encourage the movement in taking steps in laying out two new big towns which they are to construct, such as that place up on the Forth?—Quite, we have been in communication on that subject, and are doing all that we can to induce those who are responsible to look ahead and consider what the place will be hereafter.

4832. I am not quite clear what is meant by the call for Government assistance on the lines of your memorandum. Do you mean when you have got a body of individuals associated under the Board of Trade they should get powers to obtain land compulsorily?—That is what I mean. The idea in my head is the spirit trade in Norway. There you have bodies of individuals who associate themselves in a company, their dividend is limited, I think to the same rate 5 per cent. —I think it is 5 per cent.—thereupon they are granted the only license for the sale of spirits in the district which is allotted to them. I am not quite sure whether they are the natural divisions, each company is given its own area, and then they run the place in which the spirits are sold. My notion is the same, that companies like gas and water companies or any company dealing with a monopoly should have their proposals submitted to the Local Government Board or the Board of Trade or some authority, and if the point as to the dividend reserved and the scheme itself meets with approval then let them have the power to take land and carry it out. That was the idea, and that is what I mean.

4833. (*Colonel Onslow.*) I suppose that in this Garden City there will be a danger of monopoly. In the present case one of the causes of over-crowding and insanitary dwellings both in town and country is due in a great measure to one individual absorbing and getting hold of building after building, and then either he has not sufficient capital to repair, or the rack rental comes in and draws all the rent and puts nothing into buildings, is not that the case?—Well, I should have thought that the small owner is, as a rule, a worse landlord than the large owner.

4834. Then you take provisions in your plan to prevent small holders because they might be leaseholders, of course?—You see we all limiting the number of cottages to be built per acre. We are not very likely to attract the worst kind of cottage jerry builder, because he likes to get his fifty cottages to the acre, you know.

4835. Suppose a new railway line wanted to go through the property. Could not they go to Parliament and get compulsory powers to do so?—No doubt they could if Parliament thought fit to give them. Supposing we were starting, we should have some consideration from a committee. Of course, we should not mind—another line would not do any harm unless it were so made as to be destructive to our idea.

4836. To go back to the garden city. The only danger is that the older order of things might be resorted to; although the cottages might be far apart, they might be allowed to go to rack and ruin, just as we see country cottages with no other cottages near them, which are in a shocking state entirely owing to the neglect of the owner of them, not necessarily the landlord?—This is a matter that really must be left to the State.

4837. Exactly. Are the general laws sufficiently strong to deal with that?—I do not know.

4838. And if strong, are they enforced?—They are not put in force.

4839. (*Mr. Struthers.*) Do you propose that the company should get the land compulsorily?—In the future.

4840. And what about the price that it pays for the land it acquires compulsorily. Would that be fixed by arbitration or by bargaining?—The Act would incorporate the Lands Clauses Consolidation Act just as land would be acquired by a railway company. I do not propose any different conditions for the garden city. It is the value of the land plus 10 per cent.

4841. Who would value it?—The value would be settled either by a jury or by arbitrators who would assess the damage and add 10 per cent. for compulsory purchases.

4842. But the arbitrators or jury have no terms put upon them as to how to value the land?—No. You call in surveyors and valuers and they give evidence on one side and the other as to the value of the land, and the jury make up their mind on the evidence.

4843. But in your own particular case you propose to make this building of the garden city compulsory, and the question of the value of the land may depend upon what the arbitrators under the Lands Clauses Consolidation Act may think fit to take into account in fixing the amount, and in addition to the 10 per cent. they might take in the prospective value of its going to be used for this purpose?—Oh no. Supposing that land was being valued in the ordinary course the evidence of value would be the prospective value of the land in the ordinary way, and not any increase of value by what the persons who were buying were going to do with it.

4844. But then, having bought the land at a certain price you propose to make suitable allotments which are to be leased?—To be leased.

4845. Not sold?—Not sold. We did at one time think of selling the freehold, but we are going to have building leases.

4846. Would there be feus?—The Scotch term is not quite the same as ours, but it is a lease subject to certain covenants.

4847. (*Chairman.*) A Scotch feu is a perpetual lease with a comparatively small quit rent.

4848. (*Mr. Struthers.*) And the quit rent would be large or small?—Yes.

4849. You naturally look for that on those buildings?—Yes.

4850. And after paying 5 per cent. ?—There ought to be a considerable surplus if the scheme goes.

4851. What would be the destination of that surplus?—We have taken wide powers in our articles—what would occur to me would be to spend it on recreation grounds and public halls and matters of that kind, which would be as much as possible for the benefit of all the population alike; and, of course, the cheapening of gas and water and things of that kind.

4852. (*Chairman.*) You would not try the experiment elsewhere?—I do not think that would be fair to the shareholders—we had to consider that.

4853. (*Mr. Struthers.*) You would follow the general analogy of Sweden and Norway where the profits of the sale are devoted to public baths beyond a fixed percentage?—Yes.

4854. When the agricultural belt is ultimately defined you would have it divided up into considerable holdings?—We should not start with any fixed ideas. If we cannot use it for small holdings we must use it for large.

4855. But you must have some elementary notion as to the number, because you have a fixed number, and you want to limit the population?—The limit of population is the limit rather of building. I mean to say, we do not mean to cover with bricks and mortar more than a certain portion of the holding. The rest is to be free from bricks and mortar.

4856. You mention 800 acres?—I think I am right. We have got a plan mapped out, and I was told that they cover 800 acres, but I may not be perfectly accurate.

4857. Does that part which was reserved for building purposes, say 800 acres, come within the agricultural belt, supposing it got built upon?—No, the homesteads are there.

4858. Supposing it was divided later on?—Yes, that would be the idea: to keep a substantial belt of fairly good agricultural land.

4859. You expect your market gardeners to have their houses in the agricultural belt?—That we should not do, if it amounted to the covering of any considerable area.

4860. They would have to take houses in the area?—Yes, which they could well do.

4861. Or outside the belt altogether ?—Or else outside. One house in fifteen acres would not make much difference as far as the open air is concerned.

4862. As regards the suitability of the land for market gardening purposes, you have heard of the old dogma of the agricultural authorities, that given pure sand and proper manure you can raise anything ?—We have had that in our mind. I do not know much of agriculture myself, and my opinion is not of much value, but supposing our scheme were carried out, there is the town in the immediate neighbourhood and the manurial products of the town would have to be disposed of.

4863. (*Chairman.*) Do you know what the agricultural land is, is it good agricultural land or not ?—They are low rented. I cannot tell you.

4864. (*Mr. Struthers.*) The fundamental idea of the whole thing is to get the population to live under healthier conditions, I understand ?—That is it.

4865. Your reason for that is that you say the bad physique of the large towns is the result of the deprivation of fresh air ?—That is my opinion to a very great extent I say so for this reason. I know something of the children in the villages in the immediate proximity of London, and I know what rents their parents pay and how they spend their money, and I am quite sure that they are as badly fed as children in the east end of London, but there is an immense difference in their physique.

4866. You think that the distinguishing factor is the air ?—Yes ; I cannot trace it to anything else. It is suggested sometimes that it is the Board School curriculum or something of that kind, but the children in the country have the same Board School. The only difference is that when they turn out of their cottages they are turned out into the fresh air, and they spend a considerable part of their lives in certainly better air.

4867. There is a certain number of cubic feet and weight of air in the town as in the village streets ?—Yes, and the next best thing after the country is the gutter ; and one of my principal objections to the plans of improving the big towns is that they have big tenements, and children do not get into the gutter for the fresh air. They play on the staircases and under cover and they are worse off than the children in the tumble-down cottages in the country.

4868. That is your view—that there is this flow of fresh air, and you are speaking of the insufficiency of the air circulating through the lungs, so to speak ?—Has it not a double effect—they are less in the open air in the towns, and the London air is not so good as it is in the country, and the air in big towns is vitiated to a great extent, and the child does not get the same benefit from the air of the street as the child would do living in the open in the village road.

4869. But I thought that earlier on in your evidence you said that the smoke in the large towns did not make very much difference ?—I did not mean to say that. I think that smoke makes a very great deal of difference. But I do not think that the smoke in provincial towns, as far as I know it, is as bad as it is in London. It was a question of Manchester and Salford and comparison with London, and it was suggested, I fancy, that the air has something peculiar in it, and that it is more vitiated in Manchester than it is in London. I thought not.

4870. Supposing London had some means of entirely doing away with the smoke in the town, would it be as healthy to live in London as in the suburban village ?—It certainly would not. Wherever you have a great congestion in a small area you get a vitiated atmosphere. The atmosphere must be used to a certain extent by all those who breathe it, just as you might vitiate the air of a room by overcrowding it.

4871. You have vitiated the air of the room because that air is confined, but in the street the wind is blowing, as it always is more or less, and do you think that any

amount of breathing would make that difference ?—That is a very difficult question to answer. You must remember that they are continually increasing the heights of the buildings, and that very much stops the movement of the air in big towns.

4872. (*Colonel Fox.*) Your object is to build healthier cities with healthier gutters, and in addition to that, to relieve the congestion which now exists in the over-crowded towns ?—Yes.

4873. Do you intend to put any restriction upon the people who come into your city ? Are you going to admit weakly populations from the slums of the towns ?—If a manufacturer comes, his work-people will follow him, and if they follow him from a particularly unhealthy district they will have the advantage of coming to a particularly healthy district.

4874. But those people who have been in the habit of suffering from an unhealthy neighbourhood of a densely-populated town, will they have a chance of coming into this healthy city the same as anybody else, then ?—Certainly, we should not restrict any trade that is not unhealthy on account of the poor physique of the work-people.

4875. (*Chairman.*) You would think it would be a useful experiment ?—Yes.

4876. (*Colonel Fox.*) Speaking of the alien population of the East End of London, in what way are they doing harm, except by cutting down the English people's wages, perhaps ?—To my mind, they are doing a great deal more harm than that, because they are reducing the wages in the whole trade which they attack. I take it that they are chiefly employed in the slop trades. I suppose it is common knowledge that the wages paid in the slop trade are a disgrace to humanity. It simply means misery and starvation. Those people can live, and are accustomed to live, on what will not support an English person in health. Supposing you have a trade that employs, say, 10,000 unorganised workpeople, and supposing that you add 1,000 labourers in that trade, it is not merely 1,000 who suffer, but all the 10,000, because you see, as soon as an employer finds a large surplus of labour in his trade, he thereupon says, "I will reduce your wages," or, "I will turn you away," and he can do it, because he has got 1,000 to come in on any terms that he likes. It must be so in the absence of trade organisation, and the over-supply of labour tends to, and has the effect of, reducing the wages of the whole trade. I am satisfied that one of the reasons why wages in the clothing trade are so pitiable is because of the influx of those people, who can live on what we consider to be almost nothing, and who, by the way, are very good workpeople, very industrious, and very enterprising, and they very readily get on. But, in the meantime, they are crushing our unhappy natives and bringing down wages to starvation point.

4877. The evil lies in this, does it not, that they can live on a less wage, and they are more thrifty and more abstemious ?—Yes.

4878. In your garden city are you going to have houses where they sell nothing but beer and spirits, as is done in ordinary towns, or are you going to start houses more on the lines of a restaurant ?—We have got three licences altogether, and we have got the liquor traffic in our own hands. We did not propose to make it a temperance place, because that would only drive the people over the border, and the evil would be worse then. We have not decided about it, but we thought of Lord Grey's scheme, something on that line, and we rather invited him to take over the licences, either on that or some scheme like it. All of us are not violent temperance people, you know, but we desire to offer counter attractions.

4879. On a liberal footing, but not to make the sale of beer too prominent ?—No, we want to give them a chance of getting recreation without the necessity of getting alcohol.

Mr. Neville.

Miss M. K. DOWDING, called ; and Examined.

Miss
Dowding.
—

4880. (*Chairman.*) Would you kindly state what has been the nature of your experience, what, in fact, are your qualifications to give us evidence ?—I am a clergyman's daughter and I have seen a great deal of poor people. My father has had very poor parishes. He was at St. Thomas's Scarborough, a fisherman's parish, very poor, and a place in Lancashire during the cotton famine, and I have seen some very great poverty in agricultural places, too, and since then I have been in the Girls' Friendly Society for eighteen years, and worked also in Cumberland amongst the miners' boys and girls and amongst the factory girls.

4881. You wish to speak of your recent experience in Wiltshire ?—Yes.

4882. Near Chippenham ?—Yes, it is a great factory town.

4883. Not a great town ?—It is becoming so. There are about 11,000 people. There have been various factories built lately and there is a great deal of girl labour. They make the Milkmaid Brand, that is the tinned milk ; and then there is the wool—that is going down, and the silk throwing. There is a cocoa factory and a large foundry, and recently they have made all the Great Western Railway electrical work. That is at Chippenham. That has very largely increased in the last five or six years, but the girls work a very great deal. They do practically most of the cloth work and nearly all the tinned milk, the making of the tins.

4884. And you say from your experience of these years that there is more evidence of physical deterioration to be noticed amongst the classes that you have mentioned than there was before ?—Yes. I think that the children are very mean-looking and poor. I did not know what it was before coming thirteen years ago, but I can say that where the mother works the baby goes to pieces. The women work when they become widows, almost continuously, and the baby is left.

4885. You are speaking of Chippenham ?—Yes. The babies grow up anyhow. The boys and girls work at the factories up to the time that they are married, and after they are married, both men and women.

4886. You attribute a great deal of the deterioration to boy and girl marriages. You are aware that they are not married as young as they used to be ?—Not quite so young, possibly, but still they are married very young. I was thinking of Cumberland and Yorkshire where they are engaged at thirteen and fourteen in the boy and girl class in the Sunday School. They are all engaged. They marry very young there, at sixteen or seventeen.

4887. But the general fact remains that early marriages do not take place so frequently as they used to do ?—I have no statistics on the point.

4888. There are the statistics of the Registrar-General ?—What do you call a boy and girl marriage. Not twenty, perhaps ?

4889. (*Dr. Tatham.*) The age of marriage is now higher than it was ten or fifteen years ago ?—You do not know what it is now.

4890. (*Chairman.*) In a district in Westmoreland it is from twenty to twenty-three ?—Oh !

4891. (*Dr. Tatham.*) It varies considerably ?—It seemed to me that they marry before they are fit to keep a home, either man or woman. Of course, when they are working they have no domestic learning and they pass straight off to the factory, even before leaving school.

4892. (*Chairman.*) Do not they have household management taught them at school ?—I do not think so.

4893. There is some effort made to make them familiar with it, I think ?—Well, they have book-work and paper-work, but I do not think that it is very practical.

4894. The homes in the places that you are describing, are they bad ?—They are very insanitary, and we have a most awful river, full of sewage.

4895. You are speaking of Chippenham ?—Yes.

4896. Does not the sanitary authority exercise its power ?

—Well, it is to be done. There is to be a sewage scheme, but we have been looking for it for two or three years and it is now supposed to be started this year.

4897. And you say that public opinion is not alive to the needs of the people ?—No. They think because it is country air it is perfectly healthy. They do not seem to think that the country air is vitiated with sewage.

4898. The new buildings that are built are under proper building regulations and conform to modern ideas of sanitation — do they not ?—No. Because the sewage scheme has not come off. There is no connection, you know. They are higher and cleaner ; but, of course, they are closer together than they used to be. There are three or four cottages where there was one, and a garden, and I think that is worse. We are getting more cases of diphtheria and scarlet fever than we used to, and there is no proper sanitation. They cannot connect them, you know.

4899. Does not the local authority keep some hold over the building ?—It looks over the plans, but does not connect the houses with the system of drainage. Unless something is done to compel them, it will not be done.

4900. But as to the houses, what have you to say ?—They are very much overcrowded because of those industries growing so rapidly. We have recently had Saxby and Farmer from London, who have brought from 1,500 to 1,600 people.

4901. They have brought them from London ?—Yes.

4902. Where are they placed ?—In the cottages, which are always full. They are building for them, and in time they may have enough.

4903. But if a man brings down 1,500 people, he can hardly expect to have them housed ?—Yes ; and he goes to his people and says, " You must take in a lodger ; I have so many men, and you must take one or two lodgers."

4904. And they are suffering from overcrowding ?—Yes, overcrowding.

4905. Is the municipality assenting to this ?—I suppose they are obliged to ; the men must have somewhere to sleep.

4906. Some of these men bring their families ?—I do not think they have arrived yet.

4907. Is the land available for building purposes ?—There is plenty of land to build upon.

4908. And not at exorbitant rates ?—It is expensive, but I do not think it is prohibitive.

4909. You have something to say about the condition of young mothers ?—Yes. I think the young mothers are fearfully ignorant, and will not come to mothers' meetings.

4910. They are unwilling to learn ?—Yes, they think that they know better.

4911. What are those horrible and ghastly tales that you refer to ?—Do you mean about the babies when they are born—about the mothers' carelessness ?

4912. You say in your memorandum you have had " horrible, and even ghastly " tales told you ?—That is about babies, and the carelessness with which they are attended to when the mothers are confined. Very often the baby really is very neglected, whether wilfully or not. I do not know, but when the mother dies the baby is nearly always buried with her.

4913. Do you mean buried alive or is it dead ?—No ; it is allowed to die, it is not particularly wanted probably—and they do not know what to do with it. The mothers want much more attention during the confinement.

4914. You are now speaking of the condition of things in Wiltshire ?—Yes, as a rule the poor do not go to the regular midwives.

4915-16. Do you think it would be a good thing to require that a doctor's certificate should be obtained for every death of a child below a certain age ?—I should like to do it for every confinement : either a doctor of their own or a parish doctor—someone should be at the expense.

4917. It would be a step towards seeing that no death as the result of a confinement could be registered except with a medical certificate ?—They generally do have one.

4918. It is not necessary ?—I do not think that would stop the deterioration.

4919. It might not—but it might bring home these culpable cases to those who are wilfully negligent ?—Quite true.

4920. Have you formed any opinion as to the different causes of infant mortality ?—I think that the diarrhoea, owing to the sewerage, is a main factor. The babies seem to feel it more, being more in the house.

4921. Is it not due to the food ?—It is partly due to the tinned food. It is not that the tinned food is bad ; but they leave the tin open. Of course every tinned thing ought to be turned out.

4922. Do they not get any pure milk ?—Hardly any at all—it goes to the factory. I should like the borough people to order it.

4923. The municipal agencies do take it in hand in some places ?—They do order everything else, and they might order milk, I think. The people pay 4½d. a tin, and that lasts a week, but at the end of the week it is not drinkable.

4924. It is in a filthy state, I suppose ?—It is in a horrible state, impregnated with oxide of tin, which the tin throws off, as soon as it is laid open, to the action of the air.

4925. How are you to deal with children from infancy ?—I think that a crèche would be very useful ; and a place to play in.

4926. Whether their mothers are at work or not ?—No, they are pretty well at home then. But they have no recreation ground at all ; only one school has a playground ; there is no space for them at all.

4927. I should have thought that in country districts there were plenty of places close at hand ?—In the roads.

4928. I do not think there is much traffic in the streets of Chippenham ?—There is a good deal of traffic in the main streets ; but the best common land is now enclosed, and it is not allowed to be used at all ; it is in the hands of the burgesses—a certain number of very good people who will not let the people play, and there is no other grass near.

Might I allude to the last witness in reference to the town and the country ? I think the main reason why they are so poor in London is that in the town there is a want of grass. The grass gives out oxygen and takes up the carbonic acid gas, and there is no grass in London except in the parks, whereas in the country there is always this oxygen being given out.

4929. Is there a striking absence of proper care of the sickly and debilitated in the country districts with which you are familiar ?—They look upon it as a sort of accident of Providence ; they do not make any effort if it is a child rickety or sickly.

4930. Have you not got a hospital ?—A cottage hospital, and there are free tickets to Bath, but they will not take the children. They can go to the Bath Hospital, but they will not.

4931. There is a prevailing indifference ?—Yes, if some one went round to the mothers it might be useful.

4932-6. Do not you think you could do something with them at school age ?—They are very young. In the Girls' Friendly Society we see them seventeen to eighteen, but even then they do not take in things. I think all that school work takes up a very long time, and is not of much use.

4937. Does the factory life unfit them for domestic life ?—Yes, they have no idea of domestic work ; they pay their mothers just as they would pay any stranger. Everything is supposed to be found for them, their food and everything, and they are not supposed to do work at home. They have nothing to do with home, they say.

4938-9. Do you think that further provision should be made for the medical supervision of the children in school

life ?—The school seems to spread infection of all sorts and it must come from carelessness. I do not think there is sufficient care taken.

4940. They are not allowed to go to school when they have contagious disease, are they ?—Last week there were six or eight cases of scarlet fever. In one case a child asked to come to class (G.F.S. Class). Her brother had been taken to the Isolation Hospital the week before, and I refused to admit her. She answered, "But we are all going to school, just the same." I do not think there is enough care with regard to people in contact with diphtheritic cases. I do not think they examine them properly, but let them wait until they develop malignant diphtheria.

4941. Is diphtheria very prevalent ?—It is constant. They have an epidemic of either diphtheria or scarlet fever alternately.

4942. And you think it is traceable to the want of proper sewerage ?—I think that is the main thing, but it is gross carelessness not to separate them and isolate them.

4943. (*Dr. Tatham.*) With regard to this question of school children, and the way in which infectious diseases spread amongst them, are you aware that under the general law of the country it is incumbent upon medical men to notify the existence of infectious disease amongst their patients ?—Yes.

4944. Is that neglected in the case of Wiltshire ?—I think in the case of sore throats they take no notice ; and if it is diphtheritic throat it is the same thing. I think many of the so-called sore throats are diphtheritic throats.

4945. There is no provision for the examination of the scholars there ?—I do not think there is. They go occasionally to the school when there is an outbreak.

4946. But speaking generally, what would you say ?—I do not think there is any examination. I am manager of one of the schools, the British School, and they never examine them unless there is an outbreak.

4947. So that that would tend to increase the number of cases if they only examine when there is a genuine outbreak of diphtheria ?—Yes.

4948. And then the school has to be closed ?—Sometimes they do close it and sometimes they do not. Sometimes they send one class down ; but I do not think that that is of much use, because the children meet in the playground and the class room.

4949. Is there a County Council in Wiltshire ?—Yes.

4950. Do they supervise in any way ?—They have made attempts to do so, but it is not very successful. The Local Government Board is moving in this sewerage business—they threatened. I do not know what you call it, to prosecute the town unless the sewerage scheme was started this year.

4951. Is that a recent threat ?—That is why it was started. It had to be started in January in consequence of the threat.

4952. You speak of the milk supply being very defective in Wiltshire ?—I think that it is all sent to the great milk factory—they can make better terms if they send it regularly.

4953. It pays them better ?—Yes, much better.

4954. And the consequence is that the children of the working classes get practically no milk at all ?—Very little.

4955. What substitute do they give ?—This tinned milk ; and the tins are constructed in a bad way : they are very thick on the top and you have to strike them with a heavy tin-opener, making a jagged edge, so that you cannot close them again—you cannot push the top down tight and any amount of polluted air gets all round it.

4956. Do you think that they get improper food ?—They give them many bad things, herrings and that sort of thing, and especially bread. They ought not to give them anything fermented until they are two years old.

4957. Is infant mortality very high in Wiltshire ?—It is high : whether it is higher than in other counties I do

Miss
Dowding.

not know. I think that Dr. Thomas, who came three or four years ago, mentioned that it must be looked to.

4958. What part of Wiltshire are you particularly acquainted with?—Chippenham. I have lived there. It is half way between Bath and Swindon. They tell me that it is worse in the rural districts.

4959. In Chippenham the mortality amongst infants is very high you think?—Yes, and that was mentioned by Dr. Thomas. I think it is partly due to infants not getting attended to by the doctor but by the young assistant mostly, and by the dispenser, even. It is not that the doctor will not go; but these people go up to the doctor at ten o'clock say, and he is busy and the mother either stays for an hour or an hour and a half—then she gets tired and the dispenser examines the child. I do not think that the doctor refuses to see them. I do not suppose that he would or could, but practically they do not see the doctor.

4960. But you think that there is general neglect of young children?—Yes, very small children, it is only amongst the children.

4961. It is, you say, owing to the ignorance of the young

mothers who are unfit to bring up children?—Yes—they do not seem to know the importance of the first two or three years of the child's life and they give it brandy (I mention in my memorandum the way they take it themselves), but they give brandy and gin to the children. It lessens the size just as you might do to a terrier or small spaniel—it lessens their size by taking drops of it constantly.

4962. Have you ever compared the general appearance of infants in your immediate neighbourhood with that of children in other parts of the country?—In Cumberland and Yorkshire they are much larger, but that is partly because they come of a better stock; the people themselves are healthier.

4963. You do not think that the children are better looked after?—They have more milk for them. I do not think that you have this want of provision of milk except where these great factories are. I think that it is local, the want of milk. A child ought to be fed on milk entirely; they give them as I mentioned tinned milk, and the 4½d. for the week would only be part of the food; they make it up by giving them bread and sop, and one thing and another.

Mr. B. SEEBOHM ROWNTREE, called; and Examined.

Mr.
Rowntree.

4964. (Chairman.) You are the author of the book upon the conditions of life and labour in York?—Yes.

4965. Therefore, you have made some considerable study of the conditions of the problem which we are asked to investigate?—Yes, a very fair amount.

4966. Are you in a position to say anything on the general question as to whether the conditions that make for deteriorated physique are increasing in intensity, or otherwise?—I do not think I have any scientific information on the point. I have a general opinion that the conditions are such that it must be so. There is a greater proportion of people living in towns.

4967. You must set against that the improved sanitation in the towns?—Yes.

4968. I suppose you will admit that where local authorities make full use of the powers that the various Acts of Parliament place in their hands, there is no reason why anyone should live under actually unhealthy conditions?—I think it is very difficult for them under existing conditions to avoid doing so in towns.

4969. For what reason?—On account of the high rents.

4970. On account of the obstacles which are placed in the way of the discharge of their duty by the local authority?—On account of the difficulty of getting good accommodation at the rent which people are able to pay, and the impossibility of a very large proportion of the population securing sufficient food for the maintenance of physical efficiency, no matter how economically they spend their incomes.

4971. I thought it rather appeared from your book that a very large proportion of the poverty you describe is due to causes which are within the control of the classes that suffer from it?—I divided the poverty into two classes. I say that 10 per cent. of the population of York are living in "primary" poverty, over which they have no control, and 18 per cent. in "secondary" poverty, over which they have control. But you have the 10 per cent. who are in "primary" poverty.

4972. That is a small section of the population, but it is regrettable that it should be so, of course?—It is four millions of the population if the proportion is the same in other places.

4973. It does not do to assume that; you would not judge of the whole of England from the conditions of York? That would be, surely, unscientific?—I only said if they are so. There is just as much reason to suppose that they are as that they are not.

4974. On the contrary, I always understood York was one of the places which is, and has always been, bad, partly from the fact that it is one of the oldest cities in England?—Only one portion of it is very old.

4975. Historic York is an old city?—Yes, but the proportion which that bears to the present city is very small.

4976. I know York very well myself, and from its features one is impressed with the fact that it has probably had more difficulty to adopt itself to modern conditions than many other places?—I have exchanged opinions with a great number of people who have made a considerable study of the conditions in other towns, and I myself am of opinion that the conditions in York are no worse than in other places. I should be surprised myself to find the condition throughout England better than the condition in York.

4977. There is a very considerable Irish element in York, is there not?—A decreasing proportion.

4978. But it has been considerable in the past?—Yes, it has been considerable.

4979. That always tends to depress the standard of life in a town, does it not?—Possibly; I do not know.

4980. It is generally assumed to do so. Then with regard to the consideration of the principal causes of physical debility, which would you put first?—I have put them merely in an arbitrary form in my *précis*. But, I think, first of all, there is the question of the feeding of infants, with regard to which there is a very great amount of ignorance. For one reason or another, of course, a very large number of children are not nursed by their mothers.

4981. That, we may take it, is the first regrettable circumstance?—Certainly. Then there is undoubtedly, very great ignorance as to the proper way in which to feed them, if they are brought up by hand.

4982. With regard to the failure of mothers to nurse their own children, according to your own observation, is that due to necessity, or indifference, or what?—We made some little investigations with regard to that, and it seems to be very largely the physical inability of the mothers to feed their children.

4983. They are too weak?—Whether it is that they are too weak, or whether it is due to the nervous stress of town life, or what it is, I do not know.

4984. Do you think that early marriages are on the increase?—I should think they were not.

4985. The Registrar-General's Return shows they are not: so that it is not due to women becoming mothers

Mr.
Rowntree
—

earlier than they used to that this weakness arises?—No. The conditions of town life, the later hours, and the greater excitement of town life, the absence of quiet and so forth, all tend to increase the number of mothers who cannot feed their children.

4986. I suppose the conditions of their lives when they first marry, are not so acutely uncomfortable as later, when their families have become larger?—No.

4987. Do you believe it to be the case that mothers are just as reluctant or just as incapable of nursing their first children as their later ones?—I should think so, but I would not be quite certain of that.

4988. Do you think maternal improvidence, maternal carelessness, and maternal ignorance, grow with the growth of the family?—No, I should not think so.

4989. You do not think they are over-weighed by the pressure of circumstances so as to make them more careless?—I think the class of mother that would be careless at all, is careless with all her children probably; if you have a decent mother, she is not careless with any.

4990. Do you not think that as maternal responsibilities grow upon her, possibly her sense of duty becomes less, and she becomes more careless out of sheer despair?—That might be so where there are a very large number of children.

4991. You attribute a great deal to the want of proper education on the subject?—There is a very large amount of real ignorance on the question of infant feeding. One comes across it constantly. My secretary, who has done a very great deal of visiting amongst the poor, has constantly come across most gross ignorance with regard to infant feeding. The constituents of the food given to the children are entirely wrong. There is an inadequate supply of bone-making material, and you get rickety children, and the child starts very badly.

4992. That is from want of milk?—Yes. Milk is expensive. I think wherever the mother can nurse her child she prefers to do so, because it is cheaper, and less trouble, at night particularly. Of course, it is very troublesome for a mother to have to get up and warm food for the child.

4993. How would you suggest that this lack of education on the subject is to be supplied. Do you think the schools should do it, or that it should be done later?—It is a little too early in the school.

4994. You suggest that the local sanitary authority should supply information on the subject?—I would suggest two things. The first one is that the local authority should supply leaflets.

4995. Would they be read?—If they only dealt with one thing at a time I think they would, if printed in big type with not too much on them. I think the mistake which has often been made with regard to leaflets is to try and make them too comprehensive. If you can get one fact on a leaflet and distribute that, and then get another fact on another leaflet a little later and distribute that, say one with regard to the food of the children and another with regard to the general management of children, fresh air and so forth, I think they would be read.

4996. Do you think that evening continuation schools for girls are a good institution?—I do not think they would attend them. I think it would be an ideal way if you had compulsory evening schools like Germany. That is just the time you want to take them. Then in addition to leaflets and lectures which, I think, people would attend if they are good, we should have more infant milk depôts established, such as exist in Battersea, St. Helens and other towns.

4997. By means of municipal effort?—I do not think so. I do not think that is the best way.

4998. That is the case in Battersea and St. Helens?—Yes.

4999. And in Liverpool and various other towns, I believe?—Yes. I think if you could get them by private effort there are certain advantages; because the personal element is very important, I think. The advantage of

these milk depôts is that you get thoroughly good food supplied to the children to give them a start, and then it is extremely important to associate with these depôts the visiting of every parent.

5000. By ladies, do you mean?—Yes.

5001. Like the Manchester Health Society?—I do not think they have quite the kind of lady I have in my mind in Manchester. We have started a milk depôt in York recently.

5002. Is that by private agency?—Yes. the York Health and Housing Reform Association have done it. We visit every working class house where a child is born, or try to do so; we have not quite got our organisation complete yet.

5003. They have that in Manchester I understand?—They have just begun, I think, last week.

5004. The Manchester organisation is of considerable antiquity I believe?—They have voluntary ladies and uneducated women.

5005. They have the agents of the municipality below them?—They have women to whom they pay 16s. a week, I think.

5006. Yes, but they act under the direction of the ladies of the city?—My idea is that to get the best results you should have ladies visiting who have real knowledge with regard to infant feeding. If they have some experience as hospital nurses, or something of that kind, so much the better. But it requires people of very considerable tact and real sympathy. Everything depends upon your lady—if you get the right person people will take advice, I have seen that constantly in regard to the visits at York. We have most remarkable results where the whole treatment of the child has been entirely altered.

5007. Has it had the effect of reducing infant mortality?—There is no doubt about that. I have seen several cases since August where a child's life has been distinctly saved by it. I was in the depôt the other day, and a man told me that his child would have been dead now if it had not been for the depôt. I feel that these depôts fail to do the utmost good unless the lady visitors are associated with them. That I believe, is the best piece of educational work that could be done. Our experience of York is that if you have one visitor who is prepared to work hard and systematically, she can deal with a town of 70,000 or 80,000 people, supposing there was not more than an average of 70 per cent. of the working classes. I do not quite know yet—I could not get the figures before I came here—what proportion of the children are hand-fed, but there is not nearly the same need to give time where the mother is nursing her child. You want, however, even in these cases, to give a certain amount of information with regard to the general treatment of the child and so forth, of which there is supreme ignorance amongst a very large section of the working classes, and above the working classes for the matter of that. Our medical officer of health tells me that it is by no means confined to the poorer classes. Of course, the wealthy classes have nurses for their children.

5008. These depôts are not intended to be eleemosynary, are they?—I think it would be very difficult to make them pay, but I think it could be done.

5009. We are told that the Battersea depôt, which is municipal, is paying?—I think the one in York will pay in time.

5010. At the outset you must expect a loss?—I have a statement here, which I prepared for another purpose, of the York depôt with the accounts. (*Document handed to Chairman*). We have gone rather carefully into the matter in York. We visited all the English depôts before we began ours; at the present time we show a loss of about £2 a week.

5011. What number of people are customers of it?—At the present time we only have about sixty-five. We have only just begun. We lost £81 in the first half year, and that included the cost of starting and so forth. The cost of initiating such a depôt to deal with something like 150 babies would be from £250 to £300. The whole thing is not serious.

Mr.
Rowntree.

5012. Do you mean the loss is not serious?—The capital is not serious. I may mention the way in which we are going to try to meet this loss in York. We are beginning to supply sterilised milk in bottles, not only for infants, but for anyone who likes to buy it. We started that a week or two ago, and there is a good profit in that. We are also trying to get a sale of modified milk for wealthy customers sent to their houses direct at 5s. a week, which yields a good profit. If we can do that and get a sale for sterilised milk, and also get a larger sale for the modified milk, which we shall, I think, as soon as the thing becomes better known, we shall make both ends meet.

5013. How many children are born in York of the class that you have named, weekly or monthly?—About forty a week. The visitor is paying forty visits a week, and then there are other visits which are required afterwards as well. A certain number need not be visited for six months again, if it is found that the mother is nursing her child.

5014. Can you tell us what proportion of mothers out of that forty a week would be likely to nurse their children?—No, I cannot; the figures are not ready.

5015. You are making some inquiry?—I asked the Secretary of our Association to get the figures, but she had not them ready.

5016. What security have you that the milk you get is pure to start with?—We make very stringent conditions with regard to the supply.

5017. From whom do you get the milk, from outside I suppose?—Yes, we get it from outside, but we make extremely stringent conditions with regard to the supply. I have the conditions here. We have a veterinary inspector who is in our service who goes round periodically to examine the cows and cowsheds.

5018. I suppose the dairies from which you get the supply are outside the administration of the York sanitary authority?—Yes.

5019. So that you have to depend upon the discharge of their duty by rural sanitary authorities?—We undertake the duties ourselves; we have our own inspector.

5020. But you cannot insist upon sending an inspector into cowsheds which are not under your own authority?—Yes, it is a condition of our contract. These are the conditions. (*Copy handed to Chairman.*)

5021. You make it a condition of your contract?—Yes, we pay rather more for our milk on that account.

5022. I suppose, generally speaking, the security that the law does provide for, is not made use of in rural districts with regard to milk supply?—I imagine not.

5023. You know there are stringent conditions by which the milk may be made the subject of very careful inspection if the local authority choose to enforce them?—Yes, There is no difficulty at all in any depôt making its own contract and its own conditions.

5024. If you get the milk supply within a reasonable distance so that you can see that these conditions are being observed, that would be so?—Yes.

5025. And that is so in your case?—Yes. The dairy from which we get our supply of milk cannot supply cream and we get the cream from the Pure Milk Dairy. I imagine that is the purest milk in England; it is spoken of by Messrs. Newman and Wittenbach as representing the high water mark of dairy farming in this country.

5026. Does your milk depôt issue instructions to parents on the subject; you say it performs the double duty of supplying food and educating parents?—Yes, we distribute leaflets on the feeding of children with different colours representing different ages.

5027. (*Mr. Struthers.*) May I ask the price?—It varies between 1s. 6d. and 2s. a week according to the age.

5028. That is the supply to the children, but I mean the cost of really pure milk?—9d. a gallon in summer and 10d. a gallon in winter.

5029. (*Chairman.*) With regard to the dietetic value of different food stuffs, is not that difficult to ascertain, because there is a good deal of difference of opinion on that.

Here, in this room, we have had very different opinions expressed?—Scientifically there may be differences of opinion with regard to exact dietetic values, but roughly speaking, I should have thought there was general agreement with regard to it.

5030. There is the chemical presumption in certain cases and also the factor of assimilability which is quite apart from that?—It is generally accepted that a pound of peas is more nutritious than a pound of cabbage.

5031. Chemically, but a very competent witness said that the whole theoretical value of peas as diet was vitiated by the fact that they were extremely unassimilable. I am glad you mentioned that, because it was specially stated. We are at once plunged into a morass of doubt, and there is a great deal of difference of opinion on matters of that kind?—I know that there is a very great deal of difference of opinion upon the exact dietetic value of different food stuffs, for instance as to whether white or brown bread is the more nutritious. Chemically, brown bread is more nutritious, but alimentary research shows that white bread made of seconds flour is more nutritious, because it is more assimilable. There you are dealing with differences which are not of great moment. I believe the difference between the chemical dietetic value of white and brown bread is not very great. With regard to details there is certainly not agreement. With regard to important differences there is, I think, general agreement.

5032. I am only putting in a caveat as to the real value of it?—There is very great ignorance amongst the working classes, for instance, as to the dietetic value of cheese.

5033. That value is very great, I believe?—Yes, it is very great. In York we distributed about 9,000 or 10,000 copies of a handbill of the kind I have in my hand, indicating in popular form the dietetic value of different foods.

5034. (*Mr. Struthers.*) Cheese, again, is an extremely indigestible food, is it not?—That depends how it is taken.

5035. That is the most important thing to mention, as a warning?—Yes, we have done so. It states on the handbill, "If you find cheese indigestible, try eating it more slowly, or grating it on your potatoes or vegetables, or else make cheese puddings or macaroni cheese." People usually bolt it after a heavy meal.

5036. (*Chairman.*) Take it in large lumps?—Yes.

5037. (*Mr. Struthers.*) I know many people who suffer from indigestion traceable to cheese—at least that is what they are told by medical people—notwithstanding the different forms in which they choose to prepare it?—Is that proportion greater than those who suffer from indigestion due to meat, do you think?

5038. I do not know?—There is no doubt the scientific men would agree roughly with regard to the different dietetic value of different foods, and that is all that is required for the purpose.

5039. (*Chairman.*) Will you go on to say what you conceive to be the second great cause of physical deterioration?—Apropos of what we have been saying, of course we must remember, in connection with the question of the low standard of physique owing to mal-nutrition, that a very large proportion of the population—whatever it be, it must be reckoned in millions, whether four millions, two millions, or one million—have not enough money to get food, let them spend their money as well as they possibly can. They cannot do it, and that, of course, is a very important factor.

5040. With regard to the young, would you advocate some system, at any rate during school age, for supplementing parental resources, where necessary, by giving children who have to undergo a certain amount of brain work sufficient food?—Yes, if it is done judiciously. There is a very great danger of pauperising them.

5041. With every intention to maintain responsibility?—I should like something to be paid for the food given in schools, even if it were supplied at very low cost. I think a point which has not always been realised is the fact that the time of special stress in the life of the poor is the time that the mother is bearing children. What the effect of that is upon the offspring is not fully recognised; it is not really known, I think. But one can hardly help thinking that it must be prejudicial.

Mr.
Rowanree

5042. Do you think, if the parents who were poor, knew what food was the most valuable in proportion to the outlay upon it that a great deal might be done to reduce the difficulty that is caused by poverty alone?—Yes, but not to remove it.

5043. If they knew, and could be induced to act upon their knowledge, the outlay upon food which, from the point of view of nutrition, was most productive?—Yes, but the things which are the cheapest often take the most cooking.

5044. And they recoil from the trouble?—Yes. A thing like porridge takes a great deal of cooking in the morning, and the work which a working woman has to do in the morning is considerable if she has a family of children to wash and dress and send to school, and so on.

5045. Do you confirm what we have heard as to the extreme laziness of a great many of the mothers?—I think it is very greatly exaggerated. Of course, there are a number of lazy mothers amongst the poor, as amongst all classes of the population.

5046. It does not affect the children in certain classes, but amongst the poor it is of immediate importance. You do not think that is a charge which can be generally brought against them?—No, not generally, by any means. It is undoubtedly so in the minds of a number, but I think it is exaggerated amongst those who do not know the poor well.

5047. You put the intemperance of the parents as one of the points you wish to bring forward?—Yes.

5048. Do you think that drunkenness among women is increasing?—I cannot say. There is more alcohol consumed per head of the population now, of course, than there was forty or fifty years ago.

5049. We have had it stated here that the average mother, if she is at all hipped or out of sorts, always has the black bottle ready to take a nip, and that the child is often asked to share the nip. Do you think that is a general failing?—I should not think it was a general failing. I should imagine there are more teetotallers among the working classes now than there were.

5050. You think there are?—Undoubtedly.

5051. You think that legislation to reduce intemperance is needed?—I think that is of the very first importance.

5052. Will you kindly indicate to us how you think it could be best done?—I should suggest a scheme similar to that which was outlined in the Temperance Manifesto recently published, with which I daresay you are familiar.

5053. Which was that?—I have it here. (*The document was handed to the Chairman.*) The very definite recommendations of the signatories include: "(1) A large speedy and definite reduction in the number of licensed premises; (2) wide powers of local self-government (with provision for their immediate operation), including permissive powers of (a) veto, and (b) public control under which, subject to the regulations of statutory law, the whole of the retail traffic in a locality could be conducted without the stimulus of private profit, and without direct and appreciable pecuniary gain to the locality itself; (3) a scheme of constructive reforms which should include the provision and maintenance of adequate counter-attractions to the public-house." Such a scheme as is set forth in the Manifesto would permit of the drink trade being taken out of private hands and the monopoly profits, amounting to not less than £20,000,000 per annum, which now go to strengthen a dangerous and baneful monopoly, could be utilised for national purposes, great care being exercised that they were not so expended as to give any locality an inducement to drink.

5054. That must be a very slow process, must it not?—No, I feel that the country is ripe for such a measure. I think that any Government that came in that was in favour of radical temperance reform could pass a measure of this kind. It has the support of an enormous number of people. Of course, the signatures to that Manifesto are very striking.

5055. Removing the whole trade in drink from the hands of the present holders?—The process would be that you would give a time notice to the trade that at the end of a certain period all licences lapse. Then the locality would have the option; they could either

apply local veto if they can, which would probably very seldom be done in the case of towns, or, in the alternative hand the licences of the locality over to a company approved by the Licensing Authority. The company would then manage those licences in the interests of the community; they would submit all their accounts and management to Government control; they would not take more than four per cent. interest upon their capital, and everything above that would go to the National Exchequer. The first charge upon the profits would be the provision of adequate counter-attractions, which is a matter of first importance, and whatever was over would be used for National purposes.

5056. Do you think that the nation would make so much out of that scheme as they do at present out of the excise?—They would make the excise and the profit as well.

5057. The consumption of liquor, presumably, will be enormously diminished?—Yes, one hopes so.

5058. That, of course, is the basis of the matter?—Yes.

5059. (*Colonel Fox.*) But they would make a profit on other things—people would eat more if they drank less?—Yes.

5060. The profit would be made on other things than beer?—Yes.

5061. People would eat more, would they not?—What they do in Norway and Sweden is this: as the sales decrease they put up the price and weaken the spirits, so that they get their profit in that way. Their profits do not decrease with their sales. They have steadily been increasing their prices and steadily decreasing their strengths.

5062. You allude in your *précis* to a sort of restaurant instead of merely a beer-house. You are speaking now of beer-houses where they sell beer, or beer and spirits: and to take the place of that you suggest a place that is attractive, where they can obtain beer, tea, coffee and eatables, or anything that they like?—I would not make them attractive, no.

5063. You would make the restaurant attractive, would you not?—No, I would not make the restaurant where intoxicants were sold in any way attractive.

5064. I thought you were saying just now you recommended that these houses, which took the place of the beer-houses, should be attractive?—I would make attractive places where no beer was sold at all.

5065. Do you not think it is going too far to suppress beer entirely?—I should sell beer. You will have your public houses, but I should have those rather severe, and I would have the attractive places where no beer is sold at all.

5066. I thought you were going to abolish the beer-houses: would it not be better to make them restaurants where the working men could go and have their eatables and drinkables, tea, coffee, cocoa or beer?—No; the places I should try to attract him to would be temperance restaurants.

5067. Do you not think that one of the great faults has been the fact that people go in for the absolute extreme, that is, teetotalism: do you not think that that has done more harm to the temperance cause than anything?—I do.

5068. Therefore, why not introduce beer in the excellent restaurants which they are having now—I keep harping upon the old question of Lord Grey's Public House Trust, which is on lines which seem calculated to keep people away from drink: there they can have beer if they want it, but it is not pushed prominently forward?—You have to make them attractive now because they are in competition with other public houses, but when the whole of the licences are handed over to this company they have no need then to make them attractive. If a man wants beer he can go and get it.

5069. Have you ever thought of what we have all over London now—the cabmen's shelters? In the old days half of the cabmen were drunk, because the only place they had to go to was the public house, where they had beer. Now they have shelters and a cabman is very rarely seen drunk, because in those shelters they can have their chop or whatever they want. I have been in several of them lately, and was told by them that they can get a chop cooked there and eatables of various kinds, and beer if they like it, or tea, cocoa or

Mr
Rountree.
———

coffee, any mortal thing they like. The result is that they do not want to go into these low public houses, and they remain sober. If you can do that for the cabmen in a small way you can do it for the working men in a larger way, by having shelters in the nature of restaurants where they can get anything they like. You can have your restaurant where a man can get a meal, and something to drink as well?—I would have those, but the ordinary man does not want anything to eat when he goes in for drinking; he wants the drink. I would give him his drink.

5070. But you would not bar a certain class of men who are accustomed like honest men to have a glass of beer—you would not bar them from going into your restaurant by making it a teetotal restaurant, would you?—I would have restaurants with licences in the same way that you have at the present time for *bona fide* eating and drinking.

5071. (Chairman.) Is it not the case in Germany that the working classes take their families to have meals at popular restaurants?—Yes.

5072. (Colonel Fox.) They have a very good mild beer which does no harm—something like the watered spirits you spoke of?—Yes.

5073. (Chairman.) Would you be prepared to say that the mild beer, such as Colonel Fox has described, is more unwholesome than tea?—It depends on how strong the tea is, and how mild the beer.

5074. I mean in the normal conditions in which tea is drunk. Personally, I should say tea was the worse of the two?—I am not prepared to say. If you get your beer mild enough it might be less harmful than strong tea.

5075. It might be much more wholesome than any tea?—Yes.

5076. We had a lady here not long ago who said, with regard to the feeding of children, that she would much prefer to see them fed on beer than on tea?—I would not go so far as that, because you have no guarantee that they will stop at this mild beer.

5077. (Colonel Fox.) If there is no other beer there but the mild beer, they are bound to drink it?—Yes, but if you feed the infants on beer, when they get older they would put away childish things and take something stronger than beer.

5078. When a working man's day's work is over or week's work is over, he wants to go to some place where he can meet his chums and have a chat. There is no place he can go to except the public-house. Why not have these restaurants, with beer and other drinkables and eatables, such as cocoa, tea, &c.? Why not encourage them to go to these places, and then they will not drink half so much?—With regard to this profit of £20,000,000, a first charge on that would be the provision of counter attractions on a most liberal scale—beautiful rooms fitted up, people's palaces with all kinds of attractions, concerts, music, lectures, etc. I would have a splendid gymnasium and swimming baths, but I would not have beer sold in those places.

5079. What a pity! If you had mild beer there you would draw all classes, the very men you want to get?—I would not close every place.

5080. (Colonel Onslow.) All the bad characters would go to the dull places and the men already reclaimed would go to the others?—I do not think that is the experience in Norway and Sweden.

5081-2. (Colonel Fox.) You must accept the fact that in Sweden drink is one of the greatest curses. I have been there many times, and the great curse is punch-drinking?—I forget the figures for the whole of the country, but certainly in Gothenburg the sale of spirits has decreased 50 per cent. in thirty years, and in Bergen more than 50 per cent. in twenty-five years under this company system.

5083. (Chairman.) On the question of housing, of course you attach a great value to improvement in that particular?—Yes.

5084. There, of course, you come into contact with difficulties of another kind. The great difficulty in regard to the housing problem is the indifference of the people themselves to the conditions under which they live?—Yes.

5085. And their reluctance to move?—Yes.

5086. And in the case of the poorer classes, their incapacity for moving?—Yes, I think it is just the indifference that comes from anyone who is used to a low condition; he does not want to be improved.

5087. He does not want to be disturbed. Is not the local authority embarrassed with the further difficulty of providing for the displaced people if they apply the laws against overcrowding to the extent which they might do?—What I myself would like to see would be the town making a wide use of Part III. of the 1890 Housing Act—some improvement would have to be made in that before it would be thoroughly satisfactory—and buy a ring of land round the town, and then develop it municipally as building estates, on the lines of Bourneville. I do not mean in long rows of miserable streets.

5088. Creating a Garden City, in fact—a suburban city outside?—Yes, and connecting that to the centre of the town by trams—the trams being municipally owned, which is the *sine qua non* of success.

5089. Can they do that under the existing law?—They can do it under Part 3; but there you have to form a scheme, and you do not always want to form a scheme straight away. You want to buy the land so as to get the increment of value as it comes and form your scheme slowly as it goes along, and the law does not permit that at present. I believe it can be wriggled out of by saying that you are going to form your scheme “shortly” if you only say it often enough.

5090. Should you say that local authorities are culpably neglectful of the powers under the existing laws, as a rule?—I do not think public opinion would support them in taking any extreme measures at the present time. I think the public want to be educated.

5091. Do you think there is a growing feeling on the part of the public in favour of utilising their powers more than they did?—I think there is.

5092. The public are becoming more alive to the dangers of ill-health, to national prosperity?—Yes. I think that schemes such as Bourneville and Port Sunlight, and Garden City, are good, and indicate what can be done.

5093. You would not suggest an interference by a Government authority, such as the Local Government Board, which is the office charged with the duty. You would not suggest any drastic intervention on their part to compel the local authorities to discharge their duties more thoroughly. You think it had better be left to the slow advance of public opinion?—I would remove all the difficulties which there are at present in the way of putting such a scheme as I indicated in force. There are difficulties in detail at the present time. I would remove those and make it exceedingly easy. I would make it difficult to continue building miserable cottages in the way that is done at the present time. There might be considerable pressure put on by the Central Executive in the way that there is in Germany, where they do not actually order the towns to undertake a building scheme, and so forth, but recommend them to do so, and encourage them.

5094. Germany is very different from this country, because the great industrial development in Germany succeeded instead of preceding as it did in this country any comprehensive knowledge based upon scientific hygiene?—Yes.

5095. And therefore Germany was fully alive to the sanitary conditions of the problem before it had to face the great increase of the urban population?—Yes.

5096. Whereas the great increase in this country in industrial development preceded, not only any healthy public sentiment on the subject, but any scientific knowledge?—Yes.

5097. That I understand to be the case?—Yes; but we have those things now, and therefore there is nothing to prevent the Central Executive encouraging such schemes, probably sending communications down to the local bodies encouraging them to undertake such a scheme as I have indicated. I think one often hears that the poor will not move out, if houses are provided.

5098. That is what Mr. Booth says among other things ?—I think his expression is that we must always remember that a town population moves outward in rings, and it seems to me there is a profound truth in that statement. You will always find a very large number of people who are glad to move out and then, of course, they make room nearer the outside for the slum dweller. The slum dweller will not leave the slum. The mistake has been in people attempting to get the slum dweller to move out.

5099. Mr. Booth testifies to the value of gardens as an attraction ?—Yes. I am associated with a little scheme in York conducted by private enterprise where we are trying to get people to move out. We are building cottages about a mile from the boundary of the city, each cottage having a garden, and we find that we can build an artistic cottage thoroughly well built of the best materials with a large living room and scullery, bath, three good bedrooms, and a garden, to let at 4s. 6d. a week, the tenant paying rates, to show 4 per cent. on capital.

5100. Is that being done at York ?—Yes ; it is a scheme of my father's. We are doing it now. We got the figures out only last week.

5101. In talking about the efforts made to raise the lowest levels of human life, Mr. Booth says, "Success can only be very gradual and never perhaps complete ; the principle of action is unchangingly the same, to interfere by administrative action and penalties at each point at which life falls below the minimum accepted standard while offering every opportunity for improvement." I pressed him to explain what he meant by that, but he rather hesitated to do so. If you had to interpret that somewhat cryptic dictum in practice how would you do it ?—I do not know. I do not quite see what he means. With regard to the scheme I mentioned, the value of gardens must be borne in mind when we are thinking of rural rents.

5102. The value of the asset of the garden ?—Yes.

5103. Do you think that the class we are discussing will make full use of a garden ?—I think the higher section of the working classes undoubtedly would make good use of a garden. I do not say that every man would, but a very large proportion would. In the few houses we have already built it has been quite striking to see the improvement in the health of the people who have gone out there.

5104. Because of the additional open space ?—Yes.

5105. And the value of the garden in raising produce would add to their dietary and so on ?—There is no doubt of that.

5106. They can make a good deal, but are they willing to do so ?—I have taken out a number of figures myself. George Cadbury could tell you the figures of Bourneville—1s. 11½d. a week for one-eighth of an acre.

5107. That is what they can make ?—Yes.

5108. Do they ?—Half a dozen of them actually did make it.

5109. They did it under his immediate eye and encouragement ?—Yes. I have some figures here which I only got this morning referring to allotments in York. I have taken twenty-five gardens, and these are the figures for 1902—I have not the figures for 1903 out yet. It averages about 8½d. a week for one-fourteenth of an acre.

5110. Clear gain ?—Yes, after paying a rent at the rate of £7 an acre, and the cost of the manure, seeds and all expenses, it came out to 8½d. per allotment per week.

5111. (Colonel Fox.) Taking everything into consideration except labour ?—Yes. I only had the figures this morning, and have not had time to carefully analyse them, but I notice that the profits vary from 4s. 10d. to £4 18s. 11½d. for the same sized allotment.

5112. That is due to the individual factor, I suppose ?—Yes, it shows what can be done. One man actually got £4 18s. 11½d. from the one-fourteenth of an acre. These figures are extremely carefully got out.

5113. Can you let us have these figures, or a copy of them later ?—Yes. I am getting last year's figures out, and will publish them together.

5114. (Mr. Lindsell.) How do you calculate the profit ?—I take out of pocket expenses. I do not count anything for the labour.

5115. (Mr. Struthers.) You suppose that all the produce is sold, but do you know that it is ?—Very little of it is sold.

5116. How do you value it ?—I have got about half a dozen families, who have no allotments, to keep budgets for me for the whole year, showing what they have actually paid for their vegetables, taking full advantage of all the cheap times, buying at half-past nine on Saturday nights, and all that kind of thing ; and I have also got one or two fruiterers to keep statistics for me the whole year round of what they are actually selling at. Then I have taken those figures, and have taken the average price every week for every kind of vegetable. I have taken rather low prices, and I have calculated the value of the allotment produce all at those prices, different for every week.

5117. (Chairman.) That is the basis of this calculation ?—Yes, I think this is rather a severer thing than George Cadbury's was. He let them value their own vegetables. Of course, a man likes things to appear at their best. I valued these myself, and I valued them low ; I valued them at just the price they would actually have had to pay. On the allotments a great many would grow flowers, which I valued at nothing.

5118. Turning to the effects of the different conditions of employment, you have something to say on that subject, I think ?—One feels, of course, that the rural population were working for the most part in the open air, and then when they come into towns they work in factories, and shops, and so forth.

5119. You attach great value to the hygienic effects of open air ?—Yes, an enormous value.

5120. The atmosphere of York does not suffer much from smoke pollution ?—Not nearly so much as many towns. What I feel, is that the hygienic conditions of many factories are exceedingly bad.

5121. Is not the law strong enough on that point : Is not the last Factory Act a very considerable improvement, particularly on the point of ventilation. It is with regard to factories, but I am not sure about work-rooms ?—In a modern factory with which I am familiar, the directors asked their chemist to analyse the air in all the rooms. It was only built ten or twelve years ago, and is a model factory, regard having been had to the health of the workers, and no unhealthy trade is being carried on there ; a good deal of attention is given to ventilation, and the cubic air space per worker is very considerably in excess of the statutory requirements.

5122. Was that before the Act of 1901 ?—It was last year, yet although in most of the rooms the air was pure, in a few rooms the parts of carbonic acid gas per 10,000 parts of air were as high as 20. You will remember the Departmental Committee which was appointed to go into the question of the air in factories recommended that twelve parts per 10,000 should be the maximum allowed. In this factory the directors had a system of moving air introduced mechanical ventilation, and gave 2,000 cubic feet of air space for each worker. The over-lookers report better health in the rooms where fresh ventilating appliances have been installed. They are positive in regard to the improvement of their own health. In one case of a room containing sixty-five to seventy girls engaged in light employment, the percentage of time lost through sickness during a six months' period dropped from 5.9 to 3.1, after a supply of 2,000 cubic feet per girl per hour had been secured. If, in a modern factory of that kind, built really with a view to the health of the workers, you get those conditions, one can imagine what it is like in some of the old factories. Yet an inspector walking through would not have said a word about it ; it was not nearly bad enough for that. What I feel is that in many solicitor's offices you get little lads there developing consumption, and also in all kinds of offices and shops. One cannot help feeling that a great deal of the impaired physique is due to the conditions of work.

5123. I suppose the conditions of workshops are more liable to evil influences than in factories ?—I should think very much so.

5124. And particularly the smaller workshops which are not so liable to inspection ?—Yes.

5125. Is there much employment in workshops in York ?

Mr.
Rowntree.

*Mr.
Rowntree.*

—No. I feel certain that the question of the air in factories and workrooms is a very important point, quite apart from what are known as dangerous trades.

5126. Would your experience suggest any amendment of the law ?—I would tighten up the law very much.

5127. Are you familiar with the provisions of the last Act ?—Not in detail.

5128. That was a very considerable advance ?—It was an advance, but still it permits such conditions as I have described.

5129. I should hardly have thought it would, because it was particularly strong on ventilation. You have formed some opinion as to the need of recreation, as a counteracting influence to tendencies towards physical deterioration ?—Yes, one feels that in the country districts there is no need for the children to have organised recreation. But when they go into the towns it is a matter of supreme importance that they should have this. One feels that except in a few towns the urgency of that need has not been really fully recognised.

5130. There again improvement is noticeable ?—Yes, but very slow.

5131. You do not think it is gathering momentum. Surely a great deal of attention is being paid to the value of physical education now ?—Yes. I was speaking just now of the recreation.

5132. But that is a branch of it. York has no difficulty in getting open spaces, has it ?—They are miserable little places when one compares them with the conditions in America.

5133. Outside York you can get to a big open space in a very short time ?—But you are not going to get three, four or five-year old children walking one and a half or two miles to the playground ; they would not be allowed to.

5134. But immediately below the bridge which connects the station with the town, there is open space enough there ?—Yes, but I think one important thing to remember is what the Americans have emphasised so much, that a mere open space is not enough, that to make really full use of an open space you want to have someone in charge of it who will organise play for the children. They have come to the conclusion there that an open space is of very small value, unless there is someone in charge.

5135. Are you talking now of children at school age ?—Yes, children's playgrounds.

5136. Do not the schools have playgrounds in York ?—Yes, but they only play in them in recess time, not after school hours ; just in the short recess they crowd in them and run about.

5137. Would you suggest municipal action to provide this ?—Yes.

5138. And they should keep caretakers and instructors in the open spaces ?—In America, for instance in Boston, there is no single open space which has not one or two janitors as they call them, men or women who have had experience of kindergarten methods, and who organise the play for the children. That is growing enormously in American cities ; they are spending considerable sums. They see the need for really organising play just as a master in a better class school here does. He knows it is no good letting the children stand about, and shiver in the playground with their hands in their pockets ; it is necessary to have someone to take charge of and organise the games.

5139. Under the Swimming Baths Act you have baths, I suppose ?—Yes.

5140. Are they used ?—Yes, and they bathe in the river also.

5141. On the whole, from your experience, which is of a very considerable kind, may I take it that you think ameliorative tendencies are generally getting the upper hand in the struggle for national prosperity, or the reverse ?—I think the grave point is the constantly increasing number of people who are subjected to town life. We are now beginning to realise that we cannot much longer recruit the towns from the country. I speak without statistical information, but I should have imagined that the increase in the town population was really overtaking the ameliorative agencies.

5142. For every one person who lived in the towns

in 1851 there are three now. The number in the rural population has slightly diminished. That is in what are called urban districts, but there are vast numbers of urban districts which are just as healthy as the country : they are not densely populated ?—67 per cent. of the population are living in towns of over 10,000.

5143. But there are zones in all those towns—sub-urban zones which are perfectly healthy ?—Yes, there are zones which are healthy in all towns, but there are some of the worst slums in some of the smallest towns. Taking a town like Hitchin, you cannot find any slums in London worse than those.

5144. (*Mr. Struthers.*) Garden City is close by Hitchin ?—Yes. The slums are terrible in Hitchin.

5145. (*Chairman.*) That does not effect any very large proportion of the population ?—I am not sure that it does not.

5146. It is a small place ?—I am speaking of the proportion to the population of Hitchin, and if you take it that in other towns the proportion is the same it would.

5147. But I must submit it does not at all follow that because there is a small section of the population in Hitchin which live in these conditions that you would find the same proportion in other towns, which rather seems to be your idea ?—No, except that I have taken an opportunity when I have been knocking about lately to see for myself. Whenever I have had a few hours in a town I get somebody to take me round, and I have never found any town without those conditions. The best town I have been through is Leicester.

5148. Infantile mortality is higher there than any other town in England ?—I have travelled about and been lecturing a great deal lately, and I have had people take me round. If I go into one town after another and find the same conditions everywhere, I am more or less justified in saying that those conditions prevail.

5149. Of course if you generalise from a large number of instances that is quite different.

5150. (*Dr. Tatham.*) Do I understand from what you have said, and from the cursory reading which has been possible to me, of your interesting book, that your observation has been mainly concerned with the city of York ?—My general observations.

5151. I think your book is largely based upon that ?—The book was based on York entirely.

5152. Generally speaking, your observations have been more concerned with the city of York than any other part ?—Yes, but always bearing in mind such knowledge as I have of other towns, which I have tried to get as I travelled about.

5153. Is it your opinion after careful consideration which I am sure you must have given to the point, that alien immigration is at the bottom of a good deal of the poverty which you speak of in our great towns ?—I do not know. It certainly is not so in some towns in the north. It does not affect us at all in a town such as York.

5154. You are aware of what is stated to be the effect of alien immigration on labour generally ?—Yes, to lower the standard of life.

5155. To lower the wages to vanishing point almost, so that English people cannot live on them ?—Yes.

5156. Do you think that is to any large extent the effect of alien immigration in any great towns which you know of ?—It certainly has a bad effect in towns where alien immigration is an important factor.

5157. Upon that point you have no information ?—I have no definite information. I know in Leeds it has a bad effect upon wages.

5158. We have had evidence here that it has a bad effect in many cases. You spoke just now of a health society they have in York ?—Yes.

5159. That is one of recent establishment, I think ?—Yes.

5160. Could you detail to me in a few words the kind of work they are doing ?—They organise lectures. They have as secretary a lady who used to be a sister in one of the London hospitals, and who also held some post under the County Council—I think a health lecturer or something

like that—and she visits very largely amongst the poor. She does a good deal of this visiting in connection with the infants milk depôt which was opened by this health society. We seek to influence the Council generally to form public opinion on health and housing matters.

5161. Are there not several ladies engaged in that work in York?—Only the one paid by the Society. My secretary does a great deal. She was a sanitary inspector.

5162. Are you aware of the work which has been done for a considerable number of years now in Manchester by the Ladies' Health Society?—Yes.

5163. From what you have said in answer to the Chairman, I think you were scarcely aware of the very extended work which the ladies of that Society are doing. I might probably shortly explain to you that that Society consists of something between twelve and twenty ladies who are engaged in domiciliary visits amongst the poor, personal visits, and that under them they have acting a very large number of ordinary women of the working class, who, under the direction of the ladies, undertake work of great importance amongst the poor. Were you quite aware of that?—Yes. I know just how it is worked.

5164. And for a great many years now they have been doing that work?—Yes. All I was saying in answer to the Chairman was that I rather doubted whether these working women whom they employ would be quite suitable to take up the very delicate work of advising the mothers how to feed their children. A working woman might take it from a person whom she considered a lady, and not from another working woman.

5165. I think I ought to tell you that each paid district visitor works under the direction of a lady who is really responsible to the Society for the work in her district?—I am aware of that.

5166. I am glad to be able to tell you that is so from personal experience?—I was staying with one of those ladies a short time ago. I think a good deal of their work consists in disinfecting houses, and in general teaching with regard to cleanliness, and so forth.

5167. That is part of their work, but they are also engaged in instructing the poor how to keep house, for instance, and how to cook food for the family, and how to look after the children, and how to feed them?—I think the work is entirely admirable.

5168. All this work is being done under the direct personal supervision of the Medical Officer of Health for the city?—Yes.

5169. You are speaking now of infant mortality in York, and you are showing—as you have done in your book—the enormous difference between the mortality in different parts even of that town?—Yes.

5170. Differing from 94 in 1,000 to something like 247?—Yes.

5171. Do you think the higher rate is due mainly to poverty of the mothers who are unable to give proper nutriment to their children?—Poverty and all that poverty means—bad housing, bad clothing, bad feeding, and neglect and ignorance.

5172. And it is amongst the slum dwellers mainly that this terrible mortality exists, does it not?—No, there is a very high mortality in districts which are not the worst slums.

5173. But the poorest districts?—Yes, but not necessarily slums. I distinguish between a dirty neglected house which one associates with a slum and one where there is honest poverty.

5174. Do you find that consumption is very destructive in York amongst the younger part of the population?—I am afraid I forget the figures. There is undoubtedly a great amount.

5175. You think there is an excessive amount compared to other towns?—I do not know about compared with other towns.

5176. Speaking generally, there is a great deal?—Yes. There is a very large amount of consumption in York.

5177. And that amongst the children?—Young people—not quite children I think.

5178. (*Mr. Lindsell.*) I think you expressed the opinion that the increased evils in towns are outpacing the palliatives?—Yes, that is an opinion, it is not based on statistical information.

5179. You seem inclined to hold that opinion?—One fears that.

5180. You fear that the rapid increase of urban life is outpacing the palliatives which modern science and modern philanthropy are introducing?—I am afraid so. I would not like to stake my reputation on the statement.

5181. Given what remedies there may be, town life must be in itself worse than country life?—I think a great deal can be done by having the town worker to dwell outside.

5182. Decentralisation?—Yes.

5183. That is your cure?—Yes. You can have your workers living outside in the scheme I briefly outlined while they are working inside.

5184. That necessitates a good deal of travelling by trains and railways?—Yes.

5185. Distance from work is not altogether a good thing?—It is a choice of evils.

5186. Do you not think that the work and the workmen can go together—decentralise the centres of work as well as the centres of population? I think you can to a certain extent?—There are very great conveniences in having factories and offices close together.

5187. You know there are various attempts being made in that direction?—Yes.

5188. Do you feel sanguine about their success? In regard to the economical condition of labour, generally speaking, the tendency has always been to draw together in large aggregate groups?—One cannot help feeling that the movement is somewhat artificial. It is opposed to economic tendencies. If you can educate people up to it, well and good, but the amount of labour and labour of a very high order, which is being put into this Garden City movement at the present moment is enormous. One almost feels it will always be so. I do not think you will always find people who are prepared to put that into these things.

5189. It is a sort of hothouse growth, rather than a natural one?—I think the Garden City will be immensely educative, but I should be very much surprised—and very much delighted—if one saw a large growth of Garden Cities on anything like natural lines. There are undoubtedly for any business immense conveniences in being near together to be able to just run across to your printers or tin-maker, or solicitor.

5190. (*Chairman.*) Has not the telephone rather annihilated distance?—Yes, but the telephone, of course, would not bring back the proofs from your printer or bring you the tins, or boxes that you want, and that kind of thing. Then there is another thing, namely, the constant variations in the number of people you require. Another advantage is this, in our town for instance, the railway employs the fathers and we employ the children very largely. If there were no railway near at hand, we should be very awkwardly situated.

5191. (*Mr. Lindsell.*) The employé in a factory must necessarily be less healthy than an employé in the open air, however well ventilated the factory may be?—Yes. Immense improvements might be made. We have large rooms in our factory where about 500 girls are employed, and the air is changed completely every seven minutes. It is passed through water screens—iced water in summer—so that the air will be very pure. One feels that in the coming century there will be a lifting up of the ideals with regard to ventilation in the same way as we have had in the past century with regard to drainage.

5192-3. You are also inclined to think that these bad influences are not confined to the slum population, but town life injuriously affects the class higher than the class that is living on the verge of absolute poverty?—I think there is no doubt about it.

5194. Then you are almost inclined to believe in progressive physical deterioration as things are at present?—No, I do not think so, because I think you have seen

*Mr.
Rowntree.*
—

Mr.
Rountree.
—

almost your worst now. You have practically nothing more to draw from the country now.

5195. But you can go on increasing the towns and increasing the town population?—Yes; but the palliatives will begin to tell. You have the bulk of your people in the towns already, and you are only beginning your palliatives. As you increase the palliatives you will improve the physique in your towns.

5196. Among the palliatives you would put in a very high position, not merely the improved conditions of life, but improved attention to the very, very young?—I would give improved attention to the very, very young, and to food, and I would put temperance very high, and, of course, housing.

5197. I suppose intemperance does not tell upon the constitution till a man has reached a certain age?—But the children are neglected. I am not dealing with the physiological effects of alcohol—they take a long time to work; but I am talking of money going in drink which ought to go in support of the children. One-sixth of the income of the working classes at present goes for drink.

5198. You think the Norwegian and Swedish system of placing all the drink traffic in the hands of monopolies, under certain restrictions, is the best solution of the difficulty?—A somewhat modified system. I have the outlines of it all here.

5199. Would you entirely confiscate all existing interests?—The interests of the public houses. I would leave the brewing in private hands.

5200. But how would you deal with the business in which several people depend for their livelihood upon the property itself; would you abolish all tied houses? Suppose a brewery had 100 houses—a very large freehold—scattered over large areas, and these houses are deprived of their licences, they would become practically valueless?—I would give them a time notice; I would not give them any national compensation.

5201. That is the publican; he can seek another livelihood; but there are certain people who have sunk a large capital in a brewery and the property thereto annexed; if you adopt this system without some consideration for them you entirely destroy that property?—It is the risk of an abnormally profitable trade.

5202. Supposing it is paying 6 or 7 per cent., if you did away with these houses it would pay nothing?—They have taken their risk.

5203. A few large brewery trusts would then get the whole supply of the country: would you not ruin thousands of perfectly innocent people? Would it not be hard to destroy all the small brewers in the country?—I do not think that you would necessarily destroy them. A certain amount of drink would be required—a less amount, of course.

5204. The licences would all be taken away, and another place would be set up, and the Public House Trust Houses, as we will call them, would probably go to one or two large breweries in the town, which would amalgamate and form a gigantic trust which would get the business and ruin all the country business?—I do not see that it follows. People would go where they could get the best beer.

5205. Do you think that business deprived of freehold properties could compete with the large ones; would not all the country brewers follow the fate of the country bankers?—They might amalgamate themselves, possibly.

5206. You think it could be done without any great injustice? I am not talking of the publican but of the owner of brewery property. It seems a very large problem?—I should be perfectly prepared to give a time notice; I should not go further than that.

5207. What is your opinion of the rival harm done by the gigantic gin palace and the small country public house. Do you not think that one tendency of the extinction of a large number of licences would be the vast growth of certain large establishments which would lead to a great deal more harmful drinking than the small country public house where just a few neighbours gather together every night?—I think some reduction of the number of licensed houses in England while the trade is still in private hands will never make any great change in the drinking habits of the people. I think the only solution of the question is to take the trade out of private hands.

5208. And to put it into companies with a monopoly?—Yes. The interests of the nation are to reduce the consumption of alcohol; the interests of the trade are to increase it. Every glass of drink that they sell means an added profit to them. The interests of the trade and the interests of the nation are diametrically opposed, and it seems to me that under no system of legislative jugglery can you possibly bring them together.

5209. Do you not think these companies might not only take the houses but the brewing also?—Yes, if they like, I have no objection.

5210. If they had 5 per cent. they would be really glad to have it?—I have no objection if they like.

5211. You were saying that the houses which you mentioned have a rent of about 4s. 6d. a week or something like that?—Yes.

5212. (*Mr. Struthers.*) With taxes added?—Yes.

5213. (*Mr. Lindsell.*) It is rather high for a country cottage, is it not? The agricultural labourer does not pay that?—No, but he does not pay any adequate return on his house at all. His wage is based on the fact that he will get a cheap cottage.

5214. It does not often happen that the house belongs to his employer?—You will never find a builder putting up cottages in the country as a speculation or as a return upon capital. That is why you have your rural housing problem.

5215. (*Mr. Struthers.*) What are your rates?—9d. or 10d.

5216. Does that include poor rate and school rate?—Yes.

5217. (*Colonel Onslow.*) I should like to follow a point of Mr. Lindsell's: you say you will give a time notice to these small brewers?—To all licensee holders.

5218. You are, I think, a great manufacturer of chocolate?—Yes.

5219. Supposing that the medical profession showed that it was very harmful: would you think it was fair that you should be given notice that the State were going to interfere with you, and without giving you any compensation for all the money you had spent in plant, and so on?—We are simply discussing whether the trade have any legal right to their licences. They have never paid for them.

5220. (*Mr. Lindsell.*) I was talking of the manufacturer not the retailer?—He has only paid for the freehold of his house.

5221. (*Colonel Onslow.*) Whether it is beer or whether it is cocoa, or anything else, it is a business, and if a man is suddenly to be stopped in that business, surely he ought to have compensation if he is going to be stopped by the State?—But, surely, if the State has given licences for a year, they are absolutely at liberty to take them away at the end of the year.

5222. But the State have not got the licences at present?—I mean the magistrates have given licences for a year, and there is no reason if the public say that there are too many licences or that they want them removed, why they should not be all removed. The brewers have taken all risks.

5223. In the excellent information which you have given us in regard to Class A and B of the standard of life, you give a great many examples of houses and full particulars about them, and there is one point I wish to ask you: who are the owners of those houses? I do not mean the names, but what are they?—Very often working people who own two or three.

5224. With no capital?—Very little capital.

5225. Are any of them owned by men in a higher grade?—Yes, a fair number.

5226. With capital?—With capital.

5227. There are sanitary laws and sanitary inspectors and all that sort of thing who appear to be fully competent to deal with these matters: how is it the laws are not enforced?—The lack of public opinion.

5228. But there must be sanitary inspectors?—Yes, but there is no public opinion to see they do their duty.

5229. How is it possible under the sanitary laws that

there should be such a state of things as is pointed out here, of one water tap to twenty-four houses, one closet to something like on an average, seven or eight houses, and ashpits not cleared out: whose business is it to see to all that?—The municipality.

5230. Do not they do it?—No.

5231. Is there no means of forcing them to do it?—They have been forced to do it now.

5232. Why have not they been forced to do it before?—So long as public opinion did not absolutely force them to put the laws in order, they did not do it.

5233. What sort of persons were they who formed the Corporation that they had no higher sense of consideration for the people?—Many of them own property themselves.

5234. It is necessary to have somebody to force them?—I wrote to the Local Government Board with regard to the water taps.

5235. (*Mr. Struthers.*) Then it was the Local Government Board who forced the municipalities to carry out the law?—Yes. What is required is a strong public opinion. It seems to me that the public should be enlightened regarding what the laws are, and what their powers are.

5236. It is not only in a town like York, where very likely the upper classes never see these things, but in the country where you constantly pass insanitary dwellings, and you can see by the outside, and the smell as you pass them, that they are insanitary?—Yes.

5237. If we are told, as most people seem to think, that the law is strong enough, how is it possible that those things can go on?—Because you have a council with very low ideals. Their medical officer of health reports that certain houses are insanitary; the council inspects them and says: "We are not going to take action in this case; it is all right." They do not know. Then there is nothing for it. The medical officer of health dare not write to the Local Government Board, because he would be dismissed, and therefore it requires somebody independently to take the odium upon himself, which is very considerable sometimes.

5238. Can a medical officer be dismissed by a county authority without the consent of the Local Government Board?—They certainly can in the towns.

5239. (*Chairman.*) Everywhere except London. You would advocate something being done to improve their security of tenure?—Yes, I think it should be done, because it is very difficult for a progressive medical officer as things are now.

5240. (*Colonel Onslow.*) It is practically impossible for a man to carry out his duty?—Yes, he cannot do it.

5241. Without losing his own livelihood?—That is so.

5242. Therefore, although the law is strong enough, the means of carrying out the law are not sufficient?—No.

5243. Of course you made some of these investigations yourself: it was not entirely done by your agents?—Some was done by myself, and I checked the others.

5244. You have personal knowledge of a great deal of what is vouched for in your book?—Yes. I do not say personal knowledge of it all, but I have satisfied myself as to its accuracy. I have not put anything there which I do not believe to be absolutely accurate. I have taken the very greatest pains to prove the accuracy of the information.

5245. (*Mr. Struthers.*) You rather infer the deterioration of the physique of the people from the increasing numbers in towns?—Yes.

5246. And from the proportion of people in primary poverty in York you infer about four millions right through the country?—I would not say that; I would not care to tie myself down to that. I say it is obvious they must be measured in millions.

5247. But, of course, the country districts on the basis of your reasoning must be better than York?—More healthy, yes. I do not know that there is less poverty, but I do not think it has such bad effects.

5248. You must allow something for the remaining population of the country districts; they are not all yet transferred to the towns?—No, but those which are left

are largely young children and old people. If you look at the census figures you will find that the ages of people in the country are very different from those in towns.

5249. You spoke of the ignorance of the mothers about the care of their children; do you think that the mothers of the present day are worse in that respect than they were a generation ago?—I have no means of knowing.

5250. What do you think is the probability: do you not think there is some increase of knowledge even in the lower classes of recent years?—I think very likely that is so, but I should imagine a smaller number of mothers are nursing their children, and so, though the knowledge may be a little more, the physical deterioration due to ignorance may be greater.

5251. That may be due to physical weakness?—Yes,

5252. With regard to the visiting ladies you speak of, who work in connection with the depôt for distributing milk, I do not quite gather whether you mean that they should be amateurs or professionals, so to speak?—They should be professionals. They must be very carefully selected, they must have real knowledge, and they must be people of experience, and of great tact and sympathy.

5253. They must have special training?—Yes. For instance, one is coming to me to-day to help my secretary, and she would train her herself. She would start by taking her round with her, and in a few months' time she would be able to go by herself.

5254. Let us consider what the training means. I understand you lay considerable stress upon a knowledge of the constituents of food and a good range of physiological knowledge?—Yes, not more than an educated person can get up in a few months.

5255. Do you think that a person should be chartered to go round and advise people in this authoritative way who has not gone very thoroughly through a course of instruction on these subjects?—The problem is very much the same in every house.

5256. If you are going to select one, two or three individuals who are going to be placed in the special position of what will be acquired authority, they ought to be able to speak, not as to whether I, or you, or any ordinary intelligent person can speak about these matters, but with full knowledge?—If you only had one visitor I should not think of having her a person at all approaching an amateur, if you have one visitor she must be a person of real knowledge, but she could have working under her two or three whom she trains herself, and who would always come to her in all cases of difficulty.

5257. But this special person would be a professional?—Yes.

5258. And would be paid, I presume?—Yes.

5259. And indeed would be a person with practically a medical training?—The training of a nurse.

5260. Not more than that?—The training of a nurse with a certain amount of knowledge of hygiene, and so forth. I do not think medical training is necessary.

5261. Do you not think it would be a very useful occupation and profitable both to the persons and the town if certain medical ladies were appointed to these posts. I mean there are a considerable number of ladies who are now qualified to practice?—It would be a very excellent thing if you could get them, but the question is, if it is not impracticable except in certain cases.

5262. I should think you would get them at very reasonable rates—ladies of that description?—The ladies in my mind would have a salary of about £150 a year.

5263. I am sure you would get the ladies I speak of at a lower rate, because the corresponding man, the young practitioner, or the medical man beginning his professional life takes a situation on board ship, and so on, at £60 and £70, and sums like that, and female labour of whatever class is generally cheaper?—Yes.

5264. You speak of primary poverty; will you say what you mean by that?—Primary poverty is the poverty of families whose total earnings are insufficient for the maintenance of physical efficiency, no matter how carefully spent.

5265. What would that sum be: I suppose it would vary in different conditions?—It would vary in different towns according to rent and so forth. The figure I made

*Mr.
Rowntree.*

Mr.
Roun'rec.

out in York for a family of man, wife and three children, paying 4s. rent, was 21s. 8d.

5266. Paying 4s. for rent is primary poverty?—No, he would be in that class if the income fell below 21s. 8d. That is the amount which I say is necessary for physical efficiency.

5267. A person with that family with 18s. in York would certainly be in primary poverty?—Yes.

5268. That is to say he would not be able to get sufficient food to maintain himself and his family in a state of efficiency?—Yes. I am fully aware that those are only average figures. If you take half a dozen men they will probably all require different amounts of food to maintain them, but when you deal with thousands you must take an average figure. That average is based upon the best information available at the present time, the information of Dr. Atwater, of America, which I submitted for criticism to two or three British experts. I was speaking to him on the subject and he said he did not think that that figure was too high as an average.

5269. Besides the 4s. rent what other expenses are included?—Sixpence a week for clothing for parents and 5d. for children; 1s. 10d. for coal; and 2d. a week per head for all else.

5270. How much for food?—3s. for adults a week and 2s. 3d. on the average for children.

5271. On inquiry you find that that sum, no matter how invested, would not produce sufficient for proper nourishment?—Less than that would not for people engaged in moderate labour. If engaged in sedentary labour they would require less.

5272. For tailoring they would require less?—Yes. A navy would require more.

5273. If in the open air they would require more?—If they were doing hard work in the open air they would require more.

5274. But even mild work in the open air?—I do not think so.

5275. Now about this plan with regard to buying up all the public houses and so on. I am not going into the question of compensation, but there is another point I wish to put to you: your plan resembles that of the Gothenburg?—Yes.

5276. But the essential difference between the two, as I take it, is this that whereas in Gothenburg and in the corresponding scheme in this country the profit in the public houses in any locality would be spent in that locality, you propose to put all the profit from all the localities into the national exchequer?—Yes, I think that is extremely important.

5277. When it goes from the national exchequer what are you going to do with it?—I would earmark a certain amount equal to £1 for every ten of the population to be spent in the provision of adequate counter attractions.

5278. In the different localities?—In the different localities. That would take four millions.

5279. So that you collect the profit from the different localities by excise officers, that is to say, officers of the Central Government, and then do some calculations by clerks in an office, and hand it back to them again?—Yes, in proportion to the population, and not in proportion to the amount they sent up. That is a *sine qua non*.

5280. Why do you lay such stress upon this, because it would be more expensive?—So that there should be no inducement to the locality at all to drink. If the locality like to pass the local veto, and close public houses, it would get just as much as the locality which drinks heavily.

5281. The mere question of profits to the locality from public houses managed by them would certainly make an ordinary locality indisposed to veto drink absolutely; but putting the local veto aside, do you think an ordinary locality, even if it got profits from public houses in its district would be at all disposed to positively encourage drinking?—Yes, I think so. I think if the local hospitals or local recreative agencies benefited directly in proportion to the amount consumed in the district, public opinion in that district would be in favour of drinking, and not in favour of suppressing drink.

5282. In that case the consumption of spirits in Gothenburg and Bergen ought to have gone up?—No. The Company system works so powerfully that in spite of defects the results are far better than under private licence.

5283. It ought to be going up since the time the system was started?—No, I said it would go down if my scheme were introduced into Gothenburg.

5284. Take the people of Bergen; they certainly drink less spirits than they did under the old system when there was no monopoly?—Yes.

5285. When this scheme at Bergen was in working order for two or three years, did the people begin to realise that there was a very considerable profit?—Yes.

5286-7. On your theory, that ought to have led these people to encourage drink, and therefore the consumption of spirits in the later years of the monopoly ought to have been greater than it was in the beginning; is not that a good argument?—The Temperance and Reformers Legislators of Norway realized the danger of the system adopted in Sweden, under which the profits of the trade went directly to local objects, and in 1894 a law was passed whereby 65 per cent. of the profits goes to the State. I do not see why it should take a few years for localities to find out that they are making a considerable profit. I do not see why they could not recognise that from the first day. It would not take them long to realise that if all the profits of the district are going to be spent in the district it is to the advantage of the district that the profits should be as large as possible.

5288. Does it not exactly follow from that, that once you have introduced this system, the consumption of liquor would go on increasing, because the popular opinion is in favour of the consumption of liquor?—No, I don't think so at all.

5289. If it does not encourage the consumption of liquor what is the good of taking away the profits from the locality and putting them into the national exchequer?—I thought you were referring to my proposal with regard to the consumption of liquor?

5290. No, I am speaking of the monopoly system generally?—I thought you were referring to my proposal. So long as there is a knowledge that the rates are lowered by the amount that is drunk in that locality, there will always be a tendency on the part of the locality to oppose any action which would materially reduce the consumption of alcohol.

5291. Putting it the other way, I understood you rather to say, that in addition to that there would be a positive desire on the part of the community to increase the consumption of liquor in order to get further profits of this kind?—I think that if increased consumption meant diminished rates the danger referred to would be continually felt.

5292. I think that it certainly would be an obstacle in the way of imposing a veto, but I do not think that the mere fact of profits accruing to the public houses would make the people in the locality encourage drinking in order to make larger profits?—What I feel is that it would discourage any progressive temperance sentiment in the district.

5293. It would discourage any movement in favour of an absolute veto?—Or even materially reducing the consumption of alcohol apart from absolute veto.

5294. What sort of steps do you propose to take for reducing the consumption?—You might say that we start with one house per 1,000 of the population. There might be a temperance propaganda going on in the district—not teetotal, but temperance propaganda. So long as there was no influence working against it, it might bring the locality to such a point that the next time they came to vote they would be in favour of one in 2,000 of the population instead of one in 1,000. But if there were against them the knowledge that if the consumption were reduced the rates would go up, that would be constantly put in opposition to progressive temperance sentiments.

5295. That assumes rather that some reduction of the number of public houses would certainly reduce the consumption of drink?—If you do it to a large extent, it would.

5296. If you do it to such an extent that you are approaching the veto, I am with you at once; it is cer-

Mr.
Rowntree.

tainly an obstacle in the way of people vetoing it, or even approaching the veto, but I do not think that that would ever lead people to encourage drinking for the sake of increasing local profits or diminishing local rates. If that view is right, then I do not see the gain in transferring the money to the National Exchequer, and distributing out to them again. That is a more costly system, is it not?—What would you do supposing there were country districts which had adopted the veto? Would they get nothing?

5297-8. They would get nothing?—They would be penalised.

5299. It would depend on the size of the district to a certain extent. You said that in Boston the Corporation have appointed officials to take charge of games in the public parks?—Yes.

5300. You do not know whether it is the municipal authority or private enterprise?—It is a public authority.

5301. Is that a recent thing?—Yes, comparatively.

5302. Where would one get information about that?—The whole thing is in this book. (*Book handed to Mr. Struthers.*)

5303. You spoke of slums in Hitchin?—Yes.

5304. That is quite a small town, is it not?—Yes, I should guess it to be about 3,000 or 4,000.

5305. Slums in a town of that kind cannot be so very bad, because there is no difficulty in getting to the open country as there is in York?—The overcrowding in some of those houses is terrible, and the conditions at night also, when all the windows are closed, as they religiously are in slums.

5306. With regard to the overcrowding, that is another case of the law not being carried out?—Yes, I think there are conditions there which are really illegal.

5307. You said that in York, while the parents are employed in the railway, the children are employed in work such as yours?—Yes.

5308. At what age do you take children?—Fourteen, fifteen, and sixteen.

5309. Not earlier than fourteen?—Very exceptionally, when a child has passed its labour examination.

5310. With regard to the comparative healthiness of open air employment, it seems to be assumed that open air is necessarily healthier: is it your opinion that work in the open air is necessarily healthier than it is in a well-ventilated factory?—If you have a really well-ventilated factory, I do not know that the open air would be materially healthier.

5311. Take a moderately ventilated factory—I am going to put against the case of the operative in the moderately ventilated factory the case of an agricultural labourer, who is working in the fields in all sorts of weather?—I would not say that the conditions of the agricultural labourer are better.

5312. He is subject to wet and exposure, almost invariably ending in rheumatism by the time he is forty?—Yes.

5313. It has been so often said that open air employment is necessarily healthier than work in towns generally. Is it your opinion that that is quite established?—Not if you have a reasonable ventilation in your workrooms, and if you are not living in overcrowded conditions.

5314. And also that for any kind of employment that can be carried on in the open air to economic profit there are counterbalancing disadvantages?—Certainly.

5315. (*Colonel Fox.*) You were saying just now that a great number of children who were born into the world are affected because the mothers do not understand the choice of food for them, or how to cook it—it is ignorance?—It is not quite a question of cooking with the young children.

5316. It is a question of cooking when they get over the milk stage?—Yes.

5317. Will you tell me why you do not approve of girls receiving instruction at schools when the impressions are so strong and so lasting; why do you not approve of girls being trained to cook?—I do approve of it so far as it goes, but I think they forget a great deal between the

time of their learning and the time they have to practise it.

5318. I mean girls between thirteen and fourteen?—Most of them would not practice it till they are twenty.

5319. It is the most receptive time of their lives?—Yes. The amount they learn at school is very small.

5320. But simple cookery?—I think as far as it goes it is good. I would not for a moment be in favour of reducing the amount of knowledge of that kind.

5321. I am not speaking of fancy cooking and going in for competitions?—I am in favour of increasing the knowledge of simple cookery rather than the reverse.

5322. First of all, they would assist their mothers immediately after going from school?—They go into factories; very few of the girls we are considering will go and help their mothers. They will either go into domestic service or else into factories. They do not stay at home.

5323. At all events, in four years' time they will probably become mothers themselves, and they will remember the things which they learnt at school which they liked, just as we remember our nursery rhymes and fairy tales?—Yes.

5324. It would be a very good means of getting this fashion into the homes of the poor working classes, would it not?—I think as far as it goes it is admirable.

5325. In addition to what you are stating about lady workers?—Yes.

5326. You suggested wiping out the brewers, I think?—Not wiping them out.

5327. In what way do you suppose the breweries will be carried on?—They will supply these companies.

5328. And be satisfied with a profit of 5 per cent.?—The brewers will simply supply the drink for these companies at such profits as they are able to obtain.

5329. It will not affect the brewers in any way?—It will, undoubtedly.

5330. Why?—Because they would not have any tied houses.

5331. You would do away with tied houses?—Yes.

5332. You do not suggest putting the brewing into the hands of the municipal authorities, or anything of that kind?—No, I do not think there is any need to do that.

5333. Simply do away with tied houses?—Yes, and put the whole retail trade under company control.

5334. Why not introduce in place of the tied houses what I have already suggested to you, these forms of restaurants instead of purely beer-houses. When I say restaurant, I mean a place where they can have eatables as well as drinkables?—I should not object to see restaurants where drink is simply taken along with food, where a man wants to go and get food and he gets a glass of beer along with it.

5335. Then you speak of what you call slum dwellers. Are those people who do not work at all? How do you define a slum dweller?—What I mean by a slum dweller is a happy-go-lucky person who spends his income as soon as he gets it, who cares nothing for his home, who neglects his home; who may make very good wages, but who drinks them and eats them. Probably if he gets his wages on Friday, on Monday he is pawning his clothes. I distinguish him from the man who is genuinely poor and is trying to do work. He may be drinking and gambling to some extent, but he is genuinely poor and does not get a good wage, but leads a steady life.

5336. It is not simply a slum dweller but a loafer?—Very often; not always—he may be a hard worker.

5337. A slum dweller does not mean simply a man who is an unemployed loafer?—No.

5338. You were saying just now that you attributed the poverty amongst the working classes to alcoholic drink?—The secondary poverty.

Mr.
Rowntree.

5339. I was surprised to hear you say that only about a sixth of the earnings was spent in drink ; I thought the proportion was much more ?—6s. per week is a figure which is practically established now as the result of very exhaustive inquiries.

5340. Out of a 36s. wage ?—35s. is looked upon as the average family income, and 6s. out of that goes for drink. It is not my own figure ; I am merely quoting a fact.

5341. In what you call Class D, skilled workers at 30s. and over, and unskilled workers, they are those whose families can help them in making things better ?—It is possible that in Class D there is a greater proportion than that, but I take the working classes as a whole. Of course the working class includes a great number of people who only earn 15s., 16s., or 17s. These, no doubt, spend less than 6s., and therefore the better paid section of the working classes must spend more than that sum.

5342. We know of men in the docks earning from 30s. a week, and at the end of the week they drink pretty well half their pay ?—I think that is quite likely. The figures have never been taken out, but amongst those who receive 35s. a week, or high wages, the amount will very likely be more than 6s. Six shillings is the average figure of the working classes and includes those who have not got it to spend.

5343. Amongst those who get more you think the drinking is higher ?—Yes.

5344. Do you not think that the reason of that is that they have no other place to go to but their dirty home and therefore they go to a public house ?—Very largely so.

5345. And it is those beer-houses which you want to see abolished and to give them something better to go to, to prevent them spending their money purely on drink ?—I would make the really attractive thing the place where there is no drink at all. There we are at issue.

5346. (*Chairman.*) There is one thing I want to ask you. You were talking about the ventilation of factories, and you appeared to think that there was still a great deal of room for improvement. Are you acquainted with Section 7 (1) of the Act of 1901 : "In every room in any factory or workshop sufficient means of ventilation shall be provided and sufficient ventilation shall be maintained" ?—The word "sufficient" has not been clearly defined.

5347. It goes on : "The Secretary of State may by special order prescribe a standard of sufficient ventilation for any class of factories or workshops of that class, and an order made under this power may supersede any provision of this Act or Order of the Secretary of State with reference to ventilation in cotton cloth factories." ?—The word "sufficient" has not been defined. The Commission appointed in 1901 made a definite recommendation as to the amount of CO₂ per 10,000 parts of

air that should be allowed as a maximum. They would furnish the factory inspectors with simple instructions for testing the amount of impurity in the air, and if an inspector found more than twelve parts he could say : "Now I condemn this room and you must forthwith introduce ventilation ; I shall be here again in a month, and you must rectify it before that time."

5348. Do I understand you to say that the Secretary of State has not made a special order under that Section ?—It was our own factory that I was speaking about. I imagine it is much better than the average, because it is a modern factory, and there was some moving ventilation there.

5349. (*Mr. Struthers.*) You are aware that the returns made by the Board of Agriculture show that the wages of agricultural labourers in various parts of England range from 12s. to a maximum of 16s. and 17s. ?—Yes.

5350. Would it be your opinion that all those agricultural labourers live in a condition of primary poverty ?—It depends on the size of their family and the rents they pay. I do not wish to speak about the country because I do not know what subsidiary means of income there are. One knows they can get fuel, they can get fruit and vegetables, and they have allotments ; they can also get rabbits and milk and all that kind of thing.

5351. In brief, you think there are many circumstances which explain why an agricultural labourer on 14s. may be in a condition of greater efficiency than a town man with 21s. ?—Than a town man with considerably more than 14s., at any rate.

5352. (*Chairman.*) Would you say that a larger proportion of people are living in a condition of primary poverty now as compared with forty years ago ?—Certainly not—not so large a proportion.

5353. Should you think absolutely a greater number ?—I have no knowledge of my own, but from what one has read of those who have studied the subject the opinion appears to be that the number is very possibly as great as it has ever been, but the proportion will be considerably less.

5354. Are you aware that, so far as the general rate of real wages can be represented by figures, in the years 1860 to 1864 it was represented by the figures 70, and in the years 1901 to 1902 by the figures 136 ; that is an enormous improvement ?—Yes.

5355. Nearly double ?—Yes.

5356. It is nearly 100 per cent. in forty years ?—I am not aware of those figures.

5357. These are the figures given in the "Westminster Gazette" ?—There were figures in the Fiscal Blue-book to the effect that they rose from 1865 to 1900 by 44 per cent., general wages ; agricultural wages considerably more.

ELEVENTH DAY.

Wednesday, 17th February, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

The Hon. Mrs. ARTHUR LYTTLETON, called; and Examined.

5358. (*Chairman.*) We have before us a *précis* of the points upon which you are prepared to speak. Will you state what your experience has been upon the subject of our inquiry?—I have not had any direct experience in schools, that is to say I have never been a school manager, but I have had considerable experience amongst the poor in Cambridge, in a suburb of Manchester, where I was for three years Poor Law guardian, and in Hampshire, Herefordshire.

5359. Have you been able to form any general opinion upon the question of physical deterioration; should you say, looking back for ten or twenty years, or as many years as you are able to look back, that the conditions have become aggravated of late?—I think that they have. As far as I can tell, the girls are more weakly and less able to work, and certainly the teeth are worse; but that is a difficult question.

5360. It is not a very certain index of physical deterioration, as a rule?—I should say certainly, from what one hears of the conditions years ago, that there is less power amongst those growing up—less force, they have less strength altogether.

5361. You could not go so far as to say whether it is general or applies only to certain parts of the country where the conditions are most unfavourable? We have had a great deal of evidence from Manchester and its neighbourhood where it is stated things are very bad indeed?—I know something about Herefordshire. I should say that the girls who came for instance into my mother's service are less strong than in my girlhood thirty years ago.

5362. Has that been due to any extent to the migration of the better class in Herefordshire from the rural districts into the towns leaving the worst to remain?—I should not have said so from my own experience. They have migrated to some extent. No, I should say not—I should say that these girls thirty years ago would have been more capable and stronger than they are now.

5363. They are the pick of the rural population of Herefordshire at the present moment?—I suppose they are the pick. Herefordshire is very sparsely populated of course, as a whole.

5364. Why should Herefordshire be in this position? I suppose the cottages are better and the water supply is better than formerly?—They get no milk. I do not know whether it was so thirty years ago. Certainly before that they used to get more milk. My own impression also is that very often they are in school rather too young.

5365. The rural schools are fairly well ventilated, are they not?—Yes, but they walk great distances, and they go very young, because the mothers like to get rid of them; then they are often kept in classes sitting up and quiet, which is said to be good for discipline, and is, in a sense, but we should not like our own children to be treated in that way.

5366. They are made to sit quiet without sufficient intervals of exercise you think?—Well, as to exercise, they get a certain amount of play, but the playgrounds

are often poor, and they are kept in classes where they sit up and are kept quiet, whereas our own children would be playing about and lying down occasionally.

5367. And then you have something to say about children between three and five years of age?—Yes, They send them to school early because they like to get rid of them. If you ask them if they would not like to have them at home they would say they would not, and one of their reasons is because they wear out so many boots running about in the fields. We have all through England I think, by the School Legislation, kept the children in worse air than they would have been thirty or forty years ago, when they were not obliged to be in school and could run about.

5368. We are aware of the importance of fresh air, but I should have thought that in the rural districts the feeding was not worse than it was a few years ago—one would have thought it might be better because the wages are higher?—I think that this enormous increase of tinned meats has contributed to this deterioration. They buy so much tinned food. I cannot speak from my own experience of it, but I know from friends who have told me that they have many tinned things, and they feed the children upon these a great deal. Then as to bread. I know in Hampshire some years ago they used to have cottage baking and the flour was very much better. The bread they eat now is often poor stuff. The baker goes round and supplies them with bread, it is of course much easier to take the bread from the baker, so that they have given up the old ovens. I do not know whether it obtained in Hereford, but certainly in Hampshire it did. They used also to brew in Hampshire a rather light beer, but that is entirely gone. I think that they have got to depend upon the foods which are brought to them in tins, and they are not so nutritious as the old foods.

5369. But in the case of very young children the suitable diet is milk. Do the mothers suckle their children?—They usually do that.

5370. That solves the problem for the first year or so?—Yes.

5371. We have heard that very few of them get milk?—I think that they do not get it and they do not care to buy it. They think that it is too expensive and they cannot see that it is the proper thing. They do not get the milk at all. It pays the farmer better to send it to big centres of population or the neighbouring towns and the children do not get it at all. They would take it if they got it given to them.

5372. Do you think that the British rustic will ever acquire a taste for goat's milk?—I do not know.

5373. The goat is very hardy, and in parts of England where there are waste lands where they can feed them it would be a good thing and certainly the French peasants appreciate the advantage of goat's milk?—Yes. I was talking once to a woman in Normandy when I was waiting at a railway station and she began to speak about children. She was surprised and shocked to hear that the poor children did not get milk in this country. She

Mrs.
Lyttelton.

Mrs.
Lyttelton.

said that in France they got either goat's or cow's milk. Mostly goat's I suppose, but she evidently thought that to bring up children without milk was simply horrible.

5374. You think that there is less milk used in the rural districts than there was thirty or forty years ago?—Yes, because the transport has become much easier and more organised, and where it used to pay the farmer to sell the milk to the people in his neighbourhood he now sends it away. Unless you get some organised method of getting milk, and can induce people to believe that milk is essential, I do not see how it is to be altered.

5375. Do you think much could be done in schools in rural districts to instil sound notions of household management into girls?—Yes. It could be done in school hours—simple cookery lessons and some kind of health lessons given to the girls in school hours.

5376. But is it not within the power of the managers to do it under the Code, although it seems difficult?—It is not often done, is it?

5377. I do not know what the case is in the rural districts but it is so in the towns. The county council is the education authority now?—And in school hours?

5378. Yes. Of course the difficulty is the early age at which girls leave school—by the time that they become mother themselves do you not think they have forgotten what they have learnt in school by that time? I want to know whether by keeping the girls longer in school, and making them take those subjects compulsorily, you could do anything?—Yes, if it is compulsory. The eager girls will learn anyhow, but the girls who are not keen do not go to the continuation classes. Of course some of them go to service and there they would learn a certain amount.

5379. (*Mr. Lindsell.*) Girls' wages are useful to the family you know?—Yes, certainly.

5380. (*Chairman.*) I suppose domestic service is to a certain extent a training for household management?—Yes, I think it is.

5381. They must pick up something where there are children in the household?—But they go back to their own cottages, where everything is different. That is what made me say that I should like to see the cookery teaching done in the people's own houses, because they see excellent utensils and fine things at school, and when they go back to their own homes the whole thing is different.

5382. You want a simpler method and ruder apparatus?—A simpler method and ruder apparatus—much more like what they have in New York. They have tenement classes in New York which are very successful. First they did not take to it, but afterwards they found that they would learn something, and they could be taught to use up vegetables and cottage garden stuff.

5383. We had a lady here the other day who told us that she was staying at a small farm house where they had a cottage garden full of fruit and vegetables, but the people lived on tinned fruits and tinned vegetables?—Yes, I daresay. If they would learn anything about the making up of vegetables in the way the French people do with their stews it would be much better. If you could get tenement or cottage lectures where they could show them how to use up their things with their own home utensils it would be useful to them, for this they do not do in the elaborate classes. I do not fancy that it is done in England. I have not heard of it. In a few cases it may be done, but not at all widely. You would have to pay for it, and it would have to be done by the authority.

5384. I suppose the cottagers are better than they were; much greater attention is given to sanitation?—In many cases I think that they are better than they were, but still a great many of them are very bad and they are overcrowded.

5385. Even in the rural districts?—Some of them are very bad still. Of course, they are improving very much, but some of them are very bad.

5386. Even with the decrease of the rural population the cottagers are overcrowded do you think?—The people cannot get cottages; they leave the country because they cannot get cottages. If a young couple want

to get married they are often obliged to leave to get a house. It does not pay people to build the cottages; and then directly they get into the hands of the smaller owners, which sometimes happens, they are often very bad.

5387. Are the mothers merely ignorant or is it a reckless indifference?—I think that they are ignorant. You know what they say—that what is good for themselves must be good for the children.

5388. They think that it is a kindness to give the children what they get themselves?—Yes, I heard yesterday from a friend who was last year looking after some country holiday children, and provided them with excellent food, meat dinners, and tea and jam and cake, and when they went to bed a glass of milk and some bread: and one little thing of nine years of age said—"I do miss my tasty supper," and she was asked what the tasty supper was, and she said—"sometimes a bloater and sometimes a halfpenny saucer of pickles," and that was from a child of nine years of age.

5389. They want something with a bite in it?—Yes. My friend found that this halfpenny saucer of pickles was what was liked, and that they got all those tasty things at home, and it is bad, of course, for their physical development.

5390. In the rural districts is infant mortality greater than it was?—I do not know that: I do not think it is so in the districts with which I am acquainted. I do not know about others.

5391. You refer to health visitors in your memorandum. When you lived in Manchester was that system of lady health visitors in existence?—It was: it was not in our own suburb of Eccles—but it did a great deal of good in Manchester. They got the entrance into the houses and got to know the people, and the people began to trust them.

5392. And the assistants are paid by the municipality?—I think so.

5393. And they work under the direction of a committee?—Yes. I saw that the Battersea Borough Council proposes to have a lady health inspector. I do not know whether it has yet been sanctioned, it seemed to be a useful thing.

5394. It does not require a very large number of ladies to cover a considerable area, we understand?—I should not think it would.

5395. Mr. Rowntree, whose name is known in reference to York, I think said that one lady would deal with a population of 70,000.

5396. (*Dr. Tatham.*) He is wrong there.

5397. (*Chairman.*) He said that was with a special view of going to the houses of mothers when children were born: he said there were some forty births in York weekly, and perhaps one-fourth or one-fifth of those would be fit subjects for the advice and assistance of the lady visitors to mothers and their infant nutrition, and from that he argued that one lady could cover the whole ground, with assistants.

5398. Do you think there would be any difficulty in finding not only ladies with sympathy, but with knowledge?—It would be easier to get the knowledge than the sympathy. Of course you want a lot of tact.

5399. But a great many people have this sympathetic faculty in dealing with the poor?—You can easily get that knowledge, but you would have to be careful not to put the mothers' backs up.

5400. Many of the mothers of the upper classes have not very good ideas of the management of their children, have they?—That is true. If Health Inspectors were paid and it was a regularly understood profession, I have no doubt the people could be got who could take such a position.

5401. It is claimed that the system in Manchester has reduced the rate of infant mortality?—That may be so. I have no doubt that the results in Manchester have been wholly satisfactory.

5402. As you suggest here in your memorandum, do you think that parents might be given some notion as to what is required in the way of ventilation?—Often in

Manchester, if you found some one with a cold, they would say, "Oh, unfortunately the window was open a little, all night." It may be because they are accustomed to bad air in Manchester, and the atmosphere is often certainly very bad, but they do not mend it by shutting the window.

5403. We had a gentleman, Mr. Rees, from St. Thomas's in Pendleton, here the other day. Do you know him?—Yes, I know him a little.

5404. But he brought a very serious accusation against the local authorities in Manchester, for the way in which they winked at the pollution of the atmosphere; would you say that that is true?—It is perfectly true.

5405. And he described the Manchester atmosphere as very bad?—It is very bad, and when we lived there the one thing we were told was not to open the windows, but I do not think it is quite so bad as that. There is no reason why it should be so bad, and it might be immensely altered for the better.

5406. Mr. Rees said that there were very few prosecutions, and that, if they were prosecuted, the manufacturers paid from 5s. to £5 fine, and that it was much cheaper for the manufacturers to pay the fine once or twice a year rather than to go to any expense to remedy the evil?—They used to tell us that the remedy was to fine the stoker.

5407. But the manufacturers ought to be made responsible, ought not he?—But he does not care unless you send him to prison without a fine. If you fined the stokers they said it would be useful.

5408. Are the furnaces properly built?—They told us that if the stoker was more careful there would not be nearly the same amount of smoke. But they let the fires die down and then put a lot of coal on and black smoke issues, and the atmosphere—well London is nothing to it. The whole population must be affected by such an atmosphere. People care very little. I have sometimes talked to friends of mine who live there, and they do not seem to think that it mattered very much; they said the people were all very well, and what did it signify.

5409-10. Are they well? We have been told that the physique of the people of Manchester is extremely debilitated?—Yes, people say that they were kept going by the influx of people from the Dales to Manchester. The police are a fine lot of fellows, and they mostly come from the Dales. People say that the atmosphere is not positively deleterious to health.

5411. We have had some suggestions for dealing with very young children by having an attendant in the school; do you think that would be practicable?—I should like to see the young children in school put into a *crèche*, but that would involve more attendants to look after them.

5412. But not an attendant with a very superior training?—No. Do they teach them there? I did not know in these baby rooms that they taught them anything.

5413. (*Mr. Lindsell.*) Only to make things?—How long are they there?

5414. I should think up to about five years of age. They are inundated with these children under five years of age. The parent is not bound to send them until they are five years of age?—He can if he likes, and he constantly does.

5415. There is a feeling in some quarters that it is very much better not to send the children to school before they are five years of age?—Yes. It seems to me that it cannot be right to treat young children in that way. It must be bad for them in all ways. I should like the *crèche* system more fully developed and the children kept in it till a little later on.

5416. (*Chairman.*) There are hardly enough children in the average villages to make it pay?—I do not think it is so bad in villages.

5417. In villages they can be dealt with at home, you think?—It is more in the towns that it would be useful because it would not be so necessary in a village. I think even at five, perhaps, they might be better at home. I speak without much experience, but I think that, even if the *crèche* lasted a year or two longer than it does it would be better. In the case of our own children if they

are taught later than five it is all right—they build up their physique in the meantime.

5418. (*Mr. Struthers.*) They do not treat them in that way very long when they are young?—But only half an hour is too long at a time.

5419. But it does not come to more than that, but a great deal less.—Are not they sitting up in class?

5420. I think that the teaching of very young children consists mostly of games, and they are not more than a quarter of an hour at work, for instance?—Do they lie down at all?

5421. I understand that in these baby rooms they have cots for the very small children?—That is not after five years of age.

5422. It is what the child is fit for, and it is not a question of age. If the child were likely to be hurt by sitting up its position would be altered?—Do not you think that all young children are the better for lying down—it rests their backs.

5423. I am afraid I am not an authority upon that subject.

5424. (*Mr. Lindsell.*) They do sit at galleries and not at desks?—I think if they could be treated up to the age of seven with more room to play in and to lie down and lounge, it would be better for them.

5425. Would you abolish compulsory attendance?—No, but I should like to see them taught much more laxly up to seven, and to treat them as infants.

5426. (*Mr. Struthers.*) I think that it is the intention to treat them so?—I hope it is.

5427. Would you not be inclined to distinguish between the compulsory attendance in urban and rural districts? It might be quite reasonable at five in the towns and six in the country?—Yes, I think that is very likely to be true.

5428. As a matter of fact although nominally in Scotland there is compulsion at five years of age, in very few rural districts it is enforced. We cannot get the Board to enforce it and we do not try it?—I see.

5429. (*Dr. Tatham.*) I think I gathered from what you said this morning that you really think yourself, that there is progressive deterioration amongst the members of the poorer classes?—Yes. I should say that I do think so.

5430. Is it progressive?—Yes.

5431. And you would be of opinion that the way to counteract that would be by beginning in the school with the young children?—Yes.

5432. According to your own experience do you think that the children are sent to school frequently very imperfectly fed, and, therefore, unable to acquire such information as is offered to them?—I believe that to be so, but I do not know it from my personal experience. From what I know of very small children it is very likely to be so, because if you give them things they do not like they simply throw them away and do not eat them; and they are compelled by the present Code to go to school and often do so without sufficient food.

5433. And you would disapprove of that?—Very much so.

5434. Do you think there is anything like over pressure in the case of young children in the schools?—I do not know, but my impression is that it may be so, because every teacher is very anxious to make her own classes do well, and naturally enough therefore, there would be a tendency to press them.

5435. We have had a great deal of evidence to the effect that, in the opinion of witnesses, in the place of what is called book learning there should be given practical instruction to young children; would you concur in that?—Yes.

5436. And as they approach womanhood the girls should be taught to manage the house and to cook food and that kind of thing; is that in accordance with your views?—Quite so. I should like that teaching to be in school hours, not voluntary.

5437. And that kind of teaching should take the place of so-called book work?—Yes.

*Mrs.
Lyttelton.*

Mrs.
Lyttelton.
—

5438. I think I gather from you that you know the neighbourhood of Eccles very well?—I lived there for five years.

5439. Do you think that comparing the children in the neighbourhood of Eccles with the children of, say, those in Herefordshire and other counties that you spoke of, the children in Eccles are physically inferior to the children of the country?—No; I should not have said they were, but Eccles is not Manchester, of course.

5440. I know the place quite well?—I was thinking of what the Chairman said about Manchester. No. I think that the children of Eccles compare very favourably. I think they are better fed in the north, and, so far as I know, they do not take so much of the tinned food and the pickles I spoke of as the children of London do. I think the poorer classes there eat very well, and I was always struck with it.

5441. But near to Eccles there are a great many much poorer people?—Yes, much poorer.

5442. Do you think that the poor people there take as much care of their children as they do in the country?—I should not think that there is much difference?—Of course, in the case of a person who drinks and has a moral lowness of tone, it is different, but taking one person with another, I should say it is about the same. I believe that nothing has done so much among the superior working women as the Women's Co-operative Guild, which has had a great educational effect upon them. It does not seem to get on so well in the south of England. I had a great deal to do with the Women's Co-operative Guild in Eccles. I was one of the people who started it there, and I was struck with the educative force it had, partly because it was managed by the women themselves. Women of the artisan class often gave the lectures; this is more effective than when lectures are given by the richer classes, with some exceptions, of course. This Co-operative Guild had an excellent effect. The members would discuss questions of health and management of children also, and I think that was very useful. That was the people teaching themselves. The women's branch of the Guild is almost solely educative.

5443. Working something like the Ladies' Health Society of Manchester?—Well, the Ladies' Health Society gets visitors and sends them round to teach people. The women who belong to the Co-operative Guild will listen to a lecture from one of their number, and discuss the subject afterwards. It is a voluntary thing entirely, and it is not done *de haut en bas* and they like it very much better. They are a very fine set of working women.

5444. (Chairman.) Do you get a large proportion of them?—Yes.

5445. (Mr. Struthers.) What sort of a place is Eccles; is it a village or a manufacturing town?—It is what is called a village, but it has 20,000 people in it. It was formerly a great residential suburb of Manchester; now the rich people are going away, and the middle class and the poor are increasing.

5446. What distance is it from Manchester?—Four miles, but there are houses all the way, and you go by tram.

5447. (Colonel Onslow.) Practically it is part of Manchester?—Yes. But beyond it there is a very large district called Patricroft, which is much poorer. We were always told that the people were not typical Lancashire people, because Manchester is very cosmopolitan. But they are a splendid lot of people. An audience of Manchester working women respond to a speaker quite as much as an audience of the richer class in the South, if not more. The Co-operative Guild is a very excellent thing, for, besides other subjects, it teaches the members how to manage their homes.

5448. (Dr. Tatham.) This guild is under the aegis of the ladies in that neighbourhood?—No, it is the women's branch of the great Co-operative Society and it is presided over by Miss Llewelyn Davies. But the point of it is that it is not started by ladies for the poor, but by the artisans for themselves.

5449. Do you not think that there would be a distinct advantage in connecting the guild with some advisory agency of this kind?—Possibly so.

5450. That is the reason why the Manchester Ladies' Health Society succeeds so. We have heard a good deal

about the health visitors—they are really sanitary inspectors, but the reason why the whole thing succeeds is that operations are directed exclusively by ladies who go into the poorer districts and supervise the operation of the female health visitors from personal knowledge of them?—I fully believe that. I do not mean that is a reason against the health visitors, but simply that for women this Co-operative Guild is a great educative force.

5451. You spoke just now of the dearth of milk in the neighbourhood; is it worse in Eccles than in Herefordshire?—I do not think they have any milk anywhere.

5452. You trace the difficulty of obtaining milk to the fact that the farmers find it more profitable to send it to the big towns?—Yes, and constantly when they do make an effort the poor do not care to buy, because they are not properly aware of the advantage of milk; and this might be got over by teaching them its advantages.

5453. That seems to be the general opinion?—I think so.

5454. (Mr. Lindsell.) You would not say that the advantage of fresh air is less among the cottage population than it used to be?—I think I should, partly because the windows shut much better than they used to do and the draughts are kept out.

5455. One has known of windows that were not made to open in former times. I know one country—not England—where not a single farmer's or other person's house was constructed to open; they were hermetically sealed?—Well they do not open them much now. I am rather a fanatic on this subject and I often notice carefully as I am passing cottages and houses, and I find constantly that every window is shut except on a very fine day in summer. The houses are so much less draughty than they used to be and the people get much less fresh air; then children are kept in schools much longer and they do not run about so much out of doors. Although the schools are very well ventilated, if you go into the room you find that the air is not really fresh air.

5456. Is not it very much the fault of the teachers and not the fault of the building?—I quite believe that, but I do not think the teachers care enough about fresh air. They are often afraid of it; and the consequence is the children are brought up in a bad atmosphere.

5457. And modern improvements, both in the way of sanitary arrangements and cheap food, are not altogether an unmixed blessing if they have produced some of these evils?—I think they have.

5458. The extraordinary facility of getting all kinds of food without much trouble in cooking has produced a habit of laziness in girls you think?—Yes, but I do not think there is any reason why these household things should not be taught the children.

5459. The remedy is almost an educative one and not legislative at all?—I do not want to see a system of free food for children, and I think we ought to try everything we can before coming to that. I cannot but think that with proper education and care the thing might be done.

5460. You spoke of the tenement classes of New York. Are they classes held in people's own houses?—Yes, they are. They are classes held in the people's own homes; five or six women of the poorer class go to these lectures with their own cooking utensils and they have the advantage of seeing their own things used.

5461. There is a very large portion of the population in whose homes that could not possibly be done would you not say?—That is so.

5462. And the class one particularly wants to get at too?—Yes, you mean the people who are in London living in one room?

5463. In one room and a large family too. Could they be instructed elsewhere?—But you could have a room in a tenement house. The whole point is that it should be done with the things which they are accustomed to.

5464. The great difficulty would be, would it not, that the interference on the part of the health visitors and teachers would be resented in the homes very much at first? You would have a greater prejudice?—Well, you might, but I think that it would go after a bit. They would see the advantages of it. It would have to be very carefully organised, of course.

Mrs.
Lyttelton.

5465. With regard to very young children would you prefer that they should not go to school at all in the earlier years? Should the sending of children to school be discouraged or encouraged?—Where they have homes such as they have in the country where they can remain quiet without danger and comfortably and in fresh air I should send them later. In towns, where they have only a single room then perhaps it would be better to send them to a school and to get arrangements more on the *crèche* system up to rather a later age. It would depend rather upon the condition of the children.

5466. You think in our school system that they are over crammed?—Yes.

5467. That was much worse under the system of payment by results?—I daresay this new Education Bill in that way may possibly have a beneficial effect.

5468. The payment by results has been abandoned gradually now or rather is confined to a very few special subjects?—That I suppose is so.

5469. The advantage of the alteration would probably be that the county authorities being now large important educational bodies would take up the question in a more general spirit instead of leaving it to the haphazard decisions of school managers, and therefore wait a little time?—Yes the whole thing would be more studied; I have no doubt about that.

5470. (*Colonel Onslow.*) We have had evidence before us here by ladies who have seen a great deal of this sort of thing, that girls both in the town and country are less fitted for housewifery duties than their grandmothers were, and they attribute that mainly to the fact of their disinclination for home life. What do you say about that?—You mean where they go to factories?

5471. No; I mean more in the country. The young wife.—That the young wife is disinclined to house duties?

5472. Well, she is said to be lazy and does not get up in the mornings?—Well, some time ago, a friend told me that the woman lies in bed and the man gets up and makes her a cup of tea, but it is a thing I can hardly credit.

5473. You have not experienced that?—No; I should not have said that that was my experience, but I think that these people are very ignorant.

5474. It is not their own fault, but it is the want of the opportunity?—Well, in some cases they are delicate, and if you are not very strong, and you have to walk a quarter of a mile for water that is very tiring you know.

5475. We were told that one of the things that led to this state of things was that they were fond of amusement, or, to use a common expression, they were too fond of gadding about?—That would not occur in the country—there is often no place to go to, if you are speaking of the rural districts.

5476. I think we were told that that was the case in the country. You know Hampshire—what part of Hampshire?—Petersfield, on the borders of Sussex.

5477. You were speaking of cooking, and said that no bread is baked at home now—is not that a great deal owing to the fact that there is practically no gleaning now?—No doubt they used to glean.

5478. Before machinery was used it was very much in vogue in farming life; there was very much more corn of a kind, and the stubble was hard, and the people used to get enough corn in gleaning to last them throughout the year?—I daresay that is so; whatever may be the reason it is very lamentable that it should be so, because they could get good bread then.

5479. And if they did not get that they got the tail wheat. The less acreage of corn now would have that effect to a very considerable degree would it not?—That is very possible.

5480. Regarding the question of air, do not you think that very much in higher classes, certainly with the lower middle classes, and even in the upper classes, there is an ignorance of the necessity for air noticeable?—I do not think that one person in a thousand of any class understands the advantages of fresh air.

5481. It is not confined to the very poor?—Oh, no; not in the least.

5482. And the teachers have a well-built school, and they block up every hole, and that you would say is owing to their ignorance of the benefits of ventilation?—Yes.

5483. It emphasises the great necessity for their being instructed does it not?—I wish that some man of science would invent a paper which was sensitive to the pollution of air. I am sure that in churches and theatres and public buildings if you had a paper which began by being white, and gradually grew black as the air got polluted, people would see that and take note of it. I want an instrument to show impure air, and I wish somebody would invent one. People do not know that the air is so bad.

5484-5. (*Chairman.*) There is a very simple apparatus which shows a certain amount of carbonic acid?—Yes; but I want the man in the street, or the man in the concert hall, to know that the air is impure, and they would begin to learn something of value. Churches are often the worst offenders.

5486. (*Colonel Onslow.*) With regard to the lady health visitors, do you know that in a very large number of parishes they have parish nurses?—That is an excellent thing; that is increasing very largely.

5487. And the extension of that would be very good you think?—Yes; they are first-rate teachers.

5488. They are far better than well-meaning, but ill-advised, lady district visitors?—I think they would be. Our own village nurse, in Herefordshire, says that the difficulty with the air is tremendous. She goes into a room very often which she can hardly remain in.

5489. They generally find that they can deal with the poor people well without trouble?—Yes.

5490. And especially if they have a uniform on?—I think that the poor will receive them—they must have tact you know.

5491. (*Mr. Struthers.*) Would you have all classes of persons on your committee?—It is an excellent plan to put all classes on the committee, because then people feel that they have a voice in the management and can make any criticisms which may occur to them.

5492. Is the dislike of fresh air in this country worse than it is with our neighbours on the Continent?—I do not think we are so bad as they are.

5493. Do not you think that we are a good deal better?—Certainly. Our fires are much better than their stoves.

5494. We know in travelling on the Continent what difficulty there is in getting the railway carriage window open, and there is no corresponding difficulty in England?—That is so.

5495. So that however bad we are we are not behind the mass of humanity?—I should not wish to say that we are.

5496. But still you think there is a great deal of room for improvement?—Yes.

5497. You say, I understand, that the bad housekeeping is not due to indifference or want of interest on the part of the parents, but it is due to ignorance chiefly?—I should say so; I think that it is ignorance; many women, certainly a great number of women, have comfortable homes.

5498. Do you think those women in Herefordshire are more ignorant than their grandmothers were?—Well, I think so. I knew an excellent old woman, who lived to a great age and was the wife of a small farmer. She told me stories of the old days, and it struck me that things were better then in many ways than they are now. I do not want to go back to the time when everybody made their own medicine, their own jams and so on; but I think that many modern tendencies need counteracting.

5499. Do you wish to go back to the home baking of bread?—That would be a great advantage. I know houses where it is done.

5500. In what way would it be a great advantage?—It is better bread than you get from the baker. I do not know whether you could not get better bread from the baker, but the present bread is made of the very white flour.

5501. Was it better because it was made of better material, or was it better baked?—I thought it was made of better material.

Mrs.
Lyttelton.

5502. Of course, the corn from which the bread is made is grown in Manitoba and Hungary, which is acknowledged to be much better than the best wheat here?—I did not know that.

5503. There have been a great many investigations, which throw some doubt about this brown bread and dark bread being necessarily better than white bread?—I did not know that. I thought that the bakers' bread was inferior to the home-grown seconds. I may be wrong, of course, I know nothing technically of the matter.

5504. I have no opinion myself, and I am only putting the other possible view. You would not have them make their own jam, and so on?—I always have made my own jam, but I do not know whether they could do that sort of thing.

5505. The question is whether you could get equally good stuff by the new method, and save labour?—No doubt you could get good stuff. I do not want to add to the labour of the housewife. They have plenty to do if they would do it thoroughly, only they need good food. The jam they get very often is very bad.

5506. On this question of tinned meat, must it necessarily be worse than the meat they get from the butchers. You know very often the tinned meat is brought from a district where it is very cheap, and it does not pay them to make use of anything but the very best, and it is probably better than the inferior stuff that these people buy from the butchers?—But they might not get the best kind, and also they run to the highly-flavoured, seasoned things.

5507. My point is that because it is tinned food it is not necessarily bad, but it may be very nutritious?—Yes.

5508. And it might be better than the meat of a corresponding price which they get at the butchers?—I should have thought that it would be better to get bacon, for instance, at home. And again, they often give their children jam, which is quite good feeding, but they give it instead of butter or margarine, and I believe margarine is very wholesome. In the Patricroft Workhouse we used to get margarine, and it seemed very good and nutritious, and very wholesome. There is a certain amount of prejudice against it, but it seemed to me to be very good.

5509. The old fashion in the country districts used to be that they had a distinct rule not to give both butter and jam?—Yes. I think that the children of the poorer class often get very little fat of any sort, either butter or margarine, and they get jam instead.

5510. (*Chairman.*) They get bacon, do not they?—A certain amount of bacon, but not the other fat. The jam of course is good for them. If you take children for a school treat they do not care about jam, because they get it at home.

5511. (*Mr. Struthers.*) Now as to this very interesting question of milk. The amount of milk used in the whole country is very much greater than it used to be. There is a great deal more pasture land in cultivation, and the wheat crop has been going down?—I suppose so.

5512. The means of transport are very much greater now than formerly; is not that so?—Yes.

5513. So that thirty years ago the inhabitants of the towns, at all events, must have had far less milk per head than they have nowadays?—I suppose they must. But do you suppose the poor class gets much of that that comes into the towns?

5514. If it is not consumed in the country districts, or practically not at all, and the amount is increased in the whole country, it must be consumed to a greater extent by all classes of the population?—The population has increased so much, too.

5515. No doubt?—The question is has it increased in the same ratio as the milk?

5516. Do you not think it possible that while the country people have suffered in physique from not getting their proper supply of milk, it has to that extent redressed the balance between town and country, and that it has improved, on the whole, the amount of milk that the townspeople get?—Do the poor get much milk in the towns?

5517. More than ever?—But there were not so many big towns at the time the agricultural depression began, and the towns have increased since.

5518. But that is since 1872, and there were large towns then?—Yes, but they have increased since.

5519. You rather felt satisfied with the way women in the neighbourhood of Eccles managed their houses and domestic affairs generally, and the way in which they looked after their children?—I think that it was intelligently done, more so than in a great many places. I did not mean that there was not a great deal of room for improvement. There was; but they were intelligent, and fed them well as a rule.

5520. But the chief reason why they compare favourably with the labourers is because they are more intelligent. Is that not so?—Very possibly.

5521. And that rather points to what you advocate, that the real remedy is an increase of intelligence throughout the country?—Certainly.

5522. But, of course, that is not achieved merely by school work?—No.

5523. Take the question of cookery and taking care of their houses in school. It is, no doubt, very useful to have instruction between twelve and thirteen upon the subjects; but you can see that it must be given under somewhat artificial conditions?—Yes.

5524. It would be difficult to reproduce the cottage conditions, would it not?—You could in cookery, but not in the case of housework.

5525. And even in cookery it might be somewhat difficult. The meal must be artificially arranged?—To a certain extent.

5526. To enable them to show how to cook this thing and that thing; you could not cook a cottage dinner, for instance?—But you could teach them a good deal in that way.

5527. If those girls had instruction between twelve and thirteen, and then left school to go to shops and various occupations, and did not assist in the house for many years, until the time that they were married, the chances are that these instructions would have evaporated?—Yes.

5528. And with so much development of our parish nurses and the instruction of adults actually engaged in the management of houses, would you, on the chance of 30 per cent. eventually becoming the heads of houses teach them to take charge of houses?—That would be very desirable, and by health inspectors.

5529. Yes; who would also organise suitable instruction?—Yes, but for that reason I would not in the least diminish the teaching to the girls whilst they are at school, because if you have taught them up to fourteen or sixteen they may forget it in a way, but it comes back extremely easily later on.

5530. But these girls leave school at fourteen at the latest, and very many of them at thirteen?—But if they are taught at school they would learn it easier afterwards, and they would also know the advantage of it. They rather look down upon it in a way now, and they will not learn.

5531. (*Chairman.*) Is there a great abuse of tea-drinking? Has that had a bad effect?—I think it has.

5532. It is given to young children, we understand?—It is given to young children very largely indeed.

5533. And from your knowledge of these classes do you think that they get much cheese, which is an extremely valuable article of diet?—Yes, it is.

5534. That is a feature of the French peasantry, that the wife makes her own cheese, not from the milk of a cow, but from that of a goat, and they have plots of land on which they can feed their goats?—That is quite true; I do not know about cheese. Of course it would be a good thing if they did eat cheese.

5535. There are fatty ingredients in cheese, are there not?—Yes. I hope I made it clear that what I want is teaching and better expert management of the household. I do not in the least wish to say that the poor, or any other women, should be solely devoted to their household work. I think that there is a certain amount of gadding about; but still I think that they ought to take greater interest in outside things, and have more instruction. This is excellent for the poorer class, because it makes them

Mrs.
Lyttelton.

happier with their husbands, especially in Manchester, where you get clever artisans. It seems to me that by proper teaching, with both school and health visitors, you might teach girls to manage households, and make them better members of the community altogether. I do not want to see them confined solely to domestic work. But I have no doubt that they often use their leisure badly and they might do better.

5536. They do not seem to use it at all?—That may be so.

5537. (*Mr. Legge.*) Have you ever heard of a suggestion that girls with good homes might at the age of twelve be excused from more than half-time attendance at school, and spend the rest of the day helping their mothers?—Yes; I have heard of that suggestion.

5538. What do you think of it?—I do not think I wish it, because, in the first place, it is very difficult to say what are good homes; and, in the second place, the more you can teach the girl or boy the better it will be for them later on.

5539. And because of the difficulty of deciding what is a good home are you prepared to say that all are bad?—Not in the least.

5540. And it is well to keep them from home?—No; I should like to see the mothers realise their responsibility more than they do.

5541. Would not this be more of an incentive to the mother to have a decent home?—She would often only send her out to a place if she were sent home.

5542. But her license would be at once revoked?—You would compel her?

5543. The license would compel the child to be at school half the day and to go home for the other half, to attend in the household work?—And would you insist upon her not taking any place during the other half of the day, or helping anybody during the other half of the day?

5544. I should like the local authority to make its own bye-laws in that regard?—Because the result would very likely be that the girl would be at school in the morning, and would be sent to a place where she would be fairly hard worked in the afternoon; that would be the natural result in many cases. The mother often does not want the girl at home in the afternoon.

5545. Supposing she wants the girl in the morning and the girl went to school in the afternoon—the girl ought to be at home at the time that she is most likely to be useful, you know?—Well, I do not know that I like the idea myself, because I think that the tendency is towards making use of children amongst the poor. I think they are very bad at it.

5546. But supposing it was laid down strictly that this was not to be done?—You mean that the mother would be teaching them domestic work at home?

5547. Yes; precisely such a home where they get this cottage cookery, which you are anxious to see being taught; but that is practically impossible to reproduce in the school?—But it would be perfectly easy to teach the girls in cottages.

5548. But in an artificial cottage?—Yes.

5549. But the tendency is to provide the fittings, not as in a little family, but as you would see it in a flat?—Quite so, and it is useless. I do not believe in the letting out of girls to be half-timers more than is done now. Your proposal is that it should be done more?

5550. That it should be encouraged. At present it cannot be said to be encouraged—it is all the other way, to keep the elementary school children in full attendance up to a later age—that is the tendency at present?—Yes.

5551. And it is to provide some check to that tendency in the case of girls, where domestic employment concerns are of more moment than in the case of boys, that this has been suggested?—Of course you already get them on

Saturday very largely, the whole of Saturdays in which the mothers could teach them and get their help in cleaning the cottage. I do not know whether it is universal, but certainly in the North there is no school on Saturday.

5552. (*Mr. Struthers.*) It is practically universal?—Yes. And so you get them in that way. Any scheme of that sort would rather tend to a girl being overworked or loafing about.

5553. (*Mr. Legge.*) My suggestion is that the girls should be under licence and the terms of that licence should be observed?—That she should not have to go into any other house or to work for money in any way?

5554. If that was one of the conditions, it would be the duty of the local authority to see that condition observed?—Well, they would have their work cut out for them.

5555. Is it more alarming than the present obligations where they have to see that every child attends school?—It would add another and very difficult charge to that which they have already got. I know the way the parents do consider that their children are the means of earning wages.

5556. That is admitted. That is one of the things that is not at all admirable amongst the poor?—All the difficulty arises from their not having had a high standard on the subject and I think you would find that this might add to that evil and that these girls would be going out to help the neighbours in order to get 6d. or 1s., and that they would be wasting their time in many cases, or being overworked. I cannot say that I wish to bring back the children to help their parents.

5557. (*Chairman.*) Your idea would be to turn the children out better fitted for their domestic life?—I would rather have the younger children kept later at school so as to turn them out well fitted for domestic life.

5558. (*Mr. Lindsell.*) The clever girl gets through the standard qualification, and it is only the backward who does not?—I know.

5559. And the clever girl is not met with the difficulty, for she not only can help her mother but can go as she likes?—She can earn money as a half timer.

5560. (*Mr. Legge.*) She may be clever in a particular sense, but clever in the sense which unsuits her, or does not particularly suit her for domestic work?—According to that the girl can go and earn money at domestic work.

5561. She cannot go to learn domestic work?—She can if she likes.

5562. But there is no obligation to do so, but in the other case there would be an obligation?—That may be so.

5563. I do not want to crab my own country, but do not you think on the whole that in France and Belgium, and certainly in the north of Germany (and notably in Italy where the climatic conditions are different), and in the north of Europe where the climatic conditions are similar to our own, the poorer class have a very much greater appreciation of the value of fresh air in their homes, particularly in their bedrooms, than our own poorer class?—I have not much experience of that.

5564. In France and Belgium especially every morning their bedding and mattresses are thrown out on the bar?—Yes, they do that.

5565. The very existence of the bar is for that special purpose, and it seems to make a vast difference?—It is not perhaps so rainy there. If you could be sure of getting a fine day and sun that would be all right. There is no doubt that as far as the railway carriages are concerned we have the advantage.

5566. I think that must be conceded?—Yes, and there are the double windows and stoves. From my experience of foreign travel I should not have said that the foreigners liked fresh air as much as the English people do, but I do not know about the poor and could not say.

Mr. T. C. HORSFALL, called ; and Examined.

Mr.
Horsfall.

5567. (Chairman.) I should like to ask one preliminary question, and that is, whether your experience as a whole tends to make you think that the conditions unfavourable to the physique of the population are increasing in intensity?—I do not think that they are increasing in intensity. The area over which they apply has increased; it is a cause of great alarm to all of us who are taking any interest in the health of the people that the suburbs of the large towns receive so little attention.

5568. Are not the houses built under building regulations which were absent when the more central parts of the town were built?—Yes, but the building regulations do not provide all the conditions necessary for health. For instance, I do not know whether Dr. Tatham knows of the buildings going on in North Manchester which used to be a district of open country. There has been an enormous increase of building there and all the streets are narrow.

5569. Are the houses high?—No, but all the houses are what are called one family houses. Such houses cover a very large area, and even 100 houses cut off the inhabitants of any one of the houses to a very serious extent from open country. That great band, the newly covered land, offers an increasingly great obstacle to the very small proportion of the people in the central parts of the town who wish to get into the country. That is a drawback to small houses, each one for a family, in English towns, the importance of which has been overlooked. Because the houses are so low they necessarily cover a very large area and they cut off the inhabitants of the central districts to an increasing extent every year from the open country.

5570. They do not intercept the inrush of pure air into the central districts?—They keep it above the height of the roofs. No effort is being made in our English towns, at any rate not in Manchester and Salford, to keep wide airways towards the centre of the town. That is one of the things to which I want specially to call the attention of the Committee. In the German towns an effort is being made to keep wide channels of open building through which fresh air may pass to the rather congested parts of the towns.

5571. Converging on all those parts of the towns?—Yes, I am offering to give evidence over a most appallingly large area, partly for this reason: Three years ago a Committee, of which I am the Chairman, resolved to make an inquiry into the housing conditions existing in typical parts of Manchester and Salford. We have just finished that inquiry, and I have the information collected in proof. At the same time I myself undertook to collect German evidence as to how the authorities in the principal German towns have dealt with just the same problems that are baffling us in our large English towns. All that information I have now in proof form. I tried to indicate the connection of the different parts of the subjects as to which I want to speak in the *precis* of evidence that I sent.

5572. Will you give me a description of what you conceive to be the adverse conditions of Manchester and Salford at the present moment?—I must, first of all, refer to the invaluable life table prepared by Dr. Tatham. That is a good authority as to the results of the general conditions existing in Manchester, conditions which have not changed since Dr. Tatham left Manchester, and the equal of it does not exist in any other form. Dr. Tatham published it in 1893. Dr. Tatham's life tables give the expectation of life in different parts of England, or rather of England as a whole, and in Manchester. The expectation of life in England and Wales—according to data, collected from 1871 to 1880 and in Manchester from 1881 to 1890—was for the Manchester township including the central part of Manchester 28·78 years; for England and Wales 41·35 years; and for the outlying townships of Manchester where semi-urban conditions existed 38·11. That is for males. I have the corresponding figures for females, but I do not think I need give them.

5573. That is quite sufficient?—Now for people who had reached the age from fifteen to twenty-five the difference is much less marked in those years of greater strength.

In the Manchester township it is 5·55, for the outlying townships 6·50, and for England and Wales it was 6·79; but in the years of maturity the difference becomes much more marked. For people from twenty-five to forty-five in Manchester 8·79, in the outlying townships 11·45, and for England and Wales 11·91. For people from forty-five to sixty-five I do not think I need give the figures. Those figures show clearly that quite close to Manchester where there is space enough amongst the buildings, and where there is still some vegetation and where people are not of the poorest class, it is possible to have conditions that give an expectation of life not very much inferior to that of the whole of England and Wales. Am I right in that?

5574. (Dr. Tatham.) Yes?—Dr. Tatham showed by comparing the figures for 1881-90 of his own Manchester Life-table, and those for 1838-44 of a Manchester Life-table prepared by the late Dr. Farr, that, while in Manchester a reduction had been effected, in the time between the two sets of years, in the number of deaths of young children, a considerable increase had taken place in the number of deaths of persons of over ten years of age; and that, although the total mean lifetime had increased to the extent of about four-and-a-half years, the mean future lifetime of those who survive the dangers of early childhood had actually decreased by fully three years. Speaking of the old township of Manchester, Dr. Tatham said, and his words apply to the district to-day as fully as they did in 1893, "Here is a population of nearly 150,000 persons paying a tax which must be reckoned, not in pounds, shillings, and pence, but in years, months, and days—a tax amounting on the average to fully 30 per cent. of the lifetime of every member of the community. Here are men and women entering the period of decline at an age when they ought scarcely to have passed the prime of life. And what is particularly distressing in this regard is the thought, that although in some respects the local conditions of life have improved within the last half century, in other respects bad has become even worse."

The task which lies before us and our successors is nothing less than that of restoring to every infant in the Manchester township the twelve years of life-expectation of which it has been defrauded by the evil surroundings of its birth." The extreme seriousness of the danger caused to the Empire by the unhealthy condition of Manchester and our other large towns cannot be realised, unless we remember that the difference between their death rates and the death rates of the rural districts, by which we chiefly judge of the unhealthiness of the towns, is made much less than it would otherwise be, by the constant movement into the unwholesome towns, and from the wholesome country, of vast numbers of men and women of the ages at which deaths are least numerous, whose removal, therefore, leaves the country with a much larger proportion than towns contain, of persons, very young and old, of the ages at which deaths are most numerous, and gives the towns a much larger proportion, than the country contains, of persons of the ages at which deaths are least numerous. Moreover, each of these young vigorous immigrants into the towns for a time raises the average strength and health of the mass of the urban population, and for the moment increases its power to resist the causes of disease. Now that our urban population forms more than 77%, and our rural population less than 23%, of the whole population, the country can no longer invigorate the town so largely as it has done hitherto, and, unless towns are made much more wholesome, they must have a much more marked effect in causing physical degeneration in the near future even than they have had in the near past. In spite of the invigoration and "juvenation" of the urban population at the cost of the rural population, the death rate in 1901 for England and Wales, excluding the 76 largest towns, was only 15·03 per thousand, while that of the 76 towns, including large areas of low mortality, was 17·7, that of Manchester, in 1902, was 20, and that of Ancoats 25·28. Those are the only figures on that point. The death rate for Manchester in 1902 was twenty per thousand. That was lower than in any previous year of which we have a record except 1894. In England and Wales, excluding seventy-six great towns, it was only 15·31 in 1901. But we must remember that this twenty per thousand is most misleading; the terribly high death

rates of many small districts are swamped by the rate of the large district, which includes areas with comparatively low death rates. Whilst the death rate in Manchester was twenty per thousand, in Ancoats it was 25·26 for the central part of the town.

5575. (*Chairman.*) Is Ancoats purely an industrial district?—Yes. It is a district from which every one flies except our University settlement. From the University settlement we have got simply invaluable information as to the conditions of life. The central district had a death rate of 26·74; St. George's 24·24; in Cheetham the death rate in the northern district is 12·74 for the same year. The Jewish death rate is notable. With a population of 16,517 in Manchester the rate was only 16·99; and many of these Jews live in the very poorest houses.

5576. Are they very much overcrowded?—Some are very much overcrowded, but their houses are cleaner than English houses, and they are more particular about fresh air.

5577. And what do you say about the food?—The food is also better and they are much more attentive to their children. The difference between 16·99 and such death rates as 26·24 for the central district of Manchester is testimony to the great value of a little increase of care of children and for the general conditions of life in a house. One cannot speak very highly of the habits of the Jews. Many of them are bad, compared with our standard, but though they are dirty, they are cleaner than our English poor. Now I think that one of the things to be realised is that the conditions which I have to speak about affect such a very large proportion—such an appreciable portion of the total population of the country. We had in Salford and Manchester 764,925 people in 1900. Shall I go on seriatim through my memorandum?

5578. If you please; you can give some of the special things affecting the poor which lead to deterioration?—May I just speak of the general physical condition of the people.

5579. Perhaps this can go on the notes as it is?—I want to give a little additional matter in relation to parts of it.

5580. I think it would be the most convenient course if we put your memorandum on the notes just as it is. Then we could ask you some questions upon it.

Précis of Evidence of Mr. Horsfall, on behalf of the Manchester and Salford Sanitary Association.

When referring to evils which are producing physical deterioration in Manchester, if measures, which elsewhere have removed or diminished similar evils, have not been adopted in Manchester, for the sake of brevity I have spoken of the non-adoption of the measures as one of the "causes" of the evils.

Those parts of Manchester and Salford which half a century ago were the most unwholesome have been much improved, and there are probably to-day no parts of either town in which the death-rate is so high and disease is so common as they were in the worst districts of both towns forty or fifty years ago. But the towns are very much larger than they were then, and neither in the districts which have been recently created nor in those which are now being built are nearly all the conditions existent which are necessary for the attainment of health and physical strength.

In those districts of the towns which are chiefly inhabited by working people, the average stature of the inhabitants is very low—a man of 5 feet 10 inches in height looks over the heads of a crowd in such districts—and physique is very poor. Bad teeth are remarkably common. The children in schools are much below the English average in height and weight. The members of the University Settlement in Ancoats, who meet many of the most intelligent workmen of that part of Manchester, notice that they walk badly and that very few breathe rightly. Cripples are very common. The settlement is in touch with 180, all of whom live within a mile of the settlement.

As the stature and general physique of the well-to-do classes in Manchester are below the general average of England, it is obvious that some of the causes of poor physique are to be found in conditions affecting all classes. But the high death rates of the poorer districts show that there are some very bad conditions which influence only

or chiefly the poorer classes. There are small districts or plots which have death rates of over fifty per thousand. The results of a careful examination made during the last two years by the Manchester and Salford Association for the improvement of the dwellings and surroundings of the people, of the Committee of which I am Chairman, show that bad conditions in respect of water supply, of closets, of lack of light and air, of damp, of overcrowding, still affect a considerable proportion of the population, and make health and strength almost impossible for it. Conditions having much in common with those just mentioned are being created in many parts of the outer districts of the towns and in the suburbs. So long as dwellings may be placed so close together, a high level of health and strength must be impossible in a town. But the existence of so high a death rate as thirty-five per thousand in the Jersey Street dwellings, which are carefully superintended and are supplied with many conditions which are exceptionally favourable to health, suffices to prove that overcrowding and other defects in dwellings are not the only causes of disease. The residents in the settlement and the Clergy who live in the crowded parts of Manchester find that they need to get country air and change of scene frequently, if only for a few hours at a time, if they are to retain health and vigour. The condition of the air, by its direct effects on lungs and skin, is probably the cause of much disease and physical deterioration. By cutting off much of the scant supply of sunlight which is all that Manchester at best would be allowed by its gloomy climate to receive, it injures health. The residents in the Ancoats Settlement, who have servants to attend to their rooms and clothing, find that they have to accept a lower standard of cleanliness than they were previously accustomed to. This indicates what must be the effect of smoke and soot in producing indifference to filthiness of person, clothing and dwelling in most of those who do not keep servants. The filthiness of the air makes those inhabitants of all parts of Manchester who value cleanliness most unwilling to ventilate their dwellings as fully as they would probably otherwise do. By killing nearly all vegetation, and by its other effects, the foulness of the air contributes much to that general gloominess of the town which led Mr. Justice Day to say, in explanation of the commonness of drunkenness in the town, that to get drunk "is the shortest way out of Manchester." The foulness of the air probably does more than any other single cause to prevent well-to-do persons from living in, or quite near to, the town, and thus to maintain the separation of classes which is a most fruitful cause of the ignorance and bad habits of the poor, and of the neglect by the authorities of the districts in which they live.

Much disease is caused in Manchester by drunkenness, which seems to be much more injurious to the physical health of persons who live in foul air and do not take strong exercise, than to workers in the country. Last year 8,577 persons were arrested in the streets of Manchester for being drunk: the number of arrests for the same cause in the previous year was 7,714.

Other causes of bad health and physical weakness are: Badly chosen food, taken by many persons because their appetite is depraved by hot work-rooms, foul air, lack of exercise, drunkenness and other bad habits; taken by many others from ignorance on their own part or that of others; taken by many others owing to poverty.

Poverty, due to being out of work or to inability to earn good wages, misfortunes which are due often to bad health, often to bad habits.

The influence of unwholesome dwellings and environment, of foul air, of bad habits, insufficient wages, etc., so interact that each is in some measure cause, and in some measure effect.

Insufficient exercise is a fruitful cause of evil. Many children do not know how to play health-promoting games; many lack the moral qualities which are needed in social games; many have no place in which they can play. Town children get far too little sleep. Late hours, cigarette-smoking, the use of stewed tea, and other unwholesome kinds of food, do much harm. There is a great lack of parental control in towns.

The causes of the existence of the wrong conditions which I have mentioned are, in part, these:

Of the overcrowding of areas with dwellings, of the non-existence of wide streets, and tree-planted streets, of the insufficient supply of open spaces—the chief cause is that English Town Councils do not prepare, and have not

Mr.
Horsfall.

Mr.
Horsfall.

power to prepare, the building plans and the building regulations which are in use in almost all large German towns, and which ensure that there shall be an adequate supply of wide and of tree-planted streets and open spaces, and that all new houses shall have wholesome environment.

Of the foulness of the air—the chief cause is that the law for the prevention of smoke from factories, etc., is not fully enforced, that the penalties which can be imposed are insufficient, and that the occupants of dwellings, which, even in Manchester, produce half of the whole amount of smoke, are not compelled by law to produce the least possible quantity of smoke. In some German towns the amount of smoke has been reduced by two-thirds in the last ten years. Another cause is that we do not confine the “works” which produce noxious vapours to special districts where they can be closely supervised, and where they can do the least possible amount of harm. This is done in many German towns.

One chief cause of the existence of many conditions which lower health in a large proportion of dwellings, and in many of the places where Manchester people work, is the non-existence of the system of constant inspection of all small dwellings and of the rooms occupied by servants and apprentices in larger houses, which has been adopted in some German towns and is being adopted by most, and of a system of inspection of many kinds of work-places.

One of the causes of the poverty which, directly and indirectly, is the cause, or one of many co-operating causes, of physical deterioration, is the absence of such a system as the Elberfeld system of dealing with poverty. This system seeks to remove the conditions which are likely to cause workpeople to need relief.

One of the causes of insufficiency of exercise in fresh air is that not only are playgrounds not numerous enough, but they are not supplied with suitable apparatus, and with attendants trained to know how to make them as widely useful as possible. Nor are they open on Sunday afternoons.

Of drunkenness, some of the nearer causes are the ubiquity of drinking places and the paucity of places of wholesome recreation, and the habit of closing all places of recreation except drinking places on Sunday afternoons.

Of the ignorance, the bad habits, the vitiated tastes, the lack of good habits and wholesome tastes, which co-operate with the influence of unwholesome dwellings and unwholesome environment to lower the health and strength of a large proportion of the inhabitants of Manchester, one of the principal, if more remote, causes has been, and is, the unwholesomeness of schools, due to lack of knowledge of the conditions needed for health on the part of many teachers, managers, and inspectors, and the failure of our school system, partly due to failure to consult educational experts, partly to the employment of ignorant children (monitors and pupil-teachers) to give children the knowledge and the physical and mental habits which cause human beings to desire, and to be able to live, healthy lives, and their failure to develop the unquestionably good physical and mental powers possessed by most English children. There is a remarkable contrast between the results attained by schools in Germany, where in the large towns the school buildings are regularly examined by large staffs of medical men, who also examine the children, where the new schools are all supplied with ranges of shower-baths, where only adult well-trained teachers are employed, and those which we obtain. We are to-day compelling children to go to some schools, the foulness of the air in which, and their coldness in winter, must have very bad effects on the health and strength of the scholars. The results attained in the Practising School in Manchester, where only trained teachers are employed, and where the arrangements are supervised by the Mistress of Method of the Owen's College Day Training College and by Professor Sadler, prove that results equal to the best German results can be obtained with ordinary Manchester children.

The effect on the health of sickly Manchester children of three weeks holidays in the country shows that a great improvement in the health and strength of the population would probably follow the better ventilation of schools, dwellings, and work places.

The patriotic Association formed in Macclesfield has found that both boys and girls in elementary schools are

eager to receive physical training, and that a considerable proportion of the boys in the town are willing to serve in a cadet corps, which gives them both military drill and gymnastic exercise.

(Signed) T. C. HORSFALL.

5581. We had some evidence the other day about the pollution of the atmosphere, which I see you refer to in your memorandum. You say the condition of the air, by its direct effects on lungs and skin, is probably the cause of much disease and physical deterioration. By cutting off much of the scant supply of sunlight, which is all that Manchester at best would be allowed by its gloomy climate to receive, it injures the health and so on. We had a gentleman here two or three days ago, Mr. Rees, of Salford. Do you know him?—Yes.

5582. He brought very strong charges against the local authority of Manchester upon this particular point. I have his evidence here in which he discussed the worst causes of physical deterioration in Manchester, and in reference to this particular subject he says:—“The pollution of the air for instance is worse than ever. You have stopped, not all, but some of the most flagrant abuses, but the amount of abuse is greater than ever it was; but if I might explain a little more in detail, I may say that there are people in Manchester who systematically pollute the air, and systematically pay the fine—the ridiculous fine that is imposed; it is a mere bagatelle—it is much cheaper to pay the fine than to put up new plant, and so on”—I believe all that is true. I do not think that it is just to say that in any part of Manchester the smoke nuisance is greater than it was. The authorities in Manchester have taken more trouble than they did a few years ago to bring cases before the magistrates. Manchester and Salford have gone on extending, and in all the new parts a great deal of smoke is produced, and speaking as a magistrate I have had some experience of dealing with smoke cases myself, and I should think that the system of leaving to the manufacturer—of course we are all either manufacturers or the friends of manufacturers—leaving to the manufacturers the administration of the law against offences which are almost peculiar to manufacturers is a mistake.

5583. Have you not a stipendiary magistrate?—Yes, but the amount of work to be done in Manchester is simply enormous. We have a number of courts sitting every day, and I do not think that any of the smoke cases come before the stipendiary and the procedure in the other courts often amounts to an absolute failure of justice towards the community.

5584. Do you think that the local authorities are as careful to prosecute as they should be?—It is very discouraging to the local authority to have such inadequate fines imposed, and one of the results of inadequate penalties is that the prosecuting authority gets more or less indifferent. Our Manchester and Salford Sanitary Association has used every effort or, at least, has made many efforts to stimulate prosecutions, but there is not the least doubt that a stricter enforcement of the law, and a change in legislation giving higher penalties, would produce a great improvement.

5585. You are familiar with the law as it stands which says:—“Any fireplace or furnace which does not as far as practicable consume the smoke arising from the combustible used therein, and which is used for working engines by steam, or in any mill, factory, dyehouse, brewery, bakehouse, or gas work, or in any manufacturing or trade process whatsoever; and any chimney (not being the chimney of a private dwelling house) sending forth black smoke in such quantity as to be a nuisance shall be deemed to be nuisances liable to be dealt with summarily in manner provided by this Act”—That is the general Public Health Act.

5586. Yes, that is the Public Health Act outside London. Then a further section says: “If satisfied of the existence of a nuisance the local authority *shall* serve notice to abate.” That is peremptory; there is nothing permissive about that?—But you know how the law has to be administered by a large number of superintendents, and there is not the least doubt that a great deal of smoke continues to be made without any attack being made upon it in the courts.

Mr.
Horsfall.

5587. Do you think that any change for the better might be caused by investing the factory inspector with the duty of initiating prosecutions in matters of that sort? It seems to me to be germane to his general duties?—Yes; I think that if the number of inspectors was a good deal increased that that would be a distinct advantage.

5588. You think that there are not enough at the present moment?—There are not enough to attend to fresh work. One or two of my colleagues on the Bench have made a point of dealing with as many cases as they possibly can. What they are anxious to do is to improve the conditions in Manchester, and they complain bitterly of the indifference and of the positive opposition of many of the other magistrates.

5589. Would it involve the manufacturer in much expense if he had to comply with the requirements of the Act?—It would sometimes involve the removal of the works from a site altogether too small to one of adequate size.

5590. That would be a good thing, would it not?—It would be; but it would be enormously expensive, and you will never get the law so administered as to cause such costly removals by manufacturers themselves.

5591. Would not a readjustment of his plant in its present position answer the purpose very often?—The production of smoke is really the result of over-driven furnaces. If you have adequate boiler room, and adequate furnace room, and a well-paid fireman carefully looked after, without any special appliances you can prevent smoke. But the greater part of the smoke is produced by furnaces that are too small for their work.

5592. Do you think it is due to careless stoking?—Very often. But still there are mills and works of different kinds where the furnaces are so over-driven that they must always produce a great deal of smoke. But it has to be remembered also that it is very discouraging for manufacturers to find such a very large amount of smoke coming from the houses. Some years ago we had a careful investigation made in different parts of Manchester by the chemists connected with Owen's College—Dr. Bailey was one of the analysts—and they found that in those parts of Manchester where manufactories were most numerous quite half the smoke came from dwelling houses. So long as houses give off smoke in that way the manufacturer not unnaturally thinks that he is very unreasonably dealt with if he has to go to a very large expense to diminish his share of that half of the smoke that comes from manufactories. You divide the smoke into half and half; half comes from the manufactories and half from houses; and the manufacturer has to lessen his contribution to the half coming from the manufactories, and the householder, unless he chooses as many people do to clean their chimneys by setting fire to them, is not worried at all. No action is taken against him. I believe that unless this cloud can be made, like Wordsworth's cloud, to move all together, it will not move at all. I wish very strongly that this Committee would give attention to the possibility of lessening the amount of smoke in all houses. A few months ago a large party of Germans were sent, partly by the German Governments, to inquire into housing conditions here, and I was asked to meet them in Liverpool, and I went over to them. One of them said, "I have been in Birmingham to-day and I want to ask you how is it that you in England do not prevent the smoke as we are doing in Germany?" I said, "We do; we have a law against smoke coming from manufactories and that is more strictly enforced than it used to be." He said, "But you do not do anything about the smoke from the houses." I said, "We have no power to deal with that;" and he replied, "But we have, with the result in Hanover, where I live, that in the last ten years two-thirds of the smoke has been put an end to." That, I believe, is the case in other German towns.

5593. Do you know what the law is in Germany?—It is a general law, the *Gewerbeordnung* for the German Empire. I applied to the German Consul in Manchester for the law, and he wrote to the officials in Hanover, and they sent me an account of their procedure; but I could not get any reference to any particular Act which attacks the smoke from houses. It is the application

of the general principle, that anything that causes injury to health must be stopped. One of the Germans told me that even in Germany the procedure is rather difficult—that you require to have medical testimony to the effect that the smoke from the particular house is causing injury to health, but that testimony is given, he said. The result is that they have very considerably diminished the amount of smoke coming from the houses.

5594. (*Mr. Struthers.*) Have they any special apparatus or any contrivance in the houses?—They use a great number of apparatus. The heating of the German houses is generally by stove, and a great deal of wood is used, and coke is used also; but they do have open fire-places, and they have some kinds of apparatus which prevent smoke. I think really if the Committee is taking an interest in the subject of the prevention of smoke they are rather fortunate in getting me as a witness, because I regard myself as the one just man in respect of this. I met with the Arnott grate over thirty years ago, which was invented by Dr. Neil Arnott sixty or seventy years ago. I met with it in a house in Manchester—the house of a dentist—and he told me that he had had it more than twenty years, and that it warmed his room well and prevented smoke. I got one of those grates and tried it, and I have ever since used it. I have it in my dining-room, drawing-room, study, and a bedroom. It is an absolute success. I have had the grates in use in different houses; they are economical, and they have an open fire. You can arrange them so as to warm a room thoroughly well, you are never bothered to ring a bell for a servant, because you have a supply of coal under the fire for the whole day.

5595. (*Chairman.*) Are they unsightly?—Not very unsightly—to the eye of the social reformer they are beautiful. I had one sent up to Essex House, and I had a beautiful *repoussé* copper case made for it which cost me £65, so that it might be used in a drawing-room. Every one admires the fireplace, but that, I am afraid, is because of the *repoussé* work. But the drawback to the use of the grate is that it is rather expensive—it costs £7 10s.—and you cannot have it made into an independent stove standing in front of the closed fireplace, at a less cost than £12 10s., but still it is most economical. Half an hour after the fire is lighted it is smokeless.

5596. You say it costs £12 10s.?—Well, it is £7 10s., in an ordinary fireplace, but if you use it as an independent stove, standing independently of the ordinary fireplace, it costs £12 10s.; but it is worth the money to anyone who can afford the initial expenditure. I heard Sir William Gull say that he had used one of the Arnott grates for twenty-five years, and he regarded it as a cure to the smoke nuisance so far as houses are concerned. I will send one up to the Committee. I have one in a packing case ready to send to any society who will test it. Unquestionably, if it were possible in England to get legislation, and to have part of the poor rate remitted on all smokeless houses, it would be a good thing. They use expedients, I believe, of that kind in Germany. That would certainly lead people to introduce Arnott grates and "well" grates, which make comparatively little smoke, and there would be a distinct reduction of smoke in that way.

5597. But surely in this description you are giving here you are referring to smoke from houses rather than from factories?—I am referring to the whole mass of smoke, half from houses and half from factories.

5598. In the industrial districts you get most of the smoke there?—Yes, but there you get house smoke as well, concentrated, because you have a large proportion of small houses.

5599. But surely there are other pollutions that pass into the atmosphere besides smoke, I mean from the various factories, noxious vapours of other kinds, are there not?—Yes, in some parts of Manchester.

5600. You cannot treat the manufacturer and the householder on a parity?—Oh no, there are special evils caused only by the manufacturers.

5601. With reference to vapours of a noxious description?—There, in that part of my memorandum, I am only speaking of smoke and soot and the sulphurous acids that come from the combustion of ordinary coal.

**Mr.
Horsfall.**

5602. But you admit that there are other very unwholesome ingredients taken into the air. Is there no effort made to prevent that?—Yes. Action is taken by the Town Council every now and again when some active set of citizens bestir themselves.

5603. But there is no habitual vigilance on their part in dealing with the matter?—No. Very grave evils are detected when there has been careful inquiry. It was found that manufacturers were passing poisonous and inflammable gases into the sewers and a very serious explosion resulted from that.

5604. That would seem to show that other means should be taken to make manufacturers amenable to the law—they do not seem to have much public spirit?—Some of them have public spirit and some of them are absolutely devoid of it, but the majority have a little.

5605. And like other classes they must suffer from their worst members?—But I should be particularly pleased if the Committee would give to the lessening of smoke from houses some attention, and I think it perfectly possible that the Arnott grates could be introduced.

5606. (*Mr. Struthers.*) How do you explain the fact that this Arnott grate is not so well known in spite of its great merits?—It is partly the result of the misfortune that Dr. Arnott possessed too much public spirit when he invented his grate. He wanted the community to have advantage of it as early as possible, and he did not patent it, but it has not been worth anyone's while to spend much money in making it known. There was a firm in London who some years ago did their best to make modifications of the Arnott grate in order that they could patent it, but they more or less spoiled it and they made it in a deteriorated form, and it was so inferior that when I tried it I had to give it up. But the Arnott grate is really a most admirable piece of mechanism. If there was a larger demand for it it could be made much more cheaply.

5607. (*Chairman.*) It has been known for seventy years you say?—Yes, for sixty or seventy years.

5608. Would you advocate the treatment of all those cases before a stipendiary magistrate instead of before magistrates?—Yes. As a general rule that would be an excellent thing.

5609. So that none of the judges in those cases should be the persons who are largely instrumental in creating the nuisance?—I think that it would be a very useful change.

5610. Should you say in Manchester at large that there is no healthy sentiment on the subject of sanitation and hygiene generally?—No. There is a comparatively small set of people who care a good deal about it, but the majority of well-to-do people live out of Manchester and they care very little about it.

5611. But you have had this Manchester and Salford Sanitary Association in existence for a great many years?—Yes.

5612. And its work has not had a considerable effect upon public sentiment apparently?—It has been partly the cause of almost every improvement that has been effected. It has co-operated with the most public spirited members of the Town Council. I do not think that it would be an exaggeration to claim for it a considerable share in every improvement that has taken place with regard to the condition of Manchester and Salford since it came into existence.

5613. Has much been done in Manchester to diminish the evil of overcrowding?—Not very much. The town councils have built some houses in those districts which at one time were the worst.

5614. Are there any bad slum centres in Manchester still?—May I give you some of the facts and figures that have been collected and will be shortly published in our report. There is an atrocious state of things. In the first place the census figures of 1901 show that we had 207 one-roomed houses, which were overcrowded, containing 738 persons—overcrowded in the sense that there were more than two persons in a room. There were 886 two-roomed houses overcrowded, 355 three-roomed houses, 830 four-roomed houses. In 2,278 houses there were 16,653 persons. That is in Salford, not Manchester. In Manchester there were 34,137 persons in overcrowded houses. This is by

the census of 1901. Our examination revealed many cases like this: No. 10, B—S—Street, back-to-back house with two rooms, is occupied by two adults and four children. The bedroom, with a cubic content of 773 feet, is used for a workroom for sewing and washing. The living room, containing 1,046 cubic feet, is living room and sleeping place too for the six inmates. By the Local Government Board standard the requirements would be 1,600 cubic feet." We have many back-to-back houses.

5615. They have been removed in Liverpool?—And they have been very much reduced in number in Manchester.

5616. Have you cellar dwellings in Manchester?—We say we have not.

5617. But you have?—I only know that one case came before me as a magistrate in which a man told me that he lived in a cellar dwelling, but I have seen the official assurance that there are none.

5618. How does the local authority meet its obligations to inspect its nuisances in this particular matter?—When a case is reported to it, it is very careful. The medical officer of health discharges his duties, I think, with a great deal of zeal.

5619. You know under the Public Health Act of 1875 a nuisance is defined as "Any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates." I should suppose that every case is a nuisance within the meaning of those words?—If some qualified person were delegated to go into the houses nuisances would be discovered. But remember the state of absolute dependence of many of the people who live in those houses. They dare not call attention to the evils existing. When members of our various associations find those evils, they are sometimes begged by the tenants not to report the cases because it will mean that they will have to turn out of the house.

5620. And they have no place to go to, I suppose?—Quite so; and it is most inconvenient to go from that part of the town. The only conceivable way in which many of the causes which operate in the houses and ruin the health of the people can be got rid of is the adoption of a system which German towns are being forced into of having what is called continuous inspection of houses. Since 1901 all towns in Saxony, with over 20,000 inhabitants, must have continuous inspection of small houses, and in Wuertemberg all towns with more than 3,000 inhabitants have it. Stuttgart, with 181,000 inhabitants, introduced the system of continuous inspection of all small houses, and of servants' and apprentices' rooms in larger houses, in 1902. It has 120 unpaid visitors, who are aided by paid officials. The visitors would be fined if they did not accept the office when they are appointed. The system has been introduced into villages in Saxony. You must have every house entered and reported upon. You cannot expect very poor people to report, nor can you expect their neighbours to do so; and no voluntary organisation can be strong enough to visit all the small houses in a large town. It must be made the duty of some person to go into every house periodically to examine it and call attention to those defects in it which are interfering with health.

5621. (*Dr. Tatham.*) Is not that the duty of the sanitary authority, under the law at the present time?—Not to visit each house periodically.

5622. But to supervise the conditions of the houses generally?—Yes.

5623. (*Mr. Struthers.*) Any house where there is a suspicion?—But they ought to have a suspicion of every house. Every house that is small, and even the servants' rooms in larger houses are probably wrong, and ought to be visited. May I just read this:

"No. 7, — Street. House in very bad condition. Walls and ceilings damp and falling. This house has five rooms, and is occupied by four families—15 individuals."

"No. 1, — Street. House very old and damp. Very dirty house and tenants. House smells."

"No. 9, — Street. Walls and ceiling damp. Landlord seems unwilling to keep house in repair."

"No. 10, — Street. Back kitchen and living room very damp. Sanitary authority has requested landlord to attend to repairs and drains."

"No. 9, — Place. House terribly damp, and back bedroom walls literally wet; rain comes in and makes bed damp. Every pane broken. Tenant seems inclined to be negligent, but has no encouragement to keep house tidy owing to bad state of house."

"No. —, — Street. Two-roomed house. Invalid child in bed in bed-room, which is very damp. Water dripping from ceiling on to bed and floor. Wet patches on walls."

Respecting closets our report says: "But there are some other reasons for wishing to hasten the departure of the back-to-back house. A back-to-back house means no yard. Sanitary conveniences have, therefore, to be provided either in the court on which the houses look or in the street. Of both arrangements examples have been given in the descriptions of districts. What such arrangements entail can, however, be better gathered from our illustrations. In the first, the closets shown stand in a court. There are five closets in the block; they are usually in a filthy condition, and certainly not more than two of them are fit for use. The second illustration shows one side of a row of back-to-back houses with the closets entered from the street. These closets were found in a filthy condition, standing open to all comers. Incidentally it may be noticed that in this last illustration the closet adjoins the living room and is under the bedroom of one house. In another row of back-to-back houses examined, it was found that the smells from the closet made the room above uninhabitable, yet the house was let and occupied. It is not surprising that decent and modest people shrink from using conveniences of this kind, probably with evil results to their health."

Respecting narrow, dark streets the report says: "Incidentally we have referred to the narrow streets which are common to the districts investigated. Very wide streets are infrequent in Manchester even in the centre of the city. The difficulty of getting room for two tram lines must have made this very apparent recently. But in the poorer districts it is quite easy to find scores of streets only 24 feet wide or less. In the districts described there are streets measuring only 15 feet across, and two streets are 9 feet 2 inches and 9 feet 4 inches respectively. These very narrow streets have the prefix "Back" to their names, but, all the same, they contain the front entrances to several houses."

Incidentally the investigators mention many cases of dark rooms, though as a rule no note has been made unless the light was greatly obscured.

In — Court the houses are dark owing partly to the smallness of the windows, partly to the nearness of high buildings."

"In S — Place rooms dark owing to nearness of a wall and opposite houses. A high wall rises within three feet of back door making kitchen dark."

"In 1902 Dr. Ransome said: 'Many years ago I pointed out that there were certain districts in Ancoats where the sputum of consumptives could exist for many months and retain its virulence, while at the same time that identical sputum in a comparatively short time lost its power of reproducing the disease in my own house in Bowdon.'"

5624. (*Chairman.*) Is it not the obligation of the local authority to discover those nuisances and not to wait until they are informed before the exercise of their power of inspection?—But we know enough of the life of the poorer classes, and of the working people, to be nearly certain that in two houses out of three there is something prejudicial to health. It is no use visiting two houses, you must visit all three. We ought to have a regular organised system of examination for small houses.

5625. What would be the use of imposing fresh obligations upon the local authority if your allegation against them is that they do not utilise the powers that they have, and that they cannot utilise them?—My suggestion is to impose on local authorities duties that they can perform. At present they have duties which they cannot perform. It is simply impossible without visiting the houses to know which are the houses that are seriously wrong.

5626. Supposing that they did discover this, their power of dealing with the problem would remain in its present state of paralysis, would it not?—They use the power when their attention is called to the evil.

5627. That is my point. Do they make any appreciable effort to inform themselves of the number of cases where if

they were informed they should act?—Well, I must not be unjust to the local authorities. You are asking me, do they perform a duty which they cannot perform? The only way in which they can discover these defects would be by getting the information in the way I have indicated.

5628. Do they court information?—They certainly do not refuse to accept information that is offered them.

5629. Do they go out of their way to get it at all?—That I cannot say. I regard the system of municipal government in England as simply imbecile at present. The fact that we have a principal officer elected only for a year, and that then he must go out of office, and that he is the only man who is in a position to take part in all the work of the committees, that is simply childish. By such a system you cannot get efficiency, and all the councillors are elected for three years, and they again go out of office, and who is to give continuity.

5630. Is not there a body of permanent officials in every Town Council?—But when you speak of the permanent officials, you have, for instance, the chief medical officer of health, but he is only in a subordinate position; and his freedom of action is very much interfered with.

5631. And his tenure of office is insecure except in London?—Yes. He cannot give offence to all the members of the Town Council, and he ought to be able to do so

5632. Because he is liable to dismissal?—Yes.

5633. Would you suggest that the Local Government Board should have a veto upon his removal from office?—I would deprive the local body of the right of dismissing the medical officer of health. Then there is the Town Clerk; he is overwhelmed with work, and he has not the right of addressing the public. The men who are in the leading positions and who have responsibility are inexperienced and do not hold office long enough to familiarise themselves with their work, and the men who are continuously in office are in subordinate positions. We seem to be a set of children in England with regard to our municipal arrangements. The Germans give the Buergermeister a salary on which he can live; and in Prussia he is appointed for twelve years; and if they do not re-appoint him they have to pay him a pension, and therefore they appoint a young and capable man in the first instance, and keep him in office as long as they are able to get good work out of him. The Buergermeister is practically appointed for life, and he has lots of time for carrying out any policy for the public good that he has formed; and the Buergermeisters do form policies, and get them carried out. Municipal government in Germany is really splendid as compared with what we have here.

5634. In urban sanitary districts there is a little more continuity, because very often the chairman does hold office for some years?—I do not know about that. The Buergermeister is a salaried person, and he can give all his time to the work of the municipality.

May I just speak of some of the results of those bad conditions? I want to call your attention to this fact, that Sir Ian Hamilton, who came into very close contact with the Manchester regiment, which is, to a large extent, really raised from the Manchester district, wrote to me of it in these terms: "So you see I can claim some knowledge of your fellow-citizens. Well, you may take it from me that I never met men who showed more grit or resolution whenever they found themselves in a tight corner; but I hope I will not give you, a Manchester man, offence, if I say that their physique was hardly equal to the fine standard of their determination and courage. I have often remarked to other officers that the Manchesters would never be fully appreciated by anyone who had not seen them in difficulty or danger. From one point of view, of course, this may be taken as praise, inasmuch as what is born in us belongs to us more entirely than anything we may acquire; but I cannot but think that it is the fault of someone that these brave and stubborn lads were not at least an inch or two taller and bigger round the chest, and altogether of a more robust and powerful build."

Those are the pick of a very large number of Manchester lads.

5635. I suppose they came up to the minimum standard?—They were the survivors from the innumerable men we had rejected in the year that preceded the war; out of 11,000 men who offered themselves, only 3,000

Mr.
Horsfall.

Mr.
Horsfall.

odd were accepted. Well, then, there is another piece of evidence. Professor Meyer—who is the head of the Zoological Museum in Dresden, and who came over on a tour of inspection of museums, wrote notes, which were not intended for English consumption, but were merely to be read to his colleagues and published in the Transactions of the Museum—speaks of the miserable condition of the people of Manchester and Salford. He gives an account of the Salford Museum, and his impression was a very unfavourable one. He said that the place was dirty with soot, and as it happened to be a public holiday the Museum was full on that day of a degenerate lot of people, the like of which “we have not in our German towns.” And that is amply justified. I received the report from Dr. Meyer because he had read some pamphlets of mine and agreed with what I said. I mention this to show that this was not written as an insult to England, or with any desire to give offence to the English people.

5636. This is not due to great poverty, is it?—It is due in part to poverty and in part to drinking and to wrong conditions of life—all these things go together. You cannot say which is cause and which effect.

5637. Mr. Rowntree talks of primary poverty; that is, where the means are so small that under the most favourable conditions they could not keep a family?—It is not generally the result of primary poverty, but very often the result of secondary poverty. Dr. Meyer said that of Manchester it was “An incredibly sooty town, with over three-quarters of a million inhabitants. Dresden, which, in this respect, has an unfavourable distinction in Germany, is a real paradise compared with Manchester. We must deplore the course of a civilisation which produces such mis-growths and makes hells of places where human beings have to dwell.” If the popular notion of hell is a correct one, Manchester ought not to be described as a hell, because then the smoke presumably would be consumed.

5638. But Dresden is a much dryer place than Manchester, is it not?—Dresden is a very damp place, it has as bad a climate, I think, as damp can make it.

5639. (Mr. Struthers.) But surely it has not the rainfall of Manchester?—No, but it has a heavy rainfall.

5640. Of course it has a continental climate?—Yes, but of the worst possible kind. I knew a Scotch family who stayed there for three winters, and the father said that he would take his children next winter to Glasgow in order to have a better climate. Mr. Marr, who is the head of the Mens' House of our University settlement in Ancoats, tells me that they have a great difficulty with their dramatic performances. A stranger of 5 feet 6 inches looks a giant on the stage with Ancoats people. There are large engineering and machine building works at Ancoats. Mr. Marr says that on several occasions he has passed through a crowd of the workmen, and they have the stature of school boys; and that is the case. I stood in a great crowd on the occasion of the opening of a boys' club by the Duke of Clarence. I had to leave early with my wife who is of middle height and she looked over the heads of most of the crowd. The average stature of the people of Manchester and Salford is very low.

5641. (Chairman.) There are some racial causes to account for that. There is a large admixture of Celtic blood in Manchester?—There is, but I do not think that that is the cause. We have blood from all over Great Britain. There was a great influx into Lancashire when cotton spinning was beginning to develop. I am sure the local conditions have a great deal to do with it.

5642. The type has deteriorated in Manchester and its surroundings, do you think?—I have not the least doubt that the children of immigrants into Manchester deteriorate. There is no doubt about it at all, that the population in Manchester is inferior in physique to the inhabitants of smaller towns and of the country. I should not like to be understood to say that the people in the worst parts of Manchester are as poor as the people fifty years ago were there. I do not think that is the case. The sanitary arrangements have been improved.

5643. And your water is much better?—May I show you how the water from Thirlmere reaches some Manchester houses. In one instance we found forty-eight houses sharing one tap; once thirty houses; once twenty-six houses; once twenty-two houses; twice twenty houses; once sixteen houses; once fifteen houses; once twelve houses, and so on.

5644. Those are all matters that the local authority might deal with?—If they liked they could do so, but they have the indifference of the whole community against them.

5645. They can do so under the Health Act?—Yes.

5646. You attribute one of the causes of physical deterioration to the absence of such a system as that known as the Elberfeld for dealing with poverty. Would you kindly describe that system a little?—The possibility of it is due to the existence of the right of the German Government to claim from every citizen in civil life that he shall accept an unpaid post. Under the Elberfeld system the whole of a town is divided into very small districts and to each of those districts one of the citizens is told off. It is his duty to visit all the working class families that are likely if things go a little badly with them to need help, and to make himself familiar with the circumstances of their lives, to give them advice which in his opinion will tend to get them out of difficulties, to give them such advice as for instance how to get situations and the best work for their sons. Then if one of the families that one of the visitors is responsible for does get out of work or need help from public sources the visitor has to report the case to the organisation of the district that includes his own small one—and if they approve of what he proposes to do then an amount of money is paid through this man to the family for the time during which it is needed. The system is working so well in preventing poverty and in helping the people who have fallen into poverty that it is now being in its essential features applied by all the large towns.

5647. And it is optional in its application?—Yes, each town decides whether it will adopt it or not. In Berlin for two million people they have not found it possible to work the Elberfeld system thoroughly, but in nearly all the other large towns it is in use. It requires a very large number of people to work it. In Hamburg, in 1902, there were 1,563 visitors, each of whom, on an average, had the care of 11·8 poor persons.

5648. On what principle are they selected?—Well, the men of experience get names and get suggestions from all parts of the town.

5649. A man cannot refuse?—If he refuses he has to pay a fine.

5650. (Mr. Struthers.) There is no remuneration I suppose?—No.

5651. (Chairman.) How long is he called upon to serve?—Three years. A very large proportion of the men think the work very useful, they get a sense of usefulness to the whole community and they remain in office far longer than the law compels them. In Cologne, for instance, there are a great many men who have been in office six years and longer. The system differs from our system in preventing poverty. The visitors can give so much useful advice. After all, one of the great causes of poverty is ignorance.

5652. Have these people any executive duties?—No. In every town where the system is in use there is a considerable staff of paid officials who help these men and do all the secretarial work.

5653. (Mr. Lindsell.) They are paid by the State?—Only by the municipality. The same principle of the duty of the citizen to serve the State makes possible that other system, which I think is absolutely necessary if we are to improve the houses that are injurious to health. The Town Council can tell off any number of citizens to take the office of visitors for these dwellings.

5654. And they would collect facts as to overcrowding?—Yes.

5655. And about sanitation?—Yes. Germany has far greater difficulties on the whole than we have, because, except in Bremen, in all the towns in Germany the ordinary house inhabited by the ordinary working man is a very tall house, very often a five-storeyed house, and the

Mr.
Horsfall.

average number of people living in a German house is very great indeed. In Berlin the number is 52·6; 12·3 households. When you get bad conditions in tenements in a very large house it is very much more difficult to remedy the evil than in a one-family house. But great care is being taken by Germans to improve housing. I brought this just to show in detail some of the work done in German municipalities. In Stuttgart the office that compels the visitors to inquire into the condition of small houses also works a dwellings-bureau. They keep in a central part of the town a list of all the small houses in the town, the number of rooms in them, the dimension of the room, the way in which the house is situated, and so on; and it is the duty of every householder when he has tenants leaving to send an intimation to the Central Bureau by one of these cards (*producing the same*). Then it is known that that house is to let, and when a man wants to change his house instead of going and wasting half a day in different parts of the town he goes to the office and asks for a three-room or a two-room house, says that he is willing to pay so much rent, and they tell him at once of the houses which are likely to suit him.

5656. That is because it is a small place?—The population is 181,000.

5657. (*Mr. Struthers.*) One three-roomed house is not the same as another three-roomed house. It might have a better outlook and better air. How do you do then?—Yes, but is not it a great gain to the working man to get to know that there are certain conditions that he wants that are complied with. It saves him a lot of time, and this system is said to save the householders in Stuttgart at least £5,000 a year by doing away with the necessity of advertising.

5658. (*Mr. Lindsell.*) And agents?—Yes. Consequently it is not very popular with the newspapers.

5659. (*Chairman.*) What steps are taken to make the German householder responsible for bad arrangements in the houses that he lets? Is he made responsible much more rigorously than the householder in England is?—I cannot say more.

5660. But in effect?—In effect, certainly. The German police are much more strict than ours are.

5661. You will admit that that is one of the evils of our system, the slowness to bring responsibility to the owner of insanitary property?—Yes. May I tell the Committee about the evidence that we have got, that it is not only the bad effect of dwellings that lowers the health. Our visitors say that it is often bad habits on the part of our working people. Would you like to hear that?

5662. We will hear all that you have to say upon that point?—I have taken part in two attempts to provide better dwellings for working people in Manchester. Some years ago we built some excellent houses in Holt town—tenement houses of three storeys. The property was too small to enable us to pay for a very well-trained attendant, and we had, therefore, to leave a great deal to the tenants. Those houses which were certainly potentially perfectly wholesome, got into very bad condition because the tenants were so careless, so absolutely devoid of public spirit. The property lay on a slope and we provided a good playground within the place for the children, but the slope, of course, drained downwards, and the houses on the lower part were constantly having their walls saturated with moisture, because no tenant would take the trouble to look at the sink and take away pieces of paper and other obstructions to the drainage. Through the effect of bad conditions, the general level of intelligence and public spirit in the town has been brought very low. I mention this, because I think it is one of many proofs that we must look to education as well as improvement in the houses for any improvement of life.

5663. Education in its widest sense, not education as received in schools?—Yes, education as it might be in the schools. Well, then, the second attempt was in the Jersey Street Dwellings; there we house some 600 people. The property does not pay. Twice or thrice for a half year together we have had a dividend of 2½ per cent. The whole property is managed as a social experiment and it was started by a very intelligent and philanthropic German. A lady who has a considerable staff of voluntary assistants works in the most devoted way for

our tenants. We have boys' and men's club-rooms and a good playground. The directors spend far more on entertainments to the people than our small dividend in the exceptional years amounted to, and yet, so strong are the bad influences of the neighbourhood, and acquired habits, that the death rate in these buildings is over 35 per 1,000. The property is surrounded by other blocks where the death rate is over forty, and one block has 53 per 1,000.

5664. Is that largely due to the high rate of infant mortality?—Yes, there is a high rate of infant mortality, but the death rate from all ages is very great, and a considerable proportion of our people die in public institutions. We provide homes for the poor, and the rent in our houses is very low, so that we get the poor families. We have gradually eliminated the worst class, but we still try to get the poor. Our experience, I think, is a proof that though dwellings must be improved if our towns are to cease to be so fatal to the race, many other changes must also be made, because these rooms really, if they were occupied by healthy well conducted people, would make a perfectly good family life possible.

5665. But these changes you refer to are in the habits of the people are they not?—And also in the habits of their children.

5666. Are those cases of secondary or are they cases of primary poverty?—Some are primary and some are secondary.

5667. Have you formed any opinion as to how this section which is sunk in what is called primary poverty is to be dealt with?—I have formed a very clear opinion. If we lessen "secondary" poverty by better education and better municipal government, we shall also lessen "primary" poverty, and we shall make what remains more manageable. The material that we have in Manchester is excellent. Mr. Russell has got a lot of lads in Ancoats, and I think he is to give evidence here or has given evidence—at any rate I wish you had him here, for he knows more about our Manchester young men than anybody else. He is a splendid fellow who devotes all his leisure time—and his leisure time is in great measure taken from his sleep—to work amongst the Ancoats boys. His influence upon them is very great. He gets the boys to break off their bad habits and actually to take part in helping the people who are poorer than themselves. They are doing splendid work. Mr. Russell's and all our experience shows that our Manchester boys respond at once to good physical training. A Swiss who was living in Salford told me "Your Manchester boys seem to be born with athletics in their blood," they are so fond of exercise. Most boys have no chance of getting physical exercise in the town. We have open spaces, some of them fitted up as open air gymnasia—parallel and horizontal bars, too large for boys; the bars are too big in diameter for boys and they have flags underneath them, so that if the boys fall they hurt themselves seriously. Many do not know how to use this apparatus, and if under the influence of bigger boys they use it and they get hurt accidentally that has a deterrent effect upon the more timid boys who most need exercise. Some years ago the Open Spaces Committee, a voluntary association in Manchester, obtained permission to manage one of the large open spaces in Manchester for a couple of years. At that time it was simply an open space with no provision for gymnastic exercises. We at once fitted it up for gymnastic exercises and provided one attendant and afterwards we got a second attendant. In the course of a few weeks the number of children who used that ground I should think increased 100 fold.

5668. You do not agree with what Mr. Rees says that the Manchester children are losing the instinct of play?—Yes, so far as the majority is concerned, but with encouragement it returns. We know that a very large proportion of Manchester boys do not know any organised games. But still the instinct is there and can very easily be revived.

5669. He says that they are losing the instinct?—He means that they do not play, not that they would not play if they were encouraged. I should think that the number of children who came to this ground increased by one hundred-fold, and for the two years that we had the place

Mr.
Horsfall.

it was an unquestionable benefit. Then we handed it back with all the gymnastic apparatus to the town council, to the Parks Committee, and it continued to be more useful than it was, but it is not as useful as when we looked after it. We had two attendants. They have only one. I wish to make this recommendation: it would have the best influence upon the younger inhabitants of our towns if the open spaces in large towns were regarded seriously as a means of educating the people; if they were provided with gymnastic apparatus for people of all ages, for young boys, for older boys, and for youths; if they were placed under the care of really competent attendants, men trained to know how children ought to play, and how gymnastic apparatus ought to be used; and to keep all these men attending to their duties there should be a well-paid inspector appointed to visit all the grounds in succession.

5670. You mean an inspector of playgrounds?—Yes, a master of the revels if you like, to make the open spaces available as schools of all kinds of healthy physical exercises. I am perfectly certain that in a couple of years the usefulness of our grounds, so far as effect upon the boys is concerned, would be increased a hundred-fold, and so far as effect in bringing a large proportion of the community to the use of the grounds is concerned the increase would be still greater. That would justify the town council in providing more open spaces. The open spaces are so irregularly and so badly used at present that many people think on the whole that they are rather sources of injury than of advantage to the children.

5671. Do you not think that a great many of these boys would be incapable of making use of them from being underfed and badly nourished and so on? Some would.

5672. They are just the class that you wish to benefit most, but they are least fitted to make use of the advantages?—I doubt whether the poorest class is the class which most needs help. I believe that the class of those who suffer from secondary poverty needs just as much help; their children do not get the exercise needed for health, and do not know how to get it at present.

5673. My point is, could the children of the poorest class of all make much use of those opportunities if they were granted to them?—I think they would if they could get them. I mean those who are in a feeble and unhealthy state?—Well, the injuriousness of systematic physical training on underfed children is very much exaggerated. In my experience there are almost no children however underfed they may be who have not enough of the influence of youth about them to amuse themselves in some way. It is very much better for them and the community that those children should use their little energy in right ways than in wrong ways. There are no underfed children in schools that would not be benefited by good physical training. Then a great deal of the underfeeding and malnutrition is due to the fact that the children do not use their lungs; they do not assimilate the food that they do take. A great number of the children stoop. We all notice a large proportion who do not know how to breathe. They do not breathe through their noses; they do not hold themselves erect and do justice to what lungs they have, and that might be very greatly improved by good physical training in the schools, and the kind of physical training that I have referred to might be given in the open air of the playgrounds. I ought logically to have begun with the training in schools.

5674. There is much room for improvement there you think?—Yes. In the German schools for years they have had two hours a week given to physical training, and that is for boys who are going to serve in the army, who are sure of having a long period in which their physical development will receive a great deal of attention. Our children who are not going to receive physical training in the army after they have left school have had in the majority of schools until lately no physical training at all. Now the Code says at least one hour a week must be given to it, but as our children need it much more than the German children they ought to have at least two hours a week.

5675. (Colonel Fox.) You consider that two hours is the least that they should have?—Yes, the least they should have, and I think that part of the training given

in the two hours ought to be of a kind to prepare children for using those opportunities that they will have for getting exercise when they leave school. They ought to be trained to use in the elementary school apparatus that they will find in the open air gymnasia even if that does not reach the ideal which might be reached in the school. All children ought to be taught at school some social games that will induce them to take trouble on holidays to leave their neighbourhoods, if necessary to get more exercise. Some Manchester boys are willing to go miles. We had a control of some fields outside Manchester for several years, and we were besieged by boys' clubs who wanted the opportunity of playing cricket and football in those fields.

5676. At the present moment you are speaking of young boys in elementary schools?—Yes, of boys who had been trained in elementary schools.

5677. All boys who leave school at fourteen?—Yes.

5678. There are many elementary schools without playgrounds, and you must remember that the climate often will not admit of their being used?—It is wonderful what weather they will play in.

5679. But in addition to that, in a large proportion of schools they have no drill halls; that is a thing that is very badly wanted, is it not?—Yes.

5680. They have no covered gymnasia, and in many cases, especially in the voluntary schools, neither playgrounds nor drill halls, and absolutely no room for any form of physical training except between the desks?—Yes.

5681. Do you consider that there should be something done to supply all those schools with some kind of covered sheds or drill halls for physical training?—I do think that physical training is so very important not merely for the body, but also as part of mental and moral training, that no school ought to receive any grant at all or be allowed to be used for the education of children unless it provides the means of physical training.

5682. Would you apply the same thing to girls?—For girls also. I would not allow schools unless they had sufficient space for physical training in fine weather and in wet weather.

5683. (Chairman.) Of course the more that could be done in the open air the better?—Certainly. And in relation to open spaces for physical training I might say that I think all our teachers want a great deal more training as to the value of fresh air than they have hitherto received.

5684. (Colonel Fox.) You know that training colleges exist for teachers to be taught, but they can only accommodate one-fifth of the teacher population?—Yes.

5685. But do not you think that these teachers, both men and women, when they attend these training colleges should be trained to a knowledge of hygiene, and for their bodily welfare taught exercises, whilst at the training colleges?—I think so. All teachers ought to be trained for long periods.

5686. Do you think that the instruction both in the class-room and playground would be much better if the teachers were thoroughly trained at the training colleges?—Certainly. I do not think that any one fact does more to condemn our system of education since 1870 than the miserable physique of a very large part of the teachers themselves.

5687. I do not know whether you are aware of the fact that we have had a committee sitting—an inter-departmental committee composed of Scotch and English members, who have given us an elaborate book on physical training for the use of boys and girls in the elementary schools. Do you consider that that book alone is anything like sufficient? Is not a staff of instructors required?—I believe that if, by some miracle, we could give our teachers and managers a due sense of the value of fresh air and exercise, that the doing of that would be worth a million times all the books in the world on physical training. It is the influence of the teacher that we must rely upon. Books are invaluable only as a means to that end. May I give an illustration of the ignorance prevailing in all ranks of people connected with schools? As a manager of a school I have gone to village school before the annual

inspection. I have found the room very close and I have had the windows opened. His Majesty's Inspector has arrived and he has taken the class at one end of the room, and he has begun to feel the back of his head (some of His Majesty's Inspectors are bald you know), and he has turned round and said, "There is a very strong draught, will you kindly shut that window." and the headmaster has done so. And he has afterwards gone to another part of the school and found another draught, and he has had that window shut also, and that too when the open windows were the only means of ventilation for himself and the teachers and everyone connected with the schools.

5688. (*Dr. Tatham.*) Were you a manager of the schools?—Yes, I was one of the managers.

5689. Is there any ventilating system in the school?—We have a ventilator in the centre of the ceiling. Whether it is carried out properly or not I do not know, but I know that we rely upon the windows when fires are not used.

5690. (*Mr. Struthers.*) It would be worth while to find out whether the cord of that ventilator was broken or not?—Well, if the cord was there, I do not think that it was used.

5691. (*Dr. Tatham.*) Is that part of a manager's business?—One man is helpless. You must, in order to get a proper result, have the majority of the people in authority trained to have things of that kind thoroughly carried out.

5692. The opening of the windows might create a violent draught?—But it is better than nothing. I do not believe that any draught is so dangerous to health as foul air is. But in this case it was not a question of a violent draught, but the question of a current that could be felt on the very susceptible bald head of an elderly gentleman.

5693. (*Mr. Struthers.*) But that very susceptible gentleman might get a bad cold from it, and that owing simply to the fact that the ventilators were not in good order?—The ventilator would probably cause a draught perceptible to the susceptible gentleman also.

5694. (*Colonel Fox.*) You attach great importance to the teachers learning physical training?—Yes, I had an opportunity of speaking to a friend who had held high office in the Education Department, and I said—"After your experience, don't you agree with me that if we concentrated our attention upon the physical training of children and only gave mental and moral training to the amount necessary, to make them as healthy and strong men and women as they possibly can be made, we should get better mental and moral results than we are now doing, when we are neglecting physical health so glaringly"; and he said, "I entirely agree with you."

5695. Then you consider we are over-taxing the brains of the children with the education that we are now giving them?—In two of the schools that I visited lately, I found large classes of what are called the infants, including real infants, because their parents send us children below three to get rid of them, but including also children of five, being taught arithmetic.

5696. (*Chairman.*) You can refuse to take them under five years?—Yes, but there is so much rivalry that in some of the schools in Macclesfield, for instance, they provide mattresses for the children. Well, I have seen infants being taught arithmetic; that is to say, that the children who could be taught arithmetic were having their brains absolutely misused. They were being taught how to write sums, and to learn by words that eight tens make eighty. The younger children who could not take that in were being carefully trained at great expense to hate lessons. I do not think that children's brains are over-taxed but misused; they are asked to take in things that they cannot understand, or that cannot be made interesting to them, and that simply leads them to neglect and hate their lessons.

5697. And often sitting in a polluted atmosphere, too?—Yes; almost always, I should say, except in the large schools.

5698. (*Dr. Tatham.*) You made some remark in answer to the Chairman this morning with regard to the condition of Jewish children as you know them in Manchester, and you were saying there was a very considerable number of them?—We have over 16,000.

5699. In the neighbourhood of Cheetham Hill?—Yes.

5700. Compared with Christian children do you think that the Jewish children are healthier and better fed, and better attended to by their mothers?—I can only judge by the evidence of Jewish friends. I should say that they are certainly, that the Jewish mothers as a rule have a strong sense of duty towards their children even the poorest, and then the Jews are a much more temperate race; there is not nearly so much drinking amongst them.

5701. Do you know Dr. Eichholz?—I have never met him.

5702. Dr. Eichholz has very considerable knowledge of Manchester, and especially of educational matters in Manchester; he has examined the schools there for some years?—Yes.

5703. Dr. Eichholz confirms what you say that there is a very considerable difference between Jewish children and Christian children; that is to say the Jewish children are very much better looked after and better fed in every respect, and they are healthier children than Christian children. Would you say that that is the case?—Yes. Docs Dr. Eichholz say whether the Jewish houses are better ventilated in the east end of London? I have learnt that the Jews do pay more attention to having their windows open.

5704. (*Chairman.*) The evidence is that their houses are over-crowded?—I know that some houses occupied by Jews are.

5705. (*Colonel Fox.*) The Jewish people in the east end of London are more closely packed than the Christians, and they take in lodgers and pack their rooms full?—Do they open their windows more than the Christians?

5706. No, I do not think so. But notwithstanding that fact they derive much more benefit from proper food than the Christians do?—And they do not waste their money to the same extent.

5707. They all say they are more abstemious?—Yes.

5708. (*Dr. Tatham.*) Mr. Rees, whom you know, and who gave evidence a few days ago, said to us, "I should be inclined to doubt the results of Dr. Hall, of Leeds, and so far as they are sound there is one factor enumerated omitted, viz., that the Jews are a sub-tropical race, and they mature more quickly; at thirteen you would expect the Jewish boy to be more advanced than the English boy, just as you find the English boy more advanced than the Norwegian boy." Is that in accordance with your experience?—I have not had experience enough of young Jews to be able to say that.

5709. Amongst the various philanthropic endeavours which I know you to have made in Manchester for many years you spoke just now of the Manchester and Salford Association for the improvement of dwellings—is that the correct name?—Yes, the dwellings and surroundings of the people.

5710. Has that organisation been in operation for some time?—It is about three years since it was formed.

5711-13. Is it a success so far?—So far it has given its time and attention to making an examination of typical parts of Manchester and Salford, to the housing conditions existing there, and I have given the Committee some of the results of those investigations, those facts about the bad water supply, and we have facts also as to the altogether inadequate provision of closets and the neglected condition of the closets. We have got, I think, a great deal of most valuable information through our action.

5714. (*Dr. Tatham.*) With regard to that other association, the Manchester and Salford Sanitary Association, with which you have been associated, you have in connection with that the Ladies Public Health Society, have you not?—Yes.

5715. Is that now as it was in my time, on the lines of the Elberfeld system?—Partly. It is doing work in every way admirable. That seems to me one of the best examples of intelligence on the part of a municipal council that I know. The Ladies' Health Society started as a purely private society; ladies take districts and visit them. Then it was found that more constant work was needed than ladies could give—I do not know whether you had anything to do with the change.

Mr.
Horsfall.

Mr.
Horsfall.

5716. A great deal ?—You had to do with the initiation of the system I think.

5717. A great deal of it, but that is ten years ago ?—It was proposed that the town council should help those ladies by paying sanitary mission women for each district that had a lady visitor ; the suggestion was accepted and work on those lines has gone on ever since. The sanitary mission women give the whole of their working time to visiting the houses and making friends of the people, giving advice and reporting any defects in their houses—anything that is alterable in the habits of the family each mission woman reports to the lady who is in charge of the sanitary district ; and in time of infection when any disease is about they supply them with carbolic acid and things of that kind, and other disinfecting agents given gratuitously, and in this way the habits of a very large proportion of the families of the districts are being distinctly raised. The death rate of children has been diminished, and a considerable number of workpeople have been induced to sleep with open windows. Then the ladies—some of them—have mothers' meetings not on religious lines, but on sanitary lines. One of them meets in our settlement.

5718. (*Mr. Struthers.*) You say it does not go at all on religious lines ?—Not at all, unless you use religion in a very broad sense.

5719. (*Dr. Tatham.*) Not on sectarian lines ?—Not on sectarian lines. One mothers' meeting meets in our settlement, and there the mothers now form a most intelligent and well-informed set of citizens, taking an interest in many aspects of public life. No work could be better ; no work could more clearly prove the advantages of systematic visiting on the Elberfeld system of poor law relief.

5720. I asked you those questions because I wanted to ascertain whether the state of things which I myself knew to exist ten or twelve years ago are still in existence in Manchester. Do you know whether the number of district visitors has increased ?—It has increased but not very largely. It is very difficult to find ladies who have the necessary tact and have the control of enough time.

5721. Have the corporation taken any deeper interest in the matter now than they did ten years ago ? Do they employ and pay a larger number of district visitors ?—I think they have increased the number of mission women as the number of ladies increases. They take a most justifiable pride in the work.

5722. Do you happen to know the number ?—This last year there have been 32 ladies and 22 health visitors.

5723. You spoke just now of the almost hopelessness of there being anything better to be looked for in the future with regard to the method of laying out of streets and of buildings, in those portions, say, of Manchester outside the city boundaries : will you tell me exactly what you mean by that : is it a question of bye-laws ?—I can do that best by comparison. We all recognise, all those who take an interest in the welfare of the working classes in the large towns, that if the present deterioration is to be checked it must be partly done by the substitution of more wholesome houses and more wholesome surroundings for the worst property now in the central districts. How is that to be effected ? The town council cannot build all the houses needed : private citizens must take their part in the work, and there must be a great increase in the activity of building societies. The town councils, the central government, must be prepared to do what the authorities in Germany are doing, and advance money on very low terms to building societies who will comply with certain conditions. The Government, of course, do that to a considerable extent now. But that work must be stimulated. Now what is going to induce building societies and private citizens to take part in this work ? I should invest some money in houses—there is nothing I would make greater sacrifices for than to improve the conditions under which the Manchester work-people live. I cannot do anything, because I cannot find any place where if friends and I were able to build, say 100 dwellings with perfectly wholesome surroundings, it is not always certain that the effect of the whole would be ruined by the narrow streets, by the bad property, which under our existing arrangements the town council would allow to spring up around it.

5724. Are you speaking now of the city of Manchester ?—I am speaking of the suburbs of Manchester.

5725. I quite see now what you mean. Supposing the corporation of the city of Manchester insist upon the observance of the best possible set of bye-laws, the district outside Manchester could not be compelled to use the same ?—No ; and if I built in Manchester, the Manchester Town Council would allow the property to be ruined by narrow streets near it.

5726. Is not that at the bottom of the whole difficulty ?—Yes, it is one chief cause of the difficulty.

5727. That jerry-builders congregate on the outskirts of large towns, that they cover the ground with their wretched habitations, and that in the course of twenty or thirty years afterwards when the area comes within the control of the great corporation the whole mischief is done ; is not that the reason ?—That is the reason—a chief reason. I have consulted with men in Liverpool and other towns, and we all agree that the control of the outskirts is the all important thing. How are you to get that ?

5728. (*Chairman.*) By making them enlarge their boundaries earlier than they do ?—I think so. I think that our larger towns ought to have larger powers of incorporation of the surrounding districts than they now have, and they ought to have the right and the duty to make building plans for the incorporated districts. That is one of the points that I specially wanted to call the attention of the Committee to.

5729. (*Dr. Tatham.*) How would you deal with those areas which are outside the municipality, because you see you can extend the municipality to-morrow, but in six months' time there will be an outer zone of districts where the jerry-builder congregates and puts down wretched buildings which he calls houses—how can you control the jerry-builder ?—There ought to be no part of a densely populated country like England that is outside the domain of a competent authority.

5730. Quite so ; then you would insist upon the use of bye-laws ?—Everywhere.

5731. Of such a character that it would be impossible to build houses of an improper character ?—Certainly, and which would make it impossible to construct sets of narrow streets. Some narrow streets you must have unless houses are to be unreasonably dear ; and Germany now recognises that it has made a mistake in insisting upon all streets in the new parts of towns being too wide. But no narrow street ought to open into another narrow street. The main thoroughfare ought to be wide, and we ought to have a considerable proportion of tree-planted streets in the new parts of the town.

5732. That seems to be at the bottom of the whole thing ?—That is at the bottom of the whole thing, and if every part of a town and of the districts surrounding a town could be under the control of a competent authority a new order of things would dawn. We should no longer have the semi-slums erected on the verge of our towns which are the despair of all thoughtful citizens at the present moment. Mr. Austin Taylor quite agreed with me. He said that the control of the outskirts is what we have to fight for now.

5733. You know very well, and I know too, that the corporation of Manchester of whom we have spoken has been considerably hindered in the race for health, if I may use the term, by the fact that the districts which they have incorporated in recent years have been built under the direction of authorities which have misused their position ?—Yes.

5734. And that really the slum property which they have been obliged to take into the city is of such a character as to be almost worse than anything in the worst parts of Manchester ?—Yes.

5735. I know myself that they have suffered severely ?—That is the case. And the property built to the south and the north of Manchester at the present moment is much of it of the most miserable character, although one authority in Levenshulme acts with great intelligence. Until the powers of the councils of the large towns are increased, and until the districts just outside the towns are brought under competent authorities, these evils must go on.

I want to show the Committee this, which is a general plan of Cologne, Cologne used to be a most unwholesome town. It was the town where Coleridge counted "two

Mr.
Horsfall.

and seventy stenchcs, all well defined, and several stinks." Well, it has felt the rapid increase of urban population with the rest of Germany. It has grown immensely since 1870. Now this book here (*producing same*) gives a view of the building regulations of the town. This is the old part of the town, with Deutz on the other side of the Rhine. The streets *here* are many of them extremely narrow; great improvements have taken place, hundreds of thousands of pounds have been spent in breaking through the blocks of buildings, and letting in the air and improving the pavement. But still unless the whole of Central Cologne is to be pulled down conditions very favourable to health cannot be created there. But the central portion has become the business part of the town, and it is deserted at night just as a large part of the City is in London. Now in order to insure that the air from the country shall not be cut off from this central part of Cologne, and that the new districts shall be wholesome, these public building regulations have been made. I will give an explanation of the plan and of the building regulations, translating part of a description published by the municipal government of Cologne:—"New building regulations came into force on July 1st, 1901. They established the so-called 'Zone' or District building system, by which all the building sites in Coeln are divided into four classes, as is shown on the accompanying plan. The First Building Class includes the districts within the line of walls on both sides of the Rhine, with the exception of the sites for which 'open building,' the Fourth Class, is prescribed, and with the exception also of the main thoroughfares in the suburbs Nippes and Ehrenfeld. The parts of the town which are in this First Class are indicated on the plan by blue colouring. The Second Building Class, shown on the plan by red colouring, comprises the suburbs of more urban character, while the suburbs of more rural character belong to the Third Class. On the plan the districts included in the Third Class are left uncoloured. The parts of the plan which are coloured green indicate the districts which belong to the Fourth Class, that of the so-called 'Open' or Villa mode of building. These separate building-classes are distinguished from each other in two ways, by differences in the number of storeys and in the height of building allowed in them, and by differences in the degree to which the sites may be covered by buildings.

In the First Class buildings may have four storeys and be of a height of 66½ feet.

In the Second Class buildings may have three storeys and be of a height of 52½ feet.

In the Third Class two storeys and a height of 38 feet are allowed.

In the Fourth Class two storeys and a height of 52½ feet are allowed.

In the First Class 75 per cent. of each site, or 80 per cent. of a corner-site, may be built over.

In the Second Class, if the buildings do not exceed a height of 26 feet, 75 per cent. of a site may be built over; if the buildings exceed 26 feet in height, not more than 65 per cent. of the site may be built over.

In the Third Class, if the buildings do not exceed a height of 20 feet, 65 per cent. of the site may be built over. If the buildings are more than 20 feet high, not more than 50 per cent. may be built over.

In the Fourth Class 40 per cent. of a site, and 50 per cent. of a corner-site, may be built over.

In the Fourth Class each building must be at least 16½ feet from the boundary of the adjoining sites, and at least 33 feet from the next house.

The chief advantage of the new building regulations consists in this, that they take account of the peculiarities of all parts of the town, and that they fix the mode of building even for those plots of ground on which military rules do not at present allow any buildings to be erected, so that, when the prohibition is removed, it will be known at once what kind of building is allowed, and thus a disorderly use of the ground is made impossible. Further—and this is to be welcomed both from the hygienic and from the æsthetic point of view—a large area is reserved for 'open' or villa building, so that when, in the, it is to be hoped, not distant future, the circle of fortifications which at present checks the development of Coeln is removed, there will be round that part of the town which now lies within the Walls a broad band of villas, branches from which will extend on the south to the South Park and the Villa Colony of

Marienburg, on the West to the Town-Wood, and on the north to the Flora District."

This arrangement allows fresh air to get into the centre of these large towns. This arrangement allows fresh air to come through an openly built country to the old town in all directions, and however much Cologne increases in size there will always be this district with wide streets, many of them planted with trees where it will be always pleasant for the poorest people as well as the richest people to take exercise. Cologne can never be ruined now. It may increase tenfold in size, and the people of the poorest districts will always have a substitute for the country, if they have not the country itself. Other towns in Germany have adopted the same plan, Leipsic, Frankfort, Magdeburg have adopted, and all other towns are adopting, this system of what is called building zones or building districts.

5736. (*Mr. Lindsell.*) But those towns are not so close together as Manchester, which has towns a little way off?—The town council of Manchester should apply to the Government for the compulsory joining of Manchester and Salford, and it would seem to be so absolutely necessary for the welfare of both of the two towns that this would be granted, and then they could be treated as this densely built district of Cologne is treated, and then building regulations would be made to ensure that as far as possible this large central district should be reached by fresh air always coming from the country. But in Manchester the town council has so little provision that, when they had a splendid tract of country to the west of the town, the Trafford Park estate, from which the prevailing winds blow, offered to them, they were not prepared for it, and it was snapped up by a speculator. It is a perfect gold mine. It is on the banks of the Manchester Ship Canal, and it has now a great part of it covered by new houses and new large manufactories, and it would have been invaluable, partly for increasing the wealth of the town and partly for keeping an open space, to allow the west wind to come in to Manchester.

5737-8. Is there no part of Trafford Park available?—It is all in the possession of a building company, it depends upon their enlightenment. The corporation afterwards had to buy at a high price a large tract to the north of Manchester, a quarter from which the wind very rarely blows. That is the building plan for Cologne. Here are the building regulations for the suburbs of Berlin. All this has been planned out years beforehand. Here you have regulations as to the proportion of sites that may be covered, which affect land as far as seventeen miles from the centre of Berlin. Here too they have taken into account the quarters from which the wind habitually blows, and they have reserved more districts for open building on those sides than on others. Those are with reference to Berlin. Then we have building regulations for Magdeburg, where exactly the same system prevails. These colours indicate the districts in which different amounts of sites may be covered and different heights of buildings may be erected. The building regulations confine manufactories to specified districts. For the purpose of showing that a town, the growth of which is regulated by a carefully prepared building-plan, secures wholesome environment for workmen's dwellings which are in the town and not in the suburbs, I submit a copy of part of the official plan of Frankfurt am Main. The plan shows the position of three new blocks of workmen's dwellings in the new north-eastern portion of the town. These dwellings have not better surroundings than have most other workmen's houses in the new parts of Frankfurt and other large German towns. It will be seen that the great width of the principal streets and the proximity of the broad tree-planted Rothschild Allee and Guentherburg Allee, with the shrubbery at their intersection, make it easy for the tenants of the workmen's houses to reach in a few minutes places where they can enjoy abundant light and fresh air, and either exercise or rest. Their dwellings, therefore, are incomparably superior, in respect of pleasantness and wholesomeness of surroundings, to any new dwellings which exist in Manchester or any other large English town. The width of Burg Strasse is a little over 18 yards, and that of the Guentherburg Allee is 80 yards. Frankfurt, with 289,000 inhabitants, has 57 tree-planted streets, the length of which is 20 miles. The task of its Town Council in improving its housing system and in laying out the

Mr.
Horsfall.

new parts of the town with streets of adequate width, and with an adequate supply of open spaces, has been much facilitated by the town's possession of land. It owns 16½ square miles of land, while Manchester, with nearly twice as large a population, has only a little more than 1½ square miles, all of it in public parks.

5739. (*Colonel Onslow.*) You would have great difficulty in applying the rules to Sheffield and right across England from Sheffield to Burnley, that part seems to be one town as you pass through it in the train?—Yes, but when you look carefully at it there is a good deal of open space.

5740. Well, there is a certain amount?—It would be a great thing to preserve a proportion of that and to obtain wide tree-planted streets, and to bring into the mind of the inhabitants the fact that their districts could be kept pleasant and wholesome. They have not a notion that the central authority can possibly do things of this kind; but in a German town everybody knows that he has to submit to these restrictions and that he will get the advantage of it. I wish now to offer evidence which seems to me of some importance. I brought this book, "*Eigenes Heim*," by E. Pfeiffer, to show how the existence of those regulations as to the width of streets and the height to which buildings might be carried, and the proportion of sites that may be covered, affects the private builder or the building association. This is a very useful book, which was given to me by a member of a building society in Stuttgart. They have built a large number of houses outside Stuttgart. They bought their land, and as a building plan did not yet exist for that side of Stuttgart, they could not do anything immediately. They had to go to the special office connected with the Stuttgart Corporation and say, "Now we want to build, will you prepare a building plan for our district?" Their request was at once complied with, and streets were marked out. They rather grumbled at first, because the plan showed that they must make this very wide street with a double row of trees, and that they must have a similar street going from it at right angles, which must also be planted with trees, and they said, "It is very hard to give up so much of our land and go to all this expense." But they built all these houses and then they found it was an immense advantage to them to have these wide streets. It has made the whole of their little colony far more attractive.

5741. (*Chairman.*) You attach great importance to the trees?—I attach immense importance to the trees. I know no one fact that is having a worse influence on family life in Manchester and Salford than this fact, that for the majority there are no places where a decent working man can go with his wife and children on a summer evening to take the air, and to watch the children play. Family life is stamped out in Manchester and Salford by the impossibility of parents and children enjoying themselves together. But these street plans provide that possibility, and in Berlin and in the biggest towns in Germany I have hunted in vain for any part of the town where it is not possible by a few minutes walk for a family to all go together to some pleasant tree planted street. A tree planted street seems an emblem of civilisation and intelligence, and the absence of it an index of the contrary qualities. In this Stuttgart colony there is a very low death-rate. The people are very happy in their houses—they are not very beautiful—and a great many houses are sold to the tenants, and the whole is an excellent piece of work. I am perfectly certain that all over England there are people who would be delighted to share in similar work if they had a similar security for the environment of those houses. I do not think there is a clearer duty for people like myself than to take part in the building of wholesome houses, but I will not do it—I cannot do it—because there is no protection for the environment. May I pass on to the last subject that I need trouble the Committee about. I want English citizens to be prepared at school for co-operating with the town council. At present nothing can be done because the town council have not large enough views, but if they had large enough views they would have the dead weight of ignorance of the citizens to resist them. All that I have said so far tends to show that we are a stupid and almost effete people in Manchester and Salford, and yet no mistake could be greater. We have excellent material in Manchester, it only wants organising and preparing. I brought this formidable looking parcel just to show what good work Manchester children can do. We

have in Manchester, in connection with the University, a practising school for the students in the Day Training College, the Women's Day Training College. We manage it on utterly un-English principles. We show our belief that work can be done only by people who know how to do the work, and so we have had the curriculum of our school prepared and all our school methods devised by the mistress of method, and the school is controlled by her and a committee, which includes Professor Sadler and several other Professors of Owen's College. Our curriculum, I venture to say, is the best curriculum which is in use in any elementary school in England. It is intended for the purpose of giving the children an organic body of knowledge, a body of knowledge of which each part is closely connected with the rest. Geography and history are taught in connection with each other. The school songs have relation to the other subjects. The children receive very careful physical training.

5742. (*Colonel Fox.*) Do you give them two hours a week?—About three hours and a half; physical exercises (drill) two hours a week, and organised games about twenty minutes daily, more than twenty minutes in fine weather. The children are kept a great deal out in the open air. We have school journeys in the summer. Our school is really managed as a school of full health, of life.

5743. (*Mr. Lindsell.*) It is all under the Elementary Education Code, is it not?—No. We have kept it quite independent of the Education Authority.

5744. You get no grants?—We have no grants. The deficit is paid by private subscription.

5745. (*Mr. Struthers.*) Do you charge fees?—We charge 1s. a week, and we get children of the social standing of those families who send their children to the Board schools and Church schools.

5746. (*Mr. Lindsell.*) The parents of your children prefer to pay 1s. a week to you rather than go to the Board school?—Certainly they do.

5747. That rather does away with the ideas of its being an elementary school?—We do not wish to get grants at present at the cost of freedom of action.

5748. Your school is rather a type of what you consider ought to be?—Certainly. We have children of the Board school class and of the elementary school age. The work that is done in our school could be done in any board school or in any Church school if the managers had sufficient freedom of action and had sufficient knowledge of education and only trained teachers.

5749. (*Chairman.*) You think that yours is a type to which they ought to conform?—Yes.

5750. (*Mr. Lindsell.*) Have you got the time table?—No, but I will send the Committee the plan of studies.

5751. The shilling a week puts it above the category of elementary schools?—Certainly.

5752. That can hardly be taken as a model?—Except that we could just as well do the work without charging the shilling. We had a discussion in the Committee as to what we should charge. Most of us were in favour of the charges made by some of the Board schools in Manchester when our school was opened. But the mistress of method gave us reasons why she would rather have a shilling charged, and, on our general system of deferring to competent people, we gave way on that point. But I assure you that the character of the school is in no degree influenced by the amount of fee we charge. We do get just the children that would go to the Board school but for the existence of ours. Now one of the results of the working of the school is that the children attend in the most admirable way.

5753. (*Mr. Struthers.*) What is the percentage of attendance?—We have some delicate children who cannot go to larger schools and who keep down the average attendance. It is over 90 per cent. in fine weather. The children really dread the holidays, they are so happy in their work. One mother told us that she really thought that she would have to live in the same street because her little girl insists upon being brought to the school in all weathers. Several families have come to live here in order that their children may attend. The teachers are full of enthusiasm, and what will appear wholly incredible to the Committee, so are the managers; and many parents are

Mr.
Horsfall.

much interested. We are all proud of the place, and we all rejoice in the work. When visitors, like Archdeacon Wilson, come to visit us they do not believe the drawings have been made by the children, not from models, but out of their own heads. *These* are calendars made by some of the children, as records of nature study. These children have been taught brush work for one and a half years, having only a little time every week given to the subject. A girl made *this* drawing from what she had learnt about clover in the school. Many of our children know nothing of plants when they come to the school.

5754. (*Chairman.*) What age are the children who do these drawings?—These children were between twelve and thirteen.

5755. (*Mr. Struthers.*) Did you happen to see the drawings at the study of nature exhibition?—Yes.

5756. Did you see a set of drawings by children of twelve and thirteen which might fairly be compared with those that you are exhibiting?—I do not remember them now. *Here* are drawings done by slum children in Bermondsey, and *these* are done in a village school in Cheshire. I saw the whole of *that* done by a child in the school. *Those* are all done by children, many of them the children of costermongers in Bermondsey, attending a large Board school. All the work is admirable for children of that age. Some of them were done by children at eleven.

5757. (*Colonel Fox.*) You are developing the sense of sight in doing these things?—Yes. The child's whole nature.

5758. It is just such children as these who become drunkards in Manchester?

5759. (*Mr. Struthers.*) I do not follow you?—Children of this class and with those capacities have hitherto often become drinkers, and the difference is entirely one of training.

5760. (*Colonel Fox.*) Do you mean to say that because they have excitable brains that they become drinkers?—No. But because the healthy tasks and habits given to children in this school have not been given to the past generation, Manchester is filled to so large an extent with drunkards. What we have to explain is not that there is physical deterioration and moral deterioration, but that there is so little of it, and you can only account for that by the very good quality of the race—how it has resisted its environment.

5761. (*Chairman.*) Under the operation, I suppose, of counteracting influences?—Yes.

5762-4. (*Mr. Struthers.*) Do you mean that the spread of this kind of workers would tend to decrease the drunkards in the next generation?—Yes.

5765. What is the connection between doing this kind of school work and preventing children from becoming drunkards in their after life. What is the intermediate step?—The intermediate step is this, that these children are being prepared for using every opportunity they can get of going into the country, of going to the museums, picture galleries, and of reading wholesome books; of living on the better side of civilisation in Manchester. Most of our drunkards have been carefully prevented by the absence of all decent training from living on that better side of civilisation, having been forced into the public-houses because they had no tastes to lead them anywhere else.

5766. (*Chairman.*) It is a mere awakening of their better instincts?—Yes.

5767. When you have a high state of civilisation you must prepare people to resist the innumerable increased temptations that that increased civilisation brings with it by training them to use the better side of civilisation.

5768. (*Mr. Lindsell.*) We are doing that now, you think?—So far as schools are working on those lines; but so far as the schools are concerned where little children are forced into habits of inattention by badly trained teachers teaching them arithmetic when they ought to be taught kindergarten work, and having their senses dulled in that way, there we are only training children for the public-houses.

5769. (*Chairman.*) Are not you unduly despairing of the existing system?—If I was trying to represent the

whole system I should be misrepresenting it, but I was taking the weak parts, and that there should be so many weak parts shows how faulty the whole system is.

5770. (*Mr. Struthers.*) And the better system, how could the system be applied?—But you must remember that the excellence of this particular school that I am speaking of comes not from anything in the English system, but from Miss Dodd's having gone abroad for her ideal.

5771. Do you happen to have visited many of the other Board schools?—Yes; and some excellent work is being done.

5772. Do you think that the work done in the other schools is inferior to what is being done in this school?—Yes. Such good work can only be done in schools in which all the teachers are trained, in which the classes are small, and in which the curriculum is prepared by teachers of great experience.

5773. Do you know them so intimately as to definitely compare them?—I do know them sufficiently.

5774. Have you got here one of the better class schools who have done drawings to compare them?—I have seen them in exhibitions, and we are very closely in touch with the whole school system by this fact that our art museum lends collections of pictures to a great part of the schools in Manchester, and I come in contact with the people who know most about these things. But I must not be misunderstood. Most admirable work is being done in the Board school system—in provided schools now, and very good work is being done in some of the Denominational schools; but execrable work is being done in a great many of the Denominational schools, and a great many of the small Board schools not in Manchester.

5775. (*Mr. Lindsell.*) They have all equal chances; they are all under the same Code and the same authorities?—Yes.

5776. (*Chairman.*) It is the fault of the administration rather than the system you think?—A system which makes bad administration certain in many places is not good.

5777. (*Mr. Lindsell.*) I did not know whether you were attacking the present system of education, or whether it was the way in which the people administer that system. You admit certain results in certain schools, and if that is done in one, why not in all?—Because Manchester is a large and a wealthy town, and it has had the choice of members of the School Board from a very large number of people. The system made it, therefore, possible in large towns to have tolerably good schools; but the system has also involved the formation of Boards in very small districts where there were really not competent people.

5778. That has gone now?—Yes; but I have to report upon the results of the past order of things. The new order of things will give better results.

5779. (*Mr. Struthers.*) There are two things to be distinguished, the question of the administration of schools, and the Code which regulates, to a certain extent, the lines on which instruction is to be given in those schools. The mere fact that some schools do admirable work under the Code shows that the Code system is not in itself necessarily a bad system?—You will remember that I distinctly denied that any Board school is doing such good work as the practising school.

5780. I was not quite satisfied that you had made such an investigation into the comparative merits as to justify you in giving such an opinion?—Well, I know enough about the whole school system in Manchester to know the exceptionally good schools, and I have made inquiries from people who know the schools better than I do, and their opinion is that there is not any school in Manchester that has a curriculum in which the different subjects are so closely connected as they are in our own school.

5781. Have you ever invited the inspector of schools of the district to inspect the school, and compare it with the other schools?—Mr. Scott Coward, who is the Inspector of Training Colleges, speaks very highly of our school, and says all the work done in the training college is amongst the best in England.

Mr. Horsfall. 5782. Meaning that there are others which may stand very much on the same plane?—Well, that is the opinion of the Inspector of Training Colleges.

5783. I was thinking of the inspector for the district, has he been invited to inspect the school? Have you ever had any independent inspector?—We have had Professor Sadler.

5784. But he is personally interested in the school?—He is one of the Committee, but he does not take so absorbing an interest or so large a part in it for it to be possible to be a question of personal pride with him. He speaks of it as unique in his experience of English schools.

5785. But you have no independent inspection by any outside authority except members of the Committee?—The Inspector of Training Colleges, Mr. Scott Coward, has seen the school and notice of it appears in his report.

5786. (*Colonel Fox.*) You know I go about the country in my capacity as Inspector of Physical Training, and I take great interest in this drawing, and in nearly all the schools I have been to, I have seen scores of schools where they do things of this description, and just the same sort of thing all over the country?—But have you met with work so good?

5787. Oh, quite?—I do not at all say that work as good as the drawings is not done in scores of schools.

5788. (*Mr. Struthers.*) You are not familiar with the education that has been going on in recent years so as to be able to compare the system now with what it used to be—it is very different from what it was?—Well, I should not like to say. I have a lot of letters about the food of the people in Manchester from Miss Hobbs and from members of the Ladies' Health Society.

5789. (*Chairman.*) We shall have Dr. Niven here who will be able to give us information upon that point?—I doubt whether Dr. Niven knows as much as these ladies do.

5790. We shall also have the representatives of the Manchester Ladies' Health Society, too?—Very well. I have not spoken about one thing and that is the misuse of Sunday in our large towns. Here we have a state of things in which the great majority of people are absolutely separated from religious organisations. The Bishop of London says that in the east end of London perhaps one family in 100 is now directly connected with a religious organisation. In Manchester a large proportion has also severed itself, and yet we go on arranging the use of Sunday as if the mass of the people went to places of worship, and as if the opening of any place of recreation would take them away from religious duties. I want to urge that places where wholesome physical exercises can be got should be open on Sunday afternoon. That the play-grounds should be opened and that attendants should be there, and that boys should be encouraged to drill and go to rifle ranges on Sunday afternoon. Remember that we have for generations opened only the places where people could drink on Sunday afternoons; that we have compelled those who do not go to church to look for recreation only to places where drink is sold, and we wonder that drink is the chief amusement of the English people. Has not the time come when an effort should be made to reverse that, and to open on Sunday afternoon the places where recreation that is conducive to good physical and mental and moral health can be obtained.

5791. You have a great deal of Sunday music now, have you not?—Where can boys get physical exercise? Boys do not care for music, but they do care for exercising their arms and legs.

5792. (*Mr. Lindsell.*) You have got to reckon with the Nonconformist conscience, you know?—We have to reckon with a great deal of Conformist and Nonconformist prejudice.

5793. There is still a spirit of puritanism about?—I think that it is more inertia than anything else. They

think the system has gone on in the past, and they do not recognise that there is reason for altering it.

5794. (*Chairman.*) You think it is a subject for consideration what should be done in that direction?—Yes.

5795. (*Mr. Lindsell.*) Do you think that it would have a direct bearing on the physical condition of the race?—I am perfectly certain that you cannot divide life into compartments. You cannot divide people's lives into Sunday feelings and week-day feelings. What they learn to like to do on Sunday afternoons they would like to do other days.

5796. (*Mr. Legge.*) Do you know anything of the industrial schools?—I have been to the industrial school at Ardwick.

5797. Do you think their curriculum a good one from what you have seen of it or their general system?—I have never been so deeply impressed by any set of facts that has come to my knowledge in one day as I was by what I saw at the Ardwick School. I thought that considering what I knew of the homes that these boys came from and the conditions under which they had been sent to school, and what they had become, that we had there the solution of a great many of the questions respecting the training of all children. The change from the physical condition in which those poor boys reached the school to their robust and healthy and cheerful appearance when I saw them seemed to me to be little less than the result of a miracle. I saw the boys drilled; I saw them doing gymnastic exercises; I went through their workshops and I spent a great part of the afternoon with them, and I thought that in the management of our schools we have a great deal to learn from the industrial school.

5798. You think this curriculum would specially suit the children in slum quarters in big towns?—Certainly.

5799. And so the extension of the system in the direction of day schools of the same sort would be an advantage?—A very great advantage.

5800. (*Mr. Struthers.*) You have given us a lot of valuable information about the state of things in Germany in respect of various points. Would you mind putting in some of the documents on which you base your opinion?—Should I send you a copy of the book on the Building Society at Stuttgart?

5801. Yes, and any book describing the Eberfeld system and about the new schools in Germany where they are all provided with shower baths and so on, the *précis* of the facts on which those paragraphs are based?—I think what would be most useful to the Committee would be a copy of the volume of the Report on the housing of Manchester that I have myself prepared, in which I give an account of the best work in connection with housing, and the improvement of the environment of the people in Germany that I have heard of. In that volume I give, for instance, an account of the work in connection with the schools in Breslau, where in spite of there being 423,000 inhabitants they teach over 500 gardening in the town, where they are giving shower baths in all the new schools,

5802. (*Colonel Fox.*) You say you do not like to see those public-houses open on a Sunday and all the other places closed. Do you approve of the present beer-houses on week days?—I think we have far too many beer-houses. The number of places where drink is sold is so great that the police cannot adequately supervise them. I think that the right policy is to very greatly diminish the number of the public-houses; to insist upon things besides intoxicating things being sold there.

5803. On the same principle as Lord Grey's Public-House Trust?—Yes.

5804. Is that what you would suggest in place of the public-houses?—I should suggest Lord Grey's public-houses.

5805. (*Chairman.*) With a restaurant?—Yes.

Dr. THOMAS MORISON LEGGE, M.D., called; and Examined.

5806. (Mr. Legge.) Will you say precisely what your official position is?—I have been Medical Inspector of Factories and Workshops since June, 1898.

5807. Had you any previous official experience?—I was Secretary of the Royal Commission on Tuberculosis—the second Commission.

5808. What are your duties?—To conduct special and general inquiries into questions of health; to exercise a general supervision over the work of the Certifying Factory Surgeons, particularly in regard to those industries where they have duties under special rules or regulations for dangerous processes; and the principal work is to receive and take action on all cases of anthrax, or of poisoning by lead, phosphorous, arsenic, or mercury, received from medical practitioners under Section 73 of the Factory and Workshop Act, 1901. I have also to advise the staff of the Factory branch generally on medical questions affecting the factory administration.

5809. Which of those various medical duties takes up most of your time?—The investigation of cases of poisoning by lead principally, questions of ventilation, and the removal of dust by fans.

5810. So that the major part of your time is taken up by investigating the health conditions of certain trades scheduled as specially dangerous?—Quite so.

5811. And they really have not any great bearing upon the health conditions of the population at large?—No. All the persons who get affected in that way undergo deterioration of health.

5812. Yes; and so in that way affect the general population?—But I have not had time to conduct inquiries into the physical condition of general workers.

5813. Can you set out what statistical information your Department think has any bearing upon the health of the population?—The chief inspector issues an annual report which contains the tables supplied by the certifying surgeons, or rather, information supplied by the certifying surgeons as to the degree of injury from accident; the examination of the children and young persons, as the case may be, seen by the certifying surgeons before they are admitted into the factory, and the number that they reject.

5814. Then you issue certain tables to the *Labour Gazette*?—Yes, only of the cases of industrial poisoning.

5815. Then I suppose from time to time members of the staff of inspectors make special inquiries of a statistical kind. We had one of the inspectors lately before us from Newcastle?—He made an inquiry into dock accidents, I think.

5816. And also into children at Dundee?—That was purely on his own initiative.

5817. But some of the lady inspectors have made special inquiries, have they not?—They have made general inquiries, but no collection of physical data as to health.

5818. Then perhaps you will give a summary of what information you are aware of either in this country or abroad?—Yes, this is the memorandum:—On pages thirteen and fourteen of Parliamentary return of the Rules and Regulations made by each Factory Inspector, dated 11th May, 1836, are given the heights of 1,409 children and young persons between the ages of eleven and eighteen. In the Minutes of Evidence of the Committee on the Bill to regulate the labour of children in mills and factories of the United Kingdom, 1831 to 1832, are many references to the physical condition of the workers, but I can find no general statistics. On pages 336 and 337 of the Annual Report of the Chief Inspector of Factories for 1900, Mr. Wilson, Inspector of Factories, gives the results of heights and weights of 169 boys and girls employed in mills in Dundee. In 1902, I made observations on over 500 brass workers in Birmingham, in the hope of being able to compare their health with that of a corresponding number of iron workers and lead workers. Use was made of the accompanying form which was filled in by the workers. I subsequently made measurements of height without shoes, weight in clothes, minus coat and boots, chest measurements, strength with a dynamometer, and made examination of heart, lungs, etc. The data thus collected have been tabulated, and may be published in the Annual Report for 1903. Much

information on the health conditions of factory children in Lancashire, together with physical statistics of 10,000 children is contained in the Report to the Local Government Board on proposed changes in hours and ages of employment in textile factories by J. H. Bridges, M.D., and T. Holmes, 1873.—Detailed statistical information as to the health of linen workers in Belgium is given in *Les Filatures de Lin—Etude d'hygiène professionnelle. Rapport D'Enquête présenté à M. Le Ministre de l'Industrie et du Travail à l'Administration centrale*. An abstract (enclosed) of this report formed an appendix to my annual Report for 1902. In the International Congress on Hygiene and Demography held at Brussels in September of this year, papers were discussed on "How far can physiological methods help in elucidating the different phases and degrees of fatigue in different industries, and a resolution was passed urging that the several Governments should facilitate in every way scientific study of industrial fatigue." I think that the investigation by Dr. Glibert, of Brussels, is particularly instructive in showing how exceedingly difficult it is to get any knowledge of the health of workers in industries, where you have not a definite trade disease such as lead poisoning or mercury.

5819. With regard to the result of your study of the various returns, and so on, about lead poisoning, what general conclusion have you arrived at as to the effect of the administration of the regulations under the Factory Acts during recent years—has it decreased plumbism?—Yes, the figures bring that out distinctly. They have reduced it from 3·9 to 1·4 per cent. of those incurring risk, and that is in one trade, the china and earthenware.

5820. That is the trade which is the easiest to investigate?—Yes.

5821. What about poisoning by arsenic?—Its use is limited to very few industries, and where it does occur it does not produce anything like the same deterioration as lead does. It creates discomfort, but not so much injury to health.

5822. What about mercury?—That affects the workers very detrimentally, but it is limited in use to not more than a few hundred persons who are engaged with mercurial salts. I do not think one thousand persons in the kingdom are exposed to risk.

5823. What about phosphorous necrosis?—That has been practically stamped out.

5824. Even amongst match-makers?—There was no case reported last year, and in the previous year only one or two.

5825. Have you had no cases of phossy-jaw?—There were no cases last year. There is no other injury except phosphorus necrosis among lucifer match-workers and they do not suffer in any other way—their health is just as good as that of workers generally.

5826. Then as to anthrax, is that a serious matter at all, as affecting the general population?—It is exceedingly important to those engaged in horse-hair and the woollen and hide and skin industries.

5827. When you say that it is important in these industries it is in the localities where those industries are carried on?—Yes.

5828. What population of the workers in Bradford are exposed to danger from anthrax?—Well, probably the total number employed on wool is very large, but the total number who come in contact with the dangerous classes of wool would perhaps not be more than a few thousands. The number of cases would not be more than twenty a year.

5829. Well, now, outside these trades specially scheduled as dangerous, and which after all do not affect in the gross a large mass of the population either young or old, what do you think is generally in other industries the most deleterious condition in which people have to work?—Well exposure to injurious dust I should put first.

5830. Would you put that before work in humid atmospheres?—I should, as being more injurious.

5831. But not nearly so many people are affected?—No. But it is very difficult to find the injury to workers in humid atmospheres. One expects that it must be there, and it is brought out by Dr. Glibert in the investigations

Dr. Legge.

Dr. Legge. into the linen workers in Belgium. It is just a slow undermining of the health. It does not incapacitate them from working.

5832. Are not those the very trades in which there are most children and young persons employed?—Certainly, there are a large number.

5833. They are textile industries, are they not?—Yes, and there is female labour.

5834. It does not affect a considerable portion of the population?—But it is a serious question.

5835. It is not only working in a humid atmosphere, but in an artificially heated one also that is bad?—Yes. It has been made the subject of a special inquiry in this country, and recommendations have been made as to the ventilation which should be enforced with regard to it, but it is difficult to estimate the actual incapacity that is caused by it.

5836. As regards these matters that come in the field of factory administration we are moving ahead?—Certainly.

5837. And the right lines are being laid, you think?—Yes.

5838. Would you be prepared to go so far as one of our witnesses in saying that factory certifying surgeons should absolutely prohibit married women and mothers of families from working at all in factories?—That is absolutely impracticable.

5839. What is the law at present? They are prohibited from working for a month after confinement, are they not?—Yes.

5840. Would you be prepared to recommend an extension of that period?—No. I should not, for the reason that I do not see how they are to be supported during a longer period. I think theoretically it is most desirable, but it is not feasible. I remember receiving a letter from a medical man in Denmark asking me about our law and as to who supported the women during that period; did the State give her support, or did the employer pay her, because if neither did was not her state worse than if she was allowed to work as she pleased?

5841. (*Chairman.*) If she has a husband should he not support her?—But even then they want as much money as they can get.

5842. (*Mr. Legge.*) But still there are countries in which there is a period during which they are prohibited from working longer than in England?—It is three months in Switzerland.

5843. And before childbirth, as well as afterwards, it is compulsory?—I think in those countries there would be some insurance scheme by which support would be given during that period, and there is nothing of that sort here.

5844. But we are not looking at the matter only from the point of view of the mother, but also from that of the child, because we have had other evidence, from ladies who know a good deal about the poor, that a very large proportion of the mothers in the poor quarters of the town suckle their own children, and if the mother is in attendance at the factory she cannot be conveniently feeding her child at the same time?—No.

5845. So that if it were possible to make some provision for the time would not it be well?—Yes.

5846. (*Mr. Lindsell.*) But supposing this woman were the wife of an ordinary artisan, he has to support his wife always, but the man whose wife is in the factory has only to support her during a limited period. Should not he be made to support his wife?—I should say the expense of living in town is greater than it would be in the case of the labourer, and it would be more difficult for him to do so.

5847. (*Mr. Legge.*) It would be a very good thing if one could get the returns of the number of married women who work in that way?—Yes. I know that in the city of Huddersfield the medical officer has tabulated year by year the number of children born of married women working in the factories and women not working in factories in which he tries to show that the death-rate is not greater amongst that class working in factories.

5848. Could you send us that?—It is not sufficiently complete, in that it does not give the number of the population of the respective classes of women, so that you cannot work out a percentage. I wrote to him once and asked him, and he replied that he thought he could after the census figures were obtained.

5849. (*Chairman.*) You have not the number of married women working in factories, have you?—No.

5850. You could not get it?—No, I think not, without a very prolonged inquiry.

5851. (*Mr. Legge.*) You will agree that it would be a good thing to have a Central Bureau to collect the physical statistics of the country?—I should think it most desirable.

5852. You mean generally, and as regards the section of the population that comes within the Factory Acts?—Yes.

5853. We had Dr. Cunningham of Edinburgh before us and he was very strong from the scientific and social point of view of having a Central Bureau of Statistics. Supposing there was such a Central Bureau I suppose the certifying surgeons could be utilised for the collection of a good deal of information?—So far as the factories and workshops are concerned, I do not see what other means you could use for collecting the material.

5854. I thought the inspectors, generally, found no trouble in their duties in factories and workshops?—They would not have the time.

5855. Do you think they would resent it? Your point, I took it, was that the owners of factories would resent the intrusion of more people?—They would not resent the intrusion of certifying surgeons.

5856. Or other people?—They would most certainly.

5857. I suppose these certifying surgeons, in addition to their undertaking any special inquiries, could by grafting on the collection of physical facts in connection with their examination of children and young persons, be continually providing a body of valuable statistics which could be compared from period to period?—But it must be very clearly laid before them what they have to do. The certifying surgeons are medical practitioners; they have their own private practice in the majority of instances. It is only in a few districts—the big industrial centres—where they give up the whole of their time—in such places as Bristol, and the Potteries, and Blackburn, and Bolton, and big manufacturing districts.

5858. Have you formed any idea what would be the cost of a special inquiry by the certifying surgeons?—I believe there are just about 2,000 certifying factory surgeons, as every district must have one, in the same way that every district must have a medical officer of health or surveyor. Their main duties are: (a) To examine children and young persons under sixteen for certificates of fitness for employment in factories; and (b) to investigate and report on accidents and cases of poisoning. But of these 2,000 certifying surgeons not more than 120 of them reside in districts where they have to examine more than 1,000 children and young persons, and only fifty-seven are in really very large industrial centres, where they have to examine every year more than 2,000 children and young persons. Assuming that it was desired to have observations of 250,000 workers in each of the principal industries?

5859. You mean 25,000 workers?—Yes, 25,000 in each industry, 250,000 in the nine industries, of cotton, wool, jute, linen, iron and steel, letterpress printing, clothing, confectionery, and coal mining I should like to see the data collected in fifty selected certifying surgeons districts. The distribution of the population in these industries in each district would first have to be made so as to determine the number of observations necessary, and this being done comparison would be possible of the physical condition of the workers at the same age and employed at the same work in widely different districts in the kingdom.

5860. Or in the same districts at different times?—Yes. When I made my examination of the workers in brass, I could not examine, I found, more than forty persons a day, so that if one were to limit the number of examinations to forty a day, and these fifty certifying surgeons were to carry out the work, it could be done in less than six months.

5861. What fee do you think should be paid?—I do not think that they could be asked to accept less than 1s. 6d. for a complete examination.

5862. What do you mean by a complete examination?—I would provide them with forms on which they could take the height and weight and chest measurements. I would ask them to obtain a statement as to nationality, also as to whether the workers were born of parents living in the country or in town, and to note whether they had any physical defects or deformities. I think it would also be most desirable to have an accurate statement of the condition of the teeth, because, so far as my own observation goes, it is there I have noticed the most marked deterioration.

5863. Have you got anything about flat-footedness?—I do not notice that, one notices it infinitely more in waiters and waitresses than in factory workers. That is owing, I think, to the former having to go round sharp corners of tables, and they spread their feet out to get round.

5864. (*Mr. Struthers.*) Forty examinations in the day?—Yes.

5865. And it would cost about £2 10s.?—Yes; I work it out that if the payment were made at the rate of 1s. 6d. for each person, the total sum required would be £18,750, or £375 for each certifying surgeon.

5866. (*Mr. Legge.*) How long would it take?—Less than six months. I do not think that it would be necessary to repeat it again for ten years. I do not think I would ask the certifying surgeons in those big industrial districts always to be carrying on these investigations.

5867. That is all very well from the factory point of view, and comparing the health of one occupation with that of another, but supposing the information collected by these people could be co-ordinated by the Central Bureau, with similar information that would be asked for by medical officers inspecting schools and so on?—Yes, I should have them working in harmony with, and indeed instructed by, the Central Bureau as to how to make their measurements so as to make them comparable. The only difficulty that I see is in the carrying of the weighing machine. Although I have one specially made and conveniently packed up to take it in a hansom, I found it a very troublesome thing to carry about and get upstairs with.

5868. (*Chairman.*) You could not dispense with weight. There is a normal relation between height and weight?—No. It is a definite figure. I believe it is quite right to dispense with it so far as recruits are concerned, because their weight increases so quickly owing to the better food that they get. Of course, the factory people do not get the better food.

5869. (*Mr. Struthers.*) It does not vary with the height?—No. It quite reversed one of the tables of the British Association Statistics; so far as the height of Scotchmen were concerned they were the tallest, but when it came to weight it was the Welsh, I think, who had the advantage.

5870. (*Colonel Onslow.*) A tall man is very often a thick set man?—Yes.

5871. (*Mr. Legge.*) That is so with regard to adults, but is it not the case with regard to growing children, the relation between height and weight is almost exact and constant?—There is a relation. I would not say that it is constant or exact.

5872. (*Mr. Struthers.*) But it might be that it would be well to have the weight taken for some time, to see whether it corresponds with the height?—It is quite possible that some simpler form of weighing machine than that I have could be utilised.

5873. (*Colonel Onslow.*) The form used in nursing homes generally is a very useful form. It is a box with an arm to it?—That is the one that I carried about, but it weighs so much.

5874. We use them in the Admiralty recruiting station?—But in taking these observations they would have to carry it about from one factory to another.

5875. (*Chairman.*) Could you not insist upon their all having one?—No. You mean in the factories?

5876. Yes?—No, I do not think so.

5877. (*Mr. Legge.*) You have special means of testing the atmosphere have you not?—Yes.

5878. We had a lady this morning who wanted a sort of thermometer to hang up in any room, and by simply looking at it you could detect the degree of foulness or thickness of the air?—You cannot have that. There is no such instrument, I mean. This apparatus which enables you to tell the vitiation of the air in five minutes accurately is not the easiest thing to work. It requires some slight knowledge of chemical apparatus.

5879. A man who can use the blow-pipe and that sort of thing, I suppose?—Yes. I mean the apparatus devised by Dr. Haldane.

5880. (*Mr. Struthers.*) Have you no test to show the amount of carbonic acid by the discolouration of the paper?—No. Many attempts have been made to devise one, and it is only by this apparatus of Dr. Haldane that we have been able to do it accurately within five minutes. It has always hitherto required a chemical calculation.

5881. (*Chairman.*) Do you think that the recent Factory Act has done all that can be done to secure proper ventilation of factories?—I think Section 7 can do all that is required—at least it is as much as we can work.

5882. Mr. Rowntree, who was here a day or two ago, appeared to think not?—Unfortunately no standard has been fixed.

5883. The Acts permit the Home Secretary to prescribe one for any class of factory—has he done that?—No. The recommendation of the Committee does not meet with the approval of the society of medical officers of health and other bodies.

5884. (*Mr. Legge.*) It is too low?—They think that it is too generous.

5885. (*Mr. Struthers.*) It is too low?—Yes.

5886. (*Chairman.*) So far as this clause is concerned it is not brought into operation?—It is certainly brought into operation in the hands of the inspectors.

5887. How can it be brought into operation?—I take this apparatus into a factory, and if I find that the air has a high percentage of carbonic acid gas I should certainly try to put that section into force.

5888. Do you think sufficient is being done?—It would be better if a standard could be fixed.

5889. Because of the variety of views of different inspectors, one being more tolerant than another?—Yes.

5890. (*Mr. Struthers.*) Could you prosecute the factory owner if you found too high a percentage of carbonic acid gas in the air?—I should be quite prepared to do so.

5891. Do you think that you would succeed?—I should say one would.

5892. Of course it would be open to them to bring a contrary expert who would be instructed to say that this amount of carbonic acid gas was not deleterious?—Yes. It would be contested.

5893. It would be simpler to have a definite standard set out do you think?—Certainly. And I think to start with it would be better to make that standard a low one than to have too severe a one, which is unfortunately what the medical officers of health wish.

5894. You mean the medical officers of health in the Local Government Board?—No, throughout the country through their society. They are an incorporated society, and they have passed a resolution condemning this suggested standard.

5895. (*Mr. Legge.*) They thought it too low?—Yes.

5896. Do you remember what it was?—The standard in the Ventilation Committee's Report was twelve parts of carbonic acid per 10,000 during daylight and twenty parts per 10,000 during gaslight; and the Society of Medical Officers of Health would not go beyond nine parts both day and night, because they said to allow a higher standard during gaslight might be interpreted as encouraging the use of gas. It would be quite impracticable to work a standard like nine parts both day and night. Fifty per cent. of the factories and workshops throughout the

Dr. Legge. Kingdom might be at times beyond that standard and therefore they would disobey the order.

5897. (*Chairman.*) With regard to this question of the factory inspectors. We have taken a good deal of evidence about the pollution of the atmosphere in Manchester and so on, and the reluctance of the local authority to prosecute manufacturers for the breach of the law, in allowing noxious vapours to come into the atmosphere. Do you think that the duty of prosecuting might preferably be placed in the hands of the factory inspectors instead of the local authority in matters of that sort?—At present the factory inspector is concerned only with the conditions inside the factory.

5898. I am quite aware of that; but in the interest of the public health, with which he is supposed to be charged, is there anything inconsistent with his existing sphere of duties if he was employed in matters of that sort to put the law in motion?—Except that it would mean such an enormous increase in the staff. For instance, there are only two factory inspectors for the whole of Kent including a large part of London.

5899. (*Mr. Legge.*) How many have you in Manchester and Salford, for instance, with assistants?—There might be perhaps fifteen to twenty for the district all round Manchester.

5900. (*Chairman.*) In a district like that, could they undertake those additional duties?—I think that the local authority is the right party.

5901. Except that the local authority does not act, as we understand?—Our experience is that, so far as the getting work done by the local authorities is concerned, we have no difficulty in the big towns. In Manchester, for instance, sanitary matters are attended to at once.

5902. That is not the opinion of Mr. Horsfall?—That is our experience.

5903. (*Mr. Legge.*) You mean as regards any plaint?—So far as the duties under the Factory and Workshops Act is concerned, the local authorities in big towns do it very efficiently. Very often they wait until attention is called to defects by the Inspector.

5904. (*Chairman.*) That is where they are between the hammer and the anvil; but where it is left to their own initiative, that is the point?—Quite so.

5905. (*Mr. Struthers.*) Would not it do to have a central officer to have the power to call attention to the neglect of smoke nuisance—we are told that they do not do their duty?—That would be a matter for the Local Government Board, which is in direct relation with Medical Officers of Health. It seems to me more a matter for the Public Health Department than for the Factory Department, which is concerned with the work actually going on inside.

5906. (*Mr. Legge.*) But then the Local Government Board have no control of local Medical Officers of Health?—They have. Every Medical Officer of Health must send his Annual Report to the Local Government Board, and in a great many cases the Local Government Board pay half the salary of the Medical Officer of Health.

5907. (*Mr. Struthers.*) When they pay half the salary the Local Government Board would have the power of preventing dismissal without their consent?—The authority must have the consent of the Local Government Board before dismissing a man.

5908. (*Mr. Legge.*) But then the Local Government Board could call upon the Medical Officers of Health, part of whose salary is paid by the Board, to devote particular attention to any particular matter within their sphere of operations?—Yes. Then, such action would be of immense value in the rural districts, because it is there that the local authorities are inert, and it is in those cases that the Medical Officer of Health does not devote the whole of his time, and he is liable to dismissal at a very

short notice. If you had combined sanitary districts, and had one Medical Officer of Health to a large number to make it worth his while to give up the whole of his time to it, it would be infinitely better.

5909. (*Chairman.*) Most county councils have that power at present?—Yes, but it is permissive in England. I think that it is obligatory in Scotland.

5910. (*Mr. Struthers.*) They cannot dismiss him without the consent of the Local Government Board?—Quite so.

5911. (*Chairman.*) As to the question whether the Factory Act in small workshops is applied to any large extent, Mr. Booth in his book seems to think it is not?—In men's workshops very many of the sections of the Act do not apply, and unless there is some injurious trade carried on I should say that the number of factories and workshops which the inspector has to visit in the course of a year are so many that unless a visit is very desirable he leaves those small places alone.

5912. They escape notice?—They do. They are not visited from one year's end to another.

5913. (*Dr. Tatham.*) You say in your memorandum: "I have not found many persons obviously suffering from consumption in factories except where they have been exposed to hard silicious dust, as in ganister mining." With regard to this exposure to hard silicious dust, have you noticed any great amount of pulmonary tuberculosis amongst them?—It is very slow in its action. They may work from ten to fifteen years before they begin to show signs of it.

5914. Does it take the one form of fibroid phthisis?—Yes; and they get tubercle grafted on.

5915. That is generally the case?—It is the cause of death.

5916. Fibroid phthisis is frequently the cause of death amongst the ganister people?—No. I think that has been brought out by Dr. Haldane's investigations in the Cornish tin mines.

5917. In the report that he recently issued?—Yes.

5918. (*Colonel Onslow.*) Do you lay great stress upon the matter of teeth?—Only where the teeth are exceptionally bad.

5919. But it is pretty well known that teeth are bad in all classes of society, it is not confined to any one class or any one industry?—But one finds great differences in teeth in the different parts of the country. In Yorkshire it is much worse than elsewhere.

5920. Do you attribute that to a local cause or water, or the air, or any particular cause?—I am not able to fix upon the cause. I do not think that it is water. I do not agree with the view of the soft water theory.

5921. I know from our records that we have a far larger number of rejections from bad teeth in some parts of the country than in others, but there appear to be nothing to show why that should be, and you cannot help us in the matter?—I am not aware of the cause of it.

5922. (*Chairman.*) There is no necessary correspondence between bad dentition and general deterioration?—Of all the causes that would occur to one as likely to produce bad teeth, I should say injudicious feeding in the first years of life was the most important.

5923. Do not you find cases of bad teeth just as, or even more, numerous in the upper classes than amongst the poor?—I do not think so. When I am looking for lead poisoning I always look at the teeth, and in that way I have seen many thousands. The teeth of the working classes are, in my opinion, much worse than those of the well-to-do.

5924-5. That is when exposed to specially adverse conditions, you mean?—Not necessarily.

TWELFTH DAY.

Monday, 22nd February, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. H. M. LINDSELL.
Mr. J. G. LEGGE.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Dr. ARCHIBALD KERR CHALMERS, M.D., D.P.H., called; and Examined.

5926. (*Chairman.*) Will you kindly state your qualifications to give evidence, and what your experience is in this matter?—I am a graduate in medicine of Glasgow University and hold the Diploma in Public Health of Cambridge—I graduated in 1879, and in 1891 I was appointed assistant, and shortly thereafter junior medical officer of Glasgow. In 1898 I was appointed sole Medical Officer when Dr. Russell, my senior colleague, was transferred to the Local Government Board, Scotland, as Medical Member.

5927. You have been responsible for the condition of health in Glasgow since 1898 then?—Yes.

5928. Are you able to form any opinion as to whether the physical condition of the people is becoming worse?—I think that the death rates afford an indication of the movement which has taken place in the health conditions.

5929. And that is so far favourable?—Yes, uniformly favourable, taking it over a series of years, and taking the whole population. But I have noticed certain exceptions, particularly among the population occupying one-apartment houses. Among these the death rate is excessive.

5930. There is a diminution in the number of that class of houses?—Yes, to some extent; but their proportion is decreasing more rapidly.

5931. Would it be possible by the direct action of the local authority to reduce that evil much more rapidly than it is being reduced?—I have an impression that if we had a power somewhat similar to what exists in New York, of compelling the owners of those houses to bear some responsibility for their condition in respect of cleanliness, it would be useful.

5932. Have you no power of the sort now?—The power is against the occupier.

5933. But you have this power against the owner have you not? If the house is totally unfit for occupation it can be closed?—So far as the house is concerned, if it is an insanitary house, but I am thinking of the conditions that may exist in a house which in respect of structure complies with sanitary requirements.

5934. That is perfectly true under the Act of 1875 in England. I do not know whether it is the same in Scotland?—We have a corresponding Act.

5935. It defines a nuisance as being “any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates” and the local authority can close an overcrowded house?—Yes, on a second conviction, or if it is an insanitary house.

5936. But its being overcrowded renders it a nuisance whether the sanitary arrangements are sound or not?—That is quite true. I was thinking of the condition of internal dirtiness, both of the persons themselves and of the houses.

5937. You could hardly make the owner responsible for the dirtiness of his tenant, could you?—They seem to find it work satisfactorily in New York. May I read the section which applies to New York?

5938. Yes?—I have a paper here which contains the result of an inquiry into the death rate of one-apartment houses, and on page 21 I say this: “In a pamphlet on the tenement house legislation in New York, prepared for the Commission of 1900 by Mr. Laurence Veiller, its secretary, I find the present law stated in the following terms: ‘The owner of a tenement house was further required to thoroughly cleanse all the rooms and halls, stairs, floors, and windows, as well as the doors, walls, ceiling, privies, cesspools, and drains of the house as often as the Board of Health might require.’ Further, that ‘whenever there should be more than eight families living in any tenement house in which the owner himself did not reside there should be a janitor, or house-keeper, or other responsible person living in the house, and having charge of the same, and it was left to the discretion of the Board of Health to decide when such janitor or house-keeper should be required.’”

5939. And it would be his duty to report to the Board of Health any conditions unfavourable to health which might grow up in the houses?—I take it that along with this there would be power of eviction in the case of a dirty tenement.

5940. Exercised by the janitor?—No; the owner I assume. He is responsible.

5941. No doubt. How far is it the case at present that any rule is laid down as to the minimum of soundness and sanitary convenience in houses, below which it shall be the duty of the local authority to prohibit their occupation?—I think the standard is rising. A house that may have been regarded as fairly sanitary ten years ago would scarcely be so now.

5942. In your opinion does the local authority exert itself as much in that direction as it might do, or is it paralysed by the difficulty of making anybody directly responsible, consequently, by the difficulty of disposing of the people by any abrupt or positive action in that regard?—The policy of the municipalities varies somewhat. There are waves of strong feeling, usually accompanied by acts of displacement, and then an ebb tide sets in.

5943. Is there a sufficient knowledge of what is going on to enable them to act when called upon?—Do you mean whether they exercise the power of inspection?

5944. Yes. Do they know what black spots there are in the places they are called upon to administer; or is there a lack of information, too. Do the tenants really concern themselves about it?—No. They sometimes complain of their neighbours, but I very much doubt if they frequently complain of conditions which they themselves create.

5945. Their neighbours may be no worse in their habits than themselves?—That is so.

5946. There is no *esprit de corps* among these people then?—I think not.

5947. You would say that the standard is improving?—I think so, very definitely. Taking Glasgow as an illustration. I now certify houses under the Housing of

Dr.
Chalmers.

Dr.
Chalmers.

the Working Classes Act which ten years ago so far conformed to the standard existing at that time, that the introduction of water closets made the difference between the house which was regarded as sanitary and one which was not. That obviously represented the level of sanitation at that time. One talks of insanitary areas at the present moment, but, although it is the same phrase, it means something different from what it did thirty years ago.

5948. And, of course, your water supply is very good in Glasgow?—Very good.

5949. Have you many houses in Glasgow all fed by a common tap, or does each house get its supply laid on?—Most of them have; but in Glasgow we have certain elevations on the boulder clay, and to ensure a continuous supply to houses on these situations there is a provision whereby a house which is from 150 to 200 feet above ordnance datum must be supplied with a cistern. This is filled at night, but is only required in houses standing on higher ground.

5950. Do you draw any definite conclusions from the decrease of the death rate in Glasgow?—Well, one would be that the general conditions under which the people are living are better than they were, and that the people themselves, taking it on an average, are improved. There is a very interesting experience in Glasgow which has an important bearing on this point. In the sixties there were several years when the death rate was very high, and during the seventies the surgeons began to perform the operation of osteotomy to counteract the injurious effects of rickets on bones. Without any definite figures I may express the opinion that these operations are very much less frequent now. But, on the other hand, the number of operations for contracted pelvis in childbed have increased in recent years (we are going through that phase even now), so that we seem to be getting the same generation in the childbearing period, presenting in another form the results of rickets in childhood. Whereas osteotomies have increased in number.

5951. Do you think that the cases of contracted pelvis are more frequent now?—Yes. I speak from information given me by the staff of the Maternity Hospital.

5952. And it is now affecting the grown women?—Yes, but belonging to the generation which, as children, required osteotomies, but moved fifteen to twenty years further on.

5953. Do you think that the children of the present day will not reproduce it?—It is the experience of the surgeons that they have not the same number of osteotomy cases now to deal with.

5954. Has infant mortality now remained much the same in Glasgow, or diminished, under five years of age?—Under five years of age it has gone down.

5955. But under twelve months what is the case?—It has moved very little indeed. I had an opportunity, during the last census, of comparing the death rates under five years for several census periods. I do not think I submitted with my *precis* any figures showing this, but I may quote them from my last annual report (1902). In 1871-2 it was 106 per thousand; in 1880-2 it was 82 per thousand; in 1890-2 it was 78 per thousand; in 1900-2 it was 67 per thousand, and for the single year 1902 it was 58 per thousand.

5956. Now as to the one year old children—have you any statistics?—In this same report, I have the figures for 1873, 1874, and 1875, and I have compared them with the years 1898 to 1902. For the earlier series of years the death rates per 1,000 births read, 154, 149, and 153; and for the later, 147, 143, 145, 141, and 126. The low rate in 1902 is related to the low temperature in the summer and autumn of that year.

5957. You attach considerable importance to the registration of still-births, do you not?—I consider it is very important in connection with infantile mortality, especially as to the number of deaths in the first four weeks of life.

5958. Still-births do not touch them?—No, not directly, but it would give some indication of how the death rate in the earlier weeks of life was related to that of children born dead in the last months of gestation, were these registered. Quite one-third of the infant deaths occur in the first four weeks of life.

5959. Is that due to their mothers not suckling them to any extent, or leaving them to go to factory employment, or to what do you attribute that?—It is partly due, I think, to under feeding, but is related to the condition of the mother during pregnancy.

5960. Is that due to them being employed in factories?—That would be one cause, although I do not think that a large proportion of the married women of Glasgow work in factories.

5961. Is it due to alcoholism?—The food of the mother during pregnancy must influence the vitality of her child, and alcohol will play an injurious part at this period.

5962. Do many of those mothers suckle their own children?—I cannot give you actual proportions, but a considerable number do.

5963. Is the supply of milk for infants good in Glasgow?—Well, up to the present it is the ordinary milk supply. The corporation are just now in process of forming a depôt for the preparation of milk for infants' food. But diarrhœa is not one of the things that affects them in the early weeks of their life to a very large extent.

5964. It is not dyspepsia, is it?—No.

5965. Or is it that they are feeble?—A very large proportion of the infant deaths result from immaturity at birth.

5966. That is rather inconsistent with some of the evidence which we have had before us, which is to the effect that the condition in which the parents live has not a bad effect upon the children—that nature appears to bring the next generation into the world in as sound a state as if the conditions were favourable?—Well, the congenital conditions are causes. There is an interesting series of experiments by Dr. Noel Paton on the feeding of pregnant guinea pigs, where these sows had been fed on good food, but where it has been deficient in quantity. The vitality of the litter, I understand, was impaired. But the results of his inquiry have been published.

5967. Does he attach more importance to quantity than quality?—Quantity alone seems to have a decided influence.

5968. Should you say that the poorer classes of Glasgow suffer from bad nutrition more than those in any other big town?—I do not think I have found that. This question of infantile mortality is one that one can hardly generalise upon.

5969. It is a question you have had with you for some years, so that some opinion might be formed now. As far as I understand, it is one of the standing blots on sanitation? That is so. Both sanitary and social conditions enormously influence it. It varies in the districts of Glasgow from 63 to 217 per 1,000 births, while the rate for the whole city is 141. It would seem to mean little, but that, I think, arises from the large proportion of it which is due to conditions of immaturity at birth. These alone caused about one-third of the total deaths of infants. In the more variable elements, such as diseases of respiratory and digestive organs, I believe some reduction is occurring.

5970. It varies at different times of the year too, very materially?—Yes, in autumn. The effect is shown in the small proportion we have in 1902, which was a cold autumn.

5971. Are the illegitimate children on the increase in Glasgow?—I do not think so.

5972. The number diminishes elsewhere, I think?—I think the proportion of illegitimate children is decreasing.

5973. (Dr. Tatham.) Do you know how much it is?—I have the figures, and will supply them (*Appendix*). The death rate amongst illegitimate children is almost double.

5974. (Chairman.) To what it is compared with the legitimate children?—Yes.

5975. Have you arrived at any conclusions based upon expectation of life in Glasgow at different periods during the last century?—Glasgow has had three life tables constructed at separate periods during the last century. One was constructed by Mr. Duncan, the manager of an insurance company, for the years 1821 to 1827, and the second was for the years 1832 to 1841, and the third for

the years 1881 to 1890. In the first one the expectation of life at ten years of age was forty-two years. In the second period it fell to thirty-seven, and in the third it rose to forty-four, and a corresponding difference exists at all the other decennial periods of life. These figures are in Table A.

5976. I observe that the differences in all ages given here are in favour of the present compared with fifty years ago?—Yes.

5977. There was a great declension between the second and fourth decade of the century, and a great improvement during the last fifty years?—The depression of 1832 to 1841 is related, I think, to the enormous rush of people to the towns early in last century.

5978. Before there were any clear notions as to what sanitation meant?—Yes. And I think that it affected adults mostly before it began to tell upon the children.

5979. Should you say that during the period you have known Glasgow, the appearance of the people indicates a depression in their physique?—Are they smaller and more jejune to look at?—No. Take rickets as an illustration. There is less apparent deformity now than there was.

5980. Is that owing to your having a better water supply?—That is one factor. Loch Katrine was introduced in 1859, but much has been done subsequently to remove insanitary areas.

5981. (*Mr. Struthers.*) The water supply was blamed for the rickets?—Yes. It was suggested as an objection to the introduction of Loch Katrine that the absence of lime would produce rickets.

5982. (*Chairman.*) When you come to a later period of child life have you noticed a diminution in the death rate?—At all ages up to the *post* mature period the death rate has decreased. Some time ago I took out the figures referring to the death rate of the school periods of life, but they apply to Scotland generally—they are not limited to Glasgow.

5983. Do they apply to the whole of Scotland?—Yes. In that pamphlet presenting the results of an “Enquiry into the Vital Statistics of School Ages,” on page 9 there is a short table giving death rates per million from all causes at certain periods of life. Taking it from five to fifteen the death rate fell from 7,699 in 1860–62 to 4,847 per million in 1890–2.

5984. That is with regard to Scotland as a whole?—Yes.

5985. Is that represented in Glasgow too?—Glasgow experiences part of that decrease.

5986. What opinion have you formed as to the operation of the improving hygiene of towns?—That the expectation of life, and by implication the standard of vitality, has been increased.

5987. But it is not as general as it might be?—I think not. My impression from the inquiry, to which I have alluded, into the death rate of one apartment houses is that there is a proportion of the population, numbering over 100,000, who have not shared to any considerable extent in the improvement.

5988. One-seventh of the population in fact?—Yes.

5989. Speaking from the experience of Glasgow alone, it appears from your memorandum that a much larger proportion of its population fails to share in the advance of recent years than the decreasing death rate suggests?—Yes. On the basis of the census return of 1901 I was able to make a comparison of the death-rates in houses of various sizes, and the results showed that, notwithstanding a decreasing general death rate, one seventh of the population widely scattered throughout the city still maintained an appallingly high rate.

5990. It is not connected with any one district?—No, it is scattered all over. The district rates vary very much.

5991. (*Mr. Struthers.*) It is connected very closely with a particular type of house is it not?—Yes, the one apartment houses. A “house” in Scotland would mean a different thing from a “house” in England. We mean by a “house” actual apartments occupied. Our “house” corresponds to your tenement. We speak of

a building with three or four floors as a “tenement”; and of one, two, or three rooms occupied by an individual family as a “house” Yours is the other way. It was excessive in all the elements which result from insanitary conditions of living. It had a zymotic rate almost twice that of the city; its phthisis death rate was twice that of the social grade represented by two-apartment houses, and its death rate from respiratory diseases was 7·6 per 1,000 compared with 4·6 for two-apartment houses, and 4·3 for the city. You will find that in Table 1 on page 9 of the pamphlet on the death rate.

5992. It is not one of the tables that you gave, is it?—Yes, it is in Table C of my memorandum.

5993. (*Chairman.*) You would not even go so far as to say with regard to the class resident in these tenements that it is actually a condition of retrogression with them?—Well, it is difficult to form a definite opinion, because there is very little to compare it with in the past. I think the osteotomy illustration sheds some light upon this question. If rickets as a form of bone disease were still as prevalent, it is in this section of the population we should expect to find it. But my experience is that it is not so prevalent.

5994. Therefore you argue that the condition of this class is better?—Yes; better as a class, but when the individuals are descended from a rural stock they are probably not so physically fit as their ancestors.

5995. There are a larger number of persons subject to these conditions than formerly?—The proportion is decreasing.

5996. Would you say that thirty or forty years ago there were 104,000 people living in one-roomed apartments?—Yes, thirty years ago—in 1871—there were.

5997. The larger number of those people came in from the country—or their parents did, and to that extent they are worse, I suppose?—If you could compare them with their ancestors in the country I expect they would be worse.

5998. Is there any outflow into the country of the wreckage, as they have been called, of Glasgow?—In search of what?

5999. Because they are incapable of existing in Glasgow under the conditions of labour and the over-pressure?—I am afraid that the difficulty in all towns is to deal with this unskilled labour class, who expect to find there the casual employment which they desire.

6000. The class that sinks to the lowest level—they remain a permanent evil in the big towns, do they not?—They tend to aggravate the evil in the big towns.

6001. But when they no longer earn a subsistence wage what happens?—Then the energy is taken out of them.

6002. And they would then be the object of charity?—Yes.

6003. Is it not your opinion that the first step in any improvement is to deal drastically with that class?—If one could.

6004. Have you formed any opinion as to how it might be done?—The suggestion in my mind regarding the effect of placing the burden of cleanliness on the owner of a tenement occupied by persons of this class would be that these people would find it increasingly difficult to get house accommodation. You would then have them as vagrants and would be able to deal with them.

6005. And the community would be obliged to take charge of them?—Yes.

6006. If you are going to impose a minimum standard of cleanliness, and so on, through the action either of the local authority, or the action of the landlord upon these people, and turn them out because they do not subscribe to it, then it devolves upon the State or community to take charge of them?—Yes, if you had shelters of some sort, where they would be compelled, short of being sent to a labour colony, to observe certain standards of cleanliness you would have made some steps towards teaching them the value of cleanliness.

6007. Would not it be necessary to adopt some scheme like that of the Salvation Army in connection with labour colonies?—I am not quite familiar with the recent suggestion; but the necessity of having recourse to labour

Dr.
Chalmers.

Dr.
Chalmers.

colonies for a very considerable section is, I think, rapidly gaining a general acceptance.

6008. General Booth says that "It is beyond question that there is a section of the population, who by one means or another, contrive to subsist at the expense of the community without work. This class is prominent in times of bad trade and scarcity, and, being skilled in habits of 'sponging' and other objectionable courses, manage to secure a large proportion of the help intended for the genuine worker, who, without any fault of his own, has fallen out of employment." Then he goes on—"As a class they are constitutionally averse to work, partly because they have never felt its necessity, having learned how to exist without it, and partly because they have never been sent to any sustained and remunerative labour which they were capable of performing." Then he further goes on to say that "Much of the charity dispersed in the large cities finds its way to this class. It is thus rendered not only unproductive of good, but made into a source of positive evil, helping to support a section of the poor that so largely propagates disease, and demoralising all who come within its influence"—I think that all towns have a large number of this class.

6009. And now as to his proposal for dealing with them, "(a) That the vagrancy laws be so amended as to give magistrates the power to commit to colonies or settlements, established for that purpose, vagrants coming before them under certain prescribed conditions, for periods of not more than three years: (b) That municipal and poor law authorities be empowered to establish labour colonies for such vagrants, and that they or any charitable society doing so may—on receiving the licence of the Home Secretary—receive and detain vagrants so committed to them, for the purpose of employing them, the licence to be issued after such inspection as the Home Office may determine (much as in the case of the Inebriates Acts); (c) That such disciplinary powers as the Home Secretary may think necessary be granted under bye-laws, as in the case of inebriates' reformatories; (d) That the cost of maintaining such colonies be provided by a contribution from the Treasury, at the same rate as it now contributes to the support of inebriates' reformatories, and that municipalities, county councils, and other authorities be also empowered to contribute at such rates as may be agreed upon." Should you think that that would be a scheme that might to a large extent deal with and finally extirpate the evil?—That is the general trend of opinion, I think, in all writings dealing with this question.

6010. Do you think that the time is ripe for the application of such a remedy for dealing with this problem, which you admit is at the bottom of the whole evil?—Yes, I do think so. I believe they have a similar scheme in operation in Belgium.

6011. Do you think that a scheme of that sort might be enlarged so as to cover the case of parents who habitually and wilfully neglect their children, so that the children might be withdrawn from their custody, and placed in some kind of public nursery, and the parents made the debtors of the State, and if they evade the obligation sent to a labour establishment until they discharge the debt?—I think that you could gradually reduce the number, and that would lead a certain number of them to alter their habit of life.

6012. It would be an inducement to them at any rate to alter their life?—Yes; one of the difficulties just now in that connection is that if a man and his family fall to the level of living in lodgings or in sub-let houses it is almost impossible for him to regain his original platform. If he gets to the state of what is called with us the farmed-out house class he never rallies; he has no opportunity, the landlords will not have him, and he simply goes on paying a high rent for very indifferent accommodation.

6013. In fact, he goes from bad to worse?—I am afraid that is usually the case.

6014. (*Dr. Tatham.*) Speaking of this submerged seventh, if I may use the term, which, you think, represents your great difficulty in sanitation in Glasgow—one-seventh of the population which certainly shows no improvement, if it does not actually show progressive deterioration. Do you think it is practicable, so long as these people remain in the slums which they now inhabit, to improve their sanitary condition at all under any circumstances?—No; there can be no improvement so long as they are allowed to occupy insanitary houses. But beyond displacing them,

I am afraid you must aim at improving the people themselves. It is the habit which the slum engenders which makes the greater difficulty.

6015. Do you think so long as they remain in the slums that it is possible to improve the people?—No, they are being displaced from the slums, and the tendency is to push them on to a gradual improvement.

6016. It has been suggested that the way to deal with people that we are speaking of is to force them to leave their slums, to get them, if possible, into the country and to follow them, or rather to enable them to get into the country by a system of cheap transit trains or trams. Has that occurred to you as a possible cure for the difficulty?—My impression is rather this way, that if you plant a certain number of industries in the outskirts you will attract a certain number of people from the towns, but I do not think that the submerged classes will be attracted, or that you will be able to compel them to live in the country, and return to work in the towns.

6017. Why not?—Because they consist largely of unskilled labourers, and there is a surplus of them already. If a man is in regular employment he may travel to the outskirts to his home; but if he is dependent upon work at docks or casual work at railway stations, then he lives pretty near where he is employed frequently, and he would not always have the half penny to pay for the tram. But where it is a question of pressure upon the skilled workman, I think that, as a means of getting him in the country, it would be better if the work went out first and attracted him.

6018. Do you think that the number of rooms inhabited by a family may be taken as a fair measure of the health of that family?—It would appear to work out in that direction.

6019. That is what I understand from your report. Your main difficulty is with those who inhabit one or two rooms?—It is chiefly a difficulty of those who inhabit one room. I think our death rate without that difficulty of the one room would be something like eighteen or nineteen per thousand.

6020. Amongst the one-room population what is the mortality at present?—Thirty-three—32·7 is the decimal.

6021. Not far less than double?—Pretty nearly.

6022. Amongst the one-room population, I think, you say that pulmonary tuberculosis is much more fatal?—The pulmonary tuberculosis rate among them is 2·4 per thousand. It is only 1·8 in two rooms and ·7 in all the other houses. For the whole city it is 1·8.

6023. With regard to the mortality of infants under one year of age, you agree with several witnesses whom we have had here that really that is not substantially decreasing, and has not been decreasing?—My impression is that it is not decreasing.

6024. Speaking generally, do you think that this is a question of food very largely—do you think that children are badly or improperly fed?—It is difficult to say why, with the general knowledge increasing, and with the facilities and better opportunities of getting food, that it should have remained while all the others have improved. That forces one back to look upon the mother as being the cause.

6025. Do you think really, as a matter of fact, the feeding of infants has improved of recent years amongst the class that we are speaking of?—I very much doubt it.

6026. Do you think that young infants who are not suckled by their mothers obtain any sufficient quantity of milk?—No, I very much doubt that. Unless you wish to include condensed and preserved milks.

6027. No; I mean cow's milk?—Then I think not. I think the tendency of late in all classes is to have recourse to artificial foods, including condensed milk, and that is deleterious.

6028. We have had a good deal of evidence to show that infants practically get very little milk at all. They are fed on tea and even more harmful matters?—They very soon begin to be fed on tea, as soon as the child can drink out of a cup. Many are indifferently fed.

6029. I believe that you have in Glasgow a system of inquiry with regard to the deaths of all young children?—Yes.

Dr.
Chalmers.

6030. An inquiry by means of cards?—Yes, the system of cards is applied to all deaths, and has been so for several years.

6031. Will you put one of those cards in either here or hereafter, so that it may be included in the Committee's Report?—Yes; I have a copy which I shall put in.

6032. So that so far you do get to know the circumstances under which all the deaths occur?—Yes, we do. The position of the house and the number of people occupying it, and the sanitary conveniences and provisions generally—all these are noted.

6033. And then at the end of a quarter or a year, as the case may be, I presume you collate the records?—Yes, and they get finally embodied in the Annual Report. The death rates for all diseases are calculated upon the cards, not upon the deaths registered.

6034. Your reports are recorded on those cards as units?—Yes that is how I get out the one, two, three, and four-apartment houses.

6035. Do you think that the downright neglect of mothers is at the bottom of infant mortality?—We have had evidence that that is so in many cases?—I am afraid that that is only too true of large sections—that they are negligent in their maternal relations in this matter as in every other.

6036. You spoke of the mortality amongst illegitimate children—that the proportion amongst illegitimate was much heavier than amongst legitimate children. Do you think that that implies that legitimate children are much better cared for than illegitimate children?—Yes.

6037. Is that markedly so?—Yes.

6038. Other things being equal, where you have a large proportion of illegitimacy you would expect to find infant mortality greater?—Yes.

6039. And do you find that to be the case?—Yes.

6040. Do you think that the proportion of illegitimacy differs very widely in many of the districts of Glasgow?—Very widely. I should be glad to submit the proportions of illegitimacy in one district as compared with another.

6041. You would be able to put that in your proof?—Yes.

6042. You spoke just now of the water supply of Glasgow which is notoriously a very pure supply, it is almost like distilled water?—I believe that it is used for chemical tests as "Ammonia free" water. I understand the custom of some chemists is not to distil the water but use it just as it comes from the tap.

6043. But some persons regard the purity of water supply, because of the absence of lime, as an objection?—It was urged as an objection to the whole Loch Katrine scheme.

6044. Is not it the fact that lime can be got from food of other kinds besides water?—Yes.

6045. And therefore you would be very sorry to get another supply not so pure as that from Loch Katrine?—I should be very sorry indeed to get another supply.

6046. With regard to your observation on the mortality under five years of age, you say the mortality of children under five was diminishing until 1830, after which it gradually increased, but since then it has very decidedly decreased, has it not?—I think the introduction of the practice of infantile vaccination early in last century with the prevalence of typhus epidemics later on has been advanced in explanation, of the experience prior to 1830. On the other hand, the decrease has been marked during the last 30 years.

6047. And now it stands at what point?—I have a Table B in the Appendix. This shows the average annual mortality per thousand for three periods, and under five the rates are 106 and 86, and 76 for males, and 99, 76 and 68 for females. The periods are 1832-41; 1881-90 and 1892-1900.

6048. Amongst the submerged one-seventh high infant mortality is a considerable factor in the heavy death rate you speak of, is it not?—It is high. One-third of all our infant deaths occur in one-apartment houses. I could not take it out as a rate, because I had no means of getting at the actual number of infants born in these houses.

6049. (*Mr. Lindsell.*) Is there a very large demand for what we may call intermittent unskilled labour in Glasgow?—I think there must be. I have no means of definitely stating how it varies.

6050. That is the kind of labour that is sought after by the submerged seventh?—By a very large proportion. As to its being intermittent I am not so sure about it. I rather think that in the industries in which these people find employment the demand for labour would be pretty constant.

6051. How is it that these people get so low in the scale, if the labour is pretty constant? One would think if the labour were pretty constant they would rise above the seventh that you speak of. Is it that they will not work or that there are too many of them or that the work is too uncertain to enable them to live better than they do?—Bearing on that I began quite in the last month or two some inquiry into the food going into certain households. It was conducted through one of the charitable organisations, and they at once found—they were aware of it, indeed, before—that there was no relation between the total earnings of the individual householder and the quantity or quality of the food going into the household. Of course there is an obvious unknown factor in drink; one does not know how much goes in that.

6052. Is this lowest strata composed mainly of people who will not work regularly, or is it that they cannot work regularly?—Well there must be a number who will not, but it would be impossible to say how many who only work if they are compelled, from the possibility of starvation if they did not.

6053. Nothing could deal with this but some drastic measure of making them work by some means of bringing them back to habits of regular employment?—That is the only way.

6054. Are they composed to a great extent of people who could get good wages if they chose?—They might get subsistence wages readily enough. I do not know that the unskilled labourer often gets a good wage. It is very much the same problem that had to be dealt with by the Poor Law Commissioners in the 1834 Report. The number of unskilled persons constantly pressing on the market and displacing the regular worker causes a variation in his wage-earning power.

6055. And they are composed largely of people who come in the towns and fail to get work. Do you think that the labour market is overstocked?—The unskilled labour market is overstocked in every town population, I think. The same thing creates the difficulty in connection with overcrowding in houses.

6056. You think with the exception of these one-house tenements the condition of Glasgow is fairly good?—Well, judging from the death rate it would be fairly low for a town; apart from the exception which I have mentioned. It would be reasonable if we had not that part. I do not mean that the statements are strictly applicable to all the one-room population, although the conclusions are based upon the census figures, but there are many of them so well occupied that we must take the term one-apartment as a barometer or index to other conditions.

6057. You said that instead of moving the working class population out into the suburbs, the best thing would be to have the works there and they would follow?—If you could distribute industry the population would follow automatically.

6058. Do you see any tendency for industry to distribute itself?—Not at the moment.

6059. Except that you mentioned that it was done in one or two large firms?—There are individual illustrations of that, such as Port Sunlight.

6060. And the same idea is at the bottom of the Garden City is it not?—Quite.

6061. Would it not be much better, instead of starting a large population like the scheme of Garden Cities, for the individual firms to move down and form a small population—a nucleus of their own?—We have had an illustration of that on the Clyde. Fifteen years ago, or more, the Singer Sewing Machine Company took their works from the east end of Glasgow, down to Clydebank, nine or ten miles from Glasgow, with the result that although

Dr.
Chalmers.

there has grown up around these works, and in connection with the shipbuilding yards in the neighbourhood, quite a borough, a very large number of the workers still live in Glasgow; and their reason would appear to be this—that in Glasgow, as in every big town, there is an opportunity for the younger members of the family also to get occupation, and that it is simpler and probably cheaper to let the father of the household travel to his work, than to have all the children travelling up and down.

6062. That outweighs the cheap trains and the cheaper houses and gardens and other advantages that they might get in a more open country?—Yes. Any scheme for planting out industries would seem to require that a selection of those which would give employment to both sexes is necessary for success.

6063. I suppose the development of water power and electricity would have a tendency in that direction?—One would hope for such a result.

6064. You can get your power now from a considerable distance, can you not?—It is a question of the facility of transport.

6065. But also, I mean, the machinery could be worked now by electric power for a considerable distance from the generating source?—Yes; that should help to disperse industries.

6066. Are there any industries now worked by electrical water power in the neighbourhood of Glasgow?—It is supplied in many ways, but I could not give you any illustration of one whole work being solely driven by electric power. There is a company which obtained an Act two years ago, the Clyde Valley Company, which is now, I believe, in process of putting down power stations, but I could not give an illustration.

6067. If that tendency goes on it will undoubtedly add to the good sanitary conditions of the working classes, will it not?—It would tend, undoubtedly, in that direction. I do not think that the difficulty exists with regard to the working classes, but with regard to the unskilled classes. When we speak of the working classes in Scotland we generally think of the artisan class.

6068. The unskilled grade, that would not help in any way, then?—Unless you could apply coercive power to get them taught a trade, I do not see how you could benefit them.

6069. (Mr. Legge.) You are aware, no doubt, of the efforts made in various districts to obtain a good supply of milk by means of special depôts?—Sterilizing depôts you mean?

6070. Yes?—We are at the moment forming a depôt of that sort.

6071. Under municipal sanction, and supported by the municipality, I suppose?—We hope that it will be self-supporting, but the original grant for the plant will be from the rates.

6072. Are you going to have little branch offices?—Meanwhile our scheme is that we are to have a central sterilising depôt, and arrange with the milk vendors for the sale of the milk. We will try that first of all.

6073. What is your object—is it to supply good milk in a general way, or is it with a special view to infants?—Wholly to infants.

6074. It is to provide good food for infants?—Exclusively—to begin with, at least.

6075. Do you anticipate that in the slum quarters the parents will make much use of that milk?—That remains to be discovered. That seems to be one of the points on which there is, at present, little or no information. Before this was formed I had an opportunity of seeing several of the depôts throughout the country—at Battersea, Liverpool, and St. Helen's; and no definite information was forthcoming as to their effect upon the total infantile death-rate, they were simply gathering the information regarding the section of the population that took advantage of it. One would naturally expect that people, who for other reasons are careful of the upbringing of their children, would take advantage of it.

6076. Do you think that it would be possible to do anything by the circulation of leaflets amongst the mothers of children, and handing them to girls at school to take home, leaflets regarding the feeding of infants, and particularly such a detail as where people can get milk,

and at what price they can get sterilised milk?—In Glasgow quite a number of such leaflets are circulated bearing on the feeding of the children, and a copy is given to every parent who registers the birth of a child. That has been going on for twenty years or more.

6077. (Chairman.) Do they read them?—We hope some of them will.

6078. (Mr. Legge.) But we have had some very strong evidence that pamphlets are of no use, but that leaflets dealing with a certain point are very effective. If you had a single leaflet stating that milk was to be had in such a school district, at such a depôt, it might attract attention?—This is a general thing of four pages (*exhibiting the same*.)

6079. But this is too long. The idea is that it is best to have one side printed only, in large type, if it is to be of any use?—I see.

6080. Would you be prepared to go so far as to have milk sold in certain shops to mothers below cost price, the rest being made up out of the rates?—You would get back to an economical question then.

6081. Have you any strong view that, in the interest of the community at large, it is fair to make the sacrifice?—It is doubtful. That is the impression I have formed from my Poor Law reading. I have no actual experience; but I understand from the work of the Charity Organisation Society and poor law administration generally, that any scheme which is economically false is rarely, if ever, justified by its results.

6082. We had a scheme put forward in connection with those depôts, each shop to be under the supervision of a medical man whose duty should be to weigh each child brought to the depôt, and prescribe for it as its weight went down, and so on. Speaking as a municipal official, what do you say as to the practicability of such a scheme?—I doubt whether you could carry it out on a large scale; but I think it would be desirable to carry it out in sections, so that you might have some knowledge of what advantage your dairy was producing.

6083. You might have a medical man who went round the depôts?—I rather suggest this in a particular distributing centre, so that if you had one man attached he would make a point of watching individual children.

6084. (Mr. Struthers.) Would you have an experimenting station?—Yes. I think that sterilisation is in its experimental stage.

6085. (Mr. Legge.) But you think it is still to be encouraged?—Yes; if only for the advantage which may be obtained from the bottling of milk. I think that milk should be dealt with more carefully than at present, and the example of a depôt may tend to bring about the exercise of more care in its handling generally.

6086. There has been a good deal in the newspapers of various towns indicating that wherever there is a foreign element in any town its children seem to be better nourished than the native children. I see in the papers that the Italians in Finsbury are better than the native children. What evidence is there of that?—I have not any. I have not been able to get at the foreign population.

6087. You would not call the Irish foreigners—there is a strong Irish element in Glasgow, is there not?—No, I was thinking rather of Poles.

6088. Have you many Jews in Glasgow?—We have Polish Jews.

6089. You cannot say whether the condition of the foreigners is better than that of the natives?—No; I have no information.

6090. Against the common statement in that regard one gentleman suggested that one should remember those foreigners are of sub-tropical origin in most instances, and therefore develop earlier—do you think there is anything in that?—Well, they are not living in sub-tropical conditions here—that occurs to me. But what also occurs to me is that the immigrant is a vigorous man, with a definite intention of bettering himself, and that is why he comes here, and forms an incentive which probably does not exist in the case of his neighbour, who is a native.

6091. Do you think that the state of things in the poorer quarters of our large towns is so serious as to call for admin-

Dr.
Chalmers.
—

istrative action, to secure the proper feeding of school children, by providing restaurants or kitchens in connection with the schools, and feeding the children at the school, recovering the money possibly from the parents by ordinary legal process?—It has been suggested—it has been a matter of observation indeed—that when children of a certain grade are fed at school and have a mid-day meal the afternoon work reaches a higher standard than when they are not fed, and have no mid-day meal. That is a question already demonstrated. But I do not know, and I am not prepared to suggest, that the condition is so bad over the general population. You probably will have an occasional school where extra food supplied to the children would be an advantage.

6092. Do you know the Rose Street Day Industrial School in Glasgow?—I am not familiar with it.

6093. And Green Street and Rotten Row?—I know of them in connection with infectious diseases.

6094. I suppose you would agree that the actual steps that should be taken to deal with the health of the population in any particular area is in the first instance a matter for the local authority to decide upon?—Certainly.

6095. And not for a central bureaucratic government to take in hand?—No.

6096. Do you not think that the central government might do a great deal in the way of stirring up local authorities?—I think that they could co-ordinate effort in the matter.

6097. What is wanted is some means of stimulating the public conscience in a particular locality?—Yes, that is so.

6098. Once that conscience is aroused it is pretty certain that effective measures will be taken, you think?—Yes, that is quite obvious, I think.

6099. Do you think that one valuable means of bringing this stimulus to bear upon the central government would be a central bureau of statistics dealing with the health of the country, and also engaged periodically in taking anthropological measurements?—There would be an advantage, certainly. One illustration that occurs to me is in connection with the Poor Law administration. I find myself constantly traversing ground which is interesting to me and also to the Poor Law Authorities; and the Charity Organisation is the same. If the work of these three departments were co-ordinated, and their information were made general, there would be an advantage.

6100. Do you agree that as regards anthropological measurements a proper scheme of carrying those out periodically all over the country would be of value? Would it not have a great effect upon Glasgow if from this central bureau there suddenly came down one day the result of a census, showing that in certain vital particulars the population, as compared with ten years ago, was distinctly on the down grade?—That would imply a new organisation constantly carrying on measurements.

6101. Yes?—At the present moment I am having certain measurements of school children in Scotland taken, but they are limited in scope, and do not include head measurements, but simply chest, height and weight.

6102. That is a matter for settlement. Dr. Cunningham, of Edinburgh, gave us a list of particulars of height, weight, and chest, and pigmentation, and width of shoulders, and hips, and so on?—Those are the skeletal measurements, apart from the head, which seem to me to be of importance.

6103. (*Mr. Struthers.*) Would you then take weight?—Yes. I am taking weight in this inquiry—weight, height and chest measurements.

6104. (*Colonel Onslow.*) I did not quite catch what you said about the one-roomed houses. Are the number of people occupying one-apartment houses increasing in proportion to the total number in Glasgow, or are they decreasing?—The proportion is decreasing, and the actual numbers are slightly decreasing. On the basis of the Registrar General's Report of 1871, the actual number was 144,919; in 1881 the number was 126,264; and in 1891 it was 123,643; and in 1901 it was 123,866. But that is not the actual number dealt with here; these numbers are defective, because there are included in the one-roomed houses lodgers occupying, it may be, one room in a house with two or more. The Registrar General calls

that a family, and, consequently, he makes it a house. But the number of houses with only one apartment is smaller.

6105. The fact is that they are decreasing?—Yes.

6106. The very wretched class of the population of Glasgow are a very shifty body are they not? They come in from towns near and from Ireland to work for a short period, is not that so?—There is a very large proportion that is residential. They may move from one part of the city to another, but they remain within it.

6107. Then you think there is not a great influx coming in. Have you not got from the big towns of Paisley, and those manufacturing and mining districts a very large shifting population?—Do you mean whether there is a large proportion constantly going out and coming in?

6108. Yes?—I do not think that a large proportion is going out, except when trade is bad.

6109. Those apartment houses are occupied principally by those very low strata, are they not?—The one apartment houses are.

6110. Are those one apartment houses under the same conditions for letting as the higher class of house is in Scotland, with the usual custom of the inside letting?—Many of them are sub-let, or what we call farmed out. It is a word that has got into the Public Health Act—where you may have a room by the night.

6111. Is not there a place where the respectable poor in Scotland, especially in a place like Glasgow, can get a good home if they are not in regular employment without their being liable to be shifted during one twelve months? You know the custom that lettings all commence from Whitsuntide, and in February you have to give notice if you wish to remain on. Does not it act very adversely to the poor population who may have, owing to loss of trade or one thing or another, to move, and does not it cause great difficulty?—That partly entered into the discussion on our system of letting houses in Glasgow.

6112. It struck me that that would have a great effect upon throwing people into a worse class of house and overcrowding them?—Yes, and rather than taking one for fifteen months they would take it for a month.

6113. In England we have a weekly tenancy, and that would be impossible here?—It is not possible under the conditions of reasonable house occupancy with us. You could not get a better house in a better class district in that way.

6114. That rather helps to make this over-crowding?—I am not sure that it works in that way. It may, but I have no evidence that it does tend that way. The difficulties of this lower class in the farmed-out houses is their mobility; they may remain a few nights or a week or two only.

6115. You said with regard to this recruiting question, you are disposed to associate the Army figures with the convergence of unskilled labour towards the towns and the persistence of a high death rate in sections of the population such as that to which you have referred. With reference to the unskilled labour it is a curious fact from the recruiting experience that the recruits in Glasgow who are Glasgow bred and born are far superior to Glasgow people who have not been born there?—Those that come from the country, you mean?

6116. I do not say where they come from. They are the migratory people, the Irish, that come over, and the people that come in from the surrounding districts?—You mean the native born recruit?

6117. There are less rejections from those that are native born?—That quite supports the impression which the decreasing death rate creates; but I was not aware of the observation.

6118. It is a fact that I happened to have come across that we discover especially amongst the boys for the Navy, that the boys that have been born and bred there are better in physique than those that come from outside?—Then the boys for the Navy are enrolled early, before they become apprentices to any trade.

6119. They are between fourteen and fifteen years; and now it is raised to 15½?—Does it include those who go through the training ships?

Dr.
Chalmers.

6120. No. That is one of the industrial ships. It struck me that your shifting population was the cause of this overcrowding and the bad physique amongst the general ruck of Glasgow recruits?—That has been ascertained by your observation?

6121. Yes?—It would depend very much as to the sources from which the men came who volunteered from Glasgow but were not Glasgow men.

6122. They come from everywhere?—That quite supports the general impression about the towns that, as a matter of fact, all over there is a general movement onwards.

6123. An improvement in the resident population of towns?—Yes.

6124. (*Mr. Struthers.*) You make very considerable distinction between this shifting population which habitually lives in one-roomed houses and the rest of the population?—Yes. I think they are socially marked off.

6125. And there is a very marked difference in all the heads of your statistics under the death rates from different causes, of the deaths from phthisis between the one-apartment people and the two and three-apartment people?—It is very marked.

6126. And there is also a marked difference between the two-apartment and the three-apartment people?—Yes, but of course there are two-apartment houses and some three apartment houses which are sublet in single rooms.

6127. You are still on the shifting class who are living in farmed-out rooms?—Yes.

6128. For a week or a day or so?—We had 275 two-roomed houses sublet in separate rooms as farmed out houses in 1901, and these would not be included here.

6129. Now the one-apartment house—the death rate in the one-apartment house differs according to the various districts, does it not?—Very much, but the populations on which these district rates are calculated are very small.

6130. What I was trying to get at was whether you think there is any other factor accounting for this big difference of death rate besides the one-apartment; do you think that this difference in the rate of mortality in the one-apartment people in the districts of the city is connected with any definite force, apart from the class of people?—I think that the habits of the people supply the other factor. One might hope that it is a want of knowing what hygiene is. It may take the form of indulgence in drink and irregularities in diet, but, after all, it arises from ignorance.

6131. But the difficulty is that the one-apartment and a certain proportion of the two-apartment districts do not represent the people of Glasgow—not even the working classes—only the migratory class?—Quite a large proportion are migratory, but a number of well-behaved people occupy one-apartment houses.

6132. Taking them as a whole, do you think they represent this migratory element—these unskilled ignorant people of dirty habits?—Yes.

6133. But speaking of the working classes in regular employment, do you think the general tendency of your statistics would be to show that they are in fairly good conditions of health?—Yes; apart from the special class we are considering I think the evidence is all in favour of advancing hygiene and improved physical condition.

6134. What is really wanted in Glasgow, and probably in other towns, is a concentration of attention to this population which has fallen below all reasonable standard of living?—I think so.

6135. You say that when people get into this stratum of society they find it very difficult to get out of it again?—In the case of the people in the farmed-out houses it is almost impossible.

6136. Does the ordinary landlord fight shy of them?—Yes. He wants to have some guarantee that the rent will be paid, and he wants to see their rent book; but these people have no rent book, and, consequently, they cannot give a guarantee, and he will not have them.

6137. I thought the Corporation of Glasgow were providing for people of that sort?—No! They always select their tenants. Every housing agency must do so.

6138. Are they tenants who would naturally, if left alone, have gone into the two or three roomed houses?—They would be likely in any case to select houses suited to their requirements; but by “selection” I meant that they must be respectable people—that for houses of a given size they must not be earning more than a certain amount per week.

6139. But having that limited income they show themselves to be respectable people?—Yes; their past record is carefully inquired into.

6140. But that would be a certain means of excluding the good people who happen to be driven into the lowest class, would it not?—I doubt it. I had a census taken of the farmed-out house population in 1901, and one of the questions asked was the reason why they were occupying farmed-out houses, because the rents paid are very high—roughly 5s. per week or £13 per year—and a very large proportion, over 60 per cent., at once replied “Drink,” and they quite unhesitatingly put that forward as the reason why they were there.

6141. Still, there is a certain proportion of the entirely respectable people who are not habitual drunkards, who by misfortune are driven into this class, and find it difficult to get out, is not that so?—Into the one apartments, but I doubt if, apart from drink, many gravitate to the farmed-out house.

6142. But you have the provision of the model lodging-house—they have model tenements in the High Street?—Yes, but the High Street tenements, recently erected, are of a larger size, and with larger rents than those one-apartment houses.

6143. Are they let in one apartment or more?—I think that there is a certain proportion of one apartments, but they are chiefly two or three roomed houses. The Corporation have erected a number of one-apartment houses but they are not inhabited by the class who occupy farmed-out houses.

6144. And the one-apartment would cost more than 5s.?—5s. as a sublet or farmed-out house, but much less—1s. 10d. to 2s. 2d. per week—if occupied by the original tenant.

6145. So that that would be one way of escape at any rate for a certain proportion of the people who are driven down by misfortune into this class; for the town council takes care to investigate such cases to see that they are satisfied that they are respectable people, and they will take them into their houses?—Yes, in this way. I suggested some time ago that as there was a certain proportion of the population who never can get away from the farmed-out house unless you help them and provide shelters of some sort, if they pay regularly at the farmed-out house rate for three or six months that should acquire a market value and help to qualify them for an upper grade tenement. At present they go on paying for months this high rent, without the fact of regular payment creating any market value for them.

6146. But the municipal tenement, and the keeping them under their observation and promoting them to a better class of house if they prove themselves worthy of it, is one way of improving this class, you think?—I think it is.

6147. And an extension of that is perhaps as useful a way of improving the health of a town as anything that could be done?—That is so—the more important section of the sanitation of the town concerns itself with this very section of the population.

6148. Is there any other method of improving that section of the population on a different line?—If one could extend technical education to the unskilled class, obviously that is a method of raising them.

6149. But, of course, technical education can only follow on a really good general education?—That is so.

6150. So that it would be perfectly useless to try that?—But with a child of this class from the school at fourteen, with a leaving certificate, he is not even then qualified for any trade, and he takes what offers—the most rapidly remunerative form, which is usually unskilled.

6151. He becomes a messenger boy or takes up various casual employments, and never becomes apprenticed to any definite trade?—That is largely the cause of the difficulty later on in life.

6152. Have you thought of any way of getting over that?—I do not know that I have very definitely, but in a

*Dr.
Chalmers.*

general way: what I have said regarding technical education might be amplified by the suggestion that the training of a boy for work in after life should have some of the care presently devoted to his elementary education.

6153. You spoke of getting the population out of the town by distributing the industries over the country; you think that the population would follow industries?—They would be more ready to follow industries than to disperse of their own account..

6154. Curiously, in the case of the Singer Sewing Machine Company, which went down to Bowling, it did not work out that way?—No; and for the reason which I have suggested.

6155. The population actually lived in the town?—But I imagine that if industries became distributed, and you had varieties of them, the difficulty of finding occupation for all the members of a family would become less.

6156. It will not do to merely shift one industry, but you must have a certain variety of industries brought together at a definite centre, you think?—That is to say, to give occupation to men and women.

6157. The shifting of a Singer factory is no particular remedy?—That is so.

6158. The certain organisation of industries in order to make a town, to create a town with a definitely municipal organisation, you think that would be better?—That co-ordination of industries is partly the Garden City scheme, if I understand it aright.

6159. I think it is. I was very much interested by some remarks in your other pamphlet on the Vital Statistics of Children of School Age. These have been steadily improving?—They have been steadily improving.

6160. And not only as regards the general death rate between certain ages, but as regards that particular class of disease which has always been traced, at any rate by many people, to over-pressure at school—nervous diseases—those have improved, you say?—Yes, at school ages at least.

6161. As regards these you say as regards “the age period five to fifteen it fell 25 per cent., and at fifteen and upwards 10 per cent., but at ages under five it increased 5 per cent. Here, then, I think, we have an answer to the assertion sometimes made that over-pressure in schools tells on the nervous system of children.” That is your conclusion?—That is the conclusion I have come to. I think I guarded that by this suggestion, that nervous disease usually runs a chronic course, and might possibly appear as a cause of death later in life. But from other inquiries as to the alleged increase of lunacy, I rather think that the decrease above indicated actually represents what is occurring.

6162. On page 23, more or less summing up your conclusions, you say—“They, the children at least, are displaying a vitality more vigorous than their predecessors, and leave their school years better equipped physically than they did?”—That is the impression I had when taking these figures out. It is my opinion still.

6163. What do you attribute this general improvement in the health of the children to; do you associate it with any particular causes?—A combination of causes: Improved facilities for food, improvement in housing and in school buildings, and a higher standard of well-being generally.

6164. Many witnesses have spoken about the defective ventilation of schools in Glasgow?—I had an opportunity, with the consent of the School Board, some time ago of making a contrast between mechanically and naturally ventilated schools, and the results appeared to be definitely in favour of mechanically ventilated schools. The observations only covered six schools—three of each kind of school.

6165. As to these mechanically ventilated schools, would you consider the atmosphere a healthy one for the time of day that they were there?—It might be made that. A good deal seemed to depend upon the individual teacher.

6166. But if mechanically ventilated it would not depend upon the individual teacher?—Yes, because the inlets have movable doors, which are under the control of the teacher.

6167. But if it is a large school of 1,000 or 1,500 would it not be as well to have a person looking after the ventila-

tion, and not have it interfered with by the teacher?—That would have quite a definite value, I believe. One found, for instance, that one teacher closed the door because it was too hot, while the one in the room immediately above him did not close it at all. This possibly arose from the varying temperatures of air which is heated at a central point only. But by distribution of subsidiary coils in the smaller ducts these variations might be got rid of.

6168. But you think that these mechanically ventilated schools, if the ventilation is decently looked after, are perfectly satisfactory to spend a portion of the day in?—My impression is that it is so.

6169. It would not be deleterious to the physique of the children in any way?—No, I think not. I saw nothing to suggest that.

6170. As regards the submerged population, I suppose it would be better than the conditions of ventilation they found at home?—Usually so. The ventilation of houses is notoriously bad, even in houses of a much larger size than those we are speaking of.

6171. You think that the children were better fed, and you connect that with the improvement?—I think that the food of the people generally has improved in the past thirty years or so.

6172. But there must be a certain proportion of the children of Glasgow who are not properly fed?—I am making some inquiry at the moment, but the number of observations is not sufficient to lay before the Committee. The impression one gets is that there is a considerable number of people who live not knowing in the morning where the food of the day is to come from; they live from hand-to-mouth as it were; everything is uncertain in their lives, and food is one of these things.

6173. But, I believe, that in Glasgow there is a systematic provision for supplying food for children of that class at the school?—Yes, there are refuges; it is through them partly that I am obtaining the information.

6174. It is what is called the “Poor Children’s Dinner Table,” is it not?—Yes.

6175. We have been told by one witness, at all events, that practically the state of things is such that no child in Glasgow ought ever to go to school starving?—That is a pretty accurate description of the condition. The Society carefully inquires into the condition of every child, and they get to know the really deserving families.

6176. How long has the Society been carrying on its operations?—That I could not tell you—but it is quite a number of years, probably from the eighties.

6177. But probably the physique of the people of Glasgow does not suffer from underfeeding so far as the children who go to school are concerned?—In these inquiries we have been struck with the preponderance of the defective teeth in children. The district we have started with is one of the worst—Cowcaddens district—and there, certainly, there are quite a large number of children with defective teeth.

6178. Do you connect the defective teeth with any particular social condition? We have had figures to show that the teeth of children belonging to a good school were really worse than those of the children of a poorer class?—I do not know how it will work out with us until we can get the observations extended.

6179. But do you have any oversight of the school buildings in any way?—In a general way they come under the purview of the Public Health Act.

6180. You deal with them practically from the sanitary point of view?—Simply in the direction of closet accommodation. But there is a definite provision in the regulations of the Education Department for this.

6181. Does the sanitary officer look after them as a matter of fact?—In that relationship only.

6182. But they never carry it into such questions as ventilation?—No; save in the inquiry I have mentioned, which was undertaken with the consent of the School Board.

6183. Have you taken the question of the medical inspection of schools into consideration, as to whether the School Board should have a medical officer to inspect the

Dr.
Chalmers.

school buildings and the conditions of health?—The need for it was brought out prominently by the Physical Training Inquiry, and the inquiry now being conducted in Glasgow was suggested by that Report.

6184. Do you think it would be a good thing to have that medical inspection of schools?—If you put the children under a definite physical training you must. With one exception, I found that the decreasing death rate of children of school ages was in diseases of the heart. That is one form of disease which one wants to know definitely about before any compulsory physical drill is undertaken. If all the children are to have a certain definite amount of drill to do you must know the condition of the individual children.

6185. Do you not think that the conditions of exercises might be so gentle but cumulative that there would be no risk to children, except those who had heart symptoms which would no doubt be noticed?—You might grade the children in relation to the amount of exercise.

6186. The medical inspection would be very important from this point of view. No doubt, with a large Board like Glasgow Board, they would look very carefully as to the sanitary condition of a school; but take the case of managers of Voluntary schools, a school run by a single clergyman very often filled with the very poorest class of the population; I am thinking of Glasgow itself in this connection; there is no one with any power to see to the ventilation, the health conditions generally, except the school inspector, who is only able to visit that school very occasionally; do not you think from that point of view it would be well to have a distinct medical inspection of the schools?—From that point of view, certainly, it would be quite a definite advantage I think. I think it has been observed in certain of the public schools in England, for instance, that you have a definite increase in developing chest measurement which is quite inconsistent with tubercle. That is one illustration of the value, as far as I can see, that at once your attention is called to the fact that the children's lungs are not expanding in the regular way, then there is reason to inquire into the condition of the chest.

6187. You would have an examination of the children from time to time?—Yes, that would be part of the system.

6188. Supposing each child was examined as he came in and his condition definitely recorded, and then a visit was paid once in a fortnight later on to examine those to whom particular attention was drawn; would you be in favour of that?—Yes; re-examinations at definite intervals would be of undoubted advantage.

6189 (*Colonel Fox.*) You were speaking just now of a family living in one room; does that mean the father mother, and children?—Yes.

6190. How do they manage with their cooking in that case?—They cook in the living room, and sleep in the living room.

6191. You have also houses which you call tenements, or what?—A tenement with us is the whole building; a house is one or more rooms generally occupied by one family.

6192. But you have rooms for the skilled artisans who get a good wage. They have houses with more rooms, have they not?—Oh, yes.

6193. They have a sitting room, have they not?—Yes. Our custom is to have a kitchen, and in a single apartment house that is also the sleeping room. When you get into the two-apartment houses then they have a room and a kitchen. The room would be used for sleeping by a certain portion of the family, and the kitchen by another portion. And then you may have two rooms, where there is a bedroom, and so on.

6194. But then you have a great many houses, where you have the well-paid working classes, who have a sitting room which they never use?—It is very common to keep one for exceptional occasions.

6195. Therefore you entirely lose the space of that room. Would it not be much better to have one large room instead of a kitchen and a sitting room? They would have a fire always there, and would get more benefit out of it. But it seems that a good many of those people have a show room called a sitting-room, which they very rarely use. Is that so?—That is perfectly true.

6196. And then, as regards the unemployed, the lowest stratum—you suggest committing those people to a labour colony or settlement, do you not?—If I did, I had in my mind the permanently unemployed, the man who is unwilling to work unless compelled to.

6197. Is it that they are unwilling or incapable of working. Are the large majority of them capable of work?—They would be capable certainly. Many of them are quite capable of work.

6198. They are capable of work, you are sure?—I take it so. You mean the vagrant wastrel part of the population, who only work when compelled.

6199. If you send them to the colonies they are capable of doing some work, you think?—I have not any personal experience of the labour colony, but there is one in Scotland, and they have obtained very good results just from these very people, but with this difference, that they voluntarily offer themselves.

6200. Would you not compel them to go there?—Yes; but the people of the present colony are to be distinguished from the class that we have been describing generally by the fact of voluntarily surrendering themselves. That means an initiative on the part of the man, and indicates that he has some mental fibre left.

6201. Are those the people that you would send to the labour colony?—And also those who meanwhile fail to avail themselves of it.

6202. As regards cigarette smoking amongst boys, do you think it advisable to find some means of stopping cigarettes for boys up to the age of sixteen?—Well, I had to report on the subject about a year ago to the corporation, and my recommendation was that to stop smoking up to the age of sixteen, and to apparently sanction or approve of it from sixteen to twenty, would only get rid of half the trouble. What you want is to stop it until maturity, or further than the age of sixteen.

6203. You would go as far as the age of maturity?—Yes.

6204. (*Mr. Struthers.*) Would you say twenty?—Twenty or twenty-one was the age, but whether you could do that through legislative measures or by creating a conviction on the part of both children and parents that it is bad for them there is room for a great deal of variation of opinion. Unless you have parental influence in the matter I very much doubt the value of legislative interference.

6205. (*Colonel Onslow.*) You have been taking some measurements or making some arrangements for the height, chest, and so on, in children?—Yes.

6206. In the case of weight you make an allowance?—Well, the boots are taken off, and the chest measurement is taken over the under garment.

6207. How about the chest?—It is taken over a semmit.

6208. (*Colonel Fox.*) It is over the nipples and scapula?—Yes, over the nipples.

6209. (*Colonel Onslow.*) You take one measurement?—There are three measurements.

6210. The most valuable in your opinion is to ascertain the true (I do not mean the size of the chest) but the true physical thickness of it—the difference between the measurements?—I mean the difference between the greatest and the least measurements.

6211. You want the movement?—The range of movement. The difference between ordinary expiration and inspiration.

6212. (*Colonel Fox.*) By taking the measurement over the scapula you get a larger measurement, the best measurement is under the scapula?—Quite so.

6213. In making out these statistics it would be important to have that measurement everywhere the same?—Obviously, because you can make two inches difference in adults who had been accustomed to work.

6214. (*Chairman.*) Just one question; first as to the pollution of the atmosphere in Glasgow. Is that an evil from which you suffer to any large extent?—Yes, both smoke and fog we have.

6215. Fog is the act of God, and smoke is the act of man; but do the Town Council make use of their powers under the different Acts of Parliament to reduce the evil as far as they can?—There has been quite a definite

effort going on in recent years. Formerly the administration was in the hands of the police. In 1899 they handed it over to the Sanitary Department, and the Act has been vigorously enforced.

6216. Both as regards smoke and noxious vapours from chemical works, would you say?—Not vapours. Smoke is dealt with by the Sanitary Department, but vapour or gases from chemical works are controlled by the Alkali Acts.

6217. Have they both left Glasgow now?—The Alkali Acts have been in operation for many years.

6218. Are they quite excluded from the atmosphere by the municipal action?—A vigorous application is now being made of both Acts.

6219. And has as much as possible been done as regards the smoke nuisance?—I think so; I think pretty effectively during recent years.

6220. Do people note any improvement in the atmosphere of Glasgow; I cannot say that I do?—It would be difficult to say. We have fogs still as we used to have them.

6221. Do you think the law is strong enough?—It is strong enough, I believe, and there is a desire on the part of the manufacturer more or less to comply with the conditions.

6222. Then with regard to the town extensions. When the area of Glasgow is enlarged, do you find that you take in slums or thickly populated areas that grow up haphazard, so that the problem that the Town Council has to deal with in regard to overcrowded or insanitary areas, is often aggravated rather than relieved?—It is not the case, I think, that in past extensions many insanitary areas have been included. We have had a certain number of houses in these extensions which we have had to close up, but they were quite limited in their distribution.

6223. So with the extension of the city, the City Council have been able to acquire areas which they could lay out, or secure should be laid out, or some proper system in regard to density?—Yes, as a rule regulation comes in with regard to new buildings. But as to the effect upon the death-rate over some years, the effect produced by the

included area only amounted to a difference of 0·8 per thousand; that is if it read twenty-one for the whole of Glasgow as extended it would be 21·8 for the original area.

6224. That is the only difference in favour of these urban districts?—Yes. The actual rate of the added districts was lower, but its effect on the death rate of the whole is as I have stated.

6225. That is not a large difference?—It does not represent the actual death rate of the added districts. In them it is about sixteen.

6226. (*Dr. Tatham.*) Does the jerry builder give you much trouble in Glasgow and the neighbourhood?—Not now; the building regulations have been revised twice in the last ten years.

6227. With regard to the zone outside the municipality of Glasgow does the jerry builder appear there and cover the ground with his badly constructed houses?—Probably in times past, but what is outside of Glasgow is now in the counties or in other boroughs, and the county administration of Scotland has been greatly improved since county organisation began, fourteen years ago.

6228. Are the building bye-laws the same in the town and the country?—They are not quite the same, but they are equally good. In the county districts the building bye-laws became operative only in 1897; and there is real effort in the counties to bring up the standard of sanitation.

6229. But where you come to take a suburban district into the municipality of Glasgow, do you not find, as has been found in many of the English towns, that the property which you are obliged to take in, or which you are taking in, is sanitarially almost worse than the central parts of Glasgow?—There are three neighbouring burghs to Glasgow and they have each sanitary problems of their own, and if they were included, we should have to deal with them; but the extensions that have taken place in the past—I mean in the recent past, ten or twelve years ago—included as a rule very good districts.

6230. You are very fortunate, and I wish that were the case in England generally?—Well, that is the case with us.

Mr. JAMES NIVEN, M.A., M.B., Cantab., called; and Examined.

6231. (*Chairman.*) You are Medical Officer for Manchester?—Yes.

6232. How many years have you occupied that position?—Since 1894.

6233. And previously to that time had you any special acquaintance with the district?—Yes; I was eight years in Oldham as Medical Officer of Health.

6234. Before you went to Manchester?—Yes.

6235. So that you have had eighteen years' experience?—Yes.

6236. What do you take to be the material conditions of the evidence on the subject into which we are inquiring?—I think that the materials for an accurate judgment as to the progress of the population are not in existence except to a very partial extent. If we had had accurate measurements, even if we had had the age, height and weight of school children generally, or of particular groups of the population which corresponded with existing groups over a prolonged period, I think that we might be in a position to form a better judgment as to what had been the progress with regard to the physique of the people.

6237. You attach a great deal of importance to anthropometric data for determining these points?—I do; I think that they are important, not only with the object in view but also with the object of observing the children. I think with regard to obtaining accurate data in the school, it is a very simple matter to have a weighing machine and a machine for taking the height. If these alone were recorded and registered, as they might be once in a term, the comparison of height and weight term by term would give an indication of the condition of the individual child.

6238. You would confine that to children of school age?—I would not if you could get like facts at other ages; but I mention the school because there it is practicable.

6239. But in the case of factory workers for instance there is no difficulty in getting hold of them is there?—I think that it would be difficult, and I should not be surprised if a certain amount of difficulty were to arise in the schools. I feel quite sure that, supposing any attempt were made to get the height and weight of factory workers, except in a very partial manner, and in places where the factory workers were very much influenced by the employers, difficulties would arise. It might be tried and it would be a good thing.

6240. What sort of difficulties would arise?—The people would object.

6241. There is no indignity in it, is there?—There is not to us, but they would consider that we were unduly inquisitive.

6242. They are subject to suspicion?—That would be found a difficulty, but I do not say that it would be an insuperable one.

6243. The Anthropometrical Committee of the British Association twenty years ago examined something like 50,000 people, you know?—I do not remember that. Some of the tables would show that the number of people examined was not sufficient to justify conclusions.

6244. That was not from any repugnance on the part of the people, but it was owing to the Committee's want of resources?—Well, it is the case that the tables show a deficiency of data.

6245. That we are all feeling. Now would you please proceed with your evidence in the order in which you think best?—Now that we have got upon the subject of school children, might I explain what I feel about the education of the children?

6246. Yes; let us take it in the order in which you have prepared it?—I would begin here by taking the statistics of mortality. I think, although we have no other accu-

*Dr.
Chalmers.*

Dr. Niven.

Dr. Niven. rate data that we have some little help from photographs. I was informed by the Director of Elementary Schools in Manchester, Mr. Wyatt, that he is in possession of photographs of school children taken in schools, in the lower class of the population, twenty years ago, and recently; and that those photographs seem to show a very decided improvement in the clothing and physique of the children.

6247. Some have been submitted to us here, and they tell us the same tale?—Now I have here photographs taken by the chief clerk in the Public Health Department fifteen years ago and last year showing the slums in Manchester, and he took the worst places. It so happened that a considerable group of children gathered round the photographer, so that there are groups of children shown in these photographs, and as far as I can judge from these photographs they all tell the same story of improvement.

6248. (*Mr. Lindsell.*) In physique as well as in clothing?—Yes.

6249. (*Chairman.*) Is it more than a superficial improvement, do you think?—Of course that is a little apt to bias one's judgment. I admit that I think that that is so. Here are the five photographs of the slums in former times in the small envelope; and I put forward the rest in a certain order, in order that the best photographs may present themselves. The larger groups are recent and the others are old ones (*producing the same.*)

6250. (*Dr. Tatham.*) Are these Mr. Ellwood's?—Yes. I think I might also mention on this point that the superintendent of relieving officers in Manchester, Mr. Dewsnup, a man of excellent observing power, and generally a very intelligent man, is also of opinion that there has been up to recently, say a year ago, a very marked improvement especially amongst the children.

6251. (*Chairman.*) In Manchester?—Yes. He says that at present there are signs of deterioration.

6252. Showing itself during the last twelve months?—Yes, because there has been a great deal of distress.

6253. That is due to local causes?—Yes; that is temporary

6254. That is a fluctuating element in the question?—Yes. Now, putting that smaller consideration of photographs aside, as far as I can judge, we have only the mortality statistics to go by, and I give first the mortality statistics over the whole country, because they are necessary to check any conclusions which you may arrive at from Manchester. I take, except for the last ten years, from the Registrar General's Returns, the decennial death-rates at groups of ages in three registration districts which represent modern Manchester; taking for the last decennium the City of Manchester itself. Then I also show for the Manchester township (that is the central and insanitary portion of Manchester) the death-rates at groups of ages since 1851. These are corrected. These statistics show for the whole country, the city of Manchester also, immense improvement in the death rate at ages from five to twenty-four; for the whole country the improvement extends to higher ages.

6255. At thirty-five and upwards the death rates are getting worse?—So they did up to the last decennium; but if you look at the figures within the last decennium, there has been an improvement.

6256. But only in the last decennium?—Yes; but one must remember that if, as no doubt is the case, distress and physical deficiency at the younger ages has an important effect upon the physique afterwards, then the children recently passing into the older ages, both in the whole country and in Manchester, have been those children who have undergone, forty years ago, the physical deficiency which gave rise to those very high death rates at younger ages. Of course as things improve, we should expect that the death rates at higher ages would improve, and so they seem to do in the last decennium.

6257. (*Chairman.*) There has been no improvement in infant mortality?—Yes up to the last decennium.

6258. Under one?—Under five there has been an improvement.

6259. That is what you call "infantile mortality" under one?—Yes. I am afraid I have not the full figures.

6260. (*Dr. Tatham.*) Your Table 11 shows the deaths in proportion to births?—That is for the whole country. There was an improvement for the two decennial periods; but there was rather a retrogression during the last decennium.

6261. (*Chairman.*) Why was 1902 such a good year?—Oh: it was cool. The death rate from summer diarrhoea is low. You will see from the summing up, that except for diarrhoea, if you compare the average for the last six years with that for the six years preceding, the infantile mortality has diminished, except from diarrhoea. The total has gone up, but that is due entirely to the high diarrhoea death rate. I think there is no doubt that there has been a great deal of work done in teaching people how to feed the children.

6262. You think that has had an effect?—Yes.

6263. Do you think that is due to the operation of the Ladies Health Society?—We have done more than that; we have arrangements with the registrars of births and deaths who hand instructions to the parents how to feed the children. This has been done for a number of years.

6264. But what security have you that the mother reads them?—Perhaps one in a hundred at first did so. The proportion is constantly increasing.

6265. Does not the presence of the lady visitors secure that they are read?—But that is only in the poorest part of the city; they do not go outside the central districts.

6266. And that is where it is most wanted?—Yes.

6267. You attach great importance to this work?—Yes.

6268. You take care that every lady who takes part in this work is not only competent to give advice, but that she is tactful, and considerate, and sympathetic, and also that the advice that she gives is likely to be accepted?—That is so. Of course, they vary a good deal; but we train them, and they do their best, no doubt. Some of them are extremely good, and, of course, others are not.

6269-70. Have you any difficulty in getting the requisite type of person to undertake the work?—That I cannot say: they are appointed by the Ladies Health Society.

6271. The class of people who are paid 16s. per week?—Yes—some of them are excellent. They are like other classes of society; they vary in intelligence and capacity.

6272. Do the ladies themselves give much time and attention to it?—They do, but the practical work is done by the health visitors, at any rate in this work. Of course, I attach a great deal of importance to the work, and there is no doubt that it has done a considerable amount of good.

6273. What opinion, on the whole, do you form of the vital statistics of Manchester?—Well, I think, that as regards children of school age and young adults, on the whole, taking those death rates into account, their physical condition we may conclude has improved. There is such a marked improvement in the death-rate that it is impossible to avoid coming to that conclusion. I admit that a smaller change in the death rate might be attributed to causes which did not necessarily include physical improvement as part of them; but I think when there is such a great improvement as that, that we can only come to the conclusion that the physique has improved.

6274. I suppose that there are areas in Manchester, or people scattered all over it, who do not come up to these improved conditions?—That is true. That may be said to be true of the whole of the central district of Manchester, with regard to which I have given statistics—you may say that of it generally.

May I say with regard to that district, even—and with regard to that part we have to consider the poorest part of Manchester—that that must steadily, relatively, become poorer and occupied by an inferior class of people, because the whole population is increasing so immensely; and the poorer part undoubtedly aggravates the evil to the rest of Manchester.

6275. That is the sink of the place?—Yes, it is the most wretched part of the city; now, and in spite of that, the death rate in that portion is less than it was fifty years ago. The death rate in that central portion of Manchester has decreased, although formerly it contained samples of

the whole population, and now it contains the most wretched part of the population, and in spite of that the death rate is less than it was.

6276. Are not you keeping alive people who are better dead?—It is not a matter of keeping them alive.

However, may I go on to say that the death rate of this, the most wretched part of the city, is now considerably less.

At ages five to twenty-four the death rate is less than it was sixty years ago in the whole of England.

6277. As to the future of those people when you do keep them alive, what effect will it have on the labour market—are they fit for work?—I have not the slightest doubt about it. These figures show they must be quite good enough.

6278. Are they fit enough for regular sustained work or merely for casual labour?—I think that they are capable of sustained labour certainly. May I say that I had an examination made of the poorer families in this district by a certain number of the health visitors, and one of the points some years ago we tried to find out was whether the people coming into the city from the country or the people who were produced there were the most vigorous; and the only conclusion at which I could arrive on examining the reports made to me was that there was very little difference—that the people produced in the city were quite as good as those coming in from the outside. Of course, with regard to the question of recruiting the ranks of casual or of sustained labour, that is a matter of education and feeding. I think you may take it that, if the children are well fed, properly clad and properly educated, a considerable proportion of them in any rank of society will find their way upwards.

6279. But in this particular section of the people of Manchester, are the parents less well-equipped for bringing up their children under favourable conditions than they were twenty years ago. One does not see why the condition of this central district should be getting steadily worse and worse?—They are improving. As a matter of fact, the district is improving in its worst features. The conditions with regard to housing are very greatly improved. The majority of the worst type of houses have been entirely cleared away—that is to say the back-to-back two-roomed houses—and a great many courts have been opened out, and inclosed spaces between houses have been provided. The houses, I may say, have been very often built close together at the back, so that there is not very much room, and the streets have been blocked at the ends. While these blocks have been removed the conditions of the backs of the houses have been improved at a pretty considerable rate, and altogether there has been a very great improvement in the condition of the houses in Manchester.

6280. Do you think there has been as great an improvement as might have been expected if the powers in the hands of the local authorities had been fully used?—Of course, there are powers in the hands of the local authorities—it is a question of expense very largely.

6281. And popularity?—Yes; the Sanitary Committee go as fast as they are able.

6282. Are they kept well informed of all the plague-spots in the town, is there a lack of information as to what the evils are?—Not at all. They make systematic visits to those places to examine the houses that they are called upon to consider and condemn, and either they close them or alter them.

6283. We had it suggested that there was some lack of knowledge where the evils were that they were called upon to combat?—I do not think that that is the case at all in Manchester. There is a little difficulty in arriving at the best course to pursue, but there is no doubt whatever as to the existence of many insanitary conditions.

6284. But I suppose it is the disposal of the persons who are inhabiting the dwellings which are closed which is the difficulty, is it not?—That is a very great difficulty.

6285. In Manchester when you deal with them, are they transported to outer areas which are being opened up for the purpose?—There has been a large outer area taken just on the outskirts of the city in the north.

6286. Has that been laid out on proper principles?—That scheme has not yet been provided, but a number of areas have been reconstructed in Manchester,

and recently the sanitary authorities have been searching for areas in which they can erect dwellings in the city. The question is now in an acute stage.

6287. You give us your reasons for the high death rate and you describe the occupations of the persons living in the more central parts of the town. There is nothing in the occupations themselves which is particularly unhealthy, is there?—No. Generally speaking, it is the lower class of labour, the poorly paid; it indicates the character of the class of people who live in the centre of the towns. A good deal of it, of course, is uncertain labour. That is another important factor.

6288. Do you say that intemperance is especially associated with a number of these occupations?—Yes. I think that is so.

6289. More so than others?—It is quite well recognised; Yes, I think so. For instance, running over them, one might say charwomen, coachmen, carriers, people employed in docks and harbours, etc., porters, messengers, bricklayers' labourers, masons' labourers, cotton operatives to a slighter extent, tailors, publicans, sailormen, barmen, hawkers, costermongers, labourers generally, printers and people employed in gas works; yes, there is quite an unusual proportion there.

6290. What is the second cause to which you attribute the high death rate?—The diet is inadequate in a large proportion of the poorer families.

6291. Is that because they have not the money or that they choose to waste it?—It is due, I think, partly to ignorance, and in not a few instances it is due to intemperance. But in a considerable number of instances it is due to ignorance, an ignorance of the best diet; that is a complicated matter.

6292. There is a great difficulty in supplying that information in the case of the adult population. You can only look to seeing that the next generation grows up better provided with the requisite information?—I believe it would be possible to frame a sort of information, which could be distributed to the population generally advising them as to how best the money may be employed, when there is only a certain amount available.

6293. Do you think they would act upon such advice tendered in that way?—To a certain extent, no doubt they would. Of course, there is always a lot of pressure brought to bear by their friends and those who take an interest in them, and by people instructing them, such as district nurses and health visitors. They often get assistance. Yes, I think a certain amount of attention would be paid to that.

6294. Could you not bring the food, already selected and prepared, to them. I have heard it suggested that some system of itinerant restaurants might be organised by which food properly selected and properly prepared might be brought to the doors of the poor, probably more cheaply than it could be done by the parents themselves?—I do not think that would be good. I think the girls ought to learn.

6295. Yes, I am talking of the present generation. You think it may be impossible to indoctrinate them?—Yes. I think with that as with many other schemes. I think that whatever is done in that direction should be done with a clear understanding that it was only a temporary expedient, that the proper way to attack the difficulty was to teach children how to select foods.

6296. You would make it a domestic question?—I would make it a domestic question. I should make it a compulsory part of education. I should not leave it to be merely tacked on as a voluntary part of education.

6297. You discuss the remedies later?—Yes. I have added this. I think it is right to say also that there is a good deal of casual labour and from one cause or another a considerable section of the population is reduced to poverty, and it is right to say that not only is intemperance a cause of poverty, but poverty is the cause of intemperance. People who have not enough food turn to satisfy their cravings to drink and also to support their enfeebled hearts by alcohol.

6298. I suppose want of fresh air and want of opportunities for exercise is another thing which drives people to the public houses?—Yes no doubt. Of course they do have exercise; they go into the streets, but it is the dul-

Dr. Niven. ness and monotony and want of opportunity of going into the country and so on.

6299. You are badly off for open spaces in Manchester, are you not?—We have very fine open spaces on the outskirts.

6300. But in the centre of the town you are badly off?—Yes, although here and there open spaces have been provided at the instance of the Sanitary Committee.

6301. There is a great difficulty in getting school playgrounds for the children?—Yes, there is a deficiency of school playgrounds.

6302. And I suppose they are not available except in connection with the school hours?—While there is a deficiency, especially with voluntary schools, there is a steady improvement. Every new school which is provided has a playground attached to it.

6303. Are there any means of using the school playgrounds on Saturdays when the schools are not open?—Yes, I think they are used, as a matter of fact. The teacher has the children there.

6304. But you can hardly expect the teacher to do it; he wants his holiday?—Yes, but he does it.

6305. It is rather hard upon him?—Yes. A great many of them take a very great interest in the children.

6306. Do you not think municipal action ought to come in there with a view to provide facilities for physical education and the physical training of the young after they have left school?—After they have left school?

6307. That is the period when they are so apt to lapse owing to all supervision being withdrawn. Very few of them, I suppose, go to continuation classes, comparatively?—I do not like to express an opinion on that subject off-hand. I think that ample provision ought to be made. I think to a very large extent provision is made in Manchester. Every field that can possibly be obtained is snapped up all round the city for football clubs and cricket or one game or another. There is a very great eagerness on the part of Manchester children to get spaces for games.

6308. How is that done—by private agencies?—No, by the boys themselves.

6309. How have they the resources?—I suppose they manage to get a certain amount together. Of course that does not apply to the very poorest children.

6310. Those are the ones who want it most. We were told the Manchester child was losing the instinct of play because of the want of facilities for enjoyment after school age?—I think that is a great exaggeration. There are a large number of ragged schools in the city which take an interest in the very poorest children and put them through exercises. They are supplied with the means of giving thorough gymnastic exercises. Take, for instance, an institution like the Boys' Refuge at Strangeways, where they take in 450 of the most wretched children of the city. There they have a swimming bath and a fine gymnasium. They have gymnasias attached to the industrial schools. Swimming is immensely encouraged in Manchester. During the year ending November 7th, 1901, 339,252 baths were taken by scholars, of which number 177,258 were free. I have here the list. There are twelve gymnasias, many of them utilisable by comparatively poor children. I certainly do think that physical exercise is pursued to the limit of practicability in Manchester.

6311. Under present conditions?—Under present conditions, yes. In so far as that statement is true, it is only true in so far as the pressure of conditions imposes the absolute impossibility of exercise. I feel convinced of that.

6312. The impossibility of getting open spaces?—Yes.

6313. (*Colonel Fox.*) You know in a great many of these schools they have large halls, which they use for drill purposes and physical training?—In Manchester?

6314. In every town—the board schools?—Yes, they do drill, of course, in the school.

6315. But they have halls suitable for that?—Yes.

6316. And suitable for gymnasias?—I do not know that.

6317. I have been there and seen them in Manchester—large halls in the board schools?—Yes, there are large halls.

6318. These halls are not utilised in the evenings at all. Do you not think that you ought to make use of those

for your boys? A great number of boys' and also girls' schools could be formed for physical training in the evenings after school hours?—You mean the boys and girls could have physical training after school hours?

6319. Yes?—Of course, the ordinary school children are drilled inside, in the hall of the school, but that is during school hours. I am speaking of times when you want recreation for children, perhaps to keep them out of mischief or to give them healthy recreation.

6320. Those halls are lying idle after school hours?—Yes.

6321. You say that everything is done at present, but surely there could be something else done; there is an additional means of giving them recreation which is not taken advantage of; those places are empty?—Of course, if you can get the children to go to those schools.

6322. They are most anxious to go there. I have inquired. All they want is some encouragement. I know several who have started this plan and they have got the use of the school-room by paying for the cost of gas, etc?—I think it would be a good thing in so far as it could be utilised. My information, however, is that at present there are a number of lads' clubs in various parts of the city where the boys have gymnasias and do exercises.

6323. There are a vast number of children who cannot get to these places, and they would be only too glad to have proper classes formed and organised in the board schools which exist now and are largely empty?—Yes, they could be organised.

6324. (*Chairman.*) There is some want of system, no doubt. But now will you describe the third cause as to the character of the housing?—The houses in the poorest quarters are old and therefore insanitary. They are without damp-proof courses. In a large proportion the space behind the houses is insufficient, and this space is often closed by houses. There are still about 3,000 back-to-back houses, badly ventilated, and closets accessible to the public. There are still a few courts left. But within the last twenty years great progress has been made in the closing of back-to-back houses as dwellings, and in converting them into through houses with yards. Several areas have been cleared and tenements or cottages on sanitary principles have been erected. There are in the centre of the city about 206 common lodging-houses, containing 5,831 inhabitants. These are, as a whole, insanitary, being old, and with defective day rooms and other conveniences. There are also a large number of houses let in lodgings, many of which approximate to common lodging-houses. The system of storage of excreta is mainly a conservancy one, the majority of the houses being provided with pail closets or middens. Ten years ago the drainage of the houses and passages was in a very bad condition.

6325. (*Dr. Tatham.*) With regard not to the drainage of the houses but the main drainage, how are you dealing with that now?—There has been a complete system of main drainage provided in the city, and sewage is now carried down to Davyhulme; it is partly dealt with by precipitation with lime, and partly it is subjected to bacterial action.

6326. Have you the whole main drainage scheme of Manchester complete now?—I believe so.

6327. Have you got over your defects with regard to the treatment of sewage; is it entirely satisfactory now?—The system which is in force in Manchester is not applied as yet to the whole of the sewage.

6328. Then you only apply your system to part of the sewage of Manchester?—It is only applied at present to part of the sewage.

6329. How do you deal with untreated sewage?—It is treated; it is precipitated, and the clear effluent is run off, but it is not subjected to the more complete purification by bacteria. Great advances have been recently made in regard to the drainage of houses, and the replacement of the pails or middens by water-closets. All new houses must be provided with water-closets. Further, since November 1st, 1890, a sufficiency of space in front of and behind houses has been secured, while streets no longer end blindly.

6330. (*Chairman.*) Some of the new streets are narrow?—No, all streets now must be 36 feet wide.

6331. Is that wide enough?—I think so, for cottage property. It is mostly ground and first-floor property which is erected. Of course with streets containing more important property or more important houses many of them are considerably wider than that; but that is the standard street. There is of course overcrowding in many of the houses occupied by poor persons. But the census housing figures for the population as a whole show that, with improving circumstances, the tendency to overcrowding diminishes, while the tendency to live in a better class of dwelling increases. Prosperity and adversity alike cause over-crowding in the poorest parts of the city. With a wave of industrial prosperity more persons want to have their own house, and more workers are wanted. Every house, good or bad, is occupied, and the overflow of workers leads to overcrowding. In adversity poor families take in lodgers, or they occupy different rooms in the same house, and overcrowding is caused in both ways. Overcrowding is inevitable among the poorest class at times.

6332. Now you come to the question of food. Of course there is first of all the condition of children before school age which you do not touch upon. That is of importance surely?—It is of importance, and I have attempted to go into that subject, but there is this difference, that the machinery exists for dealing with children at school age and it simply requires extension, while the machinery does not exist for other ages.

6333. It is therefore all the more important that we should consider it?—That is so, but of course one wishes to get at the maximum of immediate practical benefit if you can.

6334. In regard to the supply of milk in Manchester, is that sufficient?—I think you can get as much milk as you want.

6335. Has it reached the proper homes?—I cannot give you the exact proportion of milk per head.

6336. Do the children of the poor get it? I daresay as much comes in as you want, but do the poor children get it?—They do not all get it, that is quite certain.

6337. Is any attempt made at municipal distribution of supply?—No.

6338. Such as they have at Liverpool and St. Helen's?—No. That is not distributed for nothing.

6339. No, of course not; distribution does not imply that?—I think if we go into the question of milk it will take a considerable time.

6340. But there is no system under municipal patronage in Manchester?—No. I may say that I am not satisfied that that is the direction in which to deal with this subject of milk. We have done a very great amount of work in connection with milk in Manchester. It is a subject to which we have given an exceptional amount of attention, and an endeavour was made to meet the difficulties of the situation by voluntary agency. A company was started in Manchester, which had for its aim, to get milk from cattle guaranteed free from tuberculosis, and to get it from clean farms, to bring it cooled down and supplied to the people in a comparatively sterile condition, in fact, what we might call fresh milk. The object aimed at by those corporations which have taken up the municipal supply is to supply milk which is sterile, in which the organisms present have been rendered innocuous; it is subjected to certain processes of modification, run into bottles, the bottles placed in baskets, each bottle containing sufficient food for one meal. Then, of course, you require a considerable administration of visitors to persuade people to use the milk regularly and properly.

6341. That is what you have done to some extent in Manchester?—We have educated them, but in the other case you have to exercise pressure as well as thought in order to render the thing efficient. My difficulty is that I am not satisfied that the difficulties are overcome by simply sterilising the milk unless you also get the milk what one may call fresh, that is to say comparatively free from processes of disintegration such as occur if milk takes from twelve hours or upwards in transit, especially in summer, and has been subjected to impure conditions to start with. I think for the complete provision of a good milk supply we must start with the object of getting the milk brought to the town fresh.

6342. And to be sure that it comes from an uncontaminated source to start with?—Yes. I think that is very

important also. If we are to do that a new milk supply must be provided, that is to say, farms would have to be provided round our big towns.

6343. Surely in Manchester you are close to a great area where milk is produced—Cheshire?—You must do one of two things. You must get your farms quite near the towns, so that the milk takes very little time to bring in and have it immediately under supervision to see that everything is right, stall feed your cattle, put them upon a uniform and regular diet as they do in the best American systems, and also in Sweden, or some means must be found for getting the farmers at a greater distance, to keep their milk under constant cooling, and carried in refrigerating cars in the city; either one or the other of those expedients would be necessary if you are going to get fresh milk. The question is a very difficult one. The difficulties are not overcome even when you have got a good milk supply. The good milk supply may be rendered futile by dirt in the house, by purchase of rubbishy fruit, and various causes of that kind. In fact, a necessary part of any very great improvement is the education of girls on these subjects practically.

6344. As to how milk should be stored?—Yes.

6345. And under what conditions it is fit for use?—Yes, and how children should be clad and cleaned, and so on.

6346. (*Mr. Lindsell.*) You say the detection of conditions must, in the first instance, fall on the teacher in the case of children?—Yes, I think so. When one remembers there are over 100,000 children in the elementary schools in Manchester, it is difficult to perceive how you are going to exercise sufficient observation upon that vast army of children by means of medical supervision. Not only so, but the teacher is in constant contact with the child. He sees it in various aspects. He especially sees the child having physical exercise, which is now generally given in the schools, and, therefore, he has many opportunities of judging of the physique of the child, which a medical man cannot have, not to speak of a great number of teachers that are in contact with children. I do not see that it is possible to get that necessary intimate knowledge of the children except through the teachers, and I am also satisfied, from my personal observation, and from general considerations as well, that to make the teachers as efficient as is necessary they will require special training on the classes of children by medical experts in the detection of conditions of illness.

6347. Would you make that a branch of the training of teachers?—Yes. I think that is quite necessary in considering the question of physical improvement.

6348. They would have to be taught what symptoms in a child indicate physical infirmity of some kind or another? Yes, I think so. The medical expert would take his classes, and he would show the teachers first what were the conditions of feebleness or inferiority in the children, and how to pick them out, how to detect defects of vision and of hearing, etc.

6349. You refer to the food question in your *précis*?—I would make one sharp division of innutrition, because in considering whether a child is suffering, whether it is obviously ill and emaciated, or out of sorts, and unable to do its physical exercises, and unable to concentrate its attention, it will be due either to innutrition or to some disease. The teacher must be taught both, in a rough sort of way, in order to make a rough determination, which it is, whether it is disease or want that the child is suffering from.

6350. If it were disease you would have him report the case, I suppose, to some medical officer of some sort?—Ultimately; of course, the first thing would be to inform the children that they must get medical advice. The child must be put under medical advice.

6351. I suppose they could not always obtain that medical advice?—I am thinking chiefly of Manchester, and there they have a medical officer to the educational authority. No doubt the teacher would report the case to the medical officer. He would then have to take it under his direct supervision.

6352. But where he found the state of the child was due to want of sufficient food, your suggestion is that he would report to the director of elementary education; if it were a physical defect he would report to the medical officer, and if it were want of food he would report to the director of elementary education?—Yes. That is a part of

Dr. Niven. the scheme for dealing with it. It is a hypothetical scheme, simply to show how the thing might be worked out.

6353-5. You do not profess that it is to be absolutely cut and dried ?—No. It is simply to show that it is practicable that a scheme can be devised.

6356. The teacher having found the child suffering from innutrition would report to the director of elementary education, and the next step in your suggested remedy is that the director goes to the school attendance officer ?—Yes.

6357. His business is to ascertain the means of the family ?—Yes.

6358. He has to go and inquire whether the family can supply food ?—Yes ; what the wages are, and what is coming in, and what are the necessary outgoings, and, therefore, what is the money available for food. Of course, that would take a little time. I think it would require an officer of some tact, but still it is a matter of detail to get the right sort of man.

6359. Would you also record the age and sex of each member of the household to the director. He would not report to the director of elementary education as to the age and sex of the whole family, would he ?—That is merely part of the means. You must do that, because you cannot construct your dietary without it. The object of doing so is to construct a practicable dietary, to ascertain whether the money which is coming in will be sufficient to enable the parent to feed the children.

6360. (*Chairman.*) Would it not be better to go for the parents upon penal process and put it upon them to show that they have given the child sufficient food ?—I do not think so. I think it is a matter in which we shall have to proceed carefully.

6361. (*Mr. Lindsell.*) You are looking to things which would not require legislation ?—I think this procedure would require legislation, but if you proceed in the direct penal way against the parent it would lead probably to shifting of the population from one district to another.

6362. Then the director, having made these reports, he calls upon the teacher to say at what sum per diem the family could be supported, and what diets could be provided for that sum. You say that comes within the teacher's province ?—I think he will have to be instructed in the matter.

6363. How could he say what sum the family could live on ?—That involves an elaborate explanation. He would have the age and sex of each member of the family which has already been obtained by the school attendance officer. Professor Atwater, of America, has given a very great deal of work to the construction of dietaries, and has prepared a rough scale on which the members of the family get the proportion of diet ; that is to say, the man gets, say, one ; and the wife 0.9 ; a boy between thirteen and sixteen gets 0.8 ; and a girl of the same age, 0.7. You know, of course, the scale of diet. He must have the age and sex in order to be able to construct it. You take, roughly, let us say, 5d., upon a family of eight, and you apply that scale to 5d. You find that on adding the result together and multiplying by 7, the money yielded in that manner is just under what the family can afford, as you have already ascertained. Then that scale of 5d. is the scale of diet which they can afford. I have prepared a series of diets costing various amounts, 8d., 7d., 6d., 5d., down to 3½d., by which they can get the necessary nutrition, and they will see whether it is practicable for the family, and on what scale of diet they can do it to give sufficient nourishment to the family. Of course, the kind of article they purchase depends upon the amount of money available. I hope I have made my position quite clear. The teacher comes in in this way, that he would be furnished with diets constructed at different prices, but it would also be necessary for him to practice the arithmetic of diet construction so as to be practically familiar with this matter. He would be furnished also with diets of different prices, and he would instruct the family, knowing how much money there was available, what diet it was practicable for the family to use.

6364. Do you think the teacher could possibly do all this and all his other duties ?—There would practically be no addition if the thing were systematised ; it would make very little difference. He would not have to calculate any diet ; it would be furnished to him. The diets upon the different prices would be furnished to him and

all he would have to do would be to apply the .9, .8, and so on, which would be done in five minutes.

6365. Having got the scale, what is his next step ; does he give it to the child to take home with him, or what ?—No, it is communicated through the director to the family. The whole thing would be done formally.

6366. The teacher says to the director "This child wants a dietary at that scale," naming the scale ?—Not the child. He says "The family can supply a dietary of such and such a scale, and the articles which they can get for the money are something like these."

6367. How is the teacher to find out that the family can supply the diet at that scale ?—From the investigations already made by the attendance officer ; he is supplied with the information which the attendance officer has procured, showing what money there is available out of the wages after paying the outgoings of the family. I know that the thing is done in a somewhat roundabout way, because I think it is undesirable that any summary procedure should be taken in the matter. I think it must be done with a certain amount of deliberation.

6368. I will not go through the successive stages. We have arrived at the stage where a teacher has told the director what the dietary means of the family are ?—Yes, and what they can get on that dietary.

6369. Then the director sends some officer ?—Yes, the attendance officer.

6370. He tells the family what diet is required and how it is possible ?—Yes, and he also offers to supply the child with a complete school diet, but, of course, the parents must pay for that diet at a fixed scale, whatever charge it may be.

6371. This dietary is to be obtained at the school ?—It is to be obtained at the school. The parent will have the option of feeding the child himself if he so chooses. Clearly under such a system it would become necessary to ascertain, whether the child was being adequately fed, or was not, before you can take any further action, and that involves taking the height and weight of the child. If upon two successive takings at intervals, say, of three weeks, you find that the child was stationary or going back, then it would become necessary to take action against the parents to compel them to feed the child himself properly, or pay for the food which was given. In that case the matter would go into the hands of the medical officer of the education authority. Of course, that is only my way of setting about it. I do not profess that that might not be greatly improved on.

6372. (*Dr. Tatham.*) In the event of its being impracticable for the parents out of their small earnings to provide sufficient food for the child, do you think that in any sense the authority should become responsible for the feeding of school children ?—Yes, I think the child must be fed. I have put it down broadly that the child must be fed.

6373. We have had evidence before us here that in not a few cases children are brought to school or sent to school, as the case may be, practically half starved, and that then they are made to go through their various exercises at school practically on an empty stomach ; do you think that that is a thing which should not be allowed under any circumstances ?—Yes, it should not be allowed under any circumstances. I should lay down the broad proposition that the school children should be adequately fed.

6374. And if the parents cannot do it the State should do it in some form ?—Yes. Of course, in Manchester it is done to a very considerable extent at present under a Free Food Fund.

6375. That is a voluntary fund ?—Yes ; I have here Mr. Wyatt's Report upon the subject (*handed in*).

6376. (*Chairman.*) What proportion of the children are fed in that way ?—He gives the number of dinners served in the course of the year.

6377. But what proportion of children would require that free food ?—I do not know.

6378. That is an important element ?—Yes, that is the difficult part of it. I have not the slightest doubt that no voluntary system whatever in our large towns can overtake the deficiency of food. Then you are brought face to face with the larger question. There is no doubt that a lot of good is done under this free food system.

I see about £400 was spent on this object, and doubtless the child could be fed for 3d. a day. It would be easy enough to calculate. One pound would feed a child for eighty days, and £400 would therefore feed 400 children for eighty days, or something like that. The expenditure was about £400. I just give these figures to show the sort of operations. Of course, it is in winter, when they need food most, and when work is slackest, and more children are then suffering from deficiency of food. A large number of masons' labourers, builders' labourers, and so on, are out of work. It is chiefly in winter that these operations are most required, and if you took the period say, instead of eighty days, at thirty days, you might put it at about 1,000 children, roughly, who would have their necessities supplied.

6379. (*Dr. Tatham.*) You say that every elementary school should possess a kitchen equipped with ordinary cottage ovens and utensils, or such as are suitable for a cottage. You would have that in every case?—Yes; I think it is of vital importance that all girls should be taught to cook.

6380. Even in school hours, as part of the system?—Yes; I should make it part of their regular course of domestic economy and hygiene. I think it should be a prolonged practical course in the various subjects.

6381. Even if she did it at the expense of some of the book work?—Certainly.

6382. She also should be taught sewing, mending, and washing?—Yes.

6383. And how to clean house?—Yes, and generally the methods of cleaning, the selection of foods, so much of dietetics as is necessary to select the proper diet, the selection of clothes, their price and properties, for instance as regards wools and flannelles, how to choose flannelles, and in fact the choice of clothing, and what it does.

6384. (*Chairman.*) Everything to make her a good housewife, in fact?—Yes. I may say that I think it is very important also that boys should be taught kindred subjects.

6385. (*Dr. Tatham.*) Subjects such as joinery, and how to make shelves?—Yes, and how to make boxes, cages for storing food, and to make chairs, and mend things about the house.

6386. So as to make them useful husbands?—Yes, and take a pride and interest in their homes, and give them a variety of occupation, so as to give man and woman mutual interests in the homes, and make them more likely to assist each other about the house, instead of the man going out to a public-house and finding his amusement there.

6387. With regard to intemperance, would you like instruction of the boys and girls with regard to the evils of intemperance?—Yes, I think that is the direction in which we have most to hope from. I think that should be made part of the hygiene course at school. I throw this out with a certain amount of diffidence, but think that alcohol might be much more heavily taxed. I think we might derive a very much increased sum from taxing alcohol.

6388. Would you differentiate between the different kinds of alcohol? Would you tax whisky and brandy more heavily than the working-man's glass of beer?—No, I should not; I should tax alcohol simply.

6389. (*Mr. Struthers.*) There is a very heavy tax on alcohol at present; do you think if you put on a heavier tax the consumption would keep up?—I do not think it would quite. I regret to say that I do not think it would go down very much, but you would get your money. Of course I know this is a view which does not commend itself either to those against interference with the sale of alcohol or to the opposite party, but it certainly does seem to me feasible to levy a larger sum of money and to utilise that for food purposes.

6390. (*Colonel Onslow.*) Would you make any difference between beer and spirits?—No.

6391. (*Dr. Tatham.*) With regard to the housing question in your experience—I am glad to hear what you have to say with regard to the improvement of schemes of houses—can they be carried out in towns or not on any adequate scale?—They cost a good deal of money, especially in Manchester, where ground is very expensive.

6392. (*Chairman.*) But are they not remunerative in the long run; is it not a productive expenditure?—Yes. Then, of course, you have to carry these schemes through the Council, and if their view is that the expenditure is not remunerative, there is a great difficulty in carrying the schemes. A certain amount of improvement schemes in the centre of the city are needed. I think it is desirable, as far as possible—personally that is my view—to take the people out into the country and house them there.

6393. (*Dr. Tatham.*) And provide cheap transit?—And provide cheap transit. I think the money can be utilised in that way just as well as the other. The difficulty is, of course, that the people will not go out, even if you do make their transit cheap, and you would have to exercise a considerable amount of pressure and influence before you would get them to go into the country. But it is much easier to provide cheaper houses in the country, where land is cheap, than in the centre of the town, where land is so very expensive. Besides you get entirely new conditions; you get a certain amount of fresh air and sunshine which cannot be provided in the centre of our large towns.

6394. You think that inasmuch as a certain proportion of casual labourers and people of that class must live in the centre of the town, provision should be made outside the zone?—Yes, I think so, and that such provision should be outside the zone, which you have to construct yourselves as well as you can. I think it should be outside the probable business area within, say, a period of thirty years—outside the area which business is likely to invade with warehouses and so forth in that time.

6395. You are familiar with the extent to which the philanthropic people of Manchester are endeavouring to deal with the matter, and that the difficulties are increased considerably by the fact that outside the municipality of Manchester there are districts which have been run up under local boards without the slightest regard to sanitation. Do you think that it is now, as it was some years ago, a difficulty with the Manchester Corporation in extending their boundaries, that they have to deal with bad property of this kind, with regard to the construction of which the Corporation, as such, has had no voice?—Yes, of course it is a difficulty, but I think it is not desirable to say too much upon the subject, because there are very considerable areas of Manchester itself which are insanitary. Those insanitary areas, I mean, are not confined to the districts which you are talking of. It is only likely that if you have in previous times created insanitary areas yourself, these small places outside will have created insanitary areas. Of course, it is a difficulty—it is just an addition to the greater difficulty.

6396. But, having regard to the existence of that difficulty, do you not think that something might be done in the way of providing uniform building bye-laws, so that it should not be possible for jerry-builders to erect property outside the municipal boundaries of the kind I speak of?—Yes, I think it is desirable to have a uniform system of building bye-laws; I think it is very desirable.

6397. You think that would be one way of diminishing the difficulties?—Yes, I think it would. It would not overcome all difficulties, but I think it is very desirable.

6398. As regards overcrowding, you think that the statutory provisions and those made under bye-laws relating to houses let in lodgings should be strenuously but judiciously carried out?—Yes, I think you must allow a certain amount of latitude in these matters. It is quite obvious that if you have a large family crowded into one room—say, the man has an ailing wife and she is not able to look after a house—under those circumstances he will go to a house let in lodgings and take one apartment in it, and they will all crowd into one room, and perhaps the children there are from the age of twelve downwards and are not able to make any money. Under those circumstances you cannot deal with over-crowding; you must wait till the children are a little older and are beginning to earn.

6399. (*Chairman.*) Do not the children suffer?—Yes.

6400. Do they get any sleep?—They suffer, but what can you do?

6401. But do they get any sleep? Sleep is as useful to a child as fresh air and food, is it not?—It is likely that they would sleep as much in one room if a larger house were occupied. The conditions are really very complicated.

Dr. Niven.

Dr. Niven. These people have sunk, let us say ; they have not been able to get enough food, and they have come down, and they have pawned their articles of furniture one after another ; they have no option except to go into an apartment like that ; they have not the means to occupy a house : landlords will not let the house to them ; they cannot get one from the Corporation, as a condition of the Corporation houses is that the people shall have furniture to put into them. These people have no option except to go into these rooms ; they cannot help themselves. This has been very forcibly impressed upon me by the fact that with a view of getting a clear idea for this Committee, I have had an investigation made by the sanitary inspectors of three limited districts, and I have made an analysis of the conditions attaching to these three districts.

6402. (*Dr. Tatham.*) Will you put them in ?—Yes. (*Document handed to the Chairman.*)

6403. We will print this, if you have no objection ?—Very well. The districts are very limited, and are the very poorest that could be found.

6404. With regard to legislation, I have here a report from Dr. Chalmers, of Glasgow, on the death-rate in one of the tenement houses ?—I have seen it.

6405. " In a pamphlet on the tenement house legislation in New York, prepared for the Commission of 1900, by Mr. Lawrence Veiller, its Secretary, I find the present law stated in the following terms :—' The owner of a tenement house was further required to thoroughly cleanse all the rooms and halls, stairs, floors and windows, as well as the doors, walls, ceilings, privies, cesspools, and drains of the house as often as the Board of Health might require.' Further, that ' whenever there should be more than eight families living in any tenement house in which the owner himself did not reside, there should be a janitor or housekeeper, or other responsible person living in the house, and having charge of the same, and it was left to the discretion of the Board of Health to decide when such janitor or housekeeper should be required.' " Do you think that is a practicable suggestion ?—It may be. It contemplates a state of things which does not exist in Manchester at all. It is no use having proposals for a condition of things which we have not to deal with.

6406. The conditions do not exist in Manchester ?—No, we have not eight families in one house.

6407. (*Chairman.*) Have you not any big tenements in Manchester ?—Yes, there is one block of tenements which has a janitor in charge, but that is a large block of tenements. Then there are two blocks of tenements under the Corporation who have got a caretaker—a skilled man, in charge of them, who keeps a set of books. But the state of things contemplated here does not exist with us at all.

6408. (*Dr. Tatham.*) I know I am speaking to an authority, a Lancashire authority at any rate, on the subject of phthisis and pulmonary tuberculosis. Speaking generally, is pulmonary tuberculosis on the decrease or increase in Manchester ?—On the whole it is on the decrease, but there has been a slight increase during the last two or three years.

6409. Generally the death-rate from pulmonary consumption at all ages has increased in the last few years ?—Yes.

6410. Can you account for that ?—Not exactly, but I think there is a gradual shifting of the population, so that more people are living at the more advanced ages at which they are more subject to phthisis. I think that may account for the slight increase that has taken place.

6411. You know that is the very reverse of what has taken place in the country generally. In the last twenty years the decrease of the death rate from phthisis and pulmonary tuberculosis has been enormous ?—So it has been in Manchester. There has been a very great decrease. If I might consult my annual report which I have here, I can turn to a few facts.

6412. It has decreased from 1,920 to 1,570 per million within the last twenty years in England and Wales—that is amongst males, and amongst females it is still greater—1,735 to 1,110. You are aware that that is the case ?—Yes.

6413. In Manchester you say that is not so ?—I do not say that. In recent years I say there is a tendency to go back.

6414. That is to say there has been an increase instead of a decrease ?—In the last few years a slight increase, but not more than might be ascribed to the fact that there has been a gradual relative increase of people living at the more advanced ages at which phthisis exacts a higher mortality.

6415. Is it not at the higher ages principally that the increase has occurred in recent years ?—I have not got the figures out. No doubt it is.

6416. I daresay you will give the Committee the benefit of those figures ?—I have not, of course, got the figures upon that point prepared, but since 1881 there has been a diminution in the Manchester death rate from phthisis from 2.42 in the years 1881 to 1885 down to 2.04 in the years 1896 to 1900.

6417. And since then ?—Since then there has been the very slightest increase ; it is extremely slight. The death-rate went lower than 2.04 and now there is just a slight increase. In 1903, however, the death rate has again gone down to 1.85, which is lower than for any previous year.

6418-21. You have not calculated the mortality from phthisis at age groups ; you could calculate them for the information of this Committee ?—Perfectly.

6422. With regard to the question of the registration of still-births, have you any information as to whether that should be made part of the law of the land or not ?—Yes, I think it is very desirable.

6423. What period of uterine gestation should you put as the limit of the operation of such a law ?—I have not thought of that. I should say six months or something like that.

6424. With regard to the mortality amongst illegitimate children in Manchester, is that very much greater than amongst legitimate children ?—Oh, yes, more than double I think. It is somewhere about double. I have the figures.

6425. Perhaps you will favour the Committee with them ?—Yes.

6426. Referring for the moment to the subject of milk supply, do you think that in the case of the poorer classes of Manchester infant children do really get any substantial amount of milk ?—Certainly.

6427. They do ?—Yes.

6428. I am very glad to hear it, because it was not so at one time ?—I think it is the exception when they do not get milk. I must say they very often get condensed milk instead of fresh milk.

6429. Do you approve of that ?—Yes, under certain circumstances. I think it is necessary. I have, on occasion, used that with my own children instead of fresh milk. I think that if they use the first Swiss unsweetened condensed milk, or equivalent unsweetened condensed milk, it very often makes an excellent substitute for fresh milk, but I am afraid they do not make a good choice ; they use milks which have to be too much diluted or separated condensed milks, so that the child does not get sufficient nourishment. That is the danger from the use of these condensed milks. Properly guided I do not think it is so great an evil. I think they get a large quantity of milk which is probably not very fresh. It is difficult to say exactly how far that is so. The milk in Manchester is extremely well protected as far as the Sale of Food and Drugs Act is concerned. The difficulty is as to its bacteriological character—how fresh it is.

6430. My reason for asking you the question is that we have had a good deal of evidence here to the effect that the poorer children practically get very little, if any, milk at all ; that all sorts of things, anything that comes to hand, is used for the food of infants rather than milk, simply from ignorance, I suppose ?—Yes ; in a small proportion of instances they use patent foods, but patent foods are more expensive than milk, so that really the impulse is towards the use of milk than to the use of patent foods. On the other hand the parents give the infant bits of bread, bread boiled in milk and foods of that kind. Unsuitable foods are very often given, no doubt, but they are not given apart from milk.

6431. With regard to the diseases of young children under five years of age, is tuberculosis increasing or decreasing amongst them ?—It is decreasing.

6432. Would you detail to the Committee the system you have in Manchester of inquiring into the deaths of infants and young children, and probably of all persons who die in Manchester, the card system. We have had some interesting evidence from Dr. Chalmers, of Glasgow, this morning. Will you detail to the Committee the system you have in Manchester; is that somewhat similar?—Yes. The health visitors are furnished with cards in the case of death, giving a number of particulars in reference to the house, also in the case of young children as to the character of their vaccination and giving a number of particulars with regard to the kind of house which they inhabit and the constitution of the family, and so on, and these cards are filled up.

6433. Will you send the Committee a copy of these cards when you send the corrected proof?—Yes, I shall be pleased to do so.

6434-5. (*Chairman.*) With regard to the point that Dr. Tatham put to you about the legislation in New York, you said it was not applicable to the condition of things in Manchester, but I think you missed the point which is the principal one, which is throwing the responsibility upon the owner of a house to cleanse the "rooms, halls, stairs, floors, and windows, as well as the doors, walls, ceilings, privies, cesspools, and drains of the house." That is the point of the legislation, to make the owner responsible for seeing that the tenements are clean in all those particulars?—Yes.

6436-9. Surely it would be of benefit, would it not, to devolve some of the responsibility as to the conditions of the tenements upon the owner and not upon the occupier.—Yes. Of course, for sanitary defects generally the landlord is at present responsible, and has to do some things in connection with the condition of cleanliness also. If we find that a house is not in a clean condition we give notice to put it so, and the house is washed over with a disinfectant and thoroughly cleansed.

6440. Do you make the landlord do that?—He has to pay. He has to do all repairs, to repair the house, and do everything. As a matter of fact, in our system of dealing with phthisis whenever a house is at all dirty, and a case of phthisis is reported to us we have the power to enforce it, but we ask the landlord if he has any objection to our carrying out this process of cleansing. Practically they all agree.

6441. Is he charged now?—The cleansing is not charged now; it is done at the expense of the Corporation, but he has to do all the subsequent putting right; he has to repaper the walls and beautify the house, and put it right again for the tenants.

6442. Do you believe any alteration in the system of rating would assist to transfer people from the central districts to the outskirts—I mean in regard to the substitution of sites for buildings as the basis of assessment?—I am afraid I do not quite understand.

6443. The present basis of our assessment system is the value of buildings?—Yes.

6444. Well, it has been suggested by Mr. Charles Booth among others, and also in the Report of the Local Taxation Commission by a section of the Commissioners, that if sites were made the basis of rating instead of buildings it would compel manufacturers to clear out of the central districts in towns where the rates are very high. That would lead to a large clearance of the population into the outer areas?—Then—you are going to use up your outskirts in factories instead of houses?

6445. Where the population is not so dense?—That is one of the greatest evils in our big towns. Take a district like Ancoats, where these factories loom over the houses and deprive them of light, and so on. I see no advantage in that. You have, at present, an immense movement of the population out into the country, even of the comparatively poor people at present. The process of building is going on and, unquestionably, this is one of the great influences for good. If you are going to take your factories out, to plant them in the midst of the houses and cast their shadows over them, I do not see where the advantage comes in. I think it would be much better to facilitate the present movement than to set up a movement of that description. I do not quite see the advantage of that.

6446. The advantage, surely, is to tend to bring the population out of the centre where the conditions are most

unfavourable to health, to more open areas on the outskirts?—The people are living out themselves. *Dr. Niven.*

6447. That is the question; is it so?—Certainly, there is an immense movement outwards. Every person who can afford it at all is going out. It is only the poorest people who cannot.

6448. And what you are doing is producing an aggravated condition right in the heart of the town, and making the evil almost irremediable?—Those are not the people who would be available; you would get the better class, such as you have at Port Sunlight. That is, of course, an ideal state of things, but there are no very poor people there. All these people who are employed in that concern are fairly well off. It is not the poor people who work there.

6449. We have had the evidence that a lot of manufacturers in Manchester are disinclined to put into use such means as they might for the consumption of smoke, and the diminution of the smoke nuisance, owing to the fact that the areas upon which their factories stood were so restricted that they could not do what was required?—As far as I know—and I believe I am speaking the truth—the Public Health Act, so far as it deals with the consumption of smoke from factories, is carried out very thoroughly in Manchester.

6450. You think it is?—I do.

6451. You are prepared to say that—we have had the direct opposite said?—Yes, very thoroughly. I do not administer it, so that it is not a personal matter with me.

6452. Whom is it administered by?—By the Sanitary Committee with a superintendent.

6453. You are not concerned with it yourself?—No.

6454. But you are prepared to say that as a medical officer of health?—Yes, and from my own observation. In fact, it is pushed as far as possible with that class of works which is less amenable to the direct operation of the Public Health Act.

6455. How is it the atmosphere of Manchester is said to be so polluted?—It is polluted, but very much less polluted than it was.

6456. You think so?—Undoubtedly. One must remember there are other districts, for instance, Salford, and I am not prepared to speak of Salford; but as regards the administration of the Act in Manchester, or for the other surrounding districts, there is no doubt, whatever, the Act is well administered.

6457. Do you think the administration of Salford in these respects does not compare favourably with Manchester?—I cannot express an opinion, I do not know. I have no accurate knowledge on that subject, but speaking for Manchester, I know that the Act is very thoroughly carried out. In fact, it was a matter of observation and pride with Mr. Carpenter, who is the chief inspector of the Alkali Acts, that the atmosphere of Manchester had so improved, as was made evident by the improvement of the plants. What I should like to say is, that the biggest evil in connection with smoke is from the cottages. In the investigations which are carried out by Professor Cohen and Dr. Bailey in Manchester into the condition of the atmosphere in various parts of Manchester, they showed that the smoke from the cottages had more to do with it than the smoke from the factory chimneys.

6458. There is no method of dealing with household smoke at present?—No, not at present, but that requires dealing with if anything does.

6459. (*Colonel Onslow.*) Do you consider the sanitary laws at present are sufficiently strong to counteract the difficulties. You say here that in the centre of the city there are so many lodging-houses and those are insanitary, being old and with defective conveniences. Is the law sufficiently strong to deal with that?—Yes, that is a matter of housing.

6460. You consider that the laws are being carried out as far as possible?—It is not always possible to say that. I believe the sanitary committee are very much in earnest in trying to find the means to improve the housing of the people.

6461. The sanitary inspector, I take it, is an official of the corporation?—Yes.

6462. Appointed by the corporation?—Yes.

Dr. Niven.

6463. Do you think it is possible, that being the case, for sanitary inspectors not to always report as they might—I do not mean necessarily with regard to Manchester or any other particular town or village?—In regard to that class of house the possibility does not exist, because I have in my possession a complete account of the most minute details for lodging-houses in Manchester.

6464. I do not mean Manchester alone?—Of course it is always possible, you cannot deny such a possibility.

6465. Would it not be far better that they should not be officials of the corporation or of the county council; they ought to be Government inspectors?—I am afraid that I do not understand.

6466. They are now under the corporation or under the county council or under the borough council or something like that?—They are under the corporation.

6467. Human nature is human nature and is it not possible that these men may be influenced. There may be a member of the corporation on the Board who is owner of some of these dirty insanitary houses, may there not?—Yes.

6468. An inspector may report and he may be told to hold his tongue; is not that possible under the existing state of things?—I think not, at least it is not very easy.

6469. You think they are above that?—No, it is no use looking to these ideal conditions; but I do not think a sanitary inspector would find it to his advantage not to report.

6470. He may report. I do not mean Manchester, but generally?—It is conceivable of course.

6471. Would it not be better if these inspectors were appointed by the Government. They should not be dependent upon the local authority. A man should not be afraid of losing his appointment?—What you are proposing is a revolution; it means taking the local administration out of local hands.

6472. Only in one respect?—It is rather sweeping.

6473. You do not agree with it?—No, I do not, broadly speaking. I quite see the object of it, and I think it is a good one; but I do not think that would do; I think it is too big.

6474. You think it is a forcible course?—Certainly; there is no condition of life but what some influence might be brought to bear.

6475. You say the death rate is less especially amongst infants now; that is a proof of the general improvement of society, but does not that mean that medical science has so improved and the sanitation and everything is so improved that the weakly ones who would thirty years ago have died now survive and only swell the ranks of the defective or degenerated physique?—That is a little inconsistent with the results of the last decennium which show a general improvement at all ages.

6476. But do you think the death rate shows that entirely?—I say in my proof that the correspondence must not be pressed too minutely, and probably there is a greater improvement in the death rate than the corresponding improvement in the physique, but that the improvement in the death rate is so great that you must assume an improvement in the physique though not quite corresponding to the magnitude of the improvement in the other. But this improvement in the death rate occurred most markedly at the period when the general conditions of prosperity as regards wages and the cheapening of food were advancing most rapidly, that is to say, they indicated a general condition of well-being amongst the people and were probably dependent largely upon better food and better clothing, although I do not deny that better housing has also in recent years had a good deal to do with it. It is very general over the country; the improvement extends to rural counties.

6477. By allowing these weakly infants under less favourable circumstances to exist, surely that must cause a larger percentage?—I do not admit it is the weaklings that remain. I should dispute that altogether.

6478. You think it has entirely improved?—You want to know what the weakling is. I am informed by Mr. Dewsnup as the result of his observations—and my own observations also inform me—that there are very many fewer children going about with bent legs, and rickets and such conditions than there were twenty years ago, and that seems to imply that there is not merely an im-

provement as regards the death rate, but also with regard to the physical condition, although it is only right to say that that improvement is not universal. But it is the opinion also of Mr. Wyatt who had examined those photographs. But every school teacher is not of that opinion. I do not know that I am at liberty to go into details, but on the whole my opinion is—there is an improvement in the physical condition of the children.

6479. I suppose Manchester and its locality are perhaps more than any part of England susceptible to trade conditions—and are better off when trade is good?—Yes, that is so no doubt. There is a good deal of fluctuation.

6480. For instance you are having a bad time now. There are a good many poor children born of poor parents now, who would have a worse chance than under more favourable circumstances of trade?—It is certainly a remarkable thing that the greatest improvement in children in 1895 occurred in the quinquennium following that in which the greatest improvement occurred in the young parents, so that it does appear as if the physique of the parents did influence the physique of the infant to some extent. I am inclined to think there is something in that, that a wave of distress of increased poverty will have some effect upon the young children. I think, however, that that might be to some extent counteracted by proper measures.

6481. Do you think probably from your experience of dealing with people that the factory class would object very strongly to being measured and weighed and so on?—I believe they would; of course I may be mistaken.

6482. I agree with you from what I know of men, even in the Services?—Yes, it is the general impression.

6483. I suppose it is the idea of interference with their liberty?—Yes.

6484. Some idea that they may be forced—I do not say into conscription exactly, but into some sort of service for the State?—Yes. May I be allowed just to press rather the point that I have raised that all school children should be fed. There is, no doubt, a very wretched condition among the poorest part of our population, and probably any improvement must be slow, but in proportion as we are prosperous the people from whom the Army will be recruited must be more and more largely the very poorest class, so that it is with special reference to the difficulties which have arisen in connection with conscription that I venture to urge this necessity of taking in hand the feeding. I think feeding is a matter of very much greater importance than physical exercise, although I do not wish to say that that is unimportant. I think the sufficient feeding of children is by far the most important thing to attend to, and that that is specially important in connection with the Army. I think there is no doubt that when trade is good you will have to rely for the Army upon this very poor class, and that in order to get good soldiers you must rear good children, you must see that children are adequately fed.

6485. (*Mr. Struthers.*) With reference to that point that Colonel Onslow was asking you, without going the length of taking the sanitary administration, etc., out of the hands of the local authority, might it not be possible for the central authority to have some power of veto on the local authority dismissing officers in certain circumstances, that is to say, that the central authority might have a certain amount of control over the action of the local authority? In Scotland, for example, I understand medical officers of counties may not be dismissed without the consent of the Local Government Board. Might not such an arrangement in England be desirable?

6486. (*Dr. Tatham.*) That is the case in London, too.

6487. (*Mr. Struthers.*) But not through the rest of England?

6488. (*Dr. Tatham.*) No.

6489. (*Chairman.*) Unless the Local Government Board pays part of the salary. In that case they have a voice.

6490. (*Witness.*) It is impossible altogether at a moment's notice to put one's own conditions aside, but I think there are many instances in which that would be desirable. That question does not affect me.

6491. (*Mr. Struthers.*) You can quite understand that neither Colonel Onslow nor myself have been thinking of

the large towns, but we know there are many minor villages where this question in one form or another becomes very critical from time to time?—Yes.

6492. You think it is desirable that the public officer should not be unduly under the influence of his department?—Yes, I think it is desirable.

6493. (*Colonel Onslow.*) What I am thinking of more than towns is the country districts?—Yes, I think it is desirable in the country districts.

6494. (*Mr. Struthers.*) Do you happen to know about the district immediately surrounding Manchester, whether the county authority has rules for the erection of buildings?—Yes, there are building bye-laws in Withington, I know.

6495. I mean in the immediately surrounding districts of Manchester, which are not themselves boroughs, not Salford?—This is a district in the county which I am speaking of.

6496. And they have building bye-laws?—Yes.

6497. We rather gathered from Mr. Horsfall that they are the things he wanted?—Yes; they have them at Withington.

6498. You lay special stress on the feeding of school children as one of the most important things to be done?—Yes, I think that is absolutely vital to the future of physical improvement.

6499. And towards that being properly done you would have the teachers instructed in the training colleges, I presume, in such a way that they would be able to understand the obvious defects of children's physique, and whether a child was suffering from innutrition?—Yes, I lay stress upon practical instruction by medical experts.

6500. Hitherto there has been a certain amount of instruction in the training colleges, but it has been not practical—it has been on physiology and so on. What you have in view is practical instruction?—Yes, I think that is by far the more important.

6501. Showing them how to pick out children who are not properly fed, who have defective eyesight, and so on?—Yes, and to teach them what are the indications of deficiency in food. Of course, it is not easy, and they will not usually know of themselves how to distinguish.

6502. Assuming that they have been so instructed and can pick out certain children who are in their opinion underfed, I presume their opinion will have to be confirmed—you would not take them as the absolute authority?—In the first instance, but not in proceeding to strong measures.

6503. You would not take their statement that the child was ill-fed to be absolute—you would have further investigation by medical men that that was so?—Not for practical general purposes.

6504. You would not?—No, you could not; the thing is too big; the medical officer to the education authority would have nothing else to do. There would be a very large number.

6505. But there would be a considerable number of medical officers required?—There is only one.

6506. My suggestion is that that number should be increased?—It will increase slowly. You have to consider also how far you are to multiply medical officers. You will not pay them a large salary, and you have to consider what is the amount of work they will do, and whether the thing is worked efficiently. It can work in this way—because the teacher is always there, and with comparatively little effort he can do a good deal; whereas, if you multiply the medical officers with little pay I do not think you will get it done.

6507. But we do not want medical officers in substitution for the teacher. What I thought was that there must be a fair number of cases where the teacher says that a child is ill-fed, and so far as his knowledge goes it is so; but he would like to have his opinion confirmed by somebody who knows more about these things than he does; do not you think that such cases should be referred to a medical officer?—There should be a medical officer to whom they could be referred if need be. I think it is absolutely necessary, but I should not make the reference very frequent, I think, not in a large place at any rate.

6508. Then there was a point I do not quite understand in your suggested procedure. The teacher has found out a child who is not properly fed and has reported him to the director of the educational organisation?—Yes.

6509. And then you say the director would call upon the teacher to say at what sum per day the family could be fed. Would it not be better for the director himself to find that out?—It might be done by clerks in the office. It is quite conceivable, but they would have to undergo a certain training. It would not be a bad thing for the teacher who was engaged in teaching dietetics to determine that himself. I think it would be rather a good thing.

6510. Was your object in proposing this part of your arrangement to keep the teacher's mind bent upon this subject?—Yes, the subject of diet.

6511. I rather thought that might be so.—Then is there any sound well tested scientific basis for the construction of dietaries at the present day?—Of course it is largely experimental.

6512. You know that what is called domestic economy has been taught in schools for a generation, but that the text-books on which that domestic economy has been taught, dealing, of course, with dietaries, with food values, have changed every four or five years on important points. For instance, the books of not more than five or six years ago spoke of what they called flesh-forming foods and heat-giving foods?—Yes.

6513. Now, I understand that is a distinction which has been absolutely given up; it is no longer held to be a scientific one?—It was more a loose way of talking than a distinction. It could never have been unknown to anyone that flesh-forming foods were also heat producers if they chose to think about it. It was simply a rough way of talking.

6514. That was a serious matter. If you put down such rough things in a text-book for schools, children immediately take it as an absolute fact?—That indicates an absence of precision of statement rather than a change in knowledge, does it not? At least it strikes me so.

6515. You think it might not be misleading?—It is misleading, but it is rather, I think, that we have gained in precision of statement than that our knowledge has become more precise. I do not think there has been any change in the scientific attitude towards these things.

6516. I thought there was considerable debate of recent years of what exactly was the function of various foods—carbonaceous foods, fats and albuminous foods—what they did in the body?—Yes, certainly, but there is this broad distinction that proteids are capable of repairing waste, and of building up the body, which the other foods are not, except in so far as the salts are concerned, and that all foods are capable of being burnt to produce so many calories of heat or energy as the case may be.

6517. Generally, you think there is a sufficient basis or scientific knowledge for the construction of workable dietaries?—Absolutely. The only difference in opinion consists simply in how much is necessary. The dietaries have been constructed by seeing what amount and proportions of proteids, fats, and carbo-hydrates are used by individuals on a freely chosen diet. From that has been determined experimentally the amount of these constituents in the diet. It has been largely a matter of experiment.

6518. In this country?—Yes, by Playfair, and also by Atwater.

6519. I thought Dr. Atwater was an American?—Yes, he is an American.

6520. Is he connected with this Bureau of Agriculture which has been conducting experiments lately?—Yes, I believe so.

6521. These experiments are rather of a novel kind, they have not been done before?—The newer methods of determination have not been adopted by Atwater, so far as I know. Atwater's experiments are on the same level as the previous English determinations.

6522. What I was thinking of is a series of experiments in which the men are kept in a cage?—Yes.

6523. And fed on certain foods, and do a certain amount of work, and everything is measured?—That is not the way in which Dr. Atwater's results have been arrived

Dr. Niven.

at. I do not think the knowledge arrived at in that way is of sufficient amount to give us much guidance at present.

6524. You spoke of a series of dietaries which you have with you: have you constructed those yourself?—Yes.

6525. Could you put them in for the information of the Committee?—Yes. (*The document was handed to the Chairman.*) I may say that this composition of foods is simply taken from Hutchinson's book, and that the prices are those obtained from inquiry of the various persons in the poorest districts of Manchester, so that the information there practically shows what the people can afford.

6526. You spoke of the importance of girls at school being put through a prolonged compulsory course of domestic economy and hygiene: that, of course, is an admirable course which you have here. At what age do you propose they should enter upon this work?—The education authority of Manchester by a bye-law have fixed the age of fourteen at which children are to leave school, except under certain conditions. If we may take that to be the general age at which they are to leave school, then I should say that the age of between thirteen and fourteen would be the best time at which to teach them in the schools.

6527. Perhaps you will be interested to know that the children in Scotland must remain in school till fourteen and that in the Code of last year we have arranged that girls shall spend that last year, from thirteen to fourteen—provided they have reached a moderate level of general education—in such a course as you propose here?—I was not aware of it.

*Mr.
Fosbroke.*

Mr. G. H. FOSBROKE, D.P.H., Cantab, called; and Examined.

6532. (*Chairman.*) You have been Medical Officer of Health to the Worcestershire County Council for the past fourteen years, and also Medical Officer of Health of a number of small urban and rural districts in Worcestershire for the past thirty-one years?—Yes.

6533. You have very considerable knowledge of the conditions of rural life?—Yes. I have devoted my whole time to sanitary work.

6534. Entirely in Worcestershire?—In the Midlands, Worcester, Warwick, and Gloucester.

6535. Have you formed any general opinion upon the question with which we are commissioned to deal, as to whether there is physical deterioration and, if so, whether it is growing in intensity?—I have confined my evidence entirely to my experience of the rural districts, I think, decidedly.

6536. You think there are evidences of physical degeneration?—Undoubtedly.

6537. Generally, or limited to a particular class?—I think it is more particularly limited to the agricultural labourer, and as I have said in my proof, to the agricultural labourer of what I call the clay districts as distinguished from the market gardening centres where such deterioration in my experience does not exist.

6538. Do you mean the conditions of occupation or climate, or what are better?—The facilities are greater for obtaining better wages in market gardening centres, and, consequently, the more robust types do not leave the districts in the way they do in the others.

6539. Whereas, in the other parts they get depleted by the exodus of the best types into the town?—Yes. To give you a practical proof of that, I may say that thirty years ago, it was the commonest thing for a labourer to carry two and a quarter cwt. of corn up a ladder; now you very seldom see it. Farmers tell me the same.

6540. They are an enfeebled lot?—Yes, they are.

6541. I suppose there are conditions affecting them which are improved: They are probably better housed, and get better wages, and, therefore, better food?—Undoubtedly, they are better housed and better fed.

6542. And yet that does not counteract this tendency to weakness which you describe?—No, such is my experience.

6543. Have you any other facts to illustrate your belief besides this question of the power of men to carry heavy weights?—Generally the farmers say that the men are of a weaker type altogether. The more robust men go into the towns.

6528. You would combine that course with a certain amount of literary instruction, to a certain extent, even after thirteen; you would encourage them to read, for instance?—I should not put much stress upon that; I do not think it is of much moment except under guidance. They read trashy stories, and so on.

6529. Those girls have had a complete year of this kind of training, from thirteen to fourteen; they go to shops and factories, and they do not start housekeeping till eighteen, twenty, or twenty-two years of age. Do you not think that the knowledge they acquire at school is likely to have pretty well evaporated in that time?—Not if it has been long and thorough enough, but it will diminish in intensity, and in value, no doubt. I think it is very desirable that continuation classes should be provided for girls who are willing to continue their education.

6530. It is very desirable that this education you speak of in the day schools should be reinforced at a later age by some further instruction of the same kind?—Certainly; and, as a matter of fact, that is done to no slight extent. I do not wish to exaggerate the amount, but continuation classes are amply provided in Manchester, and only limited by the extent to which young people are willing to take advantage of them.

6531. Do married women, for example, attend domestic economy and housekeeping classes?—I have not the figures. I know the attendance, although not small, is not so large as might be wished.

6544. Has your population been diminishing?—Yes, in the rural districts except in the market gardening centres.

6545. Do the vital statistics bear out this presumption. —In the rural districts the vital statistics are very meagre. They are generally confined to birth rates and death rates, and that kind of thing. You do not get the details which you do in the urban populations, but we find decreasing birth rates and death rates.

6546. The population is diminishing?—Yes.

6547. Is that remarkably so in Worcestershire?—No, it varies very much in different parts. In some districts, of course, it is increasing enormously, and in rural Worcestershire in the market gardening centres it has increased—at Evesham.

6548. Are there any specific diseases on the increase in the county?—I do not think so.

6549. Specific diseases which are menacing to human life and vitality?—I think not. I have said so in my proof.

6550. You think there is less drunkenness?—I do amongst the agricultural labourers.

6551. This falling off in physique is solely due, in your opinion, to the fact that the strongest types move out of the country and leave the poorer types to propagate the species?—That is my view, yes.

6552. You do not know of any records of an anthropometrical character which bear out your opinion, which have been taken in the county?—I do not, unfortunately. There is a point on the other side. I was talking some time ago to an experienced medical officer of a post office at Worcester, which is a large centre. He was quite under the impression that there was deterioration, but on going into the whole of his records we found that that was not so, when we took the average heights and weights and chest measurements, and so on.

6553. Do you not think the impressions you have of a sinister kind might be corrected by exact observation?—I think it is desirable to have exact observation, but I do not see how it is practicable to obtain it.

6554. You would agree that anthropometric records are the supreme criteria of physical deterioration or the reverse?—Yes, I say in my proof that I can only give you my impressions.

6555. Do the police facts, such as you have been able to elicit, confirm what you say?—The policemen seem to keep up their standard; but it is a popular force with the agricultural labourer.

Mr.
Fosbroke.

6556. You speak in your *précis* of districts where heavy clay predominates?—Yes.

6557. Do the labourers get flat-footed?—Not specially, but it is not uncommon.

6558. It is very common?—Yes, *lias* clay is very common in Worcestershire.

6559. Would you say what you believe to be the general causes of deterioration?—Yes. In my opinion such deterioration is in a great measure due to lack of regular employment, good wages and good houses, which induce the most robust and vigorous young labourers either to seek employments in towns or to emigrate; furthermore, the opportunities for evening amusements are much greater in towns. That I find is getting a material point with the labourer.

6560. Amusement?—Yes, he seeks amusement.

6561. But in many country districts there are facilities for amusements even in villages to a much larger extent than there used to be?—Yes, not to the extent there ought to be. Greater facilities for reading-rooms, cricket and football, are desirable.

6562. You agree with Lord Salisbury that a village circus would be more use than a parish council?—I am afraid I do not see much for a Parish Council to do.

6563. In market gardening districts you think there are counteracting tendencies to the deterioration which you meet with elsewhere?—Yes; I do. A man finds he has every opportunity of progressing in life—that he is likely to improve his position by staying there.

6564. Do you think there is any way of retarding the tendency of the agricultural labourer to go into the towns besides providing him with amusement?—Of course, that is quite a minor point; I feel very strongly that the provision of the land is what they require.

6565. Have you much experience?—Yes; in the first place I should call your attention to what has been done in Worcestershire—probably you may know of the small holdings there. The County Council purchased 147 acres of land and resold it to the men; they not only resold it, but offered them facilities for building houses, which have been attended with great success.

6566. Did they advance the money?—They advanced four-fifths.

6567. What size were the holdings?—They vary from two to about eight acres. That is the experience under this Act. But the great point, which is so to speak the main work there, is the liberal interpretation which the County Council made of the Act and gave them loans for building houses.

6568. Have they made any other experiments, or is this the only one?—That is the only complete experience so far as the County Council are concerned, although I believe extension is contemplated; but in the district in which I have lived the greater part of my life, and in which I own land, thirty years ago poverty was common in the winter; it was systematic as the winter came round. These men agitated for land and I opposed it in those days, but they got it.

6569. In the form of allotments?—Yes. It is very good land. But of course all land is not suitable for such a purpose. They got the land, and the result has been that now in the winter they never get pauperised, except quite the old people. They used to come round in organised gangs begging, but now such a thing is unheard of.

6570. You really think that that tends to arrest the exodus into the towns?—I am firmly convinced it is so.

6571. They are interested in the cultivation of the soil?—I could point to many men who were agricultural labourers at one time, who now own two or three horses and carts and are prosperous.

6572. And quite content with country life?—Yes, in that parish these men have started a Co-operative Society and have a number of stores about the district, and this society provides money to build houses on loan, and they have already built twenty.

6573. (*Mr. Lindsell.*) What parish is that?—Bidford.

6574. Is that near Evesham?—Yes, but it is just over the Worcestershire border in Warwickshire; these houses have been properly built from the savings of the agricultural labourer and the Society is entirely administered by them.

6575. (*Chairman.*) Are the County Council under taking similar enterprises to this which has been so successful?—They had under consideration the question of adopting it in another part of the county, but it was found it was too remote and the population was too small. It was such a decaying locality that it had really gone too far for them to do anything.

6576. I suppose your evidence is that more might be done in that direction, not only in Worcestershire, but elsewhere?—I think so; I think much more use might be made of the Act than is made.

6577. Now with regard to the housing in the rural districts I suppose the cottages of considerable estates are very much improved are they not?—On some estates very much.

6578. Generally so?—There are some where it is not so.

6579. Is there any difficulty in getting cottages in Worcestershire?—In some places they are scarce.

6580. Are the rents extravagant?—No.

6581. What about the cottages belonging to small owners?—Many of the older cottages are in a bad state—they are very often mortgaged.

6582. Does the rural sanitary authority exercise its powers to bring them up to some minimum standard of soundness and proper sanitary condition?—Yes, a good deal has been done in that way.

6583. You could not say there was any marked neglect?—No, I would not like to say that, but the difficulty is this that many houses which are really unfit for habitation, if you were to try to bring them up to a proper standard you would close them and there would be nothing else to take their place.

6584. That is your difficulty?—Yes.

6585. Would you attempt to bring pressure on the landlord?—Yes, I could name one district where a whole series of houses have been closed because the landlord would not do anything, and that is part of a large estate.

6586. (*Colonel Onslow.*) The landlords would not do anything?—No, the houses were not worth it.

6587. (*Chairman.*) How have they been provided for?—They wandered away. It is in that district that the County Council considered the advisability of applying the same method as in the other case.

6588. Is there a scarcity of labour for the ordinary purposes of agriculture?—In some instances; but I believe not to the extent there was a year or two back. Agricultural methods have changed.

6589. I should have thought landlords would have been wise enough to have kept the labourers there?—I think many cannot afford to do so; how the home of the rural labourer can be generally improved I candidly admit I do not know, as it is quite impossible to provide cottages at rents which the men can pay, if the investments involved are to be remunerative. I should like to mention that I do not think that deterioration is confined to males alone; I have noticed it is extremely common among the females, the anæmic domestic servant is extremely common.

6590. Is that due to bad diet?—I can hardly explain why it is.

6591. You will admit they are better fed probably because they have better wages?—Yes, but an anæmic servant is more than common.

6592. Is that due to the vice of tea-drinking?—They do drink tea, but I find domestic servants are fond of vinegar and pickles.

6593. Vinegar is very anæmic in its tendencies is it not?—In my opinion, yes.

6594. Do you think that any very great ignorance prevails among the rural classes as to the best forms of diet?—Oh yes, extreme ignorance.

6595. Do you think as much is done to remedy that ignorance in the schools for the sake of the young generation as might be?—I hold very strongly that teaching of elementary hygiene is of vital importance.

6596. And household management in its widest sense?—Yes, cookery for instance.

6597. Everything to make a girl a good housewife?—Yes.

Mr.
Fosbroke.

6598. I observe you hold that among the conditions connected with elementary education that are unfavourable to health is sending children so young to school?—That is my view.

6599. Will you tell us what you have to say about that, because I think that is very important?—I think no child under five years of age in a rural district—as quite distinct from an urban district—should be sent to school.

6600. At present they are not compelled to go to school, but you would not allow them to do so?—I would not allow them.

6601. That would relax the pressure of building in rural districts which would be a good thing?—That is the suggestion I have made to the Chairman of our County Council. Why enlarge your buildings for little children who, in my opinion, would be better at home.

6602. And especially in the rural districts it is not like a town where infant classes are large and special attention can be paid to them, and where there are exceptional conditions favourable to their attendance; in the country districts the children between three and five are fewer in number and probably very much neglected, but they do go to school?—Yes.

6603. (*Mr. Lindsell.*) Do you find they go much in rural districts under the age of five?—Yes, the mothers are only too glad to get them out of the way in order that they may do work.

6604. That is not only in towns, but in the rural districts?—Yes.

6605. They cannot send them any distance?—They send them as much as two miles and it is surprising how these little children, whether it is rain or fine, come dragging along at the same pace.

6606. (*Chairman.*) You think that they would be much better occupied running about in the open air?—Yes, running wild; and I have duly considered the argument against such a proposal to the effect that infants would be less orderly if they did not go to school before five years of age; that is my opinion, and I have taken the advice of a large number of country practitioners in the last few months.

6607. You think their brains would not suffer?—I do not think so.

6608. It would also have the direct effect of keeping mothers at home and compelling them to attend to their domestic duties?—Yes. In teaching of children, particular attention should be given to feeding and cooking. It is such a common practice for the elder brothers and sisters to look after the little ones. The only thing that surprises me is that so many survive.

6609. That is one of the reasons why you would pay special attention to cookery and household management in regard to elder girls, because they pass into their homes almost at once and apply what they have learned?—Yes, I strongly hold that, but it should be suitable.

6610. Do you think the present curriculum formulated by the Board of Education does not make it as practical as it should be?—I think there is not sufficient discrimination for the rural districts.

6611. You think it is above the heads of the children?—Often.

6612. The appliances used and the methods followed are too foreign to their own experience, and are therefore not of much value?—That is so, and they are being trained to a sphere in life which does not keep them in the country.

6613. The conditions under which they are taught cookery in the school should approximate as near as possible to the conditions which obtain in their own houses?—Yes, the Worcestershire County Council have five whole-time health missionaries working with the greatest success amongst the poor.

6614. What are their duties?—They go from house to house and school the parents in regard to feeding, clothing, and the rearing of children.

6615-16. Like the Manchester Health Society?—Yes. We have had them in Worcestershire entirely paid by the county council for more than six years—lady health missionaries we call them.

6617. Do they pay special attention to those households where there are very young children?—Yes, in fact,

in one instance, as probably Dr. Tatham may remember, we have returns of births, but we could only succeed in getting these in one district; but we do hear of the births in many other ways. Their instructions are really to get hold of the mother as soon as she begins to have children.

6618. And to explain to her the principles of better management, and proper nutrition of a child of that age and all the rest of it?—Yes, we find great success, more particularly amongst young mothers.

6619. They respond?—Yes, and even the ratepayers in the district do not object to the cost involved.

6620. They see the utility of it?—Yes, and they do not begrudge the money. I have never heard anyone begrudge it.

6621. Is the staff sufficient for the purposes of the county?—No, it is insufficient for all parts. We started with one, and we have now got five; they are paid 35s. and £2 a week.

6622. Do the children of the poor suffer in Worcestershire, suffer a difficulty in getting milk?—Yes; not so much in the market gardening centres, because men keep cows, but in the typical agricultural village you very often could not get milk.

6623. What substitute is there; do the mothers suckle their children for the first five or six months?—Yes, and some of them much longer.

6624. How do children get fed if the mothers do not suckle them?—The most general answer if you ask them is: "They live as we do."

6625. That must be very destructive to them?—Yes, very.

6626-7. Is infant mortality high in Worcestershire?—In some parts very high, but in the rural districts, no. I have all the details.

6628. Is it higher than the average of England and Wales?—Some parts are very high. In some districts it amounts to nearly 200 per thousand—180. Oldbury and Redditch are bad, and the Black Country. And it is in those districts that we have the health missionaries at work.

6629. I should like you to put in those figures?—I will let you have the report which I made seven years ago, which led up to the whole question, which strongly recommended health missionaries. I have the figures here, but they are all given in the report.

6630. If you will let us have the report we shall be glad?—I will do so. Before we leave the question of health missionaries I should like to say that, when they first began their work, they had to use the greatest possible tact, but now we find the mothers send for them.

6631. They value their advice?—Apparently, yes.

6632. Do they give advice upon children's teeth, among other things?—It is the younger children—they see them at the teething age.

6633. How is attention called to children's teeth? I suppose school teachers do not pay much attention to it?—That is a point I mentioned in my evidence. I think children's teeth are very much neglected in after life.

6634. Do you think some system of medical inspection of schools would be a useful thing?—I do.

6635. Where children are defective in any particular, the school teacher's duty should be to call the attention of some medical officer to the circumstances, with a view to its being reported to the parents?—We have an open-air sanatorium for the poorer classes in Worcestershire, and we found it was absolutely necessary to appoint a dentist, as one of the first things, to make examinations. The patients we see there are the labouring class.

6636. Do you think that is a defect which is growing in intensity?—Yes.

6637. To what do you attribute that—diet?—Partly, I think.

6638. And want of cleanliness?—Yes. I think the tooth brush is unknown in a labourer's house.

6639. (*Mr. Struthers.*) But it never was known?—No.

6640. Why should it be worse now?—I do not say it is.

6641. (*Chairman.*) You can use other things besides a tooth brush—the stick of a lucifer match is said to be just

as good as a tooth brush?—I do not think they do use anything.

6642. Is juvenile smoking common?—It is extremely common in the country districts. I have mentioned also that I deprecate cigarette smoking very strongly.

6643. (*Colonel Onslow.*) It is mostly cigarettes, I suppose?—Yes.

6644. (*Chairman.*) You would go so far as to prohibit the sale of cigarettes to boys under a certain age?—Under sixteen.

6645. Do you believe any ill effects follow from cigarettes being sold in sweet shops, which children frequent?—I think the habit is so modern that one has not realised what the ill-effects are.

6646. It is said that many sweet-shops hold a licence for selling cigarettes, and the children go there to buy sweets, and buy cigarettes instead, very often?—I heard of an instance only yesterday where that was done.

6647. We are told that sweets are just as deleterious as cigarettes very often?—Yes.

6648. Have you any knowledge of that? Something was written to the paper about it a few days ago, that in many of these sweet shops nine-tenths of the sweets are not made of sugar, but of glucose or other destructive compounds?—I have no knowledge of that. There is another question which I have suggested, namely, that I think there should be much more physical training in the schools, such as drill, hockey, skipping, and other physical exercises.

6649. I believe there is an effort being made to systematise that, but when children leave school is anything done for young lads to keep them physically up to the mark, or is it supposed that their ordinary avocations will do that?—In some of the urban centres you get the lads to do it, in Worcester for instance. I believe the "Lads Brigade" is very popular there, and that they are doing good work.

6650. These brigades rest upon the basis of physical instruction, do they not?—Yes; but in the rural districts there is nothing of the kind. For that reason I think there should be every facility for football clubs and cricket clubs, and so on, even in the country districts.

6651. It would not be difficult in the country districts to provide that?—It is not, but the difficulty is that the boys cannot always get their things together.

6652. I should have thought that the richer members of the community would be always willing to help them to that extent?—Football is much more common than it used to be.

6653. It is much less expensive of course?—Not necessarily. But it is more common than it used to be, and I think it should be developed. Will you allow me to add that I think practical agricultural subjects should be taught in schools, such, for instance, as pruning for the elder boys.

6654. The processes of horticulture and also of agriculture?—Yes.

6655. Do you think that would interest boys in rural life?—Yes. When a young agricultural labourer goes into the fields he knows nothing about pruning, or grafting, or pig keeping, poultry keeping, thatching, &c., and often never tries to learn.

6656. All matters of that sort would help to arrest the influx of people into the towns?—Yes, I think it would.

6657. (*Colonel Onslow.*) It would be more useful than some of the articles in the code now?—Yes. I do not wish to say anything against education, but I think it should be made useful and practical, as well as suitable for local requirements.

6658. Whom would you call upon to instruct them, the ordinary country schoolmaster could not do it?—I do not see why suitable teachers should not be told off to go into certain districts, say once or twice a week to each school.

6659. (*Chairman.*) Itinerant teachers?—Yes.

6660. The county council being the authority could supply those?—Yes.

6661. (*Colonel Onslow.*) There are local demonstrators now who go round?—Yes.

6662. Is that more for the older people?—Yes, and even then one finds great ignorance on the part of those for whose benefit such instruction is intended: they are prejudiced.

6663. You mention here consumption in the rural districts does not seem to have decreased in the last few years?—Consumption in Worcestershire is low, and for thirty years it decreased a great deal, practically on parallel lines with the rest of the country. Worcestershire started to decrease at the point where other counties have now got to. But latterly in the rural districts, if you take ten years, I have not found the rates to have changed very much. I have the figures if you wish to have them.

6664. The deterioration you find in the country people is really due to the best men going off into the towns?—That is my opinion.

6665. For instance, if three strong men go away, and leave three physically weak men, naturally that must affect the whole of the country. Does that affect the next generation?—I think so.

6666. Although a man may be physically not able to lift a sack of corn on his back, he may be otherwise a healthy man?—He may be.

6667. Why should not he produce healthy children?—They are not of the same stamp. I enquired of a large London contractor who is making a railway in the district, and he tells me his experience. I have received a letter from him since I came into this room saying that his navvies, especially where drawn from the agricultural labouring class, are nothing like as good as they used to be. I can read you what he says: "This class of man as a whole is very much inferior to-day to what it was twenty-five or less years ago." Then he goes on to say: "Of course, these remarks do not apply to all navvies, as we are glad to say a good number are self-respecting and decent fellows, and not much behind their predecessors, but where this class is recruited from the poorer agricultural labouring class we think our remarks are justified." That is from a large Westminster firm building a railway from Honeybourne.

6668. It is a common experience is it not? I have heard it said that farmers generally say men are not so strong as they used to be?—Yes, but is it equally commonly said that "no man is as good as his father"? One often hears that.

6669. Do young housewives neglect their house-duty in your part of the country?—Many of them do, because there are facilities for their working out of doors.

6670. Apart from working out of doors?—They seem to be ignorant. Unless they happen to have been cooks in domestic service they do not know anything about cooking.

6671. Do not the old mothers instruct them?—They are equally or rather more ignorant.

6672. Very much is put down to education nowadays, as upsetting the young women—they will not attend to home duties because they want to go into shops or something like that, but that is not the whole fact?—No. That is the tendency.

6673. That cannot be the whole fact if the old women are as bad as the young ones?—The tendency of the young women of course is to go either to the factory or to the shop from the country districts. With regard to domestic servants there is the greatest difficulty in getting them. You do not often now see the old-fashioned, robust, red-faced dairy servant.

6674. That is so everywhere, is it not?—Yes.

6675. One heard of the old women of one's younger days—you probably can go back a greater number of years than I—that they were better housewives than now, and kept their house clean?—Yes, I was thinking more particularly of cooking.

6676. Why should they not instruct their daughters in the same way?—All their early days the daughters are at school.

6677. You think it is partly due to education?—Yes, I think so.

Mr.
Foshroke.

Mr.
Fosbroke.

6678. (*Colonel Fox.*) You say that good wages and good houses and amusements in the towns attract the rural population there?—Yes.

6679–80. Do you not think that education has really been the primary cause of all this, suiting them, as it does, to be clerks; they get employment more readily and better wages in the town?—Yes, and not only that, but there is often lack of full-time employment for the labourer in many farm districts; if they stayed there there would not be complete occupation for them.

6681. You say that the aim of the teachers should be to have the healthiest instead of the most forward children and that would be a move towards physical improvement; do you think that if they could reduce the amount of mental education and have daily physical training a better child would be produced both mentally and physically?—I do think so.

6682. Their brains would be more active and consequently they could concentrate their thoughts on their work better than if you give them so many subjects which tends to prevent concentration?—Unquestionably that is so.

6683. I think you deal with the question of cookery in schools?—Yes.

6684. Have you ever considered whether it would be better to keep girls later in the schools, up to the age of fifteen, in order that they may be better prepared for household duties when they are married?—Possibly.

6685. To keep the girls longer at school so that they might be taught the duties of a housewife as regards keeping house, diet, and also how to cook all simple food: are you in favour of that?—I do not know that I am in favour of their being kept at school very much longer, but I think they might have evening continuation classes.

6686. (*Colonel Onslow.*) That would be difficult in country districts, would it not?—I do not think so. The old night school was very well attended.

6687. (*Dr. Tatham.*) With regard to domestic servants you speak in your evidence of their being affected very frequently with anæmia of a certain type?—Yes.

6688. Do you notice that tuberculosis, phthisis, is very prevalent amongst them and increasingly so?—I have no evidence to that effect.

6689. Is it your general impression?—I cannot say.

6690. It is difficult to get facts?—Very difficult. Rural statistics as you know are very difficult to obtain.

6691. We have had evidence here from a lady evidently very well informed who told us that she thought that the young housewives at the present day of the labouring classes have a tendency to become very lazy in their housewifely duties—they very much prefer to get off to the towns, if they are near a town at all, to the theatre and music hall, and that their conduct at home is not what the conduct of their mothers was some thirty years ago: is that in accordance with your experience?—No, the facilities for getting to places of amusement are not great in Worcestershire.

6692. You think the temptation makes the thief?—I think so.

6693. You think it would be a libel on the young wives of the working classes of the present day to say that they were more lazy than their mothers were?—I do not know about that. I think they might be much more industrious than many of them are.

6694. They are less inclined to work you think?—Yes, I think they are unless they can earn something in the fields as many of them do.

6695. There is a craze for getting money somehow, to spend it on dress I suppose?—Yes.

6696. (*Chairman.*) Is there much employment of women in Worcestershire?—Yes.

6697. Young women?—Yes, women of all ages.

6698. (*Mr. Struthers.*) What wages do they get per day?—They are often paid piece work. Some of them will get as much as 2s. or 2s. 6d. a day or more. It entirely depends on the kind of fruit they are picking and the abundance of the crop.

6699. (*Dr. Tatham.*) You expressed the opinion just now that young children residing in rural districts ought not to be sent to school until they are at least five years of age?—Yes.

6700. Do you know whether or not it is frequently the case that young children are sent to school half starved?—I do not think that there is very much of that in the rural districts.

6701. Not so much in the rural districts?—I do not think so. I have asked many schoolmasters, and though one understands it is very common in some urban districts, I think it does not obtain to a very large extent in rural districts—not in rural Worcestershire.

6702. (*Mr. Lindsell.*) You were speaking about milk. I suppose milk in the rural districts is scarce and hard to obtain?—In some places.

6703. In the market gardening districts, I suppose many of them have a cow?—If they can get grass land, a few of them have.

6704. And you think milk is fairly supplied there?—I think it is better there.

6705. Do you know of any establishment in Worcestershire where they endeavour to supply sterilised milk; do you know anything of Far Forest?—I have heard of it. I believe it is managed by a clergyman with great success. I only heard of it just about a fortnight ago, and I have not been able to go there. He is a gentleman who is newly come into the district but I hear him very highly spoken of.

6706. I wanted to hear of its success and so on, but you have not seen it?—No. The clerk of the peace was over there a few days ago and he tells me it is a great success.

6707. Is it mainly sent into the towns?—I believe it is mainly sent to Kidderminster and Dudley.

6708. With regard to these points about the schools, are the county council starting cookery schools and teaching practical useful cookery at all in the rural districts?—I am afraid at present our Worcestershire arrangements have not got into thorough organisation.

6709. But there is reason to hope that they will take that line?—It was undertaken under the Technical Education Committee in many instances.

6710. Will it not be carried on under the present system?—I think at present things are not quite ship shape.

6711. And the same with regard to cottage gardening. There are powers to do all that sort of thing?—Yes.

6712. But you would like to see it continued, not merely taught in the elementary schools but carried on later in the evening continuation schools?—I certainly should.

6713. Have you considered whether compulsory attendance at evening schools is feasible in the rural districts?—I am afraid not in the present feeling. I think it would be bitterly opposed just now.

6714. You cannot make a horse drink unless you take him to the water, and if nobody attends them it is not of much use?—I think it would be if suitable teachers were provided. In many places I understand where these cookery schools have not been a success the reason is that they have too much of the lady to lecture and that the cookery has been above the heads of the agricultural labourer.

6715. That of course is for the persons who establish it to consider?—Yes, without doubt.

6716. There is a very considerable difference I understand between market garden districts and the purely agricultural?—That is my view.

Mr.
Fosbrooke.

6717. Unfortunately that style of cultivation is not possible except on certain favourable land?—No; I have especially mentioned that in my proof; it is impracticable.

6718. Evesham is the great market garden centre?—Right up the valley of the Avon. In the poorer districts much more could be done.

6719. Worcestershire is a great fruit-growing county?—Yes.

6720. (*Chairman.*) It is a cider county, is it not?—Yes.

6721. (*Mr. Lindsell.*) I fancy most of the cottagers in a good year in the villages can pay their rent and more out of the damsons and things in their own garden?—Many of them do. May I be allowed to remark on one question which I heard you raise with Dr. Niven with regard to the tenure of office of sanitary inspectors? Having had such a large experience of rural inspectors, may I suggest that if you are to get good sanitary administration and the men to do their duty fearlessly and well they must not be open to re-election every year or two; they must have security of tenure. As it is, the Inspectors now are appointed for short terms, one, two, and three years, five is the most except in two cases that I know of. The result is that they are very much under the thumb of their employers.

6722. (*Colonel Onslow.*) You find in country districts that very often the small householder is the worst landlord?—Very often.

6723. The very small householder, the man who has very likely risen from a small shopkeeper and has amassed a little money, grinds his tenants?—Yes, and also he tries to get on the district council.

6724. And the unfortunate sanitary inspector is under his thumb?—To some extent. I think that security of tenure is of vital importance. Might I also allude to one other matter as regards bye-laws for building in rural districts?

6725. (*Chairman.*) Are they not stringent enough?—On the contrary. In Worcestershire the County Council have been trying to induce the rural authorities to adopt building bye-laws, but not with much success, because the bye-laws of the Local Government Board were at one time on the same lines for urban and rural districts. But now

since the Local Government Board have issued a model series for the rural districts, which are admirable in every way, there is a greater desire on the part of the Local Authorities to put them in force.

6726. But it is optional whether they do so or not?—Yes. I think it should not be optional.

6727. You think it should be compulsory as in towns?—Yes, provided they are suitable.

6728-9. You admit the model ones now are suitable?—Yes, the rural series.

6730. The enforcement should be binding upon every rural authority?—Yes, I think so.

6731. With regard to the exercise of their duties by rural authorities do they take the steps they might do to see that the sources of milk supply are uncontaminated?—That is a point which the Sanitary Committee of the County Council have been urging upon the District Councils, and there again since the Local Government Board have issued their bye-laws for rural districts as distinct from urban districts for dairies there is much more inclination to carry them out.

6732. Are they optional with them?—Entirely optional, but the majority in Worcestershire have now adopted them.

6733. And given effect to them?—Yes. I believe they do; though of course many of the dairies are not what they ought to be.

6734. Does the milk, or most of it, go into the towns?—Yes.

6735. Is it within your knowledge that the sanitary authority in the towns make any inquiry as to whether the milk supply which they receive from the rural districts is protected by all the powers with which the rural sanitary authorities are invested for the purpose?—I have never heard of a single instance where they have done it.

6736. Where they have made the inquiry?—No.

6737. A great deal goes to Birmingham, I suppose?—Yes, and even to London.

6738. And you do not believe any question is ever asked?—Not to my knowledge.

6739. You would probably have heard of it if there were?—I think so.

Dr.
Mackenzie.

THIRTEENTH DAY.

Monday, 29th February, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr J. F. W. TATHAM.
Mr. ERNEST H. POOLEY (*Secretary.*)

Dr. W. LESLIE MACKENZIE, M.A., M.D., M.R.C.P.E., called; and Examined.

6740. (*Dr. Tatham.*) You are Medical Inspector to the Local Government Board for Scotland?—Yes, I am.

6741. And you have had experience which enables you to give us some information with regard to the matter under discussion?—Yes.

6742. (*Mr. Struthers.*) You start the evidence which you propose to give us by drawing a distinction between inheritable characters and environmental modifications of inherited characters. Would you just say a word or two in explanation of what you mean?—Taking the human being, you have him as he is born and as he is modified by his environment. We have to draw a distinction between the characters that can be transmitted to posterity, and others that are not transmitted to posterity. The inheritable characters, as I call them, are those that the human being would bring with him into the world at the moment of conception, and would develop, given a certain environment, in a particular direction. He will become a human being, and not a mere animal, and will have all the specific characters of the human being. But on the other hand, from the moment of conception, he has his inheritable life, and the environment produces certain modifications. These latest are not transmissible to the offspring. I make a distinction between those characters that are present in the germ at the moment of conception, which will manifest themselves in some degree whatever be the environment, and those characters that are imposed upon that individual by his life history.

6743. Would you say that it was an accepted doctrine that some characters are transmissible and others are not?—This is a disputed point; but the preponderance of authorities favour non-inheritance. But the acquisitions must be strictly defined within the lines I have indicated. You have congenital modifications, of course, which are not inheritable. They are imposed upon the organism.

6744. But those modifications imposed upon the ovum would not affect the next generation?—No.

6745. You do not think that there is any stage at which the environment, so to speak, modifies in any respect the inheritable characters?—One would not say that. The environment would affect the nutrition of the ovum and therefore impair its vigour, with the result that the next generation might suffer in vigour, and in that respect show arrested development; and it is quite conceivable that on account of the defects of nutrition you might have organs interfered with, so that, as the result of defective nutrition, you might have the next generation suffering.

6746. You do not agree with some people who have given us evidence that the character of the offspring does not depend in any degree upon the nutrition of the mother during the period of child-bearing—that is to say, that provided there is nothing abnormal, everybody has, so to speak, a fair start, quite irrespective of the condition of the mother, and that the average child is born healthy?—No. I could not accept that position, because I should look upon the mother as the environment of the growing ovum, and her bad nutrition will certainly interfere with the ovum. There can be no doubt whatever upon that point.

6747. It comes to this that you do not regard environment as beginning with birth, but you take a period a good deal before the birth of the child?—Yes; not from the moment of conception, but even before the moment of conception. We take that as beginning the life of a new individual.

6748. You lay considerable stress on the health of the individual child, that it greatly depends upon the state of health of the mother and the nutrition of the mother during child-bearing?—I believe so, undoubtedly.

6749. If the mother suffers from insufficient food or from exhaustion or over-work, or disease, the result is that disease is shown in the child?—That is my opinion.

6750. Then one of the two important things, the inheritable, and the environment modifications, you regard the latter as being the branch which specially requires our attention from the health point of view?—That is so.

6751. As following upon what you have said, you would, I suppose, say that we ought to direct attention to securing the proper condition of the mother?—Entirely, that is the first problem.

6752. And precautions should be taken that she should not suffer from over-work during the period of child-bearing?—Yes; before and after child-bearing.

6753. How long before, do you say, she should be prohibited from work?—That is a matter for empirical examination. In Switzerland, I believe, it is six weeks before confinement, during which they give rest and ease and I forget how many weeks after confinement.

6754. Is there any district in Scotland of which you have knowledge, where married women, during the child-bearing period are employed in work largely?—Yes. Practically I know of no place in Scotland where any special rule is made giving them a remission of labour before confinement, unless in individual works, but I do not know any of those.

6755. There is no law against married women working during child-bearing in any factory in Scotland?—I should not like to say just beforehand, without having the Act before me, because certain recent modifications have been made.

6756. Could you say whether there is any rule about married women working in a factory after child-birth?—I could not speak with any certainty.

6757. As to the extent of the labour of married women, have you any knowledge as to how far it prevails in Scotland?—In the statistical sense, I have very little information; but in Dundee, Edinburgh, Glasgow, and everywhere I go, I find in factories certainly that the predominant labour is that of females.

6758. But are they married females, or only unmarried?—They are largely married as well as unmarried.

6759. Would you say that a very large proportion are married females?—I think so, but I cannot give any figures. In Dundee, from Dr. Templeman I learn that the extent is very considerable in the factories; I have been given to understand that it prevails to a large extent

in Dundee. I do not know whether it prevails in other towns, but that there is a considerable number I am satisfied.

6760. Do you know Paisley?—Not well.

6761. There is a large amount of female labour there, but I have understood that it is of the unmarried women?—I do not know.

6762. But in Dundee you think that there is a large proportion of married women engaged in it?—Yes. Would you allow me to say that this doctrine of the caring for the mother would not necessarily begin with the confinement of the married women, but there are the conditions preceding marriage, which are very important also.

6763. But we must make some starting point you know?—You are thinking of the immediate injury to the offspring, are you not?

6764. Yes. There has been some information obtained of recent years as to the effect of nutrition on the size and weight of the child, has there not?—Yes.

6765. Could you give us any particulars of that?—I do not know whether the Committee has had it before them, but if not, this research of Dr. Noël Paton on the influence of diet in pregnancy on weight of offspring would be useful.

6766. Would you kindly put that in?—Yes.

6766A. Would you give us a word or two as to the effect of it?—The investigations started from an impression that Dr. Noël Paton had in investigating the food of Edinburgh families of the poorer class, and the effects on the child and the mother. He concluded that the mother in two periods of life was under-nourished in early married life. For various reasons life was made very difficult. As the children grew up, the wages were less. Consequently the later children also suffered. That led him to investigate further. He found a continental investigator had gone upon the supposition that by altering the diet of the mother he was able to reduce the size of the child before birth, for example children born of rickety and deformed parents would otherwise have been still-born. He made an experiment with guinea pigs. The number of offspring of well-fed guinea pigs was not altered, but the weights of the offspring were distinctly altered. That of the under-fed mother was about 30 per cent. less than the offspring of the well-fed mother. The experiment is only a beginning, of course, and one cannot draw final conclusions from it, but it seems extensive enough to indicate one thing, that the offspring get fed from the excess of the nutrition of the mother, and are not fed at the sacrifice of the mother; by which I mean that if a mother is over-fed, then the embryo is well-fed, but if the mother is under-fed the embryo also suffers in greater proportion than the mother herself, that is to say, the first part to die or to suffer is the embryo. A popular impression is that it is the contrary. I am giving this on the authority of Dr. Noël Paton's research.

6767. But the effect of this experiment that you tell us of is in this direction at all events—that if there is not sufficient nutrition for feeding the mother and child the mother must have it, so to speak, that the tissues of the mother take it over, and that there is little left over for the child?—That is clearly Dr. Paton's conclusion.

6768. At what stage is the weight of the offspring taken?—In this instance, in guinea pigs it is taken at birth.

6769. Do I understand this point that the nutrition of the parent—good feeding or insufficient feeding—had no effect upon the number of offspring?—The average number is practically the same. In the one Table it is 2·7 in the number of young, and in the other Table it is 2·5, with seven experiments in one lot and four in the other.

6770. Has this experiment been continued for a sufficient number of generations to show whether the continuance of over-feeding, for example, may not reduce the number of offspring?—I do not know whether that is so.

6771. There is a very common opinion that the well to do classes (I am speaking of human beings now) who presumably are better nourished, have a smaller number of offspring on the average?—Yes.

6772. But so far as these experiments go what do they prove?—Well, physiologically that ought not to be the case. But there are so many other circumstances intervening. Perhaps you might just let me read one sentence from Dr. Noël Paton's paper: "To the physiologist, the point of chief interest seems to be the demonstration of the limitations in the extent to which the tissues of the mother can be utilised for the construction of the embryo. The nourishment of the maternal tissues seems to take precedence over the nutrition of the fœtus. Were this not the case—had the embryo the prior claim to nourishment—we should find that in badly nourished mothers each gramme would produce a greater proportionate weight of young than in well nourished mothers. This is exactly the reverse of what occurs. The mother thus appears to pass on the surplus nourishment to the fœtus, and the better the nutrition of the maternal tissues, the greater is the growth of the young in *in utero*." That is indirectly confirmed by Dr. Paton's previous food investigation.

6773. Could you give us some illustrations of inherited deteriorations?—A simple way perhaps would be to take the name of diseases in the official list, and name one or two of the classes that I should call inheritable—not necessarily inherited—deteriorations. I should say that probably certain tumours, or the capacity to develop certain tumours, are inheritable. That, of course, is hypothetical, because our evidence is very difficult to bring to the point, so that we cannot be dogmatic about it. Then sarcoma, a tumour of the muscles, or forms of cancer, might be inheritable in the sense that certain tissues are likely to develop, without any special regard to the environment.

6774. Have you any other broad classes of disease which you regard as inheritable deteriorations?—Then possibly certain classes of deformities might be inheritable, but these, so far as recent research goes, the majority regard as the effects of environment. But that I should regard as one of the points where it is impossible to draw any clear lines.

6775. Would you regard insanity as in many respects inheritable?—In the same sense as one would regard diseases of the nervous system, or the inheritance of tissues that come easily off.

6776. But supposing the person that has put off those tissues is put in favourable circumstances of living, do you think there would be that development of the special taint?—I think there is a possibility. But then again the line is not so clearly defined that you can speak dogmatically, nor could you speak of all forms of insanity in the same way.

6777. What do you say as to drunkenness—alcoholism, would you regard that as inheritable?—As such, that is to say, as the specific form of drunkenness called alcoholism, I should not say that it is directly inheritable, but I should say that certain unstable nervous systems are directly affected more than others, and that probably the alcoholism of the mother after and preceding conception might have an effect upon the nutrition, and possibly might poison the ovum to the extent of interfering with its development. But that is really the infection of the ovum in its environment. As a contrast to the inheritable characters, it is very striking when you go through the whole list of diseases to find the tremendous proportion that are quite definitely due to environment; for example, among the general diseases in the official list there are thirty-nine specific infectious diseases, and these are explicitly due to influences affecting the organism.

6778. So large a proportion as that?—It is not a percentage—it is only thirty-nine out of eighty. Another general disease—Hæmophilia—that is a case, so far as our knowledge goes, where the taint is inherited. For example, the specific infections, which are all probably due to minute parasites, and the diseases due to animal parasites, 118 species, affecting the human being, and then vegetable parasites, something like thirty-nine species. Then there are the diseases due to poisons, and so on, and the diseases due to exercise and strain and overwork and under-feeding, and those due to nutrition, such as scurvy or goutiness, rickets, and anæmia and chlorosis, and several others; those are directly referable to conditions of environment.

6779. Is that goutiness attributable to food?—Well, some are more liable to be affected by the food. Then we

Dr.
Mackenzie.

Dr.
Mackenzie.

have diseases of the nervous system, sixty-one named classes, and a considerable number of these are clearly owing to environment.

6780. So that out of the whole list of diseases the greater proportion belong to acquired deteriorations?—Distinctly.

6781. And those are practically the most important from the health point of view?—Yes.

6782. There have been proposals for dealing with the other classes; that is to say, the inherited classes, by segregation of the unfit. You have heard of such proposals, have you not?—I have heard and read of many proposals.

6783. Are many of them in your opinion practical, or worthy of consideration in detail?—Apart from segregation in asylums and Poor Law hospitals and infirmaries and so on, as at present carried on, I find nothing that does not involve issues that are, to my mind, more dangerous than the remedies themselves. The proposal to lock up everybody that is defective is much too short a road to the result. Possibly a good deal could be done, but most of the proposals suggested are to my mind much too sweeping to be practicable.

6784. You do not think that any proposal for preventing in any way the reproduction of the insane would be worth considering?—Well, one would hardly say not worth considering, because at present the reproduction of the insane is considerably modified, owing to asylums, but an extension of that might be made. I do not know what.

6785. One is told of numerous cases of persons confined to asylums for a time, and then let out, and then brought back, having increased the population in the meantime?—Yes. If any way could be devised of preventing reproduction without raising serious issues and difficulties, it is certainly a very desirable thing, but I do not see any practical mode of effecting it without sacrificing too much.

6786. You would not have any objection to the putting of the lazy and idle in labour colonies, would you?—No, that is quite a practicable thing.

6787. That is rather in the category of acquired deteriorations. By proper discipline you think they could be brought out of that.

You could give us illustrations showing the effect of acquired deterioration from the examination of the children in Edinburgh. As a result of that examination I think you came to a very clear opinion that the systematic medical inspection of schools is one of the things that is most called for at the present time?—That is my opinion quite definitely.

6788. Could you give us some idea as to how you would organise such medical inspection?—I had hoped to present to the Committee a copy of a book which I have just elaborated to set this forth, but it is not quite ready. I shall send one to you afterwards.

6789. I am speaking generally of the general organisation for the moment. You would propose to have a medical officer employed by the school authority, would not you?—Certainly.

6790. Take such a town as Edinburgh, now. Several officers would be required, would they not?—Yes, but a city like Edinburgh might have a medical officer of the schools and each group of schools could be put in charge of medical men in the locality, or have special assistants of the medical officer to take a group of schools and to examine systematically the admissions to those schools. The principal practical difficulty of the system is in attempting to cover the examination of the whole of the children now in school. That is a very large order; but it would be quite a practicable thing if the school area were divided up into districts very much as parish districts are divided up, and it would be quite a practicable matter to examine all the admissions to those schools. Roughly in a school of 1,600 the admissions in any one year would be somewhere about 200 new children?—Supposing 200. The first examination for all the points that were gone through in the Royal Commission investigation with the exception of about eighteen measurements, which were not health measurements, could be quite well conducted at the rate of forty or fifty or sixty children per day. That is not a very formidable task.

6791. Your idea of the organisation is this; that each educational authority should have a medical officer who

would in a large town give his whole time to that work?—Yes.

6792. That he should have under him either assistants who might take a large number of schools, giving them whole time; or that medical men who are in practice might each have charge of a group of two or three schools, it may be, working under the direction of the medical officer, and that the duty of these men would be to examine all the new admissions to the school from the health point of view?—Yes.

6793. That would be done in the autumn, when the great influx of new scholars would come in?—Yes.

6794. And then after that the children newly admitted would be comparatively few to examine. But those medical officers would continue to visit and examine the school once a fortnight?—Yes.

6795. And go to the school at the request of the headmaster to investigate any particular case?—Entirely so. In the towns, that would be satisfactory enough. The difficulties would arise when you come to the counties.

6796. What would be the relation of the medical officer of the schools to the medical officer of health for the town?—He might be made the same individual, and I think that would be in many respects a very desirable thing to do, for one reason I have already given. In the case of the Public Health Acts, the local authority for public health has direct control over the sanitation of the schools, and also direct control of the children so far as infectious disease is concerned. All the powers with reference to throats and skins are perfectly adequate.

6797. To what extent are they used—does the medical officer of the town make any inquiry as to the ventilation of the school?—Well, it is exceptional in my experience certainly, but I should not take the present practice to found upon.

6798. Some at any rate might object to your proposal, and say: Very well, if that is part of the medical officer's duty at the present moment why not employ him without making an extra salary of it?—I should not make a separate salary of it for the sanitary inspection, because that is part of his duty now.

6799. What would be the part of the examination not at present his duty?—The individual examination of ears, eyes, heart, and lungs, every disease except infectious disease. He can examine the children for the last now. It is within the Scotch law; but he could not, except with the consent of the parent and the children, examine for the non-infectious diseases.

6800. Of course you know one of the most important parts of this individual examination would be the examination of the eyes and ears, which are specialists' work?—Undoubtedly.

6801. So that your staff for a given district would have to include some specialists of that sort?—Yes.

6802. And probably a dentist?—Probably a dentist. Excuse me, I was saying that in a town that need not present any difficulty, because the eyes, ears, and teeth could be done very accurately now. An expert in the course of four hours would do perhaps thirty an hour, so that it is not a formidable thing. An expert can go through it very rapidly.

6803. But you propose to have the expert, and not trust to the medical officer of the schools together with his general assistants?—No, that is a special work over and above that. But my point is that, in order not to multiply authorities and officials, it would be advisable to have this work under the direction of the Public Health Department. I do not say that it is bound to carry out all the details.

6804. It has been suggested to me to have this medical inspection of schools under the general direction of a Board of experts who would, of course, be subject to the ultimate control of the central authority, *i.e.*, the education authority?—Clearly.

6805. The education authority ought to appoint a Board which might comprehend the Public Medical Officer of Health if he is not the school Medical Officer of Health, and probably a surgeon and dentist and a physician, who would lay down the lines on which the medical examination is to be conducted?—Yes.

Dr. Mackenzie.

6806. And who might be paid a fee. Is that a good arrangement?—That is a sound proposal. But what one would like would be not to be dogmatic about how it was to be done in each place.

6807. Clearly that applies more readily to a town; but in a country district it would be extremely difficult you think?—Yes.

6808. To what extent would you make use of the teachers in looking after the health of the pupils?—I think that the teachers could make a preliminary examination of general nutrition. They could supervise the height and weight measurements, which are very important; make a general segregation of doubtful eyes and of deaf children as a preliminary, and scrutinise for infectious diseases as a matter of course.

6809. They could easily have such knowledge as to enable them to pick out underfed children, you think?—I think so, easily.

6810. Do you think that some further instruction of teachers on those lines is desirable?—Yes.

6811. There is a class going on at present for the further instruction of teachers in Edinburgh in matters of health, is there not?—Yes.

6812. That should have a good effect?—Yes.

6813. And do you think that such classes should be encouraged all over the kingdom generally?—I think so.

6814. You can give us some information as to food in relation to deterioration as illustrated from Scottish poor-houses and prisons?—I do not wish to enter into any detail before the Committee, but I should like to call their attention to two documents, and possibly the Committee may have had them before them already. The one is by Dr. Aitchison, on certain effects of diet. This research was undertaken in a Scottish poorhouse. He found that where the diet prescribed under the Scottish Board rules was rigidly followed out, the result was that in thin patients there was great excess of urine and a diminution of body weight. He experimented and found that by increasing the fat of the diet the nitrogenous waste of the muscles could be so far arrested, and by increasing the fat a very little, equilibrium was restored. The result was that a reconstructed dietary has been issued by the Local Government Board for Scotland for poorhouses.

6815. Is it the same dietary as in England?—Not the same dietary, but very much on the same lines; but, on the whole, the English diet is more varied, if not more generous. The point of this is to demonstrate that it is not so much the quantities of food as the proportion of the ingredients that make it up, that are important. For instance, it has been found by experiment that an increase of nitrogenous food, such as the increase of meat, would not necessarily quite preserve the weight if the fat of the body had been previously exhausted, and not supplied in the food—half the quantity of nitrogenous food, if the fat was given, was as good as double the amount of nitrogenous food if fat was not given. It is a popular idea to increase the meat, but it is really the balance of the diet that is equally important.

6816. Would you say that a dietary of pea-soup or peas in some form or other would be a good diet?—I think so.

6817. It is highly nitrogenous, but it is deficient in fat?—Yes: but by adding to it carbo-hydrates, and a small amount of milk, it would be all right.

6818. You distinguish between carbo-hydrates and fat?—Clearly; but all the same, as one of the results of this investigation, this diet was modified to the extent of adding suet pudding twice or three times a week; and that had the effect of making a diet that was insufficient into a diet that was, on the whole, adequate.

6819. Was a record kept of the change of the persons in their weight?—Yes, by Dr. Aitchison in the investigation. But at the present moment as a sort of check, or a probable check upon the diet as now issued by the Local Government Board, an investigation has been set going whereby the paupers—all the admissions of the six largest poor-houses in Scotland—are being systematically weighed on admission, and at four periods after admission at intervals of a month. This is a specimen of the register. (*Handing in the same.*)

6820. Perhaps you will put in Dr. Aitchison's report, and also those schedules you are showing us?—Yes.

6821. But generally the effect of adding more fat to the diet of these paupers is to improve their condition, more than doubling the amount of nitrogenous food alone?—Yes.

6822. On those principles the traditional diet of the Scotch peasantry would not be a very good one, with oatmeal?—But oatmeal and milk form a good mixture.

6823. Even from the point of view of fat?—Yes, in sweet milk—there is a thing called skim-milk in which there is less; but the oatmeal itself contains a good deal of fat.

6824. Has this principle as to the importance of fat in the dietary been long accepted, or is it a new view?—It has been accepted for sixty years, but the stress has been put on the nitrogenous part, but in the last ten years the balance of the diet has been considered equally important. Formerly it was said: You should increase the proteids, but now it is recognised that the proteids and fats are equally essential.

6825. Would you say that the question of dietary for different ages and different conditions of work has been worked out on a scientific basis?—Yes. I think a great deal has been done by Atwater in America, and there is another by Dr. Crauford Dunlop on the food requirements of varying labour. He experimented in detail, and in a formal report much more detail of the diet is given; but in this particular print, from the Scottish Medical Journal of May, 1901, you gather the results of a particular experiment at Peterhead Convict Prison. There was a difference of about 200 calories in the construction of the diet which resulted in converting a diet complained of, where 82 per cent. of those who had it lost weight, into a diet which resulted in no complaints and in only 23 per cent. who had lost weight.

6826. That rather points to the question of suitable food being food to the liking of the user?—On the whole, where a person is healthy that does not matter—but in cases of disease the liking has no bearing.

6827. Are there any authorities on the question of diet, on a really scientific basis. Where is that to be found?—I shall be glad to let you have them.

6828. Well, one great cause of physical deterioration is the insufficiency or improper balance of food you say. What is the next in importance as a cause of deterioration to be guarded against from the public health point of view; is it air?—Air, unquestionably; housing resulting from bad air and uncleanness, of course, but that to a less extent.

6829. I observe in your report on the schools in Edinburgh that you consider that the schools there are well ventilated on the whole?—Yes, on the whole.

6830. Would you say that the children are better in them than in their homes?—Certainly.

6831. So that from that point of view there would be no objection to the children having a fairly long day at school?—Not from that standpoint.

6832. You would not advocate their being let away in the afternoon, would you?—It just depends. In the Edinburgh schools the intervals, as I found at the four schools, of relief from labour were very numerous, so that I do not think that the question is pressing. In the country schools it is rather different; from two or three enquiries made, I gather that the country children are distinctly longer at school, and have not so much time in the playground.

6833. But when they are out of school they are more in the open air, are they not?—Not more, but they have purer air.

6834. But in coming and going to school, and also in having more work about the house and farm, that is bound to give them more fresh air than the children get in the towns?—Certainly.

6835. After food and air is there any other acquired deterioration to call attention to?—These questions of the labour of the mothers we have dealt with already. Another point that is of practical importance—but I do not see how to get at it—is the amount of sleep for the children. The present defect of housing results in preventing the children getting sufficient sleep.

Dr. 6836. That is simply another aspect of overcrowding, is it not?—Yes, and overcrowding more than in the ventilation—the noises and other things to keep the children awake.

6837. You mean the things which prevent children getting the proper proportion of sleep?—They do not really get rested and it causes irritability and nervous exhaustion.

6838. But that is the minor effect of overcrowding?—Yes.

6839. Is there any other point to draw attention to as a matter to be guarded against?—Apart from the general public health matters, which are taken for granted, and infectious diseases and the conditions of labour both in working rooms and factories, all these are overcrowding. But those are provided for, of course.

6840. Have you any statistics as to the proportion of the population of Edinburgh who live in houses of three rooms or less, and more than three rooms?—I am sorry that I have no figures. Taking the population all over, although it would be an easy enough matter to get figures, I am not able to give you that figure.

6841. I wish to know whether you think that any legislation is needed to strengthen the hands of the municipality in dealing with overcrowding?—One would not like to answer hurriedly, but I hardly think so. The present legislation for overcrowding is exceedingly drastic, and if systematically applied I have no doubt it would result in improvement.

6842. To what extent does the central Government department, such as yours, have the power of effectively dealing with a local authority which neglects its duty in this matter?—Where the neglect of duty is a specific thing having relation to specific conditions, such as overcrowding or special nuisances, the powers are complete; that is, the Local Government Board can present a petition to the Sheriff Court or the Court of Session requiring the local authority to do what it is enabled by statute to do, and the Board repeatedly does so.

6843. It is done?—Yes. Wherever it is not done it is threatened, and a threat is usually sufficient. But it has been done in a considerable number of cases. That is in specific instances of neglect. Where the neglect is of a general character and there is a total neglect of all their statutory functions, it is still open to the Board, under another section, to present a petition to the Court requiring them to carry out their duties in a general way without any specific thing. But you must justify such a drastic step. There is such a case before the Court now.

6844. Do you ever deal with a large municipality in this way, a town of 50,000 inhabitants?—Yes, in the matter of hospitals the powers have been enforced in detail.

6845. The other question is to what extent the medical officer under the local authority is the absolute servant of the local authority—has he any right of position?—Oh yes. In Scotland all medical officers of health and all sanitary inspectors hold office subject to the Local Government Board's sanction, that is, that they cannot be removed except with the sanction of the Local Government Board in Scotland. They get appointed by the local authorities, but cannot be removed from office by them.

6846. (Dr. Tatham.) During good behaviour or during pleasure you mean?—The clause is: "No medical officer or sanitary inspector . . . shall be removable from office, except by or with the sanction of the Board." No doubt it would have reference to good conduct.

6847. (Mr. Struthers.) Does the Local Government Board contribute to the Sanitary Officer's salary?—Yes, it gives a percentage. I cannot give the figure, but it is about one-third to one-half of their salaries where they give their whole time to the work.

6848. That of course gives the Board a *locus standi* as to dismissal of such officers?—It gives a double hold—the grant is withdrawn if the work is not efficient and also they have absolute power.

6849. (Colonel Onslow.) The Medical Officer of Scotland and I suppose the sanitary inspectors in the same way cannot be removed without the Local Government Board's sanction?—That is so.

6850. Does that give them sufficient power in this way that if a medical officer or sanitary inspector finds some-

thing wrong which he wishes to report he makes a report which may affect very closely in his pocket a member of the Corporation whom he serves, and it is quite possible that pressure might be brought to bear upon him by his being told of losing the appointment if he pressed this. Is that quite impossible in Scotland?—It is quite impossible in Scotland; theoretically at least. It is a man's own fault if he accepts any other position than what actually exists, namely, that he cannot be removed except by the Local Government Board.

6851. He can report on a house, for instance, that has not proper sanitary arrangements, and it does not matter to whom that belongs. His report is bound to be taken up, you think?—Yes.

6852. Without any fear that by so doing he damages somebody in pocket and will lose his appointment?—Of course, as I say, individuals differ, but that is the exact legal position.

6853. The man is really able to carry out his duty?—I think so. He cannot be dismissed by the local authority that appoints him.

6854. In your examination in Edinburgh when you examined those children on the Royal Commission on physical training how did you select the children that you examined?—Well, they were selected as nearly as conceivable by ballot.

6855. Not by personal inspection. I mean to say you did not go and out of twenty pick five?—No, in the first school that I examined I took children of all ages, from seven to eight up to fifteen. The schoolmaster took all the children of those ages in the school in the different classes, say six to nine, and he put the numbers into a hat and a pupil teacher pulled out the numbers. In the other cases, I took the odd numbers from the registers, which is practically the same.

6856. It really gave you a good guide to the general physique of the children?—I think so on the whole. The basis was perhaps a little narrow, because the children amounted only to 10 per cent. of those in the schools.

6857. Were the numbers examined sufficient to give you a good idea, do you think?—Well they were on the narrow side. I do not think you could, for example, make an inference *simpliciter* from the number of diseases found in those 600 children and say if that proportion were found in 600, therefore the same would take place in the 30,000 of Edinburgh children. I do not think that would be good reasoning. But I suggested to knock off 50 per cent. of the diseases found just to save that error. That is too big a margin to knock off, of course.

6858. In your memorandum you have, "Medical inspection of school children—specimen schedules." Have you one of those?—Yes, I shall be pleased to give them to you. That is a specimen, which I consider practicable.

6859. This attempts to take up a very large number of points?—The first four sections are really points always already in the possession of the teacher. The remaining points look more than they really are in point of elaboration, but I have gone through it with a view of reducing them to what is essential, and I have come to the conclusion that that is the least you can ask on fresh admission.

6860. You would have it carried out on admission to the school?—Yes.

6861. And periodically afterwards to see the result on each individual?—Yes.

6862. How often?—I think that ears should be examined every year or two years, and eyes the same, and especially the latter.

6863. Your scheme goes for a general medical inspector of a district?—Yes.

6864. And under him medical officers of sections—groups of schools?—I did not complete the idea, when Mr. Struthers was examining me, for the counties. In the towns it is much less difficult to get specialists, but in the counties in the present arrangement where every parish has its School Board, it would be exceedingly difficult to federate them for that.

6865. (Mr. Struthers.) If you had a larger area would that do?—It would enable the man in the position of county medical officer of health, who in his case has to inspect for the whole county area to direct the inspection. The schools are small; you get 50, 100, and 200 children.

Dr.
Mackenzie.

6866. (*Colonel Onslow.*) What is known as the union medical officer, the medical officer who is appointed, he is not confined to one village, he could go to a great many. Might not that be carried out?—In Scotland we have not an officer in exactly the same position as in England; he is the parish doctor.

6867. But the inspectors would simply look into the school occasionally, and the teachers would bring cases to their notice?—Yes.

6868. And if they found the children, say, suffering from something radically wrong in the teeth, eyes, or ears, they would refer it to the specialist of that district or that area?—Yes, or in the case of the county that can afford it, such as the larger counties, it would be best to give an assistant, dividing his time between the public health aspect and the individual child aspect.

6869. It would need to be special men rather than the general practitioners?—I think so. That would give rise to the same difficulties as arise in the case of the general practitioners with reference to the public health. That is, if any one particular man would be appointed for the purpose he would be appropriating another man's patients, and that would give rise to a difficulty. That is a reason for putting it in the hands of the general public health authority. If that coincides with the larger area of the school authority it would be a simple matter.

6870. Now to come to quite another subject. With reference to the reproduction of the insane, would not the reproduction be lessened owing to the insane being placed under charge more carefully now than formerly?—I would not say that it has lessened, but the actual management of the insane keeps it, to a certain extent, down. I cannot give you figures.

6871. General statistics show that insanity has increased enormously through the whole kingdom?—But not necessarily from inheritable causes. It might come from outside causes; and a large proportion of insanity may be stress of life in middle age, where there is no taint at all in the family. I have known of such cases. Although the family taint is assumed to be considerable in most cases, or rather great importance is attached to any indication in a family, there are cases clearly that become insane after the reproductive age, that is in women between forty-five and fifty—a considerable number of cases; and in a large proportion of these cases the taint may not be inheritable. But you cannot make a general proposition to take in all forms of insane people.

6872. The reason of it might be this, might not there be a greater number of insane and wastrels now, in proportion than there was fifty years ago, from the fact that it is more usual to put them under care now?—I think that is a contributory cause to the increase of figures, but I do not think it is the whole cause.

6873. As a boy you would see in the country villages the silly boy of the village?—Yes.

6874. And now these boys are taken charge of in an institution?—No doubt that is so, and that has had the effect of increasing the figures. I have not gone into the lunacy figures, but there is a substantial increase even allowing for that. On the other hand, one has to remember that the death-rates have been going steadily down for fifty years, and that a larger number survive. Then, again, on the other hand, there is no doubt there is greater refinement of diagnosis and greater care with the insane.

6875. (*Colonel Fox.*) Have you any suggestions to make about improving the food and feeding of the poorer classes?—It is difficult to make a direct suggestion, but I think in the direction of education you can do a good deal to teach both the children themselves and the teachers in the matter of food. I think that the amount of use made of the cheaper kinds of food is not anything like what it should be. Of course the thriftless classes go in for the relatively expensive food. I think that a good deal could be done educationally, but I am not prepared with any organised suggestions for feeding.

6876. Do you think that the bad feeding of the children of the poor is due to ignorance on the part of the mothers, or due to poverty?—It is largely due to ignorance, it is also largely due to poverty.

6877. Is not it principally due to ignorance of how to cook the food or how to select it?—That is an element,

but not quite the whole element. You will have to go into the condition of the houses in Scotland.

6878. Do you think that if girls between fourteen and fifteen were taught properly simple cooking that that would tend to improvement?—It would tend in a good direction, but the condition of a good many of the Canon-gate children, and the condition of their families, were such that it did not admit of the provision of food, and even if they could get it, of the cooking. They had to rely upon what they could pick up. No doubt the improvement in cookery and the supply of cheaper foods would be of great benefit. I wish to guard myself from saying that that meets the whole case. I think that absolute poverty is in some cases such that they cannot get the food.

6879. Do you think that the milk supply could be improved?—Yes, by action on the part of local authorities, and having better organisation, and creameries, and dairies, and so on—that is quite practicable.

6880. (*Mr. Legge.*) About this inspection of school children, do I gather that you are going to hand in something in the nature of a detailed scheme which we could print in the Appendix?—I have here a book which I have written on the particular problem; it is a practical book, discussing organisation, and I propose to present a copy to this Committee.

6881. Does that book give anything like a definite scheme?—I give a definite scheme for counties and towns, and also a detailed schedule, which I can hand in.

6882. Clearing up such points, as regards ears, for instance, where you say that they ought to be examined once every year or two years—there is a considerable difference between the one year and the two years. One would like to know what was your definite suggestion as to what is enough?—If you appoint your medical officers for schools, you will find, by first examining all admissions and keeping a record of them, that the subsequent inspections will be very much facilitated, because that schedule would remain on record. It would be a case of going over this increase, checking defects; in a few months it could be ascertained as to whether there is any alteration. In the meantime, your teacher is in touch with the medical officer, and continually observing all the year. So that it would be a simple matter to do the ears once a year. But you must make a difference with the localities.

6883. But you have no objection to our printing in the Appendix the details of your scheme?—None whatever.

6884. Is your scheme supplemented by an estimate of the cost?—I have given one estimate of the cost by Dr. Bruce, of Dingwall, who made a rough estimate, and he brings it to £30,000 a year. In that estimate, he includes what I should regard as strictly the work of the local authorities at present, and, consequently, that would have to be deducted. But really the only basis for an estimate is our experience on this Edinburgh investigation, and you can hardly take that as showing what the reasonable routine expense would be.

6885. Are you quite sure that children living in the country are more out of doors than town children?—On the average, yes.

6886. My experience of the Gallowgate and streets like that in Glasgow, is that the children are out in all weathers—all night?—Do you mean in the streets?

6887. Not only those selling matches and newspapers in the streets, but others amusing themselves in the open air?—That is one of the points I should have said—that they do live a great deal in the open air—but the air they get is not so good.

6888. That may be, but I never saw a child in the country out after dark, whereas I find the streets of towns crammed with them after dark?—No doubt, that is so.

6889. (*Mr. Struthers.*) But possibly the children in the country get up earlier?—Yes.

6890. (*Mr. Legge.*) Not so much earlier?—Wherever they are after dark, I know the habits of a great section of the country, and there is much more fresh air for them, I know. You assume equal times; but the air is better than in the Gallowgate in Glasgow.

6891. But there is surely an extraordinary change in the air of all towns after sundown?—Yes.

Dr.
Mackenzie.

6892. And from dark onward there is not so marked a change between the air of a town and the open country? One would not insist so much upon that.

6893. I insist that the children in the towns are more in the open air than the children in the country whatever the quality of the air is?—Even supposing that, you are exposing them to all the noises of the towns.

6894. And the fun of it too, which is not a bad thing?—But it is exhausting all the same—they are never at rest—both the adults and the children. I think it tells upon the nerves of children, for they have to go out of town. It becomes intolerable. Those who have examined children for the Fresh Air Fund know the difference in them at the end of the two weeks. There is no reason for it but the change of air; but the difference is very striking on the children.

6895. But has it occurred to you that the enjoyment of a town child of a fortnight in the country is not nearly what the enjoyment of a country child would be coming into the town?—That is perfectly true.

6896. And that would, perhaps, be a stimulus to its intellectual capacity?—Yes; but, of course, one would not assume that the intellectual capacity of the town child is higher, but that it is on a different footing.

6897. Now, in your memorandum, I note this passage. You say, “If inherited characters are to mature, therefore, the mother must remain (a) capable of maintaining her own physical equilibrium (b) capable of giving her excess of nourishment to the embryo. If she fails in (a) or (b) the embryo either dies or suffers in rate of growth, or in ultimate size.” Well then, I suppose, from that we should draw the conclusion that in your opinion the child of a slum mother would be born defective in growth?—It may be so.

6898. That is to say if the mother has not been able to maintain her physical equilibrium?—Yes.

6899. And the same with the factory worker?—Yes, I think so.

6900. As bearing upon that point, we have got some curious figures which might interest you. You are aware of charities which look after mothers in the slums, one of the largest being the Royal Maternity Charity in London?—Yes.

6901. And the cases treated by that charity one would presume to afford a fairish proportion of those children who are found defective at birth?—No doubt.

6902. However, the physician of that charity has put the following question to the medical officers working for the charity in different parts of London—“What number per cent. of new born children amongst the poorest class would be capable of living a normal physical existence were it not for neglect, poverty, and ignorance, and would indicate that a good physique for coming generations might be anticipated from their condition?”—We have just had handed in the replies from eleven of those medical officers, giving what appear the results in different quarters; and they make out, on the whole, that in their districts 86 per cent. of the slum children are born in a condition which may be described as “fit to live a normal physical existence?”—I should quite believe that; and possibly even more, but my point was in this general statement, that it more affects the rate of growth and the size of the children at birth, and the start they get. Among the Canongate children, we found that the weights of the school children were very distinctly lower than the weights at corresponding ages at another school drawn from a well nourished community. Making allowance for every difference in labour and housing, we concluded that a certain amount was due to under-feeding, and of course we could draw the inference that before coming to the school the under-feeding had been going on, and probably from before birth. Probably they were under-fed at school age; and they had a bad history up to that time. It does not follow that these children do not, within their limits, develop into perfectly fit citizens, provided that they are free from defect. About getting smaller children and undergrown, it is a disputed point whether the ultimate size of those children may not come to as good a result as the better nourished, but I do not think that it is the case. Some maintain the one, and some the other. But everywhere where I have been able to get actual measurements of the children of those working men labouring, and the

children themselves, working early in life, the figures are against the working child, as far as weight and height go, which indicates that their growth suffers, and that must suffer from conception onwards. I have some figures from Mr. Richet's *Dictionnaire de Physiologie*, where the difference between the children of the middle classes and the working children of the working classes amounts to a difference of 3·9 centimeters at the age of six and a half—that is the difference for girls; and about 2·4 for boys. So that I think we have fair ground for maintaining that deficient nutrition of the mother affects the child at birth, and a deficient nutrition after birth affects the growth of the child up to school age, and of course after. I do not say, of course, that you have not very good citizens being made out of these children, providing they are not rickety or deformed.

6903. (*Mr. Struthers.*) But that distinction in height and weight might be recovered after the age of twelve with proper feeding, might it not?—Yes, and certainly with the children of the working classes, we found that even where height and weight are not as great as in the other classes, yet in the matter of grasping, the older children of Canongate grasped quite as well as the Bruntfield School children.

6904. That is the point: are the statistics of height and weight so terribly important as showing the efficiency of the classes of the population?—It is not the final statement. But I argue that question in detail in a special chapter of my book.

6905. For instance, you have the long, thin, lathy man and the short, stout, sturdy man?—Yes.

6906. Is not the latter type more efficient for practical work?—Undoubtedly.

6907. Then the well-to-do Bruntfield boy, as compared with the Canongate boy, is it not probably the case that the children of the Bruntfield School bulk heavier, that is, that they are fossier—softer?—One might say that *à priori*. But I did not find that on examination. I thought them well knit and well put together.

6908. (*Mr. Legge.*) I think you indicated your opinion just now that local authorities have, in your opinion, sufficient power to deal with the question of over-crowding?—I think so on the whole. Of course there is a branch in which the larger local authorities are moving which, I think, is a sound enough direction, that is, doing what Glasgow did and ticketing a certain house for a given cubic space. But as a fact the powers are sufficient, I think, and very considerable.

6909. Could you state whether in Scotch law they can go for the owner direct?—I do not think so.

6910. Do you think that would be a good thing?—Yes, in certain classes of property it might be an improvement.

6911. To bring the responsibility to bear upon the owner?—Yes. And a great difficulty is in dealing with the farmed-out houses. That is a difficulty and the law might be improved.

6912. Then as to the question of taxation of site values?—I do not think I have expressed any opinion upon that.

6913. You are not prepared to express an opinion on that as a policy, are you?—I do not think, although it is important, that it has the importance usually assigned to it. I do not think that in the larger places it would make much difference to the housing. One reason why local authorities have supported that movement is because it improves the range of the subjects for taxation and makes the raising of rates an easier matter, but I do not think that it is a major factor; although it is a factor, I do not think it is a major factor in the question.

6914. It seems the general opinion in this country, both in England and Scotland, that all those matters of the health of the community are best left in the hands of the local authority, that we do not want to centralise administration. If the authorities know that the conditions in their town are thoroughly bad they will, in most cases, take action, but the difficulty is for them to realise that the condition in their town is thoroughly bad, as compared with the results that can be got in other towns. Can you think of any means by which one can bring to the knowledge of any particular locality that the state of things is worse than in similar localities in the country?—Well, it is a little difficult just to answer that question directly.

Dr
Mackenzie.

But at the present moment in the counties of Scotland the appointment of medical officers and sanitary inspectors has in the last ten years resulted in an enormous amount of improvement in the counties, including the farmhouses and villages, and colliery villages and so on. One of the reasons for that improvement has been that the Local Government Board require them to give an annual report, where before no such report existed. Within the last few years all local authorities have to give an annual report of all work done during the year. Those reports are scrutinised in detail by the Local Government Board; they are all compared among one another, and correspondence is started from them bringing to the knowledge of the local authority anything of an urgent kind, or anything demanding further inquiry, and it is reported on by the sanitary authority. The result is that a very great number of points are brought systematically before the attention of the local authorities. The development of that will continue steadily to go on as the administration of the Acts grows older. A great many of the things now done in the small towns in Scotland are directly the result of this annual report by the sanitary organisation. I am speaking entirely of Scotland.

6915. We have had brought before us by more than one Witness a suggestion of some importance, namely, that there should be a central Government Bureau of statistics to collect from all parts of the country, and from all classes of the population, anthropometrical figures and facts, utilising perhaps teachers, certifying surgeons, the Factory Department, and so forth. The Central Bureau would co-ordinate the work, would publish the facts, and circulate them. Would you approve of that?—Yes, I think that is quite a sound idea, and I think that it is essential that some Central Department should have charge of anthropometrical statistics.

6916. You think that there is great importance to be attached to anthropometry?—In anthropometry I should include height, weight, and girths: you would have to specify the measurements.

6917. I mean superficial measurements—no lung testing or that sort of thing, which requires a man of physiological and medical training?—At the present moment I do not consider that that condition of things is of much administrative value, but I can anticipate, in the course of years, results of administrative value to the community, and it is worth serious consideration.

6918. (*Mr. Struthers.*) I have just one or two questions to ask about your report to the Royal Commission on Physical Training in Scotland. That report has excited much interest and has been frequently referred to in public speeches and discussions, and I am not so sure that some of the inferences drawn from it are quite justified. On page 24 there are some general remarks. These remarks are not yours, so that you are not in any way responsible for what is said there?—That is so. I have no responsibility.

6919. The main point is the comparison between Edinburgh and Aberdeen as regards health. That is no part of the scheme of your report—the direct comparison?—Oh, no.

6920. The Commission's Report says a comparison made between the two towns is on all points greatly to the advantage of Aberdeen?—Yes.

6921. But that would of course depend to a very large extent on how the sample of children was taken?—Yes.

6922. Now the children came in each town from the bulk of the population?—Yes.

6923. On page 78 comparing that with Dr. Hay's first table on page 102, you find this state of things: that of the samples taken in Edinburgh 35·32 per cent. lived in two-roomed houses; 45 per cent. in very small, *i.e.*, in one or two-roomed houses, 25 per cent. in houses of more than three rooms. The corresponding figures for Aberdeen are 30·5, 29·5, and 40·1, that is to say, as far as the sample of children goes a much larger proportion live in one or two-roomed houses in Edinburgh, 45 per cent. as against 30 per cent. Those living in three-roomed houses are approximately the same?—Yes.

6924. As against 25 per cent. in Edinburgh in houses of more than three rooms, 40·1 per cent. Aberdeen?—Yes.

6925. But on page 101 of the report Dr. Hay compares the sample with the population as a whole?—Yes.

6926. He says of the whole population of Aberdeen 39 per cent. are in houses of less than three rooms, 30 per cent., which corresponds with our figure in both, in houses of three rooms, and 31 per cent. in houses of more than three rooms?—Yes.

6926A. That is to say that the sample of children examined in Aberdeen was distinctly better than the population, because it contained a smaller number of children drawn from one and two-roomed houses, and a greater number of children drawn from houses of more than three rooms, of the corresponding population?—That is the legitimate inference to be drawn.

6927. And that the Aberdeen sample was on the whole too good a sample of the population?—I think one is bound to take that view, not only for this reason, but for another reason. In Edinburgh there are approximately 30,000 School Board children. In Aberdeen approximately there are 25,000 School Board children. Yet the difference in population is as two to one, Edinburgh being rather more than twice the population of Aberdeen. The meaning of that is, that in Aberdeen there is a much larger proportion of School Board children than there is in Edinburgh and therefore it includes a bigger lot from the better classes; a larger number of the better classes would be drawn from the Aberdeen School Board children than there would be in Edinburgh.

6928. There are many facts that all tend in that direction, that the sample taken in Aberdeen is a better sample of the population of Aberdeen than the sample taken of Edinburgh as a whole?—I think so. One has to remember that in Aberdeen there is not a big population of slum children.

6929. Would not a larger proportion of the population of Aberdeen live in three-roomed houses and not so many in houses of less than three rooms?—There would be a greater proportion.

6930. Perhaps you could get the figures from the census tables showing the distribution of the population of Edinburgh according to size of house, just as Dr. Hay has done for Aberdeen?—I think I could get them.

6931. It would be interesting to see how the sample of children taken in Edinburgh corresponds as regards the character of the houses with the population on the whole?—I can do that.

6932. On that comparison depends really whether the two sets of children are proper samples of the children as a whole?—Yes.

6933. In the case of Aberdeen it is not so, and the presumption is it may not be so in the case of Edinburgh?—Yes. I think one would have to say, taking both towns, that you cannot properly take 600 children in either town as enough to justify propositions applicable to 30,000. It is too narrow a basis for a statistical argument. But there are many points that are not statistical.

6934. Then in the report it says (paragraph 116, page 24): "The ratio of health in both cities harmonises with these facts. Thus there are among all the children examined in Aberdeen 0·5 per cent. in apparent poor health, while in Edinburgh there are 19·17 per cent." Does not that suggest some rather different standard. Is that a wholly objective difference?—I think if the tables are compared minutely it will probably be found that my standard differs to a great extent from Dr. Hay's in the matter of minor diseases.

6935. Would not you say on the face of it, considering the class of facts we are dealing with, which is very much judging of appearance, such a disproportion as 0·5 as against 19·17 is most certainly due to some difference of standard, whatever the facts may be?—There may be a certain amount of difference. It is a difference that must arise out of several things. It is either a different kind of population that we are handling or there is something which is not easily explainable on the face of it.

6936. Then the next paragraph 117: "The same tale is told by the statistics regarding the condition of nutrition of the children. Aberdeen shows 9 per cent. of its children badly nourished, while Edinburgh shows 29·83 per cent."?—Yes.

6937. Surely that is not correctly stated, because those figures in the case of Edinburgh refer not to the proportion of children badly nourished but to the proportion of what are called "thin," who may be perfectly well nourished.

Dr. Mackenzie. Now look at the figures—which table have you got?—Table III for personal appearance and cleanliness, that is page 81 in the Edinburgh report, and that corresponds with Table III of Aberdeen, page 104.

6938. Well those figures are taken from that table, are not they?—I think so. There is a further table given by Dr. Hay at the end of page 118 where figures are further worked out, but the substantial figures are the Table III.

6939. The figures are 9 per cent. for Aberdeen, and 29 per cent. for Edinburgh?—Yes.

6940. But those figures in the case of Edinburgh refer to percentage of “thin” children and not to those badly nourished?—To both, quite so.

6941. But you yourself say that the figures cover the unfed and thin from excessive exercise?—Quite, I found it necessary in going through that to say that there were children thin, not badly nourished. But I tried to check that, as I indicate in the report by correlating the healthy appearance, and getting the percentages of those that lacked health.

6942. You think that those figures given do not represent the comparative numbers of children who are badly nourished?—They are not exhaustive.

6943. But of children who are thin?—There is that element of the well-nourished thin child and the under-nourished thin child. But that is to be made out by other considerations than mere figures. I am not sure that that healthy thinness amounts to much of a percentage, especially given the conditions of life.

6944. In London Street it did make a considerable difference, as is shown by the fitness for exercises?—Yes, there was a very good distinction between a very good and bad lot, and it was correlated with the bad houses.

6945. Does not it come to this, that the samples from Edinburgh and Aberdeen did not justify a comparison between the two towns?—I accept that. I do not think the figures are sufficient.

6946. And that certain things like the thinness of children and their mental alertness and complexion are highly subjective matters in which it is very difficult to say that the same standard applies?—Quite so.

6947. And any conclusions to be drawn from them might be fallacious?—Yes. In order to reduce the error I personally did that part of the examination for all the 600.

6948. Now, to a very important point: Do you think the sample of children taken at Edinburgh really represents even the general condition of health in Edinburgh?—That again, I do not have figures for.

6949. But on the face of it, would not you say that the schools you took that from do not touch a considerable portion of the population of Edinburgh which attends school, such as Heriot's, the Merchant Company, and the High School, and so on?—They were Edinburgh School Board children, and I confined myself to them.

6950. Look at page 86 for a moment. There is a comparison of weight and height of the four schools you examined?—Yes.

6951. At different ages from six to fourteen. How many children would be in each age group at that rate?—Twenty-five.

6952. Well now that is rather a small number to compare the height or weight of one school with another, is it not?—Yes, and for individual ages it would be less than twenty-five, because we have to divide 600 children, 150 out of each school, and dividing these children into groups of twenty-five, it would leave only eight or nine children of each individual age.

6953. Supposing I went down to North Canongate School and picked out eight children of ten years of age and got an average height, and you came to-morrow and took eight children of ten years of age and examined them, might not those figures differ?—They might differ from North Canongate compared with any other school.

6954. I am speaking of abstract statistics now?—Yes.

6955. Take eight children of ten years of age at a time out of twelve hundred?—You could not have average heights.

6956. But the difference between the two samples might amount to a couple of inches perhaps?—Between two groups of ten at that age?

6957. Or whatever the number was. You take eight?—Yes.

6958. If you examined eight children of ten years of age to-day and I examined the same number to-morrow, is it not possible that the difference might amount to a matter of a couple of inches?—That is possible, but I should not like to apply an abstract argument to the concrete case of Canongate for a special reason; if you compare the table of deviations (Table VA., 84), we find that while there was an occasional tall person in Canongate you had the majority undersized, whilst in the others you will find an occasional undersized one, still you have a bigger proportion the other way.

6959. But still I want to be quite clear about this point, that the difference between two samples of eight drawn from the same school might be as great as between similar samples drawn from two different schools (if both were large)?—Yes, and it is too small to take 600.

6960. Apart from your special knowledge of Canongate the comparison between the children of different ages in the two schools is therefore placed on a different footing?—Yes, as a mere matter of height and weight. There were other facts to interpret my heights and weights by. Of course I qualify that point in the report.

6961. You are going into a further examination of North Canongate?—I have not begun yet.

6962. It would be very interesting to know how your figures for the whole school correspond with the samples?—That is one of the reasons for extending the examination.

6963. (*Dr. Tatham.*) In Scotland, I think I am right in saying, that the poor law and the public health authorities are the local government board. There is no division as in England, between the public health and the poor law?—The central authority is the local government board for both, but the local authority for public health is entirely different from the poor law authority, but in the central authority one department covers both.

6964. Not as it is in England?—I do not know how that is.

6965. There are two sections?—They are both sections of the local government board.

6966. Quite so, but the two organisations are superintended by two separate authorities. Do you know that?—From other information I infer it, as suggested, but it is different in Scotland.

6967. My reason for asking that question was this:—You said that within the last few years the county medical officers of health of Scotland presented to your board an annual report, which report was of great value as regards the improvement in public health?—Yes.

6968. And you also said that the report was carefully considered by the board?—Yes.

6969. Since these reports emanate from medical men, are they examined by medical men?—I examine them in the first instance personally myself, and when anything special arises the medical member of the Board, Dr. Russell, and the Board as a whole deals with them.

6970. Now as to the general condition of the children. According to your experience, do town-bred children compare well or ill with the country-bred children, speaking generally?—Given the corresponding classes, I think, the country-bred children have the advantage.

6971-2. Manifestly?—I think so. But, on the other hand, the conditions are so very unlike that I hesitated to make that statement, except in the most general way, because the life of a town, and the life of a town-dweller are generally so exacting that the country child has no excuse for not being better. The town child of equal strength may not look so well or so strong a child as the well nourished country child, because the town life in reference to the complex environment is more against the town child, but, I think, on the question of nutrition the advantage is with the country child.

6973. Is it a question of feeding?—I think so, partly. The country child has, on the whole, more access, in a great many parts of the country certainly, to milk, and eggs, and cheese, than the town child.

6974. It is the milk which constitutes the advantage. There is a larger proportion of the milk given to the country child, I mean cow's milk, not condensed milk?—

It is difficult to get the exact truth, it varies in the better class artisans. In Leith, as medical officer, I found that was so, that the milk counted for a great deal; the mere fact that there were so many milk shops and dairies indicated that. There was a great amount of milk consumed, and it was mainly for the children; but in the very low classes, I do not know about the milk. I have no definite information upon it.

6975. We have had it stated here that in England, at any rate amongst the poorer class, milk enters into the diet of poor children to a very small extent indeed?—I think that is probable, but I cannot give information as regards Scotland.

6976. You say that in the country districts of Scotland the children do get a good deal of milk?—Yes, on the whole. My experience is mainly from the Northern Highland counties and Galloway. In Galloway, which is essentially a milk-producing county, the two counties are dairy—400 dairies in one, and 300 to the other—and 70,000 of population. The complaint sometimes made there among the cottar population is that, although they have their creameries near to them, they find it difficult to get good milk. But this was not widespread—they get a fair supply of milk.

6977. Is it true that in Scotland children are sent to school half starved?—I do not know what the proportion is, but we can speak of the Canongate. A large proportion of the children there are certainly half starved. How far that can be said generally, I do not know.

6978. And no organisation exists in Scotland to rectify that?—There are spontaneous charities, of course, in

Edinburgh, and elsewhere, but there is no co-ordination of charities.

6979. As a medical man, would you say that to subject a half-starved child to the ordinary routine of the school would be the height of cruelty?—Yes.

6980. Do you think that the educational result of such a thing would be very poor?—I agree entirely.

6981. And in the case of schools for girls is there any provision in Scotland for teaching young girls of thirteen or fourteen years of age cookery or the ordinary management of a house, washing and mending clothes, and so on?—The schools certainly do a considerable amount of that. For example, this Canongate school and the other schools that I examined, have their cookery departments, and they were attended by a considerable proportion; and that was taken as part of the routine teaching of the school.

6982. Then the cookery classes would take the place of the ordinary bookwork of a school?—I do not know how they were dovetailed into the time-table. I did not go into that at all, but they seemed to take a considerable proportion of the pupils.

6983. You would be of opinion that it would be desirable for young girls approaching womanhood that they should be taught these things so as to fit them for the care of any children that they might have, or for the benefit of their husbands?—I entirely agree.

6984. It would be very necessary that that should be done, even at the expense more or less of general education?—I agree entirely. I think that it is of more social value.

Mrs. LESLIE MACKENZIE, called; and Examined.

6985. (*Chairman.*) Will you kindly state the experience qualifying you to give evidence before this Committee?—I served my full time as a pupil teacher in a large village school, and I served two years training in a Church of Scotland Training College in Aberdeen. I was assistant in a country public school for three years, and I was visiting mistress in North Lodge Industrial School, Aberdeen, for two years, and then I was infants' mistress in one of the large board schools in Aberdeen for five years.

6986. And you continued your interest in the same subjects during your married life?—During my married life I have been keenly interested in all school and other social questions. I am now honorary secretary of the Industrial Law Committee in Edinburgh, which is a branch of the London Industrial Law Committee of which Mrs. Tennant is the chairman, and I am corresponding honorary secretary for the Industrial Section of the National Union of Women Workers, which is a social working organisation, and member of Executive of Edinburgh Social Union.

6987-8. You assisted Dr. Mackenzie in his medical inspection of 600 school children in Edinburgh in 1903?—I went with him to all the schools and did more or less the organising of the children in the sections, and did all the writing, and examined along with him for the skin and clothes and cleanliness and the condition of the heads and so on; and we together saw each child individually.

6989. Since then you have continued similar investigations?—There is, I consider, a very important investigation begun now in Edinburgh, as the result of this physical training report. The conditions were so that there is no use talking about the condition of the children until you know what the condition of their home is, and a very influential committee has been instituted in Edinburgh, and an investigation is going on in the actual homes of the children. We got the names and addresses of all the children in the North Canongate School, and had those divisions sectioned off in which the attendance officers and investigators are going round to the home of every child who is in school attendance now, and taking down a very full account of the home.

6990. Do the parents encourage you in this sort of thing?—A few object. The better parents are inclined to resent, and the others are more or less wondering what is going to be the result. But we get a good deal of

information. But at this point, I do not know that this should be made public. It is a private investigation. Their feeling is that if legislation is to take place upon any educational matter just now, it is very largely working in ignorance of whether it is to be free food or free clothing.

6991-2. When will this investigation be completed?—In some months, I think.

6993. (*Mr. Struthers.*) Who have organised this?—The members of Committee are Miss Haldane, Miss Flora Stevenson, Mr. Cowan (late master of the Merchant Company), Mr. Hector Munro Ferguson, Baillie Gibson, of the Town Council, Colonel McHardy, Dr. Leslie McKenzie, and Sir John Ratty Tuke, and Mrs. Kerr, who is the secretary of the Edinburgh Social Union, is the secretary. I am on the executive of the Social Union, and assist in scrutinising the schedules.

6994. You are making an examination of the homes from which the children in the Canongate school come?—Yes, and those in attendance now.

6995. If the parents refuse to admit you it would be rather a good home?—I do not think that there is any actual refusal, but sometimes it is much more difficult to get information.

6996. You wish to make a comparison of the three grades of school children, such as children in the public school in an isolated country district?—Yes.

6997. And children in a large board school in Aberdeen?—Yes.

6998. And children in a city industrial school?—Yes.

6999. What is generally the difference?—That the children of the same age in these three conditions, namely, country public school children, city board school children, and city industrial school children varied, to a large degree, in their physical development there is no doubt. It did not need height and weight measurements to show that. The average Standard I. country child in physical bulk is more like the Standard II. or Standard III. town school child. Of course it must be remembered that in the country, where children may have to walk two or three miles to and from school, they are not often sent very young, few come to school before six or seven years of age; but whatever the cause, my impression remains that the country school showed no such little mites as the city board school.

Dr.
Mackenzie.

Mrs.
Mackenzie.

Mrs. Mackenzie. 7000. On the whole you think there is better physique in the country school?—Bigger bulk.

7001-2. But not so alert as the children in town?—Well, if I may go on; I say this impression was well verified during the medical inspection of one of the Edinburgh schools. My husband asked that the nine- to ten year old girls be sent to him, and when they came into the room I said, "The teacher has made a mistake here; she has sent the infants," but when we looked at their sheets, they were right enough—girls between nine and ten years of age. That was my impression. I do not think there is any doubt that the purely country bred child has at all ages a larger total physical development than the town bred child.

7003. Now to come back to that point, the children in the town schools, though smaller in bulk, are perhaps more alert, are they not?—Yes, and smarter, and they get more readily out of a difficulty, but on the whole my feeling was that they were not so physically strong as those children in the country.

7004. But still for the ordinary work of life they might be as efficient?—Yes, they might be.

7005. Your husband spoke of the bad feeding of these Canongate children. Is that committee feeding the destitute children in Edinburgh?—Yes.

7006. It is now in operation in the Canongate at present?—Yes. I made inquiry. In the Canongate school 475 children are fed now and 276 children are clothed and some have shoes given to them.

7007. That has been going on for twenty-five years?—Yes.

7008. The statement in the report is that it has been going on for twenty-five years?—Yes.

7009. And I gather that every child found to be in need of food or clothes has his case inquired into by the committee. In view of that, how is it that so many children in the Canongate are still unfed?—Well, the headmaster of the Milton Street school said that he quite thought the three or four months of the free meals was the only time that these children had a satisfying meal, that is one meal a day.

7010. Why is it that those dinners are only given in the winter?—Simply from the tradition that it is during the unemployed time of the year, when the soup kitchens begin.

7011. There is slightly more need for it in the winter, but a meal in the summer is just as important as in the winter?—In the homes, it may be easier without fire and without clothing in the summer, but the conditions remain from year to year of the perfect inadequacy of home feeding and home conditions generally.

7012. Does this committee discover all the children insufficiently fed?—Not all the children, but the most of the perfectly underfed children; because it is largely through the attendance officers and teachers that the free-dinner tickets are given.

7013. With only a little extension of the operations of this Society no children would go to school unfed?—Yes, they would get food. But my point is why begin at that end when the man is earning from 25s. to 40s. per week?

7014. That is another matter. You have something to say about the effect of organised nurture, that is made possible in an industrial school?—That I saw from what I know of the Girls' Industrial school in Aberdeen. There the children are taken from the lowest slums and the condition of the homes that they came from was often extremely bad, and in a very short time with regular feeding and cleaning and clothing and exercise and sleep, they picked up wonderfully in their condition.

7015. From that you would infer that these underfed Canongate children if properly fed might recover at any time you got hold of them?—I am convinced that if all our slum-born infants were taken out into the country and brought up there in a rational manner, free from the overcrowding in dirty dens, free from the neglect and carelessness of mothers—who from Saturday to well-nigh Thursday of every week are more or less drunk—the saving of infant life would be great.

7016. Is it possible to take all these Canongate children?—Well, all the evils that can be conjured up against the boarded-out system of bringing up children, or against State or Parish homes are as nothing compared to the criminal method of letting infants die in what is called "home" in the slums I have visited. I became more and more convinced of what could be done for the very poorest and most mismanaged and most helpless children by cleaning, feeding, warming and sleep, from what I saw in North Lodge Industrial school. These poor little wretched neglected children were sent in and after even a few weeks of the ordinary daily routine of bathing, feeding, exercise in the open air and sleep, they picked up in a wonderful way and begun to put on flesh and grow frolicsome and could laugh. I remember a case of a very young child being sent in, and so terrible was its state of dirt and vermin that it had to be kept apart from the others for a week or two until its body and head were cleaned. During the process it practically slept the whole time; it became very sick, its whole body came out in boils, but it rapidly recovered and grew and put on flesh and became one of the nicest and brightest of the infant room.

7017. It comes to this, that if you could put all the children of Canongate under industrial school conditions we might look for a considerable improvement?—I have said so. My point is that if the same could be done for the masses of underfed, illclad, badly washed, and sleepless children of our overcrowded city slums we have made a great step towards the prevention of deterioration in the individual—and that being so, deterioration of the race becomes a very secondary question.

7018. What you have said covers the supplementary part of your memorandum as to housing and training. But you have something to say about the physical training. What is said in the report?—Well, it was well seen in the North Lodge Industrial School what was the effect of physical training there along with the regular routine sufficient food and nourishment; there the condition of the girls was very markedly improved after the physical training was established, and they became so expert that they took the Challenge Shield until they had to be disqualified, that is they were not allowed to compete with the board school children.

7019. In your opinion, given sufficient nourishment the children benefit by a good deal of exercise and even almost violent exercise?—Not violent.

7020. Did not they have violent exercise if they went in for the Challenge Shield?—I would not say "violent."

7021. Did not they use parallel bars?—No; dumb bells, bar bells, Indian clubs, and rings, but not parallel bars.

7022. Did you pay any attention to the physical drill in the Canongate schools?—Just seeing what was done.

7023. Did you form any opinion about it?—It seemed very cruel to let the little things go on with physical exercises when one knew they were not sufficiently fed.

7024. Did the children seem to think that it was cruel?—No, I do not think so.

7025. Because I find in the report that the children of the North Canongate School when they were let out into the playground they were bright and lively and rushing about, and there were no symptoms of being played out by the exercise. Then there is another point, the time appropriated for exercise in all these schools did not come to more than half an hour a week, and the excess of exercise is purely voluntary when they had cricket and football outside the school—one cannot prevent that?—No.

7026. Half an hour such as they get in the Edinburgh schools could do harm to no one but exceptional children?—Only to exceptional children. But there is no consideration of exceptional children in a section. There is no classification for drill.

7027. Do not the teachers take those out?—There is very little of that; just a class being out at a time.

7028. If we had medical inspection that would be remedied?—Yes.

7029. You have possibly remedies as to improved classification, what does that mean?—Well, I think that the physical condition of children presented for school

life can be ascertained only of course by medical inspection, and when the inspection reveals specially bad cases these might be handed to Boards or Charity Organisation for special inquiry into possible causes for such a condition. That would be organising on a larger scale what the limited Social Investigation going on in Edinburgh is now doing, and then to get at the facts of the home life. Someone might be authorised by the educational authorities to inquire into the economic conditions of parents on a large scale, and on lines similar to the small one now in operation in Edinburgh. If it can be ascertained that a parent is making 20s., or 25s., or 40s. a week there is no reason for his sending his children to school underfed, and the local rates paying for them.

7030. But the child must be fed?—The child must be fed.

7031. Who is going to feed it?—My point is that we ought to be able to arrest the wages of parents.

7032. (*Chairman.*) To recover from the parents?—Yes.

7033. (*Mr. Struthers.*) You must feed the child in the first place though?—I agree. But recovery of the money ought not to be impossible. We find that the parents are earning something from 25s. to 45s. per week, and they have only a table or chair in the house, and the children are without any food.

7034. What is your general impression about the children? Do the children come to the school badly fed because the parents cannot buy food, or is it because of the waste?—It is partly both. There is not food to give them sometimes. If there is any money the women are not sober or capable of cooking anything. There is no condition for ordinary cleaning, and the children are turned out dirty. And even those are an improvement upon what is left at home. I went round with the attendance officer one day, looking after the ordinary absentee children, and the children left at home, those of them under age for school, were in a worse condition than the ones sent out.

7035. (*Chairman.*) Is that inhumanity typical of the Edinburgh parent?—I cannot tell. But it is the case with the parents of those north Canongate children.

7036. (*Mr. Struthers.*) Those were parents that might provide food?—Yes. Whatever the method is of spending the money, they do not spend it on the children's clothes or food, they do not spend it on housing—they rent one or two rooms—and 76 per cent. of the Canongate people live in one or two rooms—and pay perhaps 2s. 6d. or 2s. 9d. for one room. 4s. 6d. for two rooms, even some of them live in furnished houses, and in those cases they sometimes pay 7s. 7d. per week.

7037. (*Chairman.*) With regard to the state of these homes, is it due to overcrowding; are these one-roomed and two-roomed tenements overcrowded?—They have seven, eight, and nine children sometimes besides the father and mother.

7038. Has the City Council of Edinburgh taken no action with regard to the diminution of these evils?—Individual cases do not come within their purview until some one complains.

7039. Do you mean that they are not informed of the facts?—No, they may not be.

7040. Do not they take any steps to inform themselves of such abuses?—I do not know.

7041. Supposing on the 1st May next the City Council of Edinburgh were to notify that from that date a one-roomed tenement was to contain no more than two inhabitants, and two-roomed tenements no more than four inhabitants, and if they were it would be deemed a nuisance and treated as such?—The people would be turned on the streets.

7042. What would happen?—I could not say.

7043. Would there be any means of dealing with such a situation; are there any areas that have not been developed in the neighbourhood of Edinburgh?—These people will not leave the Canongate.

7044. If the Town Council took that action they would be obliged to go?—Probably.

7045. They would have no choice?—No, but first the houses would have to become condemned dwellings.

7046. The local authority has the power of treating such overcrowding as is dangerous to health as a nuisance?—Yes.

7047. In the last resort if houses were closed which were inhabited under such conditions the people would have to go?—Yes.

7048. I presume in the outskirts of Edinburgh there are houses springing up where they could be provided for, or where they could in a short time find abodes?—That raises the question of turning them out into the street first, because these people who have been born in this place will not go away.

7049. It would be a good thing to send them away?—Probably.

7050. Would not you say certainly?—Certainly if they could be.

7051. The machinery is at hand?—Yes.

7052. And they would have to take the consequences?—Yes.

7053. They are certainly in the wrong place where they are, and it would not matter where they went?—No.

7054. (*Mr. Legge.*) I should like to ask whether you are acquainted with the Day Industrial School as well as with the ordinary Industrial School?—Yes, there is one on Castle Hill.

7055. There, as at North Lodge School, of which you have had actual experience, you are aware that one essential feature of the curriculum is that the children are only occupied at book-work, paper-work, and slate-work for three hours in the day?—Yes.

7056. And a shorter period than in the ordinary Day School?—Yes.

7057. The other hours being taken up with industrial training: do you think that is an advantage?—It is an advantage, but it depends on what the children have to be at. I think for that class of children it is a distinct advantage that the reading, writing, and arithmetic should be fairly well done, and that there is some industrial training afterwards. It looks as if that is the real point, where the working woman's condition breaks down, that they have no home training; their time is spent in doing education which is not suitable to them.

7058. Your experience is mainly with girls?—Yes.

7059. You are clear that for girls of the working classes that sort of curriculum would be the sort of thing required?—Yes.

7060. Do you see any reason why the curriculum of the ordinary day school should not be amended in certain districts in that regard?—No, I thought that more of the industrial work might be done in these purely industrial schools for girls—that is, more like domestic economy and house training and cooking, laundry work, and that kind of thing in schools.

7061. Would you go so far as to approve a system under which girls attending an ordinary day school were after a certain age, say thirteen, allowed to attend school only half time and be licensed out by the school authorities to help their mothers for the rest of the time, the condition of the licence being that the home was decently kept?—Something like that might be done if their mothers were any good in their training, which I doubt.

7062. But what a hopeless position we are in if we are positively encouraging the keeping of children in an ordinary day school, because it is better for them to be kept out of their homes. Did you notice, with regard to the industrial children of whom you had experience, that they were mentally behind the ordinary outside children after a few months?—Yes. Their purely book knowledge is distinctly below the ordinary Board School children.

7063. They are a bit more thick?—Altogether. I considered their purely book acquirements were very much behind the child of the same age in a Board School, but their hand capacity, like sewing, knitting, and hand work, were distinctly in advance. The sewing and knitting in that special industrial school was particularly good.

Mrs.
Mackenzie.

Mrs.
Mackenzie.

7064. Did you find that when they once made a start in bookwork their progress was slower than that of an ordinary child?—I think so. The results seem to me to be so. It appeared that they were only doing three things, reading, writing, arithmetic, and some little geography, and with this limited curriculum their progress was less than at a Board School where there was a greater number of subjects tackled.

7065. Do you think their progress was slow because the hours they gave to them were shorter?—No, I think there were many causes, probably they were late in starting, and their reading, and school work was altogether deficient.

7066. Having had actual experience of elementary schools, you will probably agree that there is all the

difference in the world between the child who has, and who has not been through a well-organised infant department?—Yes.

7067. None of the North Lodge children have ever been through an infant department?—No, until they come into the infant department of that school.

7068. (*Dr. Tatham.*) I think I understood you just now to say that the drink question was really at the bottom of the greater portion of the misery, especially as regards the neglect of children?—I think that if the drink question were removed, three-fourths of the difficulty and the poverty and degradation altogether, would go along with it. I have no hesitation in saying that.

Mr. W. H. DOLAMORE, L.R.C.P., M.R.C.S., L.D.S. Eng., called; and Examined.

Mr.
Dolamore.

7069. (*Chairman.*) You are Honorary Secretary of the British Dental Association?—Yes.

7070. And you come here on their behalf to give representative evidence?—Yes.

7071. Have you formed an opinion as to whether the condition of the teeth is worse now than formerly?—Personally, I have no doubt it is, but it is extremely difficult to give actual proof.

7072. Give us what proof there is.—If we are to make any comparison it must be a comparison between the condition of teeth at periods separated by wide intervals of time. If we go back to quite ancient times we find, undoubtedly, that the teeth were very much better than they are to-day. Thus, in ancient British skulls, not only is the arrangement good, the jaws well developed, and the teeth placed in a normal arch, but caries, if present, is of slight extent, indeed, mere specs. Some statements as regards the presence of caries in the teeth of old skulls are open to misconception, because no note is made of the extent of the caries nor of the general arrangement of the teeth. It is not fair, when a mere trace of caries exists and the teeth are normally arranged, to speak of carious teeth being found in these very old skulls without specifying its limited extent. Caries of some extent may be found in the teeth of highly civilised ancient races, as the Romans, but these are not primitive types, rather, very highly civilised persons paying, perhaps, more attention to the pleasures of the table than even we do to-day.

7073. You think that bad teeth are really a condition of high civilisation?—Probably, we had better say, of feeding.

7074. Of the feeding which accompanies high civilisation?—Yes. There was a difficulty in getting skulls of any intermediate period, and the only ones with which we were acquainted were those which are in the museum of University College, London, which were taken from a plague pit. The teeth are distinctly worse in arrangement and in the extent of the caries than was the case in the ancient British skulls; but, on the other hand, they are rather better than what we look upon as the condition of to-day.

7075. Did a comparison between these skulls at different periods lead you to the conclusion that the character of the jaw is undergoing a change?—Yes, that is so. The jaws were not as perfect as those of the ancient British.

7076. Do you agree that a progressive contraction of the jaw is going on?—If you mean an inherited tendency it is very difficult to be specific on the point.

7077. Professor Cunningham, whose name probably you know as one of the leading anatomists, who was formerly in Dublin, and is now in the Chair of Anatomy at the University of Edinburgh, gave evidence here, and he said, "It would likewise appear that in the white races of Europe the jaws are undergoing a slow process of shortening. The stunted character of the wisdom or backmost teeth, the small amount of space allotted to them, their variability, their late appearance, and indeed their frequent failure to appear at all, would bespeak this change in the jaws. Through this jaw shortening the teeth are reduced in size, more crowded together, and therefore more liable to disease. Indirectly this may tend to favour the early degeneration of the teeth, which is so marked a feature of

the present age, but I take it that the real cause of this degeneration is the striking change which has taken place in the character of the food." Would you subscribe to that?—Yes, except this; it may well be that if a number of children were taken quite early and fed properly on coarse food, reproducing the conditions which exist in a less civilised state, it is quite possible those jaws might grow.

7078. In the course of generations?—Even in the individual. The jaw is undoubtedly akin to a muscular process, and the more you use it the more it will grow, and it is noteworthy in that connection that I do not think the first molar is generally smaller now than in an ancient British skull, yet the wisdom tooth is, and the wisdom tooth, as one has to remember, is not budded off until about the third year of extra-uterine life, therefore it is in a plastic condition, and if the jaw grows, one could assume that the wisdom tooth would grow, having room to develop. That is if you could feed the child so that the jaw would grow, we can assume the wisdom tooth would develop properly. One cannot, of course, speak dogmatically; you cannot rule out that there is an inherited influence—there probably is—but it is quite conceivable it might be ameliorated.

7079. To state the causes in general terms, why do you consider that the condition of the teeth is worse. Is it solely due to dietary?—No, not wholly. Undoubtedly, many sickly children survive who in previous times would have died, and there is also the effect of improper feeding quite in early infancy, so that though the teeth may start to be properly formed, yet they do not succeed in getting properly calcified; in other words, when they are cut they are imperfect, having pits and fissures on their grinding surfaces, and if they are imperfect when they are cut they never recover.

7080. And therefore they are much more prone to caries?—They are much more prone to caries. If you take a primitive condition of society, it is perfectly obvious that most sickly children would die off. For instance, take as an extreme instance, the children that Darwin met with in Patagonia, where he noted that the newly born child was carried about naked by its mother and the rain froze on it as it fell, it is perfectly obvious that every sickly child would be killed off and, therefore, only those vigorous would survive.

7081. I suppose that dirt, which you note as one of the causes of caries, was as common years ago as it is now; people did not clean their teeth more?—They cleaned them naturally.

7082. By the character of the food?—By the character of the food. I remember a northern farmer who, when he was told that he should get a tooth-brush for his boy, retorted that he had never used a tooth-brush himself, he always cleaned his teeth on a pound of steak, and that is true. If you get a perfect set of teeth, perfectly arranged and perfectly formed from the beginning and eat hard food, then mechanical aids to cleanliness are scarcely necessary.

7083. But such perfect dentition is rare, and was so at any period?—I do not think so. If you take those early British skulls, I think they were mostly perfect.

7084. If you go back to that time, but I am speaking of the last 100 years?—I do not think we can prove it is

worse than it was a 100 years ago, but that is a flea-bite in the space of time.

7085. Touching the question of degeneration or physical debility which we have to deal with, it is a matter rather of comparison between now and the last 50 or 100 years?—I should say undoubtedly in the last 100 years the conditions under which many town children are brought up has very materially deteriorated, and, therefore, *a priori* the children are brought up in the less proper way and they will have less proper teeth. The general tissues of the body may recover, so that the average life may be better than it was 100 years ago, but that does not affect the teeth.

7086. We have been told that the teeth in young children in Lancashire is perhaps worse than it is in any other part of Great Britain. I think it is noted in the Inspector General of Recruiting's Returns that there are many more recruits turned back there for want of good dentition, should you say that that would be in any degree the result of the chemical constituents in the air, owing to the noxious vapours discharged into it?—I should doubt it.

7087. That has been suggested. You do not think there is much in that?—I should doubt it. Possibly it is due to occupation, and it is also said that some water in Lancashire is very soft, in which case, in all probability, the teeth would not receive their proper share of lime salts.

7088. We have been told that as a matter of fact caries is just as often found in teeth with their proper elements of lime, as in teeth which are defective in lime?—Yes?

7089-90. You could not say it is the case, that a decayed tooth has necessarily less lime in it than a sound one?—An elaborate series of chemical investigations were undertaken by Black, and he showed that as far as analyses went there was not much difference between what we call a soft tooth and what we call a hard tooth. His investigations only concerned the dentine, they did not concern the enamel. And then again this union of lime salts with an albuminous body is a very intricate one, which I do not think is fully explained; it may be that you have a proper proportion of chemical constituents without being in the proper form. Because we, as dentists, have no doubt—I am myself convinced—that with regard to one tooth we say it is a hard tooth, and very unlikely to decay, and we see that it does not, and, with regard to the next one, we see it is a soft tooth and it does decay, and when it does it decays rapidly. So that although Black's experiments were exact, as far as they went, they are not satisfying to us.

7091. They are not applicable to the problem you have to solve?—They do not convince us that they express the whole truth.

7092. That is the case with so many scientific processes when tried by the test of facts. Then we have seen and heard a good deal attributed to what has been termed saccharomania, or debauch of sweet stuffs. Do you think the tendency among children of the lower classes to spend whatever pennies they get in sweets has much to say to it?—I think it may. Undoubtedly this fact has been noticed, that when children go for a long period to schools where sweets are forbidden teeth do not decay as much as when they stay at home and sweets are allowed.

7093. That is rather in the upper class?—Yes. It would apply to the lower class too, but, of course, it is rather a minor agency; it is not the fact of spending a short time a day eating as much sweets as can be consumed; it is the fact of continually having a sweet in the mouth that does the harm.

7094. Assuming the evil to be considerable and extensive, and due to the causes which you indicate, have you considered the remedies to be adopted?—Really, the remedy consists in appointing dentists.

7095. A supervision by a qualified dentist of the children in school?—The point is this. I tried to point out that a tooth once formed will not alter of its own accord. If you have a little hole that hole will grow big as certain as fate. If you can fill it there is an end of it; and as long as the filling lasts, which, if properly done it should, that tooth does not decay at that particular spot; another

point is that if, as we admit, the majority of children have crowded mouths, and if you can relieve that crowding, reproducing as far as possible the perfect arrangement which we have in ancient times, then again there will be little or no decay. A tooth, for instance, out of its series is not cleaned even with mechanical aids, as a brush, unless you are careful.

7096. There should be judicious removal early in life?—Yes, judicious removals, and regulation of misplaced teeth, and then attention to children at school is a benefit to them not only at the time, but throughout their life. You may, by judicious treatment, give children a set of teeth which will last.

7097. You think between the ages of seven and twelve the problem of dentition for a whole lifetime may be satisfactorily solved?—I do not mean they will not decay, but you start the teeth fairly. I should have pointed out as regards the causes that much is put down to the condition of bread.

7098. When you say you would encourage the use of harder food stuffs do you mean whole-meal bread?—It means hard-baked bread. Of course, in a primitive condition the child has tough meat and so on; that is cleansing, but, nowadays, it is presumed that the child shall have all its food mashed; it is fed on pulps, and it is not allowed to use its teeth even if it would. It is alleged that flour which has been prepared by the use of rollers produces far more acid in the mouth than does stone ground flour.

7099. Would you subject every child when it goes to school to examination by a dentist, or would you give teachers certain general indications as to the cases to refer to a dentist?—No, every child must be seen by a dentist; the opinion of others is of doubtful value. That is probably the reason why the recruiting statistics vary from year to year; they depend on the individual who investigates.

7100. Have you considered what additional expense would be thrown upon school authorities by a general adoption of this scheme?—I do not think it would be very large, comparatively speaking—not as large, for instance, as teaching the piano and so on, or many extras. The child would be much better with a good set of teeth than with many so-called extra accomplishments.

7101. No doubt, there might be a readjustment of the expenditure of schools?—In all Poor Law schools the matter is enforced by the Home Office.

7102. (*Mr. Legge.*) By the Local Government Board, and in most of our schools, too?—The pauper child is better off than the one in the public elementary schools in this matter. On the training ship "Exmouth" they have been repaid by the greater number of boys they have been able to enter into the navy which is a very good illustration of the practical benefit of these dental appointments.

7103. (*Chairman.*) Do any employers of labour make any investigation?—Only in the match factories.

7104. Is that because the processes of those manufactures are injurious to teeth?—Because workers with phosphorous with carious teeth are predisposed to phosphorous necrosis I was informed the other day that in Bryant & May's factory—I do not give this as an absolute fact, but I believe it to be so—that there have been fewer men absent on sick leave since they had dentists appointed. I have been struck with the large amount of sick leave owing to dental causes among nurses at hospitals.

7105. They break down?—Yes; they have bad teeth and swollen faces, and are in bed for three or four days, whereas a little attention for half an hour would have prevented it.

7106. A great saving, and a more than commensurate saving for the original outlay, could have been effected?—Undoubtedly, if you take simply those soldiers sent out to South Africa, I do not know what it costs to send a soldier out there and bring him back again, but if you put it at £10, that means £30,000, because it is admitted that

Mr.
Dolamore.
—

Mr.
Dolamcre.

three thousand were sent out, and had to be sent back because of illness, etc., due to defective teeth.

7107. Are not any part of the medical staff of the Army professional dentists?—They have a few now, but they have not had hitherto.

7108. They have ignored it?—That is so.

7109. (*Colonel Fox.*) They recommended tooth brushes and introduced them into the Army, and it is found they use them for polishing their brass buttons?—I have no doubt they do. If you do not teach a child from quite young to clean its teeth, it is not likely to appreciate the benefits when it grows older. If you bring the child up in the habit it is a different matter.

7110. There are other means besides tooth brushes for cleaning teeth?—There are hard food stuffs, but it would be difficult to change the whole dietary of the nation.

7111. The teeth can be rubbed without the use of a tooth brush?—It is no use; you only polish the surface. The important thing is to clean the inaccessible places.

7112. The tooth pick will do that?—They could use tooth picks, of course, but it would take longer than ever.

7113. We have heard the stick of a used match described as a very efficient thing.—Quite so. Chinamen use a stick with its end frayed out.

7114. (*Colonel Onslow.*) And the Arabs and Aborigines generally?—I am told that the negroes on the west coast sit and polish their teeth when they have nothing else to do.

7115. (*Chairman.*) They have a very large amount of leisure?—Still the tooth brush is the quickest way.

7116. You think something might be done in school to bring children to the knowledge of the importance of keeping their teeth clean?—Undoubtedly, and I think myself it would repay to have a dentist attached to every elementary school.

7117. That every local educational authority should employ a dentist at any rate to exercise a general supervision over the children attending the elementary schools within the area of its administration?—Yes, every child should be inspected once in six months.

7118. As frequently as that?—I should say so. Once a year is the minimum, but I do not see any difficulty; it is not a very long matter to inspect them.

7119. But if it is to be done twice a year it means double the cost?—I do not know that that need be so because if you pay a man to attend in the elementary schools he is paid for the day, and he may as well fill up his day.

7120. Would you not be making larger demands on his time?—It might be, but if you are going to do the thing at all you must do it thoroughly. The additional expense is comparatively small.

7121. But there are a great many people who are very much afraid of additional expense, and unless you can show that you can get a maximum advantage for a minimum expenditure it is very difficult to get even the most excellent suggestion adopted?—If those people who objected came down to the London hospital and saw the condition of the teeth of the poor children brought there they would certainly think the money would not be badly expended.

7122. People do not have these object lessons, unfortunately. We have to put recommendations in a form which will not frighten people on the score of cost if there is to be any prospect of their being carried out?—Yes.

7123. Now on the general question, can you say that dental caries is a sign of general physical deterioration?—I do not think so. It is rather a reminiscence of a bad time in youth.

7124. It may be, and I dare say very often is, associated with bad physical conditions?—Yes, undoubtedly.

7125. But you are not prepared to say that, taken by itself, the increase in the amount of dental caries which is generally admitted at the present day, is one of the signs of physical deterioration?—No.

7126. A local condition?—Yes, at the time. Undoubtedly it tells the story of something lacking during childhood, from which the person recovered.

7127. It is stated in this memorandum, in regard to the examination of two schools in Edinburgh: "It was found that the ratio of defective permanent teeth per 100 children was 158·2 in the school for the children of well-to-do working people, and 273·9 in that for the children of a better class, professional men and merchants." That is obviously destructive of the theory that it should be necessarily regarded as a sign of physical deterioration?—Unless you look upon it that the well-to-do classes are deteriorating.

7128. Everybody seems to think they are not?—It is undoubtedly the better-class schools, in my experience, where the teeth are the worse—the higher the class the worse the teeth.

7129. That is inconsistent with any theory connecting dental caries with physical deterioration?—I agree, except that, of course, taken as individuals it is not certain that the individuals in high-class schools are better as animals than those in the poorer schools.

7130. All the evidence we have heard in this room would lead us to suppose that the question of physical deterioration and progressive physical deterioration is one affecting the lower stratum of society, and not the higher?—I think the reason is this, that the children in better-class schools, if anything, have still softer food than those in the poorer schools.

7131. And probably eat as many sweets?—Probably more. Many of them do not get the attention paid to their teeth which they ought to do, and which one would expect they would get.

7132. As to the evil consequences of poor dentition, there can be no question?—None.

7133. I mean the further effects?—It is a very serious matter, and is receiving increased attention. Certainly, in my experience, the number of patients which are now referred on account of general conditions associated with teeth is increasing.

7134. What is that in consequence of?—A dirty mouth. When the mouth is cleaned and made healthy, quite apart from providing them with artificial substitutes, many of them recover.

7135. It is merely a foul condition of the mouth?—Yes; they suffer from sapremia.

7136. (*Colonel Fox.*) Do you mean the saliva affects them?—No, I mean that carious teeth mean really cultivations of micro-organisms.

7137. (*Dr. Tatham.*) A decayed tooth is a septic focus?—Yes. And if you multiply that by thirty-two you will get an idea of the amount of filth which people swallow who have dirty teeth.

7138. (*Chairman.*) It is destructive to health and to digestion and so on, and produces all sorts of gastric disturbances?—Yes. That is probably why the soldiers were sent home, many of them, quite apart from not being able to take their food.

7139. It debilitated them generally?—Yes.

7140-2. Do you think that among domestic servants the evil is great?—That is well known. The condition of their teeth is simply appalling, not merely in towns but in the country they get soft foods.

7143. (*Dr. Tatham.*) The decay of teeth is not exclusively a matter of the poor class; it pervades society generally?—Yes.

7144. Has smoking anything to do with it?—No, I think provided smoking does not destroy the digestion

Mr.
Dolamore.

and irritate the mucous membrane it is beneficial as far as the teeth are concerned. When you see a person's teeth stained with tobacco they do not decay in the same ratio. Nicotine is of course an antiseptic.

7145. With regard to the injurious effect of sugar one has heard that the several coloured races, although they take a good deal of sugar and live very largely on sugar, have remarkably good teeth; is not that rather against the theory that the consumption of sugar deteriorates the teeth?—I think in the first place that the teeth start better, and in the second place no one alleges—at least we do not allege—that the sugar taken in and swallowed and washed out of the mouth does any harm. It is when it remains that it does harm. It is undoubtedly the fact that the sugar formed by the action of the ptyalin on the starch elements of food is far more potent than the sugar taken in as food. In other words, starch and flour are worse than sugar.

7146. (*Mr. Lindsell.*) With regard to this idea of having all the schools inspected dentally, would you make it a compulsory thing in all schools receiving State aid?—If you do not make it compulsory I am afraid you would not find many children would submit.

7147. The question of expense would come in when you deal with the Public Elementary Schools of the country?—Yes.

7148. There you see in the first place the parents would very probably object unless they were obliged?—I do not think they would if it were fairly put to them, at least after a time. I think knowledge of the value of teeth is spreading, and if parents saw the school authorities attach so much importance to it they would begin to think it an important matter themselves. My experience is that parents are very willing to take an opinion—poor people probably more than the better class.

7149. It would necessarily be done by an expert?—It is only playing at a thing to have it done by an amateur.

7150. There have been suggestions that the teacher should be asked to do all sorts of things with regard to children?—They could do but little in regard to teeth.

7151. It was suggested that the testing of the eye sight could be done without an expert?—In regard to teeth the teacher would not see the cavity of decay until an advanced stage had been reached. To be of benefit it must be done by an expert.

7152. The teacher would know the signs of irregular dentition?—They could see that the teeth were clean. It would be an advantage if they would pay the same attention to the teeth as to the fingers. They will send a child out to wash his inky fingers, and they might tell them how dirty their teeth were.

7153. Would you have a dentist attached to every large local education authority as one of their permanent officers?—Most certainly I would, and I believe, from the point of view of the nation, it would be a capital investment.

7154. Take a town of the size of Manchester, could one dental officer tackle all the elementary schools?—No, I do not think he could—certainly not; I should say about 900 children. There are 800 children in the Central London School at Hanwell, and to it a dentist goes down once a week, the expense being about £100 per annum. That is a fair guide.

7155. Should you intend the officers to operate in cases where they found the teeth defective?—It is no use if they do not.

7156. They might tell the children to tell their parents that they must be sent to the dental hospital?—The hospital could not undertake it; it would be impossible.

7157. You would have an operating room at the school, and every child would not be merely reported, but he would be attended to?—Yes. For instance, with regard to the little children who come to the London Hospital, they often have no father or mother—where are they to get money or help to get their teeth attended to? Or, perhaps, their father is out of work, and they are

absolutely poverty-stricken, and yet the child suffers because it cannot get help. Only to tell them to get their teeth attended to would be simply a waste of time.

7158. I meant that they should go to institutions where the attention could be given free, but not by the examining officer?—Unless the public help dental hospitals far more than they do it cannot be done there.

7159. The actual operating would have to be part of the work of the officer?—Yes, certainly.

7160. Would not that entail a very heavy expense on the rates; would it not be almost likely to deter municipal or county authorities from doing it?—You already do it in the case of Poor Law schools, and the charge has not proved excessive.

7161. Of course, they are very small and few in number comparatively?—They are.

7162. That is done by the Union Officer of Health, is it not?—No; they have a salaried official—a dentist—appointed. I am glad to say that there is a notice issued by the Home Office that the person appointed shall be a qualified dentist; and that is the whole gist of the matter. It is no use offering these children amateurs, to do any good.

7163. It would be a much larger job to examine the teeth of the whole population than those children?—It would do far more good.

7164. It might come to a very large public charge?—Supposing it cost a school of 1,000 children £200 a year—that is putting it at the outside—I do not see myself that that is so very heavy.

7165. The ratepayers are rather timid persons, especially in some counties, where there is great alarm already at the education rate; and if we are to have dentists and medical officers, and so on, very likely the ratepayer will rise; that is the only obstacle?—Those who can afford to pay might be made to pay. Of course, that is a big question.

7166. You do not know of any cases where it has been tried by school authorities?—You mean the Poor Law?

7167. No, the education authorities?—No, I do not. I do not think it has been done. Some good might be done—it would only be tinkering at it—by instructing the children in cleanliness. It would be a beginning and better than nothing.

7168. That one could do in the ordinary course of instruction. But it is the question of getting an actual examining officer, which is the crux of the whole thing. You think it would be well worth a national expenditure?—I am quite convinced that they could not spend money in a better direction.

7169. A child might pay if its parents could afford it: for the actual operation?—If it could afford it, certainly. But my point is that you must not shut out the quite poor children who really need help by the fact of demanding their pence. That would nullify the good of the whole thing.

7170. You think free tuition ought to include free dentistry?—If it is desired to do anything to check the prevalence of caries that is the only solution of the difficulty.

7171. (*Colonel Fox.*) How do you account for the disappearance of enamel—the wasting away of the enamel entirely?—I do not think it is common.

7172. How do you account for it?—Supposing it did occur?

7173. Yes?—I should say in all probability you would have to find some acid. Occupation may have something to do with it. I am told that with the girls at pickle and jam manufacturers that happens very frequently. I am told the fumes of the acids coming out of the tubs appear to act on the teeth, causing them to dissolve.

7174. I have known of several cases of people who have lost the enamel of teeth without them decaying, and that tends to show it is from the saliva—some acidity in the saliva?—In the case of better class people they probably brush it away—there is such a thing as excessive brushing.

Mr.
Dolamore.

7175. (*Colonel Onslow.*) I think you have already said that bad teeth are not peculiar to any one district in England?—No.

7176. That is borne out by repeated experience?—Yes.

7177. You find the same thing all over the country?—Yes.

7178. It is intensified in some places by the nature of the employment?—Yes; but both as regards the influence of employment and locality, statistics are needed.

Mrs. W. B. WORTHINGTON, called; and Examined.

Mrs.
Worthington.

7183. (*Chairman.*) You are prominently connected with the Manchester Ladies' Public Health Society?—Yes.

7184. Are you the president of that society?—No, I have sometimes temporarily taken the duties.

7185. You have been familiar with its operation for some years?—Yes, for fourteen years.

7186. Will you kindly describe generally what its operations are?—Manchester may be taken as having a business centre and then a band of cottage property, and then the suburbs. The cottage property where the working people are is roughly divided into districts. Each of these has a Lady-superintendent and a Health-visitor. The Health-visitor lives in the district, and spends her time in the work. We work in conjunction with the corporation, with the medical officer who pays part of the salaries of the visitors.

7187. The visitors are really municipal officers?—Not altogether; it is a joint control.

7188. The municipality pays part of their salary and the rest is defrayed by voluntary means?—They pay half the visitors on the understanding that they receive assistance from all of them. It is merely for convenience that they are paid in that way.

7189. The medical officer has the first call upon their time?—Yes.

7190. And the rest of their time is at the disposal of the Ladies' Public Health Society?—Yes, but it is not in any way divided; there is no separation; it is all in one line.

7191. Does that system work well?—Yes.

7192. Is not there sometimes a collision of allegiance?—So little that it can be left out of mind.

7193. The sphere of these ladies work is restricted to this cottage property—those parts of Manchester inhabited by the poorest?—Yes, and the respectable labouring class.

7194. Is there any standard of wages or house rent which determines the class of houses to be visited?—No, practically the districts contain very few houses which are not of the class which is wanted.

7195. You go down to the lowest?—Yes.

7196. Are your investigations limited to the houses where there are young children?—No; all the houses in the district.

7197. And therefore they are still less limited to the houses which have babies?—They are not limited to those.

7198. It is a general agency?—It is the houses where there are babies which have received special attention of late.

7199. With a view to informing mothers as to the best methods of bringing up young children?—Yes.

7200. Will you explain how the system works?—The Health-visitor practically arranges her work and what she has to do for the medical officer. If she had to visit several hours for him in a certain part of the district she would do the rest of her work in that district.

7201. That is her municipal work?—Yes, she goes from house to house and does anything she can find to do. She may find a house without a mother and put the children into the way of doing something. She also reports all sorts of sanitary defects in the houses.

7179. The Northampton shoemakers are very bad, are they not?—I do not know about that. But I know in the Lancashire districts they are really very bad.

7180. And also in the country districts?—Yes.

7181. In Northampton the shoemakers are always holding some nails between their teeth, are they not?—That causes only a trade mark—a peculiarity—a notch is worn by the nail.

7182. It is due to employment sometimes?—People like millers and jam-makers and pastry cooks are undoubtedly affected by those employments. Millers' teeth are very bad, and so are pastry-cooks'.

7202. Does she report to the health society or the municipality?—To both. The forms go to the medical officer first and then they are sent on to us, after he has extracted the information he wants.

7203. Does the Ladies' Health Society think it part of their duty to bring insanitary conditions to the knowledge of the municipality?—Continually.

7204. Does it report cases of overcrowding?—Yes, and of stopped drains and so on, and structural defects.

7205. Any conditions which are prejudicial to health?—Yes.

7206. Whether of a temporary or permanent type?—Yes, but that is rather provided for in the form used. (*Document handed to the Chairman.*)

7207. Can you explain what action the municipality takes upon the receipt of information of this kind?—They generally send an inspector at once.

7208. You mean that the result of the operations of the society is that any evil which is noted is put right?—It is put right before very long.

7209. How about cases of overcrowding?—They are very difficult to discover.

7210. I suppose there is a great deal of overcrowding in Manchester?—Yes, but not to the same extent as in other places.

7211. There has been more improvement in Manchester than in some other towns of smaller size. Do you think it would be practicable in the course of, say, a year or two for any local authority to declare that after a given date one-roomed tenements with more than two occupants, or two-roomed tenements with more than four should be deemed a nuisance and closed?—I should not think that would come within a year or two.

7212. Do not you think it is a goal at which we ought to aim?—Certainly.

7213. Why should it not come within a given period—You cannot do it very quickly. You have to displace the population, and there must be a place to go to.

7214. If you notify that, after a certain time, the local authority would deem cases of that sort nuisances under the Public Health Act, and be prepared to deal with them, do not you think it would have some effect for preparing the public mind for what was to come?—Yes.

7215. And assist development when the time did come?—Yes.

7216. Is not there some deadness of appreciation of the evil owing to the way in which it is ignored?—I do not think there is any deadness of appreciation in Manchester. For instance in the particular district in which Mrs. Bostock works, South Ancoats.

7217. That is the worst district, is it not?—No, not nearly.

7218. We have heard it described as such here?—Perhaps that is Ancoats as a whole, but parts are worse than South Ancoats, but that is quite bad enough. Fourteen years ago there were over 300 back-to-back houses, the majority of which had not ordinary sanitary conveniences; many had no tap or anything of the kind. There are now about twenty of those left.

7219. There are plenty of houses with no separate water supply?—Not many, not more than twenty.

Mrs.
Worthington.

7220. In this district, you mean, not in the whole of Manchester?—No, in this district. That is the one we know most in detail, and it is quite a representative one.

7221. Will you explain the processes by which knowledge of domestic duties generally, hygiene and sanitary information, is given to the people?—The chief part of the work is done by Mrs. Bostock in her house to house visitations. My own part is chiefly collecting such of the women as we can for mothers' meetings, which we find an extremely useful organisation. We use these very much to prepare public opinion.

7222. Do the women who attend meetings of that description act as propagandists among their associates in the areas in which they live?—Some do certainly.

7223. Do you think it has the effect of popularising notions of a higher standard of domesticity, and so on?—Yes, without doubt.

7224. You have observed that from your own experience?—Yes; we do not look for great results, but we continually see small results in places we know of.

7225. The way is prepared for the systematic visitation that the visitors make, I suppose?—Yes, that has happened rather incidentally, of course, I began talking on the question of consumption years ago, before there was any systematic consumption work, and that helped to prepare the neighbourhood for that work, and it made it easier for Mrs. Bostock to do it. She had very little difficulty in getting admitted into the homes because a notion was spread abroad of what it meant.

7226. Has it had any important effect as yet on the young children of Manchester?—That is rather difficult to say, because of course the infant death rate has been decidedly lower the last two summers, owing to cool weather.

7227. The mothers accept with gladness, as a rule, the advice which is given them?—The young ones almost invariably.

7228. Do they apply it?—Yes.

7229. Systematically?—Yes.

7230. Are the opportunities for proper feeding, if the parents wish to give it, sufficient in Manchester: is the milk supply brought within reach of the poorest class?—It is always an expensive thing.

7231. There is no attempt, as I understand, towards municipal distribution of supply?—No.

7232. (*Mr. Legge.*) There has been in other big towns in Lancashire?—Not in Manchester.

7233. It might be done very easily. Have your society considered the subject?—It might, but we are rather inclined to insist on the individual instruction of women.

7234. Have your efforts had the result of making more mothers suckle their children?—I do not think so, because they do that when they can.

7235. You think they do?—Except those that go out to work.

7236. Of course that stands in the way of a great many doing it?—A good deal of influence has been brought to bear upon them to adopt regular hours and not be quite so miscellaneous in their feeding operations.

7237. You think they have now some settled notion of what is the best type of food to give the children?—Yes.

7238. Have you any syllabus of your instruction?—Yes.

7239. I observe you are of opinion that a great deal of the physical degeneracy which is noticeable in Manchester is due to causes which have spent themselves?—Yes, but their effects remain.

7240. But it may be hoped that the next generation will be freer?—I think there is quite room for hope. They are certainly getting a little better housed, and I think a little better fed by degrees.

7241. Owing, largely, to the advice tendered by the agents of your society?—Partly to that, and partly to food being cheaper.

7242. I think, as a matter of fact, increased poverty is not the cause of worse feeding now as compared with thirty or forty years ago. I suppose that wages are better all through?—Oh yes, and things are so much cheaper, and they can get more varied food.

7243. In both ways they are very much better off?—Yes, they have to learn a great deal in the way of cooking and also in the way of expenditure. They spend very foolishly.

7244. That is due to the lack of proper instruction at school, as far as young mothers are concerned?—Yes.

7245. I do not know whether you have any intimacy as to the process of teaching at cookery schools?—Yes.

7246. You would probably agree that that might be made much more practical than it is?—Some are very practical indeed.

7247. We have heard a good deal of evidence as to a great many schools not being so—I mean the conditions of the homes of the poor are not reproduced with sufficient accuracy to make the knowledge gained in the school of much use when it comes to be applied in the child's own home?—I think that may be carried too far, because you do not want to teach a girl to be satisfied with too little.

7248. There must be a difference in degree, but similar in kind?—Yes.

7249. Otherwise the knowledge is no use, because there is no means by which it can be applied?—I think there are extremely practical cooking lessons given.

7250. I daresay there are in Manchester, but we have been told here by a great many witnesses that there is a great lack of proper adjustment of means to an end in that way?—It certainly began in that way, but I think things are gradually righting themselves as time goes on.

7251. We are approximating to a better standard of achievement?—Yes.

7252. (*Dr. Tatham.*) I should like to ask you a few questions with regard to the increase in the operations of your society. How many members of your association have you now?—We have twenty-three districts and most have only one lady over them, but some have two or three. I think there are about thirty ladies altogether.

7253. That is a considerable increase over the number there were ten years ago?—Yes.

7254. I think you said you have twenty-three districts?—That includes Salford. There are sixteen in Manchester.

7255. They work together in connection with the Manchester and Salford Sanitary Association?—The connection is only nominal.

7256. But the two are connected working on similar lines, are they not?—It is quite a separate thing.

7257. It has become a separate thing now?—Yes, the only connection I think is that they print part of our report in theirs.

7258. Would it be correct to state that the operations of the society extend as far as they can to all the back spots of Manchester and Salford?—That is the aim.

7259. What proportion do you think of the insanitary property of Manchester and Salford is now under the care of your society?—In Manchester we cover most of the ground I think. Of course it is gradually spreading. But what spreads beyond is generally a little better than what is inside. I think if we had the power of setting up another health visitor we should rather prefer to subdivide some of the districts we have, rather than take in a new one, although there are two or three parts where we should be glad to have a new one. The most pressing parts are covered. But that is not so in Salford; there are several points there that ought to be covered.

7260. Which are still unprovided for?—Yes.

7261. But in Manchester you think you have covered most of the worst districts?—Yes, the worst parts.

7262. Are the Manchester Corporation paying for a larger number of visitors now than they did ten years ago?—Yes, they pay half now.

7263. For half of the district?—Half of the sixteen.

7264. They pay their entire salaries?—Yes, but they do a great deal of work for Dr. Niven.

7265. What sum per week do they receive?—Only 16s., I am sorry to say. We are now making an effort to raise it.

7266. Has the society any hope of being able to increase that very modest allowance?—Yes, we hope to do it before long; we are extremely impecunious, but we mean to do it.

Mrs. Northington. 7267. (*Dr. Tatham.*) I am sure there is enough public spirit in the Corporation to assist you.

7268. (*Mr. Struthers.*) That is the whole pay?—Yes.

7269. (*Dr. Tatham.*) Is it your experience that the visits of the district visitors are becoming more and more appreciated as time goes on?—Yes.

7270. And, of course, that encourages the society to extend its operations?—Yes.

7271. The one thing needful, I suppose, is the pecuniary means?—Yes, we could do much more if we could subdivide the districts so as to get more house to house visitation.

7272. (*Chairman.*) What income have you, may I ask.

7273. (*Dr. Tatham.*) It is a variable quantity?—Yes, from subscriptions. We need eleven times 16s., plus the printing expenses, exactly. We have no other expenses, but we generally have a deficiency to make up at the end of the year.

7274. Speaking generally what is your general impression as regards the condition of school children in those districts you speak of: is it really visibly improving as compared with thirteen or fourteen years ago?—I think so, decidedly.

7275. That is patent to almost any one going in?—I think so.

7276. Have you any reason to think that that is largely due to the operation of your society?—I think it has something to do with it. I think it is one of many factors.

7277. And I think one of the most important. Do you think that such neglect as you observed amongst the poorer classes of mothers, neglect of their children, is due to poverty, or is it because of ignorance?—I think the vast mass is due to a sort of sloppiness of mind produced by ignorance—they do everything badly.

7278. General incompetence?—Yes, physically and mentally. They do not know how to do anything properly.

7279. They do not know how to cook food for their children or their husbands?—No.

7280. Or to keep their house in order?—No.

7281. That implies, I take it, very imperfect education by their mothers?—Yes.

7282. I am afraid it is so now, as it was many years ago when I knew Manchester, that drink is at the bottom of much of the misery and distress in those poorer districts?—Yes, certainly, but the ignorance is in a great measure the cause of the drink, of course.

7283. With regard to the operations of the Salvation Army, do you know anything about their work in Manchester?—Nothing at all.

7284. (*Mr. Legge.*) When you say that the health visitors visit all houses where there are infants, to give health and instruction to the mothers, are we to take that literally?—Literally.

7285. All mothers? Where do you draw the line as to the class of mothers; you would not invade a respectable dwelling-house?—There are not many of the better class houses in the districts.

7286. You only take certain districts which you schedule for yourselves?—The health visitors receive the names of the infants from the medical officer, and it is rather unfortunate that they do not get them until they are registered, so that they do not get them always at the very start. If they know of the infant themselves they can go from the beginning, but the lists are sent by the medical officer when they are registered.

7287. The lists of certain districts?—In the districts in which they work.

7288. And then they visit every single one?—Yes.

7289. Do they pay periodical visits after the first?—Yes.

7290. Can you give us the statistics in tabular form, showing the actual number of births and visits rendered in particular districts in Manchester?—I am afraid I have not them.

7291. Could you get them and send them to us?—Certainly.

7292. We have heard so much of attempts to attack these sort of problems, which merely touch the fringe of things, that it would be rather interesting if we could get hold of one which covers the ground and find out what the extent of that ground is?—Yes, there would be no difficulty about getting the figures.

7293. What sort of people do you get for this 16s. a week?—It is getting increasingly hard to get the right kind.

7294. What sort do you get—people who have some other money as well, I suppose?—No, in many cases not, in most cases not. The mere fact that they know what it means to live on 16s. a week gives them a very great power.

7295. Most are not those who are interested in the work, and who are fairly independent in their own circumstances?—No; we have some with other sources of income, with husbands or sons.

7296. (*Chairman.*) It is not from benevolence that they take it up?—No, we have none as amateurs, and the majority depend entirely upon themselves.

7297. (*Mr. Legge.*) What qualifications do they possess?—Practically they learn their work in the doing of it.

7298. You say they are well instructed in the technique of infant feeding, are they probationers for a time?—They are generally taught by those who have been doing the work for a long time. And then periodically we get lectures or lessons on the subject. At the end of last year they were all put through a very thorough course of infant feeding, in great detail.

7299. Who gave the course?—Mrs. Crosbie, from London, who has taken a great interest in it.

7300. Who arranged the course?—The medical officer. Sometimes we arrange the courses ourselves. The great difficulty about the infants is that very many are not caught until they are registered.

7301. (*Chairman.*) What lapse of time does that amount to—three or four weeks?—It may be as much as six weeks.

7302. (*Colonel Onslow.*) It is registration of birth not medical attendance?—The medical officer gets the figures from the registrar.

7303. (*Chairman.*) Do not the mothers knowing the value of the organisation give information themselves?—A great many of them are known beforehand but not all.

7304. (*Mr. Legge.*) Has it ever been seriously considered between your society and the medical officer of health whether these intimations could not be expedited?—No.

7305. Where does the medical officer of health get the information from?—The registrar.

7306. Has not it been considered whether the registrar could not send you duplicate notices at the same time as he does to the medical officer of health?—There is practically no delay there.

7307. You mean the delay arises between the registrar and the parents?—Yes, the parents delay in registering a birth. There are six weeks in which to register. Of course most of them are very dilatory, and put it off as long as they can.

7308. Supposing any registered practitioner or registered midwife had to give notice, that he or she had been called in, would not that help matters?—Yes, it might.

7309. (*Chairman.*) Now you have a better class of midwives under the Midwife's Act, it might become possible.

7310. (*Mr. Legge.*) It might be made an essential part of the person's duty to notify?—Yes.

7311. (*Chairman.*) That could be easily done in Manchester, where a sanitary authority gives the certificate to the midwife in the district; they could make it a part of their duty to report every birth to the Health Society, because they could impose such conditions within reason as they like on the midwives to whom they give certificates?—Yes.

7312. (*Mr. Lindsell.*) Do I understand that the care and nurture of infants is the special work of your society above all others?—It was only one of many originally, but the medical officer has been taking such an extreme interest in that of late that the work for him has taken rather that form.

Mrs.
Worthington.

7313. You have rather concentrated your energy on that particular branch of charitable work?—Yes.

7314. And it appears to be your deliberate opinion that a great many of the worst causes are no longer operative in Manchester?—Yes, and yet that sounds too optimistic. Things are bad enough, but I think the worst cases are gone. I think things are certainly better.

7315. The great evil you have now to grapple with is sheer ignorance?—I think so. It seems to me that poverty, great as it is, does not do so much harm as the waste of the money they actually have. If families were to use the money to the best advantage it would make an enormous difference.

7316. Do you think the evil effects of drink are increasing or decreasing. If drink is caused by ignorance, it ought to be diminishing to some extent. Do you think, in your experience of so many years past, the drinking habits of the lower class have increased or diminished?—I am afraid I do not see any difference.

7317. You think it is about the same?—Yes.

7318. Have you noticed any increase in drinking on the part of women?—I should not say it is on the increase.

7319. You do not think there is an increase of drinking on the part of women?—No; I do not think so. Mrs. Bostock's opinion will be more valuable than mine on that point.

7320. (*Colonel Onslow.*) With regard to the weekly meetings held in each district for the purpose of giving information—what class of women attend those meetings—the very lowest class?—Not absolutely the lowest class.

7321. You do not get the slums?—Not the very lowest class, but very poor ones.

7322. It is not the class who really require more instruction—not the most ignorant?—We get them quite ignorant enough.

7323. They are ignorant of household duties and the care of children?—Yes.

7324. And they do attend in good numbers?—The average attendance at my meetings is about 100.

7325. Are they from the same body—are they from the same class of women coming over and over again?—A good many of them have come for fourteen years—and stayed on, but a vast number change.

7326. So that the principle is really disseminated rather widely—it has spread about?—Yes.

7327. With regard to the cooking instruction which we were mentioning. These cooking classes generally go rather above the requirements for a cottager, do they not—beyond a labouring man's wife?—They do not all by any means.

7328. I mean are the utensils which are used such as would be used in a cottage? We have heard of these cooking lessons being given over a gas stove. You would not find a gas stove in any labourer's cottage?—No, but the reason of that is, of course, that you cannot get anything but gas stoves in the place where you have to give lessons.

7329. Could not lessons be given in some cottages?—That is sometimes done.

7330. Do the ladies of the Public Health Society undergo any special instruction themselves, or are they particularly selected?—No, they are quite voluntary.

7331. It seems so important in dealing with the very poor, or indeed with any poor, that whoever comes in contact with them should know how to deal with them, is it not?—We should be very glad if we could get a more trained class of lady to do it. Most of those we get have to gain experience in the work.

7332. And are liable to be deficient in tact, I think?—They are likely to be over charitable.

7333. Or, perhaps, over fussy?—Sometimes.

7334. I suppose you are very careful in the selection of your workers?—Yes.

7335-6. In a general system it would be necessary to be so?—Yes.

7337. It does not do to rub up the people the wrong way?—Yes; it has been wonderful the little difficulty

we have had; very few of the health visitors have had any difficulty in that direction.

7338. (*Mr. Struthers.*) What you say about the teaching of cooking in schools is from your own experience?—My knowledge of teaching in the schools is in quite a separate sphere from the health visiting work. I am on the Salford Education Committee and know something of their work.

7339. But you do know the actual conditions of cookery classes in schools?—Yes.

7340. Have you attended frequently?—Occasionally.

7341. I must say my impression of some of the ladies who have given us evidence on this point is that they have not seen the actual condition of the cookery classes and that, when they say cooking is carried out in a way which is not suitable for the people for whom it is given, I am very doubtful whether that is the case or not. I am glad to find that is not usually the case in your experience?—I am always hearing of cases where the girls go home and make things.

7342. So far as you have seen it, it is generally suitable; you think?—It is fairly suitable, but it would be of little use to give instruction in cooking such as the very poorest will do, because there is no cooking; they have to set the ideal a little bit higher than that.

7343. The cookery is the kind of thing which should be given to that class of girls in a school?—Yes, I think so.

7344. In the hope that they or their mothers will do something like it at home?—Yes.

7345. With regard to the lessons being on a gas stove, instead of over a fire, I suppose the Corporation supplies gas very cheaply?—Yes, but I do not think there are many gas cooking stoves in cottages.

7346. In Glasgow, I know the cooking stove is very largely used because of the very low price of gas; and one can understand, at any rate in certain districts of the town, the cooking stove being more used than the open fire?—They need the fire for warmth nearly all the year round. It comes very expensive if you use gas for heating purposes. It only comes cheaper by being used when it is wanted.

7347. If the price of gas is very low?—It is not so low as that.

7348. (*Dr. Tatham.*) Coal is cheaper in Manchester? Yes.

7349. (*Mr. Struthers.*) But even supposing they did it on an open fire, do you think the cooking is greatly affected by the fact of whether it is done in one way or the other?—No.

7350. You boil a pot or fry a pan in very much the same way?—Yes.

7351. And if they can boil something on a gas stove they can boil it on an open fire?—I think so.

7352. And the dishes which they use must be the ordinary cookery dishes, and there would be the ordinary spoons and ordinary frying pan and so on?—Yes. They use quite ordinary things, which each house ought, at any rate, to aim at possessing.

7353. What sort of things? Do they teach them to cook mutton broth?—Yes, and potato pies.

7354. Shepherd's pie?—Yes, and plain puddings. I must say they do not entirely confine themselves to those; they sometimes teach how to cook rather more elaborate things.

7355. It gives the girls an interest in cooking, now and then they give them a special dish which they fancy, but which is not necessarily very costly?—I think so.

7356. The girls like something out of the way of the ordinary plain cooking, just for the sake of variety?—Yes.

7357. And it is not unreasonable that they should have that from time to time?—I do not think so.

7358-9. So long as it is not expensive?—The materials used are generally extremely economical.

Mrs. Worthington. 7360. These are generally the kind of things which they have in the cookery classes ?—Yes.

7361. As regards the general work of your society, I take it that in a given district you work from the top downwards. You begin with rather a better class in that district, which is a very poor one ?—That was the class which was induced to come to the mother's meeting first, but as regards the house to house visitation, that goes on through all.

7362. I rather gathered this from one of your remarks, in which you speak about overcrowding so far as you knew it. Does that mean that the houses in which there is a likelihood of overcrowding are less visited than the others ?—Overcrowding is very difficult to find out. There may be a family going out at the back when the visitor comes in at the front, and so on.

7363. Of course, the health officers of your society have no right of entry into a house ?—No.

7364. They have no practical difficulty in getting it ?—Very rarely.

7365. Are they refused at all ?—I do not think my health-visitor has ever been refused. There have been refusals in the cases of some of the visitors, but very few.

7366. In a house where there was overcrowding, and they did not want it to be known, would not there be a chance of their refusing ?—Sometimes nobody answers when you knock.

7367. But, practically, there is very little difficulty about getting admission ?—That is so.

7368. How long has this society been in operation ?—Something over forty years, I believe. It has only been worked in conjunction with the corporation for fourteen years, so that it has rather altered its shape.

7369. You have told us of certain things which clearly show that there is an upward tendency of the condition of people in the districts which you are dealing with, but is not there any statistical evidence of any general improvement in these districts during the fourteen years you have been connected with the corporation ? Improvement, for example, in the death-rate in the district which you work in ?—The infant death-rate is a little better.

7370. Not much in the fourteen years ?—It is a little better.

7371. I am speaking of the particular districts which you schedule out ?—Those are parts which bring the death-rate up.

7372. On the point of overcrowding, if a man and wife have three or four children, and only have money to pay for one room, what could you do ?—I do not think you can do anything when they are all one family.

7373. You must allow them to live in one room ?—Yes.

7374. You do not see any other way of doing it ?—I am not sure that you have the right to interfere if they are all of one family.

7375. (Chairman.) The law makes no distinction at all ?—It is much rarer to have one room in Manchester than in London. It is very unusual there.

7376. (Mr. Struthers.) Take the case of a man and wife, and five or six children in two rooms ; that is about equally difficult, is it not ? You do not call that overcrowding ?—No.

7377. What would be the definition of overcrowding ?—Eight in one back-to-back house, counting two of the smaller children as one—they say that is not overcrowding. I think it would be better if you asked Mrs. Bostock that.

7378. (Chairman.) With regard to the point which you raised, the law is, "Any part or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates whether or not members of the same family" is a nuisance.

7379. (Colonel Fox.) You state in your *précis* that you find the main cause of physical degeneracy in Manchester is purely ignorance ?—The main cause at present operative.

7380. The main cause, at the present time, of physical degeneracy in Manchester is purely ignorance—you mean as to what food is best for the children ?—No, ignorance in a very wide sense.

7381. Ignorance on the part of the public ?—I mean ignorance including drink, which I look upon as the result of ignorance.

7382. Do you think that drink is the cause of poverty in a great many of these cases ?—Certainly.

7383. That is one of the main causes of poverty among the poor classes ?—Yes.

7384. In your health visiting report I see you mention leaflets ?—Yes.

7385. What are those leaflets ; what do they deal with—drink ?—No. There is one called "Hints to Householders," and another "Infant Feeding," and another on "Consumption," and so on.

7386. Do they read them ?—They would not be the least use if simply left at the house, but Mrs. Bostock will tell you that she reads them out and draws attention to them. The mere leaving of a leaflet from house to house is absolutely useless.

7387. Then, as regards cooking, do you find a family living in one room ?—We have very few of those.

7388. With regard to those that have more than one room, how many rooms do they have on an average ?—Two, three, and four roomed cottages.

7389. Do they have sitting-rooms in some of them ?—Yes, a great many waste their best rooms.

7390. The sitting-room is not used ?—That is so.

7391. Except, of course, on state occasions ?—Yes.

7392. Have they facilities for cooking, or do they buy their food ready cooked outside ?—That is the lazy habit.

7393. Is it not rather common ?—Yes.

7394. Instead of taking the trouble to cook—or rather it is their ignorance in not knowing how to cook—they are forced to buy their food outside ?—Yes.

7395. Have you had experience of seeing a girl who has left school cooking in one of those cottages or houses ?—I have not seen it, but I have heard of it.

7396. (Chairman.) Is this ignorance aggravated by insensibility to the interests of children to any large extent ?—Do you mean is it active unkindness ?—

7397. Yes ?—I do not think there is much active unkindness to children except under the influence of drink.

Mrs. Bostock, "Health Visitor," called ; and Examined.

Mrs. Bostock. 7398. (Chairman.) Supposing you are summoned to the house of a woman who had just given birth to a child, absolutely devoid of any knowledge as to its proper care and attention, and nutriment, and so on, what do you do ?—I teach her to the best of my ability, but I do not know that I am summoned straight away.

7399. When you are summoned ?—After the baby has come ?

7400. Yes ?—Perhaps I would tidy up the place and teach her how to begin to feed the baby.

7401. You would make yourself responsible for the proper care of the child, in a sense ?—In a sense, and I would do whatever I could.

7402. And give the mother all the information you can as to what was wanted for the diet of the child ?—Yes.

7403. Do you find she readily accepts your ministrations ?—Yes.

7404. With regard to these leaflets which Mrs. Worthington was describing just now, do you make her familiar with the substance of them, so far as you deem it to be useful ?—Yes.

7405-6. And you think that she studies them afterwards ; do you awaken sufficient interest in her mind to lead her to study them afterwards, and apply the lessons she derives from them ?—Yes, we often see those people even before the baby comes.

Mrs.
Bostock.

7407. Of course a woman who has had one or two babies under her care is able to apply the knowledge on the third occasion without much assistance from you ?—Yes.

7408. Do you take any steps to see that she gets milk supplied to her in proper utensils ?—We do the best we can with them with whatever they have got.

7409. You do not make any arrangements with vendors of milk to supply the milk in a form which renders your ministrations easier and more efficient ?—No, we cannot do that.

7410. Can you not ?—No. If we know a good milk shop we tell the woman to go there. That is the only thing we can do.

7411. Is it not very necessary that the milk for each meal should be in a separate utensil with a view to its being kept pure ?—No, our suggestion does not say so. It is prepared to last twenty-four hours and it must be kept in a cool place.

7412. You do not think there is any risk of contamination ?—In extreme cases it would not be wise to suggest that, because it could not be kept nice over the whole twenty-four hours.

7413. The cool place does not exist in these cottages I suppose, at any rate in hot weather ?—No.

7414. (*Dr. Tatham.*) How many years have you been working as a district visitor ?—Fourteen years.

7415. What particular district are you working in ?—South Ancoats.

7416. Is that the district that you have looked after during the whole time ?—Yes.

7417. When you go to a house do you find now that people are generally glad to see you and welcome you ?—Yes.

7418. When you began the work the Lancashire people were rather suspicious, were they not, and wanted to know what your business was when you went ?—Yes.

7419. Did you find it took some time to familiarise the people with your work and with the object of your visiting them ?—I had a system the first time. I went all through the district, visiting house to house and made myself known at every place. There were a few places where I could not get in very well, but the neighbours told each other, and then of course they were rather sorry I had not been in.

7420. The neighbours talked to one another, and told one another what your business was, and then you found them glad to see you the next time you came ?—Yes.

7421. How many houses have you got in your district ?—1,500.

7422. Do you find the houses improve very much in recent years, with regard to cleanliness ?—I do. There is a great improvement.

7423. I think you have a regular report book, have you not, in which you enter the visitations from time to time, and what you find there ?—There is not a book now, because our system of visiting is on that sheet which I handed in.

7424. You enter there the result of your visits ?—Yes.

7425. And those large sheets are sent to the sanitary authorities ?—Yes.

7426. And as a result of your reports I suppose the sanitary inspectors take up the visits ?—They do.

7427. In case any sanitary evil wants removing ?—Yes.

7428. Do you find the result of your first visit sometimes leads to the removal of a nuisance ? Do you find opposition on the part of house agents to your work ?—No, I do not find very much, but I do not know how far that goes on with the inspector, because he will come into direct contact with them.

7429. You come into direct contact with the sanitary inspector ?—The sanitary inspector will come into direct contact with the agent.

7430. You think the sanitary inspector gets into trouble occasionally with the owners of property because

of his having caused them to carry out sanitary improvements ?—He might.

7431. At any rate, so far as you are concerned and your colleagues, you do not find much difficulty ?—No, we are able to get things done which would not be done otherwise.

7432. With regard to the food of children, do you find that mothers generally are anxious to know how best to feed their children ?—They are anxious.

7433. And they are much obliged to you for showing them how to do it ?—I have repeated calls at my house for one of these pamphlets. (*A copy was handed to Dr. Tatham.*)

7434. You say you explain the contents of this circular to the mothers ?—Yes.

7435. And they take an intelligent interest in it ?—Yes.

7436. And you say from what you know of the mothers in your district that as a rule they are neglectful of their children ?—Not wilfully.

7437. If they are neglectful it is because of ignorance ?—Yes.

7438. Because they know no better ?—That is so.

7439. Where children are neglected and sent to school half-starved as they sometimes are, do you think that is in consequence of poverty or in consequence of the drunken habits of the parents ?—It is due to both causes, I think.

7440. Are there not a great many cases in which, though the wages are sufficient, the parents, being of dissolute habits, simply will not provide for their children ?—That is very rare.

7441. I am glad to hear that. In some cases it does exist ?—We do occasionally find a case.

7442. You think in that respect people in your district are improving distinctly ?—I do, distinctly.

7443. As far as you know, is drunkenness on the increase amongst those people ?—I do not think it is.

7444. You think not ?—No.

7445. Are the women given to drink ?—I do think there is quite as much among women as there has been.

7446. With regard to the feeding of children, do you think speaking generally that the poor children get much milk at all of any sort ?—The very poor ones do not.

7447. Practically they get nothing but what the family happens to be taking at the time ?—Yes.

7448. Tea, I suppose ?—Yes.

7449. And sometimes I suppose even more harmful things than tea ?—There is not a much more harmful thing than tea to young children.

7450. I mean sometimes they get stimulants administered to them ?—I do not think there is much of that now.

7451. You do not think they do so to any large extent ?—No, they do not. I find it is very rare now, anything of that kind.

7452. Do you think there is much use of soothing syrups, cordials, and things of that sort, amongst the poor of your district ?—Yes, I found at one time a great deal of it, but not now.

7453. That may be fairly laid to the account of the work of your association ?—If you tell them it is absolutely harmful, they quite see it.

7454. Do you know anything of the work of the Salvation Army in your district ?—Very little.

7455. They are doing some work, are they not ?—Yes.

Mrs.
Bostock.

7456. Do you come in contact with them at all ?—Not often.

7457. What do you think would be the principal hindrance to your work amongst the poor ?—I do not find any hindrance to our work.

7458. You are quite satisfied with the means you have of working in your district, and carrying out the necessary work there ?—Yes.

7459. And you have no knowledge of any districts other than your own ?—No, I have not.

7460. (*Mr. Lindsell.*) You put down excessive tea drinking as very high in the scale of deleterious compounds ?—Yes, for young children.

7461. I suppose good wholesome beer would be better for them ?—Oh ! dear no. I should think milk would be the best thing for children.

7462. Do you find the bad effects of tea go beyond young children ?—I should not suggest tea at all for young children.

7463. I suppose the tea that people drink is boiled and kept until it gets very black ?—As a rule it is.

7464. What do these young children get in the more ignorant families ? If you went in and found a mother feeding a one year old baby, what would she be giving it ?—If she gives it tea it is wrong, but they do do it—tea, and bread and butter.

7465. Bread and butter would not be so bad, but do you find them giving them the remains of their tinned food and things they have themselves ?—Yes.

7466. We have had cases mentioned of quite little babies being fed on tinned lobster ?—That does not come within the reach of the very poor.

7467. Do not they get a very great deal of those tinned foods compared with what they did ? That does not strike you ?—No.

7468. Because we have heard it said that in some districts there is a great use of tinned foods, and what the parents do not eat themselves they give to these little tiny babies ?—The tinned foods do not come into the hands of the very poor—it is a luxury.

7469. What do they live on ?—Soup. We tried to encourage porridge, but they would not have it ; it is too much trouble.

7470. That would be an excellent thing, but then you want milk ?—Not necessarily milk.

7471. Is not milk as expensive as tinned foods in the same proportion ? If a man was too poor to get tinned food, would he be too poor to get much milk ?—No, milk would be within their reach much better than tinned food.

7472. Do you confine your remarks to people in the extreme of poverty, or people on fair wages ? What does the ordinary artisan's wife prepare for her daily meal ?—Tea and bread and butter for breakfast, potatoes and herrings, perhaps, for dinner, and tea and bread and butter for tea.

7473. (*Chairman.*) Herrings are a very good food, are they not ?—Yes.

7474. (*Mr. Lindsell.*) Do they have meat ?—Yes.

7475. You are not much impressed with regard to tinned foods ; you do not think they are used to any great extent ?—No, I should think they would be very harmful indeed. If I saw it I would object to it very much.

7476. It has been given to us as a reason why a knowledge of domestic cooking has gone out among the working classes that they can get those tinned things so much cheaper than they used to, and they give them so much less trouble to cook ?—I do not find so much of that, but I and other things, fried fish, for instance, and chipped potatoes, and that kind of thing. Those are to be got very cheaply, and some people fly to them. It is very wrong, of course.

7477. But they are not in themselves injurious ?—Oh yes, fried fish would be injurious to young children.

7478. The small children do get fried fish ?—Yes, stale bacon, stale fish ; they have plenty of cheap fish in Ancoats.

7479. At a very early age ?—Yes.

7480. Your efforts are mainly directed to inducing the mothers to substitute for these, things which are really good for babies ?—Yes.

7481. And you think that you succeed in impressing the mothers ?—Yes. They are very ready to learn, most of them.

7482. And they not only learn but put into practice what they learn ?—Yes ; it is ignorance on their part if they get the wrong thing. If you tell them one thing will be better for them and for the children they are most willing to take it up.

7483. (*Mr. Struthers.*) At what age do they begin to get that fried fish ?—Perhaps six months. They put it into their mouths at six months old ; I have seen that done.

7484. Of course the baby does not eat it, but merely plays with it ?—No, they sometimes eat it.

7485. When do they begin to give babies tea ?—This is the thing we object to. They begin perhaps from five to six months old. Of course we know it is wrong but they do it.

7486. It is tea very much diluted, I suppose ?—It is the tea they are having at the table.

7487. At what age would you permit tea being given to children ?—I object to them giving them anything but milk until the child is eight or nine months old.

7488. Would you give children of three, four and five tea ?—I would not.

7489. You do not think it is desirable ?—Skimmed milk would be much better.

7490. Would you allow these children fried fish and so on at four and five years of age ?—No.

7491. Milk still ?—Yes.

7492. Nothing else ?—Oh no—soups and oatmeal porridge.

7493. You told me that they do make soup a good deal in these houses ?—The very ignorant do not know how, but we show them.

7494. They do make a good deal of it ?—Yes, they do.

7495. You said that they do not make so much porridge because it takes a long time to cook ?—Yes.

7496. Does it not take long to cook soup ?—The very ignorant do not know how—it applies to both.

7497. But of the two, when they are prepared to take some instruction, why is it that they take to the soup rather than to the porridge ?—It comes in with the mid-day meal.

7498. By soup you mean something like mutton broth ?—Yes, green pea soup.

7499. Made with stock ?—Yes.

7500. In which they put in all the odds and ends that they collect during the week ?—Yes.

7501. It is really economical ?—Yes. We have brought a lot of those about ourselves. It is not nearly so general as we should like it to be, but it is on the increase. There has been a great prejudice against soups.

7502. The sort of thing I am describing is the *pot-au-feu* of the French peasant—it is kept on the fire practically year in and year out, and is enriched with all the odds and ends of meat they can get. What range of wages would exist in your district ?—They are mostly labourers earning from 16s. to 25s. a week. Some are a little better than that—some have 30s.

7503. Would the bulk of them get £1 on the average ?—About an average of £1 a week I should think.

7504. Taking labourers of £1 a week whose houses have been visited by you and so on, I suppose they send their

Mrs.
Bostock.

children to school in the morning with a good meal?—No not a very good meal.

7505. What sort of meal do they give them?—Tea, and bread and butter.

7506. But they do get that?—Yes.

7507. Plenty of bread and butter?—Yes.

7508. I mean it is not so much stinting them as not knowing what to give them?—Yes.

7509. At 20s. a week they could afford to give them a little more?—Yes, porridge.

7510. Without milk?—With milk or treacle.

7511. Or syrup?—Yes.

7512. Treacle, I think, is not much appreciated by children as a rule?—It is golden syrup I am speaking of. That is what I call treacle.

7513. Do you think there are many children sent out in your district without this meal of tea and bread and butter?—No, I do not find there are many who are sent out without something.

7514. It is rare?—Very rare. If a child goes without, I think it is because the child has no appetite, and the mother does not insist.

7515. You do not have in Manchester what we have been told of in other places, children being sent out with nothing or with things like boiled turnips, and so on?—Oh, no.

7516. Do you think the girls or those women of whom you speak, who have been to the board schools and so on, make any use of the knowledge of cooking they have acquired at the board school?—Yes, I think they do.

7517. You think it has some influence?—Yes.

7518. They try to cook the dishes in the home which they had been taught in the schools?—In the very poor houses they cannot carry it into practice, because they have not the utensils.

7519. Do they cook at all in those houses?—Yes, they do a little.

7520. What sort of utensils do they lack?—They only have one pan when they should have two or three, and they have to make the best use of the one pan.

7521. They could use it for a good many things if they only cleaned it. The using of two or three dishes in the cooking class may be a necessary thing in order to get through a certain amount of work in the time, but they might do with the one vessel, because they could clean it in between: is not that so?—No, the thing would not come out the same.

7522. Do you find them make some use of the knowledge of cooking which they acquire in their homes?—Yes.

7523. Do you get the mothers interested in it?—Yes, it is surprising to see a big girl teaching the mother how to make things, but it is done sometimes.

7524. (*Colonel Fox.*) You said you attach great importance to the leaflets which you distribute, but that you

took the precaution to explain those leaflets, such as the one on "Hints to Mothers," how to feed their children, and how to look after them?—Yes.

7525. But notwithstanding all that, you visit the mothers before they are going to have their children?—Sometimes.

7526. You make it your business to do that so as to prepare them?—Yes.

7527. As much as you can you visit them before they have their baby?—Yes, as much as possible.

7528. Notwithstanding all this you find them giving them tea and bacon when you arrive there?—Occasionally they are.

7529. That rather points to the fact that the leaflets are not of themselves useful?—That does not apply to cooking, but what would be given to the baby.

7530. But if they give them tea, it shows the leaflet is not of very great value?—I am speaking now of meeting a case for the first time; perhaps. If we gave them our leaflets and told the mother what she has got to do, that is done away with at once.

7531. Do you not generally go with a leaflet before they have a baby, and explain the whole thing?—Not always

7532. You find the leaflet is of real use?—Yes.

7533. (*Chairman.*) One important thing is the provision of a sufficient quantity of sleep for the children: do you instil the importance of that upon the parents?—Yes.

7534. I suppose the conditions under which they live make it somewhat difficult to secure the children having sufficient sleep?—That is so, sometimes.

7535. Is it not frequently so?—Arrangements can be made whereby a baby could be made comfortable.

7536. I am speaking of the younger children, where there are four or five in a single or two-roomed tenement: in that case it is difficult to secure young children getting sufficient sleep?—Yes.

7537. You attach great importance to that in the development of the young?—Yes.

7538. Particularly when they have come to school age and use their brains?—Yes. The children can be put to bed early at night.

7539. But if there is a great din going on, do they sleep well?—I think so.

7540. (*Dr. Tatham.*) Have you any more of those pamphlets. (*A document was handed to Dr. Tatham.*)

7541. (*Colonel Fox.*) Do you find that the poorer classes cook their own food, or do they buy it outside?—With regard to the very ignorant, of course, if there is a cook-shop within an easy distance, they save themselves the trouble.

7542. It is not because they get it cheaper, but to save themselves the trouble that they buy it outside?—Yes.

7543. (*Colonel Onslow.*) I suppose there are not always medical men to attend to the women in cases of childbirth?—Sometimes there are.

FOURTEENTH DAY.

Wednesday, 2nd March, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Miss EVES, called ; and Examined.

Miss Eves. 7544. (*Chairman.*) May I ask you to explain what the Maurice Hostel is with which you are connected. I understand that it is purely a charitable organisation ?—Yes, it is what is called a Settlement.

7545. Is it of a religious character ?—Yes, it is religious ; that is to say, we are all Church of England. We do chiefly social work.

7546. Is this day nursery for infants one of the principal branches ?—Yes, that is one of our branches of work.

7547. How long has that been in existence ?—About five years.

7548. I suppose it was started with a view to correct the evil of parental ignorance ?—We started it for thoroughly practical reasons. We found that a great many mothers had to go out to work, and we had reason to believe that the children were badly looked after. When it was first started I really knew very little about it.

7549. Is there much factory work in the neighbourhood ?—Yes. We are close to the City area, and an enormous number of women go out to work in City factories.

7550. Married women ?—Yes, a very large proportion of them—nearly all. The reason, of course, is that their husbands are largely unskilled labourers. We have an enormous number of carters in the neighbourhood ; Pickford is quite close to us. These men earn very low wages and they have a very weak Union, and, in consequence, women have to turn out to earn money.

7551. And that leaves the children unattended ?—They send them to old women, who charge 2s. 6d. a week, and use the money chiefly for their own ends. I have had children brought to the Nursery practically, one may say, half-starved, without exaggeration.

7552. Do these women come to the children's homes ?—No, they take them to their own houses and then, of course, chiefly use the money for their own living and do not feed the children sufficiently.

7553. Are not the children fed in their own houses first ?—Yes, they are fed to begin with.

7554. Do they get any food in the evening ?—I suppose so. I am speaking of very young children, children at the breast—children up to the age of two years.

7555. What is the average wage that the men receive ?—I could not state that straight off ; it is rather a large order to give the average wage for such a varied population ; but I should say for unskilled labourers, the men I am specially dealing with, the average wage would be about 22s. a week.

7556. What addition to the family resources does the labour of the women provide ?—Some of them would earn from 12s. to 14s. a week, but a great many of them would only earn from 6s. to 8s.

7557. You realise that no improvement can be brought about by an addition to the wages of this kind of labourer ?—I do not think it is in practical politics at present.

7558. (*Colonel Fox.*) What does the woman who takes charge of the children get ?—About 2s. 6d. a week. That

s about the average price they pay. Some of them might get a little more and some a little less, but that is about the average.

7559. (*Chairman.*) You regard this expedient as a palliative for the evil ?—Yes, I do. I think it is very wrong to let those children grow up in a bad state of health. Those that die are the most lucky, because they are dead and done for, but it is those who just manage to keep alive that are in a sad state, because they grow up handicapped for ever after.

7560. Are there any crèches in existence besides those of this character ?—Yes, there are a great many run by charitable people.

7561. There are none run as a commercial investment ?—No, you would lose money by it. If you look at the end of my *precis* you will see that point mentioned. I have been very careful of finance in my crèche, and I find I have been more successful than others in doing it cheaply, but yet I cannot get more than half or two-thirds of the expenditure returned. To give these children sufficient care means fairly skilled labour. Then you want a lot of milk, and milk is always a dear food.

7562. You would propose that the local authority should take the matter up ?—Yes. I look at it from the educational point of view ; I think we need centres of instruction for the women.

7563. That is rather a different matter, is it not ; we are talking about the crèches now ?—I want crèches to be educational. The present crèches are just run anyhow. They ought to be registered and supervised.

7564. You do not think that the municipal authority has power to do that now ?—I do not know what their powers are. I think they have money to spend, and they have practically the power to spend money on it if they choose. I should think so.

7565. Under what particular provision of the law ?—At St. Pancras they have thought about having one. I believe that they have quite the power to do it. I think it comes under the sanitary expenditure.

7566. (*Colonel Fox.*) Two-thirds of the expenses are paid for by the mothers, you say ?—About two-thirds ; it varies a little. This year has been a bad year, and many fathers and mothers have only paid half, because they have been so poor ; but for the last four years they have paid two-thirds. That is not including rent. I must leave that out, because I use my rooms for various purposes, and I cannot separate the amount of rent to each of those purposes.

7567. (*Chairman.*) I suppose it is the high rate of infant mortality which has to a large extent called your attention to this matter ?—Yes.

7568. You are sensible of the fact that there has been no diminution of that ?—No, it is rising.

7569. Not all over the country ? It is about the same, I think ?—I think it is rising.

7570. (*Colonel Fox.*) I think you said it was rather a fortunate thing that these children do die ?—I did not say

that. I said that those who die are the most fortunate of the lot, because the others who just manage to scrape through by the skin of their teeth suffer all their lives.

7571. (*Chairman.*) What do you hold to be the cause of this increased mortality?—I think it is due to the want of maternal care, owing to the mothers being obliged to go out to work; secondly, I think it is due to the fact that many of the mothers do not know how to feed them properly.

7572. It is just as well that the mothers should go out to work and that the children should be left in the hands of other people who do understand them?—I do not think we ought to look forward to that. I think we ought to look forward to the idea of educating the mother so that she will know how to mind her children and bring them up thoroughly well, as she ought to do.

7573. Will you explain how you would attempt to remove the evils which at present exist?—My present small suggestion is that existing crèches should be registered and supervised. These crèches should be used as educational centres for the girls and women of the district. I think they would be willing to learn.

7574. You refer in your précis to the attempts already made to remove this ignorance?—Those are the attempts already made which I consider insufficient.

7575. You admit that the School Board does do something to remove the ignorance?—Yes, it does.

7576. But you do not think it is adequate?—No, it is too theoretical.

7577. Do not the County Council lecturers attempt to come closer to the problem?—Yes, they do. They are very good so far as they go, but you cannot teach people about a baby unless you have the baby there.

7578. Would you have County Council babies for the purpose of experiment?—No. They only send a peripatetic lecturer who talks very grandly on the other side of the table. There are no children there, and the mothers say "Oh, yes," and go away and there is an end of it.

7579. The information is divorced from practice?—Yes. I am an old science student and I worked for years in a laboratory, and I do not believe in teaching these things unless you have the things there to show.

7580. Would you explain how you think it should be done?—I do not know that I am prepared to do that altogether. I think the existing crèches should be taken over or new ones should be established to be regarded as technical schools for the training of mothers.

7581. You think that under the Technical Instruction Act it would be possible for the local authority to devote funds at their disposal to such an object?—Yes; it is a branch of domestic economy. It is very domestic and very economical.

7582. And in very close touch with the actual practice?—I think that in connection with these crèches you would often get voluntary workers like myself who have had clubs of girls, to induce their girls to go, say, once a week or twice a week to get instruction.

7583. You have girls in connection with this hostel?—Yes; I run a large girls' club.

7584. Girls between school age and adolescence?—Yes; some of my girls are about twenty-seven or twenty-eight years of age.

7585. Young women?—Yes. I do not take any girl in under twelve.

7586. Is it a club for social and recreative purposes?—Yes, and for instruction when one can get them to learn anything; but they are not very fond of learning.

7587. Do they attend fairly regularly?—Yes; one large club of girls come every day. They come during their dinner hour. I have got a very inadequate plant. If I had a sufficiently good institute I should be able to get many more girls.

7588. It is all in connection with the hostel?—Yes.

7589. Has it unlimited funds at its disposal?—No. I wish it had.

7590. Are its resources all drawn from the contributions of the benevolent?—Yes. We shall want about £2,000 to build our club house.

7591. What sort of income do you dispose of?—When

I once get my plant and material my schemes run themselves very largely. My crèche pays two-thirds of the expense, and the large girls' club pays its own way. That does not include the rent.

7592. Have you any fixed income?—No; it is not fixed I am afraid. We reckon on about £500 a year coming in.

7593. You can always obtain what you want for capital expenditure?—I do not know that we can. We always have done so, so far. I cut my coat according to my cloth; I get as much cloth as I can, and then I cut my coat according to it.

7594. What capital expenditure have you from year to year?—We have been in existence about six years, and we have been going on increasing and increasing.

7595. What is the capital expenditure in those years?—I cannot tell you straight away. I think last year we spent about £500. We get about £500 and spend it.

7596. Is that the annual capital expenditure?—I should think so.

7597. And £500 income too. Could you get the assistance you require to teach the mothers?—Oh, yes; I can get that from the London County Council. I have done that before. I get their lecturers to come down and they teach. I give them the room and find the audience, and they do the teaching. That is not sufficient, because I get women who say that they know a great deal better than the lecturer. I want proper instruction and practical illustrations for the young women and girls.

7598. Before they become mothers?—Yes, older girls. I think it would be very interesting if you could have children there. They are very fond of children. But if you give them a lot of "talky-talk" without anything to show for it they do not care about it.

7599. What opinion have you formed as to the results of a scheme of policy of this kind?—I believe myself it will be a tremendous success, because I have found the mothers anxious to learn, the small number that I have had to deal with, and the girls are very fond of children and very interested in anything practical. I think if you had an attractive course of lessons and had the babies there to show them how to wash, dress and feed them, the girls would come and be interested in it.

7600. Would not the baby suffer in the process of being experimentally treated?—No, I think they would not. You see, it would be all done under supervision. The babies cannot be worse off than they are.

7601. You think a large saving of life would ensue?—Yes, I do.

7602. And you further hope that a certain number of girls might be trained in this way to act as nurses?—That is the business side of the thing. I thought I might kill two birds with one stone.

7603. That might be incidentally a very useful thing?—I am hoping to arrange that in my crèche; I am hoping to get one of the local authorities to send their girls to be trained.

7604. You regard the whole of this as technical instruction for mothers in domestic economy?—I think one must have money, I think that it might be done in connection with the domestic economy schools of our technical institutes.

7605. In that sense you will be able to municipalise the scheme of education which you have in view?—I think so, and get it done all over London.

7606. I suppose the present municipal organisation of London is more favourable to action of that sort than the old vestry?—I think perhaps it may be.

7607. Would you make the parents pay as much as they can?—Yes, I should make them pay. I think it is extremely necessary to inquire in every case as to whether there is real need for the child to be admitted to the crèche. I find myself that some of the mothers are not at all fond of leaving their children with me. I was told that I should be encouraging the mothers to go away from their homes, but I have not found that. I do not think you want a lovely crèche and let any mother pop her baby down there. Inquiries must be made, and

Miss Eves.

Miss Eves.

it must be ascertained whether the wages of the mother are really needed as a supplement to the father's earning power. I think the ideal home is where the father earns the money and the mother spends it. This is not to be a sort of Foundling Home. I am not advocating that we should have these model nurseries and any papa's child be dumped there as long as he chooses.

7608. Do you not think that almost the whole cost might be obtained?—No; I do not.

7609. Surely if the father is earning 22s. a week, and the mother 8s., making 30s. a week, it could be done?—There is the rent, you see.

7610. What is the cost of the child in a crèche of this sort?—I am afraid I could not answer that straight away.

7611. Surely from your experience you must have some notion?—I make the parents pay 4d. and they generally pay two-thirds of the cost. I take them for five days, so they cost me 2s. 6d. a week perhaps.

7612. And they pay 1s. 8d.?—They pay 1s. 8d.

7613. I do not see why you should not take from them as much as the old women do?—They could not pay.

7614. If they pay the old women why should not they pay you?—I do not know about that.

7615. That is the figure you start with. They pay these women 2s. 6d. and the children get horribly neglected. surely it would pay them better to give you the 2s. 6d.?—Yes. I do not think I have thought sufficiently of that. I get a different class of children. I find many of my children are very poor.

7616. Have you any knowledge of the rent these parents are paying?—I could tell you roughly. I do not think anyone could get one room in our part of the world in Hoxton for less than 5s. 6d.

7617. Are these all one-room tenements?—Not all of them; a great many of them are. Most of them have two rooms.

7618. What size is the family?—They vary, but most of them have four or five children and some have more.

7619. That is six or seven people in two rooms?—Yes. Of course some of them have more children; a great many of them have eight or nine children.

7620. Surely you regard that crowding as very prejudicial to health?—It is very bad, but what can they do? There is not enough room.

7621. That is no reason why they should be allowed to depress the standard of living and debilitate the rising generation?—No, there is a great deal being done; the London County Council has made great improvements in our part of the world in providing better tenements and so on, but even now that is the state of things.

7622. What do you think would be the effect supposing the London County Council or any other local authority were to announce that after a given date no single room tenement should be allowed to be occupied by more than two persons, and no two-roomed tenement by more than four, and no three-roomed tenement by more than six?—I doubt if you could practically enforce it. You would want a large army of bailiffs to put them in the street.

7623. You would give them notice?—I suppose they would be forced to go away somewhere, but enormous hardship would be inflicted.

7624. For the moment, but that must necessarily be the case with every great step towards the amelioration of the condition under which people live?—I do not think we can do that with any justice unless we provide the people with some shelter. At the present time they cannot get any place to go to.

7625. No doubt the local authority who displaces them would have to provide in the first place for such as were willing to pay municipal rents, whatever they may be?—Certainly, but some of my people could not pay municipal rents. They could not pay more than 5s. 6d.

7626. Do not the County Council provide any others?—No, not in our part of the world. There are new ones in Clerkenwell at 5s. 6d., and I am going to see what number of rooms they let them have. I expect they let them have a good sized room and a little slip of a room,

for that money. But the ground is too valuable. Nobody ought to live there who is earning 30s. a week. They ought to live at Enfield. They want a lot more trams, or balloons to carry them through the air, or something of that kind.

7627. (*Dr. Tatham.*) I understood you to say that the London County Council are doing a great and very useful work by substituting new dwellings for the poor in place of the wretched hovels in which they live?—Certainly.

7628. Is it your experience that when such wholesome dwellings are provided they actually come to be inhabited by the people whom you would wish to inhabit them, or are they inhabited by a better class?—I think I may say on the whole, they are inhabited by a better class in the areas I know, because the two areas I know rather well were inhabited by the lowest class of people—hawkers, receivers of stolen goods, thieves, and so on, and these people when turned out would not pay a higher rent; they scattered far and wide. We had an army of vestry employees and policemen, and skilled artisans come in and live in those delightful little dwellings.

7629. That seems to be a very common experience?—Yes, I think so.

7630. To that extent the scheme is a failure?—Certainly, in my view. The real difficulty, I think, is to provide a tenement for the rent they can pay. I once had a long talk with Mr. Alderman Thompson, who is rather well known at Richmond in connection with the housing scheme there. He is a builder himself, I believe. He has told me that nobody has yet been able to design a tenement for working class people at 5s. 6d. with ground rents what they are. If you tax ground rents it would be different.

7631. What number of babies can you accommodate in your crèche?—I do not believe in swarms; I am not going to have more than thirty children. My children are only from one month old to about four years old.

7632. What size is the building?—I could not give you the dimensions of the building, but I have two large rooms, I think twenty by twelve; they are now being built, and have just the roof on; they will be ready early in the spring.

7633. They are new buildings?—Yes. My present house is only a makeshift.

7634. For how many hours in the day do you keep the children?—From eight in the morning to eight at night, and that is really not quite long enough. I think I shall have to make it half-past seven, because so many women have to be at their work by eight o'clock.

7635. What staff have you?—At present I have two nurses who look after the children. They manage it pretty well. The little toddlers who are just old enough to go, I send to the infant school which is across the road. These children come to the nursery and have some milk and have a clean pinafore put on, and then they are sent away to the school, so that they are out of our way during school hours. Then they come back and have dinner, and sleep, and then go to school again, so that I clear some of my thirty children out of the way.

7636. I understand that your permanent staff consists of only two nurses?—Yes.

7637. Is that supplemented to any extent by the young women you spoke of training?—Not at all.

7638. You spoke of your intention in the future to train young girls about sixteen or seventeen in the nursing of children?—Yes, I cannot do that at present, because my building is not suitable for it.

7639. You hope to do it in the future?—Yes. I hope I shall be able to arrange that in the future. What I am hoping—though it is very much in the air at present—is that the technical institute will draft off two or three girls from their domestic economy school two or three days a week to be trained in looking after these children. It will be a small beginning.

7640. What diet do you provide for the children?—All kinds of things.

7641. At different ages?—Yes, milk, pudding, broth.

7642. But for very young children?—I always give

them cow's milk unless the doctor specially orders anything else. I do not believe in patent foods, but if anything special is ordered they have whatever the doctor orders them to have.

7643. Do you think, speaking generally, that the children of the very poor have much milk?—I am sure they do not.

7644. They practically do not have any?—They have nasty tinned stuff. The mother buys it, and puts it on a shelf in a stuffy room, and it gets full of bacteria, and the child is fed on this stuff. I believe it is the cause of a large number of deaths.

7645. Infantile diarrhoea?—All this reported consumption of the bowels, so common in young children, is simply due to the incursions of bacilli which their mothers have so diligently collected in this tinned milk.

7646. They substitute tinned milk for the other?—Yes; the other is much too dear. They cannot afford to buy cow's milk.

7647. Is the tinned milk much cheaper?—Yes. I find I have to use tinned milk; I have a large restaurant for young women, and I have to sell them tea and cocoa at a halfpenny for a very large cup, and I have to give them tinned milk. If I give them cow's milk I should lose. The price is 2½d. a tin.

7648. What is the price of cow's milk?—4d. a quart.

7649. Has the metropolitan borough council or the district council done anything?—No, they have not done anything.

7650. Not in the way of supply of milk?—No, they have not taken up the question of infant mortality at all. They are a splendid council and do a most excellent sanitary work, and are most prompt and so on, but in this particular department they have made no move at all.

7651. They do not undertake to supply sterilised milk in any form?—No, they do not.

7652. Nor to cheapen the milk supply?—No, they have not done anything at all.

7653. You know, of course, that milk can be supplied in large quantities for very much less than you would have to pay for it?—I suppose in very large quantities it could, but if you had to buy large quantities you would have the danger of your stock going bad.

7654. Assuming the County Council did it, they could supply it cheaply?—They would have to command a regular market to get rid of it. If it could be done, I think it would be a most excellent thing, because not only my infants but my other children suffer greatly from want of proper milk. They have tea given them to drink with very little milk in it.

7655. You think, if it were possible, that the proper way to treat the case is to send the children with their mothers outside the crowded districts of London?—I think if we could migrate the whole population it would be an advantage. The central part of London should be given over to bankers and money-makers. The poor ought to live where land is cheaper. It is uneconomical to take land which is worth an enormous sum in order to build houses for the poor, and run the thing and make money on it. It is uneconomical to make the unskilled labourer live there.

7656. It has been represented to us that the great difficulty with any scheme of that kind is that the very poorest of the people for whom you would provide are just those who must live near their work?—That is quite true.

7657. How would you get over that difficulty?—We shall have to have flying machines or something to get them to and fro cheaply.

7658. (*Mr. Lindsell.*) You said just now that you sent your children into the infant school?—Yes.

7659. At what age have you been doing that?—They have what they call a babies' room, and they take the children at some schools from three years old. I do not like mine to go out until they are four. I think three is rather too young for them to go, and sit in a row on forms all the time.

7660. You find it a good thing to send them there?—Yes, because I get them out of my way.

7661. You would not agree that infants are taken too

early into the elementary schools, and that they ought not to be taken before five?—I think it would be very much better if we could manage it that at a number of schools these babies should be treated like babies. I do not think that little babies of three and four years old ought to learn; they ought to run about and wave their arms and legs. We ought to have nurseries for them and not schools.

7662. Yours is a nursery?—Yes. There are a large number of children sometimes in my babies' rooms. In the schools where I am manager there are perhaps sixty tiny mites with one young woman to mind them. She is obliged to make them keep still or she could not manage them. It is very bad for them.

7663. But that is why so many people are strongly opposed to this attempt to take very young children into schools, because you cannot avoid that sort of thing?—You have to choose the lesser of two evils—you must remember what these babies would have if they were at home. It means really that these children's mothers are very busy people; they are either out at work or working for the home, and the children run into the passages and into the streets, and so on.

7664. Some people say that is rather better for them?—I am not sure that it is not, but there are risks. I know one small boy who had both his legs cut off and another who had one leg taken off. You cannot have these little tiny mites running about with no one to look after them.

7665. On the whole you think it is better they should be in school?—Yes, but I think it is bad. It is the best of a bad job I think.

7666. You need not send yours to the school at all?—I send mine to the school to get rid of them.

7667. That is what the mothers do?—I take the line of least resistance. These mothers beseech me to take their children, because they must earn money, and in my present house I have not room. I do not like all my children to live there all day; they do not have enough cubic air space, and I send some of them to the infant school and that clears out my room for four hours a day.

7668. Is your crèche examined by any local authority?—None of these crèches are bound to be examined. That is one of the things I wish to emphasise. We none of us ought to be allowed to do what we like. I had a friendly visit from the London County Council inspector—I think he looks after babies who are sent out to women to mind. When he came to see me he said, "I have no right here, but would you mind me looking round?" and he looked round.

7669. Is there no public authority which can see that there is no overcrowding?—Absolutely none. I think it is a great evil.

7670. But they could do it, surely?—I do not think they have any power. I think they have power to inspect if the babies sleep there but not if they do not, because I had an inspector come to see me about three years ago. He said, "I want to inspect your crèche," but when I explained that the babies only came every day, and did not sleep there at night, he said "It is no concern of mine," and went away.

7671. Your idea is that a crèche on similar lines to the one you are running should be established in the industrial areas by the local authorities?—Yes.

7672. Public crèches?—I think we want to teach and educate the mothers. We must look forward to that.

7673. Your first proposal is that these crèches should be established?—As educational centres.

7674. By the municipality?—Yes.

7675. Primarily for the benefit of the children and babies, and then we come to the educational points afterwards?—I think it might be so, but in my mind the other point comes first.

7676-80. You would simply use the babies as part of the school apparatus?—Yes.

Miss Eves.

7681. Your main object is to have them as object lessons?—My chief aim is to form the ideal mother. I do not think that the mother ought to go on in her old way. As she is, she is very unideal. I want these crèches formed primarily to produce the ideal mother.

7682. You put the educational value of it above the philanthropic?—Yes, if you like to use the terms in that way.

7683. You rather consider the establishment of these public crèches as an educational means of improving future mothers?—Yes.

7684. Not primarily for the benefit of the little babies themselves?—I think we shall do much for the babies. If we could make all the mothers better, if we could have a little centre of light to instruct the mothers, they would tell one another; the knowledge will spread, and in time we shall have every mother know how to treat her children, and we shall not want crèches.

7685. Are they to be established as part of the educational functions of the municipality?—Yes.

7686-7. Or of the ordinary municipal functions?—No, educational. I think it ought to be a branch of the domestic economy school, just as you provide a school of plumbing. We have an enormous apparatus for teaching boys carpentering and furniture making. In Shore-ditch there is a great deal of furniture making. In the same way we should teach the mother how to treat her baby. I should call it technical instruction. I should compel all the girls to have a year's training in the care of children. They nearly all marry and have children, and they ought to know how to treat them.

7688. At what age would you begin to teach the girls?—I think it would be very good for them to go two or three evenings a week at the age of fourteen.

7689. After leaving school?—After leaving school.

7690. You would not treat it as part of the elementary course?—No, because I think you want all those early years to improve their general intelligence. You do not want to begin teaching the girls rules of thumb before their minds have grown.

7691-2. They are taught household management in the elementary school?—Yes, I know.

7693. (*Chairman.*) Of a very elementary kind?—Yes. This is a special kind of thing. I think they want special training for the children.

7694. (*Mr. Lindsell.*) When is a girl old enough to get profitable knowledge? Would not you allow children of the elementary schools in?—There are a great many difficulties there. The number of the children would be very great. You could not have fifty or sixty girls going for your babies. You will have to be content to train a few and trust that they will train the others. Light always spreads in a way. If we could get a small nucleus of sensible, well-educated mothers they would teach their daughters. I think we shall have to be content to go very slowly. We ought to begin with the more intelligent girls to go to domestic economy classes.

7695. You would not teach the elementary school girl—you would start at fourteen?—I think so.

7696. And at that age the girl, if she wishes to improve herself, can go to an evening continuation school?—Yes, but very few of them do; we must make it compulsory for them to go.

7697. You are in favour of continuing compulsory education?—Certainly; from fourteen to sixteen, in the evening schools. I would not let anybody loose until they are sixteen.

7698. It is very good for them to come into practical contact with the concerns of life, but it would not hurt those girls or boys to go two or three nights a week to continuation schools?—That is so.

7699. The girl being obliged for two years longer to continue her educational career. You would make part of this compulsory education the management of the babies?—I should.

7700. As a separate branch altogether from household

management?—Yes, because, you see, domestic economy now practically ignores these poor infants. In the domestic economy classes they tell the children all about puddings, but not about children—or practically nothing. The emphasis is put in the wrong place, I think.

7701. Would you make this compulsory for all girls?—I should like to know that every girl went.

7702. But a difficulty would come in there: could you furnish sufficient in the way of babies?—I do not think it would be possible to teach the whole lot. I think if you make it compulsory you will have to adopt some modified plan.

7703. You would have to select certain girls?—You might have a number of practical lessons on Saturdays, or something of that kind. It would need carefully thinking out. Most of these girls are at work in the week, but they have half day Saturday off.

7704. Do you think the girls would like their Saturday half holidays to be made compulsorily educational?—No, they would not like it, but it would not be every Saturday. A great deal of valuable instruction could be given in an intelligent way, and they might have a certain number of practical lessons on fixed days. I do not think you can deal with the whole thing at one bite; you will have to nibble at the difficulties. I do not think we should be able to teach the whole mass of the people in our elementary schools, but I think you will get a large number of girls and young women, from sixteen to twenty-seven or twenty-eight, to take an intelligent interest in it.

7705. You said the compulsory age would be fourteen to sixteen, and now you wish to continue it from sixteen to twenty-eight?—Of a voluntary kind. I think if we had these centres established we should get a much larger number of young women to attend those classes voluntarily.

7706. Should not we get rather more students than babies if you had all the girls from fourteen to sixteen?—I am afraid I have not made myself quite clear. I do not think that you can teach all the children at the elementary schools; at the same time I do think that it would be very much better than the present state of things to have the children from fourteen to sixteen and teach them infant hygiene. In addition to that we must have a voluntary system of getting young women and young mothers, women who have already got infants, to go to these model crèches and learn; and I believe they would come in large numbers. We should not get the whole population, but even if you can get a few that is a great thing.

7707. You might select some of the young girls, who announce their intention of being married, and say that they had better come and attend a course?—Yes. I think when I have my model nursery, I shall say to some of my girls, when they tell me that they are engaged—I generally hear of it—"Well, now, you had better come here and attend a course and learn about babies. You will very likely have some of your own, and you had better get information beforehand." I think they will come. I do not think the public authorities or Committees can do that work. I think it must be done by somebody who knows these girls in other relations of life. I think these girls would not go to anybody else, but I do think they would come to me.

7708. How is the expense of this instruction to be met: do you propose that a proportion of the grant earned by the continuation schools, which the girl or young woman is attending, should be paid in the way of fees to the crèche?—No, I do not. I think that girls at sixteen—I call them adults over sixteen—ought to be taught by the Technical Education Board money—the whiskey money—because that is after school age.

7709. It would not matter where the money was derived from, if it was from the educational fund of the authority. These girls would earn a grant for domestic economy, or whatever it is, which they are learning in these continuation schools, and this instruction would be part of that course?—You mean girls from fourteen to sixteen?

7710. They may be older; it is not limited to that. You are going to make it compulsory to that age?—It does not make any difference where the money comes from, but it is a very important question for the powers

to consider. I was thinking that from sixteen years onwards, they would receive the grants from the funds which are now used for technical education, which is not the same.

7711. It all goes into the same fund ?—It is not the same as the school rate.

7712. You would have it come out of the funds at the disposal of the educational authority ?—Yes. I do not think the local rate ought to be used for instructing girls from sixteen years onwards.

7713. If it is made part of higher education, technical instruction, the Act of Parliament provides that the council can raise rates for that purpose ?—That would be a special rate for that special purpose ?

7714. They raise the rate generally for secondary education ?—Yes, I see ; that is my point.

7715. They have the whiskey money, and they have the grant, but it has to be supplemented by a rate ; and if these crèches are run as educational centres by the educational authority, they will have to be supported out of the school fund, however that fund is made up ?—Yes.

7716. If they cost a considerable sum, it would necessarily, indirectly, increase the rate ?—Of course, you cannot have these things without paying for them, but it would pay us in the end, because we should not have all these children killed—they ought to grow up and do work for the nation. They die in their hundreds at present.

7717. Your idea is that this would form part of the educational system of the local authority ?—Yes.

7718. And they should pay for it, just as much as they pay for manual instruction ?—Yes. My justification for that is that I consider that feminine technical education is at present rather neglected. I think the education of young women in the care of an infant is strictly technical education.

7719. You think it is as important to teach her that, as to cook her husband's dinner ?—Certainly I do. She should be put on a level with her brother who has to make his living by carpentering and furniture making. He is provided with a splendid laboratory for his business, and I should provide the girls with a laboratory for the mother's business. She has a right to it. It is wicked to let these women kill their children. I have known these women to be most sorry at the death of their children, and yet they killed them from utter ignorance. You have no idea of what they give these children to eat, simply from kindness of heart.

7720. You run very closely into the other question, that of teaching future mothers the proper food to give their children, and so on ?—Yes.

7721. Is there anything of the sort attempted at present ?—It is all done in a scrappy sort of way. It wants systematising. I do it in a small way.

7722. Do you see the instruction given in the evening schools ?—I have looked through the syllabus.

7723. On hygiene and household management ?—Yes, but I have never heard the lessons. The case of infants is just inserted as a sort of by-question.

7724. You are not prepared to give a criticism of it as compared with your plan ?—My criticism, as an old science student, is that I do not believe in teaching about things unless you have the things there. I think to give these ignorant girls a lot of talk, with very often rather difficult words about bottles and nitrogen and proteids, and so on, and not to show them the child and the bottle and how to deal with the matter properly, is absurd.

7725. You think instruction in all these subjects, at present, is too theoretical, and not practical enough ?—Yes.

7726. Whether cookery or household management ?—I think the cookery is good. I think they do the cookery well ; I think they have excellent arrangements.

7727. We have had it rather severely criticised ; you are inclined to think it is all right ?—I am not a great cook ; I do not know whether they turn out the things as they should do, but it has always seemed to me very

practical. I know girls have to have saucepans, and pots and things, and they have to clean them, and they have to make things, and it seemed to me to be very practical and to the point.

7728. You think it has a great influence on their future homes ?—I think so.

7729. You would not condemn it so utterly as some people ?—No, but I am not an expert in cooking.

7730. You would cause fees to be paid ?—Yes, I should.

7731. Both by the student and by the parent who sends the baby ?—I do not mean by the student ; I thought you meant the parents. I should never have anybody's child free.

7732. If you treat the child as a piece of apparatus you might have to hire it—you might have to actually pay the parents ?—These children will be much better treated as my apparatus than they are at present by their mothers.

7733. But supposing you cannot get enough material ?—You will get heaps.

7734. You might have to go to the parents and say : "What will you let me have a baby for ?"—No ; then I should stop the whole thing. That would never do.

7735. (*Mr. Legge.*) I think your suggestions have been extremely valuable, but I want to plead with you for the girls under fourteen. If you want to make a start, is it not well to take advantage of the existing provisions of the existing law as to compulsory attendance ?—I think you will see I say that. If they give these classes in school it is much better than nothing.

7736. But I gathered from what you said to Mr. Lindsell that you would not let your girls of under fourteen handle your infants ?—My reason is that there is such an enormous number of them. In most day schools or board schools there are fifty or sixty children in the class. I cannot as an educationalist—I have taught, myself, for years in the high school—conceive of any possible way by which I can get fifty or sixty small girls to handle babies.

7737. Do you call the average girl of over thirteen a small girl ?—There are fifty or sixty of them—small or great does not matter.

7738. There are fifty or sixty of them ; but do you suppose they would all be available ?—No, I do not ; I do not think you could work it ; the practical difficulties would be too great. The children of the school at twelve or thirteen must have lessons on the more or less theoretical part of their duties, but I think when they come to be sixteen you can get them into smaller classes. They will not all want teaching. Some of them have good mothers and could learn at home.

7739. It seems to me that you will get them in extremely small classes—almost a matter of individuals ?—When I had a course of lectures from the London County Council on Infant Hygiene, I think there were twenty in constant attendance.

7740. You say you want compulsion ?—Yes, in the evening continuation schools.

7741. It will take you some time to get that ; in the meantime why not get such girls as desire it—whose mothers desire it—from the ordinary elementary schools to attend so many evenings a week after the age of thirteen ? I may point out that such girls are much more likely to take up your scheme later on, when they leave school, having had an initiation ?—I think it would be valuable. I should try all ways.

7742. You would not object to selected girls of thirteen ?—No ; I should welcome any attempt to enlighten ignorance with girls of under thirteen or over.

7743. You speak of girls from schools going to your crèches. What do you say to your crèches going to the schools and having them actually in connection with certain schools associated with the infant department ?—I think as your girls leave school they go away in small numbers, and in any particular school there are eight or ten girls leaving at the same time ; I should take those girls and carry on their education in this particular direction.

Miss Eves.

*Miss Evcs.*³ 7744. Do you object to having a babies' room, which is found in many a Board School?—I mean by baby an infant from one month onwards.

7745. Why not have a baby's room supplemented by a crèche?—I think it would end in that. My view is that the infants' crèche would be much more practically and easily worked if in connection with a domestic economy school and not with a day school. I think the building and so on would be easily managed and the necessary requisites more provided.

7746. There has been a talk recently of municipal milk depots for the poorer parts of the big towns. That would be a good place to have your crèche in connection with?—Yes, very good.

7747. The two might be run together?—It would be better to put your milk dépôt with your technical school; you have existing plant there—warming apparatus and pipes and things. You would not build an entirely new building, because that would cost far more.

7748. You said you do not desire very lovely crèches, fancy places, to which parents would be only too glad to send their children. But do not you think that if you handed it over to the municipality that is almost bound to result?—You have to look after these authorities of course. They like to have everything just exactly right. I think you should have some intelligent woman of practical experience to look after these things.

7749. Some say that it is the ladies, looking after cookery centres and so on, who desire to have children taught cookery such as would be found in their own private houses, and not in artisans' homes?—I do not know about that. I am afraid I do not know much about cookery, but I do not think that need be an insuperable objection. I think we could have practical people who realise that these little children come from poor homes and have to live there and that you do not want to provide them with fancy things.

7750. Could you give us any idea of the sort of practical woman you mean?—Myself.

7751. Not ladies living in the West End?—Certainly not.

7752. Not necessarily such highly educated ones as used to go on School Boards?—No; I think it is very necessary, in all these matters affecting the lives of the poor, that one should really know exactly how they live, and realise the condition of things, or else I think you do indulge in fancy expedients and fads.

7753. Would you have a selection of ladies for playing the part—would you like to enact some sort of sumptuary law?—I think we should find the right woman in every way. I think in our nurses staff, that a great many of our nurses would specialise in infant hygiene.

7754. (*Colonel Onslow.*) I imagine the most suitable person to instruct would be, say, the wife or widow of a labourer?—Not unless she was very intelligent. I think we must have somebody a little better than that. We shall have to produce a staff of teachers.

7755. Take one of that class?—I think we must aim at the sort of woman who now becomes a foster-mother for cottage homes in the workhouse—a nice, kind, practical, woman.

7756. I mean a woman of rather an upper class. In the country you would find a large number of what might be called comfortable women?—Yes.

7757. Who have got better ideas about life than the very poorest women would have; she would be more suitable than the person who had been brought up to a higher state of things, would she not?—I think so. I do not think you want a full-blown lady; I think you want a clean, sensible woman, well instructed in practical matters, superior to the working woman.

7758. Who would realise and understand exactly what class of cookery and what class of work was required in a respectable labourer's house?—I am talking about the care of children.

7759. It is exactly the same with regard to the care of children—what is required and what is possible to be done in a respectable labourer's cottage?—Yes, I think so. I want the thing to be thoroughly practical. I do

not think that we want a lot of fine ladies running wild with their fads.

7760. The danger is that their ideal is too high?—Not if it is an ideal, but you have to consider the ideal for a working class home. I do not think that that ideal working class home is the same as the ideal better class home. My babies have very comfortable beds, but I have them made of sea weed; the nurses make them for them. Sea weed is put into a piece of tick and changed every week. If they were nice children they would have horsehair mattresses.

7761. You do not want a person who has got very high ideas?—I do not think we want the thing run as a fad.

7762. Have you heard that in some places, especially in Manchester, they have a society called the Ladies' Health Society?—I have heard of it. Some friends of mine belonged to it.

7763. The women visit the homes, especially when they hear of a birth, but they also do a great deal in the way of distributing pamphlets?—Yes, and teaching them practically. I think that would be admirable, but in London the working class people are very independent. I do not think that a voluntary visitor would be let in. I think these people would have to have the badge of the County Council or some public body, so that the people would know them.

7764. Is the fact of wearing a special dress like your own, for instance, like that of a Sister of Charity, a help?—I think it is a help. You must understand that I am not generalising about the whole of London, but I do not think that my Hoxton mothers would let a lady in if she said: "I hear that you have got a baby and I want to teach you about it."

7765. You must go tactfully at first and get well-known?—Yes; you see the visitor would have had an opportunity of getting to know these women in other relations. Country people are different from Londoners. I have lived in Manchester four years.

7766-7. Do you think that the country people are less independent than the Londoner?—No, but I think they are less stuck-up. If you want to see them about practical matters I think many North-countrymen would let you into their houses, but I do not think that the Hoxton ladies would; they would say: "Why should you come and teach me: my house is my castle."

7768. There would be a difficulty in London, as there was at the beginning of the Manchester Ladies Health Society?—Yes, I think so; but I do not know whether everyone would agree with me. I do not think that London people would be willing to receive such a visitor with open arms at all. I think they would get very cross and say they knew much more about their children than she did. But I think if such a visitor could be an official of the Borough Council, or even of the school authority, or of some charity which was recognised, the difficulty would be largely removed.

7769. Official visiting is better than voluntary?—I do not think they would do better work, but I think they would not get in as voluntary workers in Hoxton. I do not know how they would get on in other parts of London.

7770. (*Mr. Struthers.*) The Londoner, apparently, is more amenable to discipline than the people in the North—he submits to authority?—I think it is delightfully characteristic, and I like them for it. The Londoner will not be interfered with, and you have to go very tactfully to work; and if you were to say to one of these Hoxton mothers, even in rather a tactful way, that you had come to teach her about her children she would probably get angry.

7771. If the visitor comes with authority either from the municipality or the School Board she takes her in as an authority?—I think so.

7772. With regard to the question of teaching the girls in the elementary schools, of course they do get something at present in a theoretical way?—Yes.

7773. You think there would be great difficulties about carrying out practical instruction of that kind?—Yes;

because of the numbers of children, but I think something might be done. Even a little would be better than nothing.

7774. You know the higher class in the elementary schools, girls of thirteen or fourteen, are taken in small sections of twelve and eighteen for lessons in cookery; they are not necessarily all a class of fifty or sixty?—I know that.

7775. The class is broken up into sections of eighteen or twenty. If they can do that for cookery is there any reason why they should not do it for infants?—I think there would be more difficulties, but I think it might be done.

7776. Every elementary school has attached to it a large infant department with plenty of babies?—You call them babies; they are rather grown up babies.

7777. From three years old I understand?—The mischief I am keenly interested in and what I want to speak upon is this horrible mortality of infants under one year. Some of the children are killed and many spoiled.

7778. Is not that rather going to the other side of your work—the care of the infant; what I have been discussing has been the training of the mother, getting her early in the elementary school?—Yes. I think you want to teach the children about the tiniest babies under three. You could teach these children something; you could let them have little toddlers, and show them how to wash them, but you cannot teach them about the smaller children, and that is when the mischief is done. These children are done for between birth and the age of about one year. Many die when they are a month or two old just from pure ignorance.

7779. In the case of compulsory attendance at continuation classes of girls from fourteen to sixteen, that instruction would be given in the evening?—Yes.

7780. And that would also have to be purely technical instruction?—I hope not purely, but largely. You could not have a lot of babies at that time.

7781. You think it might be supplemented by a practical class?—Yes.

7782. What you really wish to do is to get hold of the actual mothers?—Yes. I would rather say young women. I think many of the young women that I know would come to a class if I had a good class arranged, with children.

7783. What age of young women are you thinking of?—from eighteen to twenty-three or twenty-four.

7784. Those are girls or women who would be engaged at work during the day?—Yes.

7785. How are they to arrange to come to have lessons?—I should get one or two specimen babies.

7786. Do you not think that the Manchester plan is a more practical one, of having a visitor who goes to the actual place?—I think we shall have to do both. The ignorance is enormous and we shall have to try all sorts of plans for getting rid of it. The children in the school must be taught better than they are. We must have voluntary classes for these young women and mothers, and we also want the visitors. But I do not think the visitors will succeed in London unless they come with the sanction of some recognised authority.

7787. They must come as officials?—I think so.

7788. I do not quite gather what you mean; you have your crèche only five days a week?—Yes, because on Saturday the little girls are not at school and they have to mind the baby.

7789. Would it not be better for them to come to the crèche with the baby?—It would, but in working a crèche a great deal of cleaning has to be done and it is good to have one day to clean up. The babies do come on Saturday for half the day; they come till two o'clock.

7790. You say that milk costs you 4d. a quart. I have had information that the usual price is 3d.?—That is if one buys a large quantity.

7791. This is retail, sold at retail shops at 3d. a quart?—I wonder whether it is good?

7792. I cannot say?—I would rather pay 4d. and be sure of it. It is very good milk that I get.

7793. Your objection to the tinned milk is not so much that it is bad in itself as that it runs a great chance of being polluted?—I think that is the great difficulty. At the same time I should like to guard my answer in this way; that I have never tried feeding children on tinned milk because I despise the thing *ab initio*.

7794. To put it gently, might that not be an initial prejudice?—Yes. I never fed anybody on tinned milk.

7795. So far as you gave reasons for objecting to tinned milk, it was chiefly because of the danger of pollution after it was opened?—Yes; I am not a great expert on tinned milk, but there are two kinds of it. You can buy that which is good, and another which is called tinned milk, which is really tinned skim milk. The tinned skim milk is bad; it has little nourishment in it.

7796. I should fancy that the law could deal with such cases as that to a certain extent at present?—It is on the tin, but the mothers do not look. I do not think it is a matter of adulteration. The mothers buy it because it is a halfpenny or a farthing cheaper. I do not think there is any cheating. You can always tell which is the skim and which is not. The mothers think it is tinned milk, and they buy the skim milk.

7797. You could not prohibit the sale of skim milk in tins?—No; it is better than nothing at all.

7798. Rents seem to be very high in your quarter?—Yes.

7799. Are they as high in other quarters?—I think round Edgware Road and in Soho they are high.

7800. Lisson Grove?—I do not know about that.

7801. (*Colonel Fox.*) You told us that the main object of your crèche was to produce ideal mothers?—Yes.

7802. Rather than to encourage mothers to neglect their domestic duties?—Certainly.

7803. Then you told us also that the mothers who attend there are anxious mothers?—Yes; they are very kind.

7804. Do you not think that a large proportion of mothers are not anxious mothers, but are careless?—No, I do not. I think the great majority of mothers are very kind people indeed, and very fond of their children. Most of the mothers who come to me are sorry to have to put their children out to nurse.

7805. But they are ignorant?—Yes; they are really ignorant; they do not understand about the nature of food.

7806. Through ignorance you consider that enormous numbers of children are killed?—Yes, they are killed by kindness, so to speak.

7807. Therefore, if you only get the anxious mothers, the large proportion of mothers who are careless and practically not anxious about their children, through ignorance, are not taught?—You will not be able to make the world right in a day; you can only get the elect for anything.

7808. You have a better chance of training the large mass of women at the elementary school during the latter part of their school life, than you have by training these few in the crèches?—I think you can do a great deal. But do you know what I find in every department of life? I find girls come to my evening club at from sixteen to eighteen years of age, who cannot sew at all. I know that these girls when in the board school did beautiful needlework, but they have forgotten. If you get a little girl who has learned a good deal about a baby at fourteen, and then she goes to make boxes all day long at a shop, and marries at about twenty-three or twenty-four, she has forgotten. I am glad to say that the women do not marry very young in our part. I think it is at that point that the voluntary education in connection with crèches would revive their knowledge.

7809. Forgetfulness is not the fault of the teaching but the natural result of things?—I daresay they would not forget as much if the teaching was highly intelligent.

7810. I am speaking of needlework?—I think they forget. I think we all forget things.

7811. Do you not consider that the most receptive time of a human being's life is between thirteen and fourteen?—No; I think when you are seventeen or eighteen you have more sense, you know it is better to learn things, and you put your back into it.

Miss Eves.

7812. Is it your experience that you do not forget the nursery rhymes and fairy tales which you learnt when you were young ?—I do not altogether agree with you. You remember some. I think a young woman who is engaged to be married knows she will probably have children, and I think she takes a keen, practical interest in it then. I think if you gave her a few lessons then, on the top of intelligent training when young, that is the time she will profit.

7813. Do you say these health visitors would be resented ?—I think they would object to them in London. I believe it works all right in Manchester—it is a great success there.

7814. In many places the district visitors are resented and you only get a very small proportion of anxious mothers at your crèche ; do you not think that you are far more likely to deal with a large mass by training them at the schools ?—I should do both. I should give the children in the school as good a training as possible. It would not be the best because it would not be thoroughly practical because of the large numbers. I should compel a girl from fourteen to sixteen to go once or twice a week to an evening school, and on one of those evenings they would have to learn infant hygiene, which would also be largely theoretical, because you could not have babies. Then I should have voluntary classes of young women who are going to be married, and teach them in a thoroughgoing and practical way.

7815. That is only dealing with a small proportion ?—Each good mother makes a good daughter.

7816. You must have some form of legislation if you are to deal with the mass ; you cannot depend simply upon voluntary classes ?—No, but I think you can do an enormous deal by voluntary classes. I think the London County Council has done a noble work by means of the Technical Education Board. I think they have done a large amount of most useful work, and I think we could do the same with this if we had the means of giving practical teaching in connection with the lectures.

7817. Then as regards these infants of three years old and upwards that attend the elementary schools, you consider it is better for them to run wild, to run about, and not be made to sit down at their desks ?—Yes.

7818. Surely instead of having at every school rooms devoted to infants and teachers, you could have some form of hall built where these children could at times run about ?—Yes ; I think that would be excellent. I think the elder girls in the school would learn a good deal about these toddlers. But you would not touch the infant mortality.

7819. You were speaking about this question of children being kept at three, four, and five years of age, sitting down at desks ?—I do not think it is good, but that is not my main point.

7820. I am dealing with what you said yourself. You considered that it was a very bad thing for infants to be compelled to sit down from three years old to four or five, when they ought to be running about ?—Yes, I do.

7821. You looked upon it as a serious thing ; therefore I ask you, in lieu of that, whether it would not be better to treat them as little tiny children, and let them run about and have rooms devoted for the purpose at the existing Board Schools ?—I think it would be a great improvement.

7822. (*Dr. Tatham.*) I want to ask you one more question. May I ask you exactly where your crèche is situated ?—In Shepherdess Walk in the City Road, just between the Angel and the Bank.

7823. It has been recently stated prominently in the newspapers that the great difficulty of dealing with the very poor is that a very large proportion of the unemployed are unemployed because they will not work, and that a great many persons who allow their children to be attended to and supported by charity could, if they chose to do so, support their own children ; that the men are drunken fellows who do nothing but drink though they can earn from 35s. to 40s. a week, but inasmuch as they are drunken dissipated fellows they do not care and will not support their children, so long as other people will support them for them ; that has been publicly stated in London within the last few weeks. In the district you know so well in the City Road do you think that state of things obtains ?—I think there are a great many men who lazily waste their time, and drink, and the children would have had no food at all if the women had not worked.

7824. Do you agree with the suggestion that some legal pressure should be brought to bear upon people of this kind and that those who would not support their children should be made to do so : do you think that would be one way out of the difficulty ?—I think it would be a very good thing, but I do not think it would touch the ignorance of the mothers. They are very ignorant. They do not understand the structure of the human frame at all. It would not touch the ignorance at all. It is a very wrong thing that a woman with a very young infant should go out to work and dump the child somewhere because the husband is drinking and idling his time ; but such is the case.

7825. In the case I am supposing, when the husband is in receipt of good wages and could support his child, and keep his wife at home to look after it, do you not think that pressure ought to be brought to bear upon him ?—I do, if it could be done.

7826. Have you considered the question of labour colonies at all ?—Of course I have heard a great deal about them and have come across a good many men who have been sent to labour colonies. I think in some cases they are successful, but not in many. I think the regular full bred Londoner does not adapt himself to country ways, and I think they drift back to London again.

7827. Would you agree with giving the magistrates the power, in some of the worst cases, to commit men to labour colonies ?—I certainly would.

7828. In that case the existing agencies for the assistance of the poor would probably almost cover the needs ?—That is rather too large a generalisation. I could not say that.

7829. At any rate the existing agencies would be much better able to cope with it ?—Yes. I think an enormous amount of misery, wretchedness, and physical deterioration is due to the fact that a large number of men do not realise their responsibilities as husbands and fathers.

7830. You would make them ?—Yes, I should hold them responsible, certainly.

Mr. WILLIAM HENRY LIBBY, called ; and Examined.

7831. (*Dr. Tatham.*) You are headmaster of the board schools, Victory Place, Walworth ?—Yes.

7832. And a member of the Executive Committee of the London Schools Dinner Association ?—Yes.

7833. And also Honorary Secretary of the Scholars' Free Meal Fund in connection with the East Lambeth Teachers' Association ?—Yes.

7834. Will you tell the Committee your experience in relation to the subject before them ?—I may say that I have been in the service of the Board now twenty-nine years this March, and I have been headmaster twenty-seven years. I started as assistant in a very poor district, namely that in which I now am, and then I went to a better class district in Kennington—Clapham Road—and afterwards back to Walworth again. It always struck me that many children in the schools suffered from underfeeding as evidenced by the difficulty they had in doing their mental work. About six months before I started this fund there were two or three boys in the school, who seemed to be in great difficulties, and I said to them : "Why cannot you get on with your work ?" They said, "Well, sir, we have had nothing to eat." I said "What do you mean ?" They said "We have had nothing since yesterday morning." In order to prove the case I sent down to a baker's shop and asked the baker to oblige me with some of the driest crusts he had on the premises. He did so, and I gave them to the boys. I did not apparently watch them, but I kept my eye on them, and I can assure you that they ate ravenously, and in a very few minutes the whole of the dry bread was gone. I came to the conclusion then that they were positively hungry. I said to my fellow-teachers, "We are doing a little in aid of hungry children through the London Schools Dinner Association"—that had just been formed. I may say in connection with that Association that it is a central fund which was formed in order to amalgamate existing agencies and if possible prevent overlapping throughout London. I said to my fellow-teachers, "I think it would be wise for us as teachers to try some humanising influence in connection with our work in the schools by taking up a fund such as this is, that is to say, make it a factor in the teachers' organisation." You know the teachers have organisations—the National Union of Teachers and so forth—I suggested it should be made a factor of that for the simple reason that when the child left school he should feel that the teacher was a friend, and more than a machine driver, but had looked after the betterment of the child's condition. The teachers said, "We see a difficulty in taking this matter up as it will be such a huge thing ; the Association will be responsible for a very heavy sum." I said that I would take the responsibility of doing it, and would start the fund on the lines that we should have the money paid through the bank and draw cheques, and the accounts audited by chartered accountants ; the treasurer should be outside the teachers' profession, and the fund should be run on business lines. We started the fund, and I am pleased to say that it at once met with public approval. We secured a very good list of patrons, Members of Parliament and gentlemen connected with the district who lent their names, and subscribed, and furthermore we thought it would be nice for the children in the better class neighbourhoods, that is to say, Dulwich, etc., which is in the same division and under the same inspectorate, to take an interest in the children of the poorer class neighbourhoods, by means of school collections, concerts, and so forth. In some cases we have had those children up to see the children from the poor district fed—in Walworth, and such places. We formed the fund on those lines, making ourselves responsible, and I am pleased to say that we had help from the London Schools Dinner Association, to which we allied ourselves, because we thought it only wise and right, and also from the "Referee" fund, which collects a very large sum of money for a similar purpose. We have been able to keep the fund running for twelve years. The average balance in hand has been about £25. I may say in connection with the children and the teachers, we at once saw the advisability of getting the attendance officer to work hand in hand with us, for this simple reason that the attendance officer is brought into contact with the home life of the

children. He knows when the father is out of work ; he knows when the elder boys and girls have passed through the schools, and gone to work, and he knows when the family is in difficulties. But at the same time, he visits the homes without any idea of charity in the mind of the person whom he visits ; in fact he visits the house in the course of his official duties for the purpose of driving the boy or girl into school who is out earning something. He can give us the very best information in connection with this work. He is visiting the home the whole year round, and not only the home but the area, the district ; hence we at once incorporated these gentlemen on our Committee for the purpose of giving us general ideas of the state of the poverty they find in various districts. We have one from each corner of the East Lambeth division, and I am bound to say that we find them extremely helpful in giving us valuable information. Where teachers apply for large grants and other teachers apply for less, we say to the attendance officer, "How is this ; there is a school two or three streets off which wants half as many dinners again as the other," and he gives us the reason.

7835. (*Chairman.*) What percentage of children do you cope with ?—That depends. According to the information we can get, I should say about 12 to 15 per cent.

7836. In the poorest schools ?—More than that in the poorest schools—sometimes 25 to 30 per cent.

7837. We were told early in the enquiry that something like 30 per cent. of the poorer children were insufficiently fed ?—Yes, I based that on the wage earnings. These attendance officers have helped us considerably. We have been able to get full information with regard to the homes of the children, and the life history of several of the families has been dealt with, and furthermore, I may say with regard to culpable negligence of parents we made arrangements several years ago with the Society for the Prevention of Cruelty to Children whereby any cases which came to our knowledge of negligence of parents were sent to the Society, and they have helped us.

7838. That has had a very useful effect ?—Yes.

7839. What is your standard of parents income which entitles them to assistance in this respect ?—We do not depend upon the income ; we depend upon the immediate need of the case. A man's rate of wages may be £2 or £3 a week, but he may be out of work for several weeks. If you ask him his wages he may say that he earns £2 a week. I had a man this morning who came to me in connection with the Southwark Borough Council Relief Fund, who has not had work for two years.

7840. He has no income at all ?—None.

7841. In this family budget which you have been good enough to furnish us with, you talk about 5s. rent for a family of six persons ?—Yes, that is rather low. We have Guinness's Buildings and Warren Buildings near Victory Place Schools. The former is connected with the Guinness Trust, and the latter with the Fishmongers' Company. Some rooms at the top of the building are let at 3s. 6d. a week, two rooms ; and they come to 7s. 6d. on the ground floor. I have to average the thing. They are all huge buildings round where my school is ; they are mostly in private hands ; they would average about 5s. That would be taking a low estimate.

7842. Are most of the labourers lodged in buildings of this kind ?—Yes, 90 per cent. of the people round the Elephant and Castle live in houses of that type. There is a whole series of blocks from the Elephant and Castle right down the Kent Road—also in the rear of the Kent Road.

7843. Most of these women have to work ?—Yes, they have to go to work to augment the weekly income.

7844. That is an additional reason for providing a mid-day meal at the school ?—Yes, the fully paid meal—I have always argued for that. I have stated in my *précis* that the mothers go out to work, and then I have considered the question of growing girls, looking at the future motherhood of our nation. Of course, I am not a medical man, but at the same time I think it is very hard upon girls who are growing and who have to live under conditions for two or three years where they are underfed systematically.

Mr. Libby.

Mr. Libby.

7845. Is that due to parental neglect or parental inability?—I am sorry to say that in most cases it is due to parental inability. I have allowed only 3d. a meal for each child, and in the case of four children that amounts, for three meals per day, to 5s. 3d. a week. That is as low as you can put it. The guardians allow about 1s. 6d. a week for each child, I believe, and I should say it would be extremely difficult to provide a child with dinner, breakfast, and tea, for a matter of 2½d. or 2¼d.; but they have to do it. I have noticed this in connection with boys who have gone to the Poor Law schools; they have been physically saved, for they have had regular meals, and have looked entirely different children—fattened up and robust compared with what they were before they went away. It is the same in connection with charity schools. I went to the Duke of York's School the other day to see one of my boys who had been taken down there. He was not at all a delicate boy. I said to the Chaplain, "These boys seem hearty and well." He said, "Yes, under our system of feeding and putting them to bed early and having good baths, they are wonderfully healthy."

7846. What charity schools do you refer to?—The Duke of York's School which I visited some little time ago.

7847. The boys are there for years, are they not?—Yes.

7848. Not for a short time?—No. One of our attendance officers told me this: He said that one boy said to him, "I wish I could go back to the truant school, because I get more to eat at the truant school than I do at home."

7849. On what scale do you feed them; do you give them a meal when they first arrive in the morning?—We have some breakfast centres and some dinner centres; they are mostly dinner centres.

7850. You do not give meals at the schools themselves?—Occasionally, but we do not as a rule, because the teacher has been teaching all the morning, and it is rather a tax to ask him to go and serve meals during the meal times; it is rather an arduous task.

7851. Could you not get voluntary aid to do that?—Yes, we can get any amount of voluntary aid.

7852. You could have that in the school as well as out of it?—It rather disturbs the arrangements of the school in the afternoon.

7853. Most of these schools have halls?—Yes.

7854. And most of them have kitchens?—No, very few have kitchens; the Board have only provided kitchens in a very few cases.

7855. Would it not be a useful thing if every school was provided with a small kitchen?—Yes.

7856. It would not occupy much space, would it?—You would have to have a room where the children could dine.

7857. The school hall would supply that?—Yes. But we find our teachers, especially in girls' and infants' schools, rather object to having the halls disturbed.

7858. We are thinking of the most practical method of doing it, and personal preference must be suppressed?—There is no reason why they should not use the halls.

7859. The use of special places for the distribution of these meals means additional cost?—Yes.

7860. You hire places, I suppose, at which these meals are given?—We do not hire them for the simple reason that if we did they would be liable to be rated by the local authority.

7861. Are they placed at your disposal?—Yes.

7862. What buildings are they?—They are connected with churches, and chapels, institutes and Sunday schools.

7863. And parish rooms?—Yes.

7864. That is not an element of cost?—No, but at the end of the season we generally give them £2 or £3 for the gas or attendance.

7865. Are the meals cooked in all these places?—They come in ready cooked; they are cooked at the central depot.

7866. All the meals come from a central dépôt which is run by the organisation?—Yes.

7867. Do you mean that supplies meals all over the area?—Yes, except in one or two cases, where our local

committees prefer making their own cooking arrangements.

7868. You would be inclined to argue that that is perhaps the cheapest way of doing it?—The cheapest and the only way of doing it for large numbers.

7869. You might have done it in the schools?—There would be a difficulty in getting the caretaker or the caretaker's wife to manage the whole thing.

7870. It has been suggested that it might be worked in with instruction given to the children in cookery?—A few of them attend a cookery centre; there are only a dozen to fifteen attendants at the cookery centre at one attendance. There would not be more than twenty. I suggested to the Board some years ago in giving evidence that they should teach the children in the cookery schools, not to cook fancy dishes, but to cook meals at a certain rate. For instance, you could say to a child, "Here is 4d.;" "Here is 6d.," or, "Here is 8d.;" I want you to tell me what to get to cook a dinner for six people with this 8d."—supposing a man is out of work, and that there is only 8d. in the home. The children would go out and buy 8d. worth of whatever they liked, and cook it there and then, and see whether it would be sufficient for a man and his wife and four children. That would make the thing practical, rather than cooking fancy dishes. When they came to be mothers of families themselves they would know how far 4d., or 6d., or 8d. would go. With regard to the central dépôt where the vegetarian dinners are supplied, we use the crypt of St. Peter's Church, Walworth. The parish removed all the bodies and Mr. Horsley, the vicar, had the place cleared out entirely for two objects—one a children's playground and the other our food dépôt. Mr. A. F. Hills, of the Thames Ironworks, a very charitably disposed man, has two strong ideas—one is temperance and the other is vegetarianism—and he said to us, "I will establish a dépôt for you on vegetarian lines, and fit the whole thing up"—it cost him £700 or £800—"providing you will endeavour to teach these children the benefits of a vegetarian diet." It did not matter much to us whether they had vegetarian soup or meat soup provided it was palatable and they were able to thrive on it, and sufficiently nutritive, so we accepted his offer, and he fitted up the dépôt. He fitted up dépôts in about six or eight different quarters of London—Bermondsey, Shoreditch, and so forth. His vegetarian ideas, as a rule, except in our division, failed. He had not an organisation behind him as we gave him, where he found customers every day at the dépôt and food centres surrounding the dépôt, to demand a supply of the food cooked. He gave up the whole idea; he decided to close his dépôts, and was going to close ours, but we prevailed upon him to keep it open. The food is cooked overnight over gas. We buy a French preparation—desiccated vegetables—about ten different kinds of vegetables—to flavour the soup with, and then cook haricot beans, rice, lentils, and so forth, varied each day, and sometimes we have puddings; and when the dinners are cooked overnight they are despatched to the various food centres—these mission halls and places where we get assistance—in insulated carriers. An insulated carrier is something like a sanitary dustbin, and the soup in the insulated carrier will keep sufficiently hot for twenty-four hours for anyone to eat. The bread is brown, according to Mr. Hill's ideas, and we also have wholemeal cake. We cut that up, prepare the soup and despatch both by carrier in geographical order right throughout the district to the feeding centres. The soup is placed in charge of the carman, I should say, about half-past nine or ten in the morning. We use enamelled plates; they occupy little room, as they fit into a sort of umbrella stand. By the time the children come out of school—one centre takes two or three schools—our good friends connected with the church or chapel are ready to distribute the meals. The children come in and show their tickets—which cost 1d. each—and sit down. In a well arranged centre they sit down in an orderly manner. It is something to teach the children how to eat properly. Sometimes they go in two drafts—one at twelve or ten minutes past twelve and the other at twenty minutes to one. Then the carman comes back on his journey, picks up the empty insulated carrier and the baskets, and takes them back to the dépôt. They are cleaned out and ready for the next day. We cook puddings also. I may tell you there is no animal fat

in those puddings, but nucoline. We are bound to do that in order to keep to the strict terms of Mr. Hill's arrangement. Some are savory puddings and some sweet puddings.

7871. (*Mr. Struthers.*) No arsenic?—I do not know what it is. I think nucoline is the name of it. It is quite tasteless and without smell. We can cook 5,000 meals at this depôt if required; we do not send out 5,000, but from about 1,500 to 2,000.

7872. (*Colonel Fox.*) Do you find this vegetable diet is nourishing?—Yes. I have had a very good instance of that this season. At the Murphy Memorial Hall, in the New Kent Road, they got some outside assistance, and said: "We should very much like to cook our own food, and we do not care about your vegetable diet, your thick brown soup, and your brown bread, and brown bread cake." The pastor of the church said: "I am going to give them nice white bread, and have first-rate animal soup." We started and went on for four or five weeks. The week before last I said to the boys attending my school, "Which soup do you like, the soup you had last year, the brown soup from the depôt in the large tins, or the soup that you are having now with the nice little loaves of white bread." I separated these children and asked them individually. There was only one case where a boy said he preferred the soup from the animal food rather than the vegetarian. They said they liked the thick brown soup and the brown bread. It is more nourishing. In fact, they thrive on it. The advantage is this, with regard to the mission hall people, who help us, that there is no grease, the plates are easily washed and wiped, and there is no grease dropped about. That is a great advantage to the ladies and gentlemen serving.

7873. (*Dr. Tatham.*) You speak here of attending to the condition of our growing girls; from that I infer that you have under your care girls' schools as well as boys' schools?—Yes.

7874. What is the special need you speak of? In your *précis* you say that there is a special need for attending to the condition of our growing girls?—I am not a medical man at all, but I thought it might affect the girl from the maternity point of view in future. That was my great point. In fact, I have asked one or two people if the mothers in the poorer quarters of Walworth have large or small families, and they tell me that the families are getting smaller. I do not know—I have not any data to work upon, but it struck me it would be a very useful thing for this Committee to have their attention drawn to the question of growing girls. The medical gentlemen will give you information on that, but it seems to me, as a mere layman, that it is a far more serious thing for a growing girl to be underfed than a growing boy, looking at the future of the State.

7875. I thought you might have had some special suggestion to make?—No more than that I have inquired into it slightly.

7876. Have you any experience of the work of the Salvation Army in your neighbourhood?—I have used the Salvation Army depôts in connection with our work, and I find them admirable from this point of view, that the Salvation Army officers—of course including the women as well—are robust; they are very hearty in their way, and do not mind turning up their sleeves and doing the work effectively. They have not helped us lately; at least we have not used any of their depôts lately, but when they go into this kind of thing, they go into it enthusiastically, that is to say, the thing must be done, and done properly. They are whole-hearted, if I may use the term. I am always pleased to work with them; they do an enormous amount of good. They have been working class people themselves and know the pinch and horrors of drink and bad homes; in fact, many of them are reclaimed people. They live among the people, they talk to them in their own phraseology, and they have a great advantage in that way. People in poor districts rather fight shy of the ordinary clergyman; they would, as a rule, sooner go to a layman. But they will not do it.

7877. (*Mr. Lindsell.*) What is the full price for a meal?—We can cook a meal for a child, consisting of about a pint of this vegetable soup and a piece of brown bread and a piece of cake, for three farthings, or a little less. It costs us one penny, including despatch.

7878. What is your charge?—We charge one another a penny, because the depôt is worked in connection with the organisation.

7879. What is the child charged?—One penny.

7880. The percentage of paying children is very small compared with those that get it free, is it not?—Yes; about 7 or 8 per cent. That is because it is not thoroughly worked. I have always argued, in connection with our work, that the child in the elementary school should have the same advantages of a dining hall as the child attending a high school, such as the City of London School, or Dulwich, or St. Olave's School. This would apply where the mothers and fathers are out at work, and otherwise have sent them with a piece of bread and dripping to wait till they get home from work, and all sit down to a regular meal. There should be facilities in connection with our work in elementary schools, whereby that child without any charity whatever should go and get a hot midday meal for a penny, and it can be done.

7881. Does your Committee investigate each case and give a ticket? I suppose you sell the ticket for a penny if you think he can pay, and if not you make him a present of it?—No, we go in for part payment.

7882. You give a penny ticket for a halfpenny?—Yes, or even a farthing.

7883. But so far as you can, you think it is a good plan that they should pay something?—Yes.

7884. You would not give it free unless you were satisfied that the father was out of work?—Not for a moment.

7885. (*Chairman.*) What percentage do these classes represent?—I group the two classes together in the 6,000.

7886. What percentage pay the full cost?—I should say about 2 per cent.

7887. And part cost?—About 6 per cent. You see it is a charity. If we could get all our teachers to work on sound business lines we should get the thing done, full, part and free throughout.

7888. (*Mr. Struthers.*) It is so much easier to treat it as free than insist on money?—Yes, very much easier, and of course we do not all look at it from the same standpoint. That is the difficulty; our teachers are very good, I am not reflecting upon them for a moment. They look upon the question as we talk of it in Committee, but two out of every three teachers are ladies, and they are naturally rather inclined to give it free than otherwise.

7889. (*Mr. Lindsell.*) What you look forward to is that these food centres should be taken up by municipal authorities?—I think so; in fact I have gone into that idea. I started, and was a very strong advocate for many years of its being done on charitable lines entirely. I should premise that I believe if we take medical advice in connection with school life, we should find big revelations on this question. For instance, we had a medical man examining some children of a holiday fund, last summer. I think out of sixteen children he said seven suffered from valvular disease of the heart brought on by having wet feet and ill nourishment, and that kind of thing. That is a very large proportion.

7890. You think that all school children in rate-aided schools should be subject to some sort of medical examination?—Yes. I am a very strong advocate of that.

7891. That is done to a certain extent now by the School Board medical officer?—No, it is not done at all. We test the eyesight of the children. The teacher tests it in the first instance, and then the oculist comes round and makes an examination of the children above Standard III. My contention is this: that in connection with our teaching the medical officer of the borough or the Board should come into the school and examine the children from the physical point of view at least twice a year, so that they should not be classed simply because the children are of a certain age, or of such and such a mental capacity; they should be treated from the medical standpoint, and when we come to do that we shall find that the children who are organically sound, that is to say, have sound hearts and sound lungs, may not be robust simply from the effect of bad or insufficient nutrition. When I speak of bad nutrition I should like to pause for a moment. Bad nutrition arises in this way, that the mother of the family cooks for the father, she does not cook for the children, and the children all have to eat what the father eats.

Mr. Leiby. 7892. (*Colonel Onslow.*) You only give these meals in the winter, do you not?—Yes.

7893. Why do you not give them in the summer as well; are they not required?—We do in two instances; that is the Old Kent Road District where the gasworks are; we give summer grants.

7894. Is it not generally necessary to keep them all through the year?—It is not that; it is the fact that we should not be able to get money in the summer.

7895. During the school holidays these children, I suppose, have no food?—None whatever from us.

7896. Your supply is entirely vegetarian?—In 90 per cent. of our centres. We have one or two others where it is not so.

7897. If you had meat would it be possible to keep it down to that price?—I could not say, because I never had any experience in meat. A man who cooked for this little centre in the New Kent Road, who gave the meat, which the children did not prefer, said that he made nothing out of it, and the pastor further stated that he made nothing out of it—it cost him the same amount as the vegetarian diet.

7898. Do you find the vegetarian system is satisfying to the children?—I find it so, and they do not tire of it.

7899. If this could be extended so as to be made not a voluntary organisation but a general organisation under the School Boards all over the kingdom, would it be as suitable as a voluntary organisation?—It would undoubtedly meet the need.

7900. Would it be possible to deal with parents who could pay and do not pay, in the same way as they were formerly dealt with when they could pay but would not do so?—I should think so. The law should be strengthened in that way. We have always held that opinion. A man has no right to neglect his children.

7901. On inquiry if it was found that the family was absolutely unable to pay, then they could have it free?—Yes.

7902. Otherwise they must pay the cost?—Yes. I should charge the account to the guardians.

7903. And have the guardians recover?—Yes. I should have it on business lines instead of indiscriminate charity; in the hands of people who are capable of finding out the whole conditions of the case.

7904. (*Mr. Lindsell.*) Would not there be an immediate outcry about pauperising in certain quarters if you made the Poor Law the agency?—There very likely would be, and some people would put their backs up, but I think it is the only system of doing it on proper lines.

7905. (*Colonel Onslow.*) Do you not think that one or two prosecutions would set the matter right in one district?—It would have a wholesome effect.

7906. Was not that the case when the school fees were paid that one or two prosecutions of people who did not pay, and ought to have paid, stopped it?—I do not know.

7907. When the people were disinclined to pay, but they knew that they were liable to be had up for not paying, did not that egg them on to paying?—It had a salutary effect no doubt, but I think the parents generally looked upon free education—the point you are referring to now—the same as vaccination. They say that when you make a thing compulsory you must make it free. If you make education compulsory the consequence is that you make it free.

7908. This is practically compulsory. The suggestion is that the feeding should be compulsory, because it is either compulsory upon the parent to feed or upon the school to feed?—Yes. The line you take will be to compel the parent to fulfil his duty.

7909. Is it not rather that the feeding of the children is necessitated by the fact that it is free education? It is no use trying to cram free education into a wretched child who is starved and cannot take it in?—Of course it is not. We come into contact with the children now day by day and we find out their circumstances. No doubt they wanted feeding before, but now we get information because we come into contact with them every day and see their difficulties.

7910. (*Mr. Struthers.*) This organisation of yours has been going on for many years?—Twelve years.

7911. And the attendance officers take a great interest in the matter?—A great interest, and always have.

7912. You must know pretty well all the children attending the schools in that district who have not been properly fed?—I would not say we should know all, we should know a very large percentage of them.

7913. Do you think there is a considerable percentage that you do not know?—There is a percentage we do not know, because you can never judge by a child's outward appearance. A child should be examined by a medical officer.

7914. If there was long continued abstinence from food there would be a significant thinness, would there not?—Yes, but some people look fatter and fuller with insufficient food than others.

7915. This thing has been going on for many years; you have the School Board officer taking an interest in them and he must know a considerable number of the children who have not been properly fed?—Yes.

7916. Do these children who get this meal get properly fed; are they fit for their work during the day?—Yes, they improve very considerably although we only give the one meal.

7917. Do you think that that one meal and the chance of what they get at home is sufficient for them to do their work on?—I would not say that, but I would say it would help them very considerably, I do not think it would be sufficient for a growing child to maintain its normal physical condition and have something to build upon.

7918. You give free breakfasts in some cases?—Yes, we have two breakfasts centres.

7919. You would give breakfasts if it were shown that the child needed breakfast as well as a dinner?—Yes.

7920. Will you tell us what you give for breakfast in those cases?—We give cocoa and bread and jam as a rule.

7921. That is prepared at the school?—No, we have breakfast centres. We entrench as little as we possibly can on the time of the teacher, although it is a teacher's organisation, for the reason that we can get so much voluntary help; there are so many charitable people who take the thing up.

7922. You do not give them butter?—Sometimes, but we prefer not because if we gave them butter it would cost too much.

7923. Have you ever thought of giving them porridge and milk?—Yes, but they do not take to it in London. I have it myself. It is one of Mr. Hill's ideas, but they have not been educated to it.

7924. Why do you not try to get them to take it. I should think that if a child was offered porridge and milk and nothing else he would prefer that?—Yes.

7925. In that way he might be encouraged to take it, to his own benefit?—Yes, on the same lines as we have fostered a taste for brown bread.

7926. Is not the porridge and milk idea worth consideration?—It does not take so well. I have always said that if they persisted in porridge and milk the children would get a taste for it, and I should much prefer that, looking at it as a food.

7927. What I wanted to get at was this, do you think that there are still a large number of children attending your schools in the Walworth district who are insufficiently fed?—I think there are. I am bound to say so, looking at the class of casual labourers and unskilled workmen who are their parents.

7928. I mean in spite of your association's work?—I think there are for this simple reason, that we have not the organisation for proper means of discovery. Ours is a rough method of doing things.

7929. But you have the attendance officer going to the homes of the children?—We have that, but sometimes the mother and father are out and they do not get to know the whole conditions. I may tell you how we manage in our schools. The class masters first make a list, that is, the actual teacher of the class, of the children they think are necessitous. That list is for each class in each department, boys', girls', and infants', and the three head teachers go through the lists, mark them, and so forth. Then the list is gone through by the attendance officer,

and after that it is gone through by the manager who is appointed for this purpose on a small sub-committee. Then it is sent to the Charity Organisation Society to visit, if thought necessary.

7930. There are a considerable number of children who escape this agency?—Yes, I am bound to say I think there are.

7931. You have this centre erected for which food is selected by Mr. Hill who is a vegetarian on principle?—Yes, he equipped it; and Mr. Horsley cooks and distributes the meals.

7932. I understand that part of the condition of his furnishing the centre, was that the teacher should instruct the children in vegetarian principles: has that been done?—They have to instruct them, inasmuch as a *sine qua non* of taking that depôt was that we should cook vegetarian food.

7933. If the children are told day by day that to eat animal food is more or less a sin, and that vegetable food is proper?—They are not.

7934. Do not you think that that might lead them to prefer the vegetarian diet to the other—they know the correct answer to give?—Half the children think it is animal food; they are never told that it is vegetarian food for a moment.

7935. They do not know?—No, 99 per cent. of them do not know the difference; in fact some of the teachers do not, I fancy; it smells so nice and savoury.

7936. And you think the children thrive on it?—I do.

7937. You spoke about the necessity of feeding growing girls, and the danger rather of underfeeding and insufficient feeding in their case: do you think there is any greater danger of their being underfed now, than there was ten years ago?—I think these agencies have done something.

7938. You said something about a falling off in the number of families, and you connected that with the underfeeding of girls, at least you hinted there might be a connection; but if the girls are not worse than they were ten or twenty years ago, that does not account for the falling off of the families?—I should like to reserve my opinion on the question of growing girls. I put it in because I wished to draw attention to it.

7939. I suppose you visit some of these cookery centres?—Oh, yes; we have one in connection with our school.

7940. You are frequently there?—Yes, I visit very often.

7941. You have made a very interesting suggestion that the children should be asked occasionally, if not always, to cook a dinner for a given price, 4d., 6d., or 8d.: is not that done at your centre?—I do not think it is done generally.

7942. Have you ever made a suggestion at your centre that it should be done?—I made a suggestion, but the cookery teacher gets her instructions from the superintendent. I made a suggestion in the evidence I gave before the Committee on underfed children in connection with the School Board some years ago.

7943. There is no reason why it should not be done?—I do not see any reason at all.

7944. There is nothing in the Code or the regulations of the department against it?—I could not say what the syllabus for cookery is.

7945. It would be a good method to convert the actual teacher?—Yes.

7946. (*Colonel Fox.*) Is it not a common thing for children to receive 2d. or 1½d. from their parents with which they are supposed to buy fried fish for their mid-day meal?—It is very often done.

7947. Speaking of your fully-paid meal, how do you get paid for it?—These children prefer our meal to the fish meal.

7948. How do you get paid for it?—The children pay their 1d., and we give them a ticket. There is no question of charity; there is no discrimination, when they attend the centre, between those who pay, and those who do not.

7949. They do not give you a ticket or anything of that kind?—No, we give them a ticket.

7950. I am told that a great number of children receive 2d. or 1½d. from their parents, and their parents expect them to provide themselves with a nourishing meal, such as fish, and on enquiry they find they have spent perhaps a ½d. on a top and 1d. on marbles, and so on; they like sweets or nuts rather than good nourishing food?—I do not think that is very general. You get isolated cases like that, of course.

7951. Have you ever enquired into that?—I have heard people make statements of that kind, but when a child is hungry it goes to the fried-fish shop. Certain boys or girls may spend their money on sweets or toys instead of meals. I daresay there have been scores of such cases, but when a child is hungry, and there are not facilities such as ours, they get a halfpenny-worth of fish and a halfpenny-worth of potatoes in a piece of paper. One of our teachers suggested that we should feed the children in that way rather than by our method. That was only suggested, but we at once insisted that if the child was to be fed with our grants it must be fed on our food and not on fish and potatoes. Children like fish and potatoes, I daresay, but it does not contain a fiftieth part of the nourishment of the dinner we can provide at the same price. I think the custom of the children spending their money in sweets and that sort of thing is not general.

7952. Do you think they get more value for their money by taking your meal than by going to a fried-fish shop?—Oh yes, it is cleaner and there is no risk of bad food connected with our work.

7953. (*Chairman.*) Do you include any hard food, which is good for the children's teeth, in your dietary; do you make them eat crusts of bread?—They eat bread; they are long loaves.

7954. With plenty of crust?—Yes, crust as well.

7955. (*Mr. Struthers.*) There is a piece of crust to every piece?—Yes.

7956. (*Chairman.*) They use their grinders?—Yes.

7957. (*Colonel Fox.*) They do not put it in the soup?—Sometimes I have seen boys break it into the soup. They generally eat a piece of brown currant bread as they go away.

7958. (*Mr. Struthers.*) What kind of teeth have your children got?—There was a period when I used to have time to go round and examine the teeth pretty well every week, but as a rule I think they are fairly good.

7959. When you did examine you found them fairly good?—Yes, as a rule, but the difficulty was that the teeth were not attended to; they overlapped one another and I advised them to go to the hospital.

7960. (*Chairman.*) You think medical inspection would be hardly sufficient; would you require a dentist's inspection as well?—Any inspection as long as you get the health of the children attended to.

7961. The ordinary medical practitioner would not be much of a judge of the condition of the child's teeth, would he?—I do not know. I spoke of special medical officers, and I referred to officers who have had experience in connection with children's hospitals and know a good deal of child life. Weak and ailing children might be sent at any season to convalescent homes at the cost of the municipality on the medical officer's advice. Nurses should be employed to visit the schools periodically and attend to childish ailments of a slight nature and tell them the cause and treatment, thus giving practical instruction.

Mr. Libby.

FIFTEENTH DAY.

Monday, 7th March, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary.*)

Miss DEVERELL, called ; and Examined.

Miss
Deverell.

7962. (*Mr. Lindsell.*) You have for some time past been working as a junior inspector of schools under the Board of Education ?—Yes.

7963. You formerly worked under them in Liverpool ?—Yes.

7964. And latterly in West Ham and its neighbourhood ?—Yes.

7965. How long have you been in West Ham ?—I came there two years ago last Christmas.

7966. In your experience as Inspector of Schools you have had, I suppose, considerable opportunities of seeing the homes of the children that attend the schools ?—Not much of seeing their homes. I have heard of their homes from the teachers, and the children, and the managers, and, along with the attendance officers, I have visited the homes occasionally.

7967. Your information is mainly derived from what you have been told by teachers and attendance officers then ?—Yes, and my own observations.

7968. Is it mainly by visiting the homes and by your observations thereon, or is it mainly from information you have succeeded in gathering whilst an inspector of schools ?—I should say it was on information, corrected by my own observations.

7969. You have also had previous work of this kind before you were Inspector of Schools ?—Yes. I was Secretary of a Working Men's College in Waterloo Road. I saw the home life of the poorer class, and I have also done some investigation for the London School of Economics, and I have been a member of societies which are interested in the conditions of working people, and various things of that kind.

7970. Therefore, your experience extends over a very considerable period and is not confined to the time that you were Inspector of Schools ?—No.

7971. In all the areas in which you have worked you have come across some well-defined slum areas, is that so ? The general impression I have is of considerable well-being, but there always are areas of great poverty and neglect, and also many cases in schools which are not entirely in slum areas.

7973. There is a certain percentage of slum life which exists, scattered about ?—Yes.

7974. What would you like to say about the main features of those areas ?—The most conspicuous feature has seemed to be negligence rather than poverty ; negligence sometimes coming from the extreme difficulty of doing better, but very often from the want of knowledge.

7975. You are telling us now why it is more due to negligence than poverty ?—Yes. A very good test that it is due to negligence rather than to poverty is the question of the sleep of the children. Anybody, however poor, can put their child to bed, even if several other people mean to get into the same bed later on, but you do not find that these children have any bed-time.

7976. You say that in your opinion the most conspicuous feature in these areas is not poverty, but negligence ?—Yes.

7977. Many of those families have sufficient money to lead decent lives if they knew how to do so, you say ?—Yes.

7978. And you notice that there is a good deal of unnecessary extravagance amongst them ?—Yes, for instance, buying in very small quantities at the corner shop, which is very disadvantageous, for the things are dear, and they buy the wrong things.

7979. In buying in small quantities they have to pay more for them, and they would get them cheaper if they took in a larger stock ?—The fact is that they have no larder, no place to keep the supplies. They could not buy flour by the sack, or a large quantity, and they have to buy it by the quartern or half-quartern ; and so it is with highly respectable and well-trained persons, they have no place to put their stocks and they buy them in small quantities. The prices at the corner shops where they buy their things are very high indeed.

7980. Your experience is that food among them is generally plentiful, but it is unsuitable and taken irregularly ?—Yes.

7981. Would you illustrate that ?—Well, the children come to school, and they have no regular breakfast ; they have, perhaps, bread and butter as they dress, and they get some bread when they start, and they have very cheap butter. But they bring lunch to school, but it is only bread they have, and they get bread only till they come home at dinner-time and in the evening. It is bread and butter, jam, and tea. Tea is the only form of cooking which seems to take place—I mean the making of it.

7982. How do they manage about the other food if tea is the only thing that they cook ?—I do not think that they have much cooked. They have bread, tea, fruit, and sweets.

7983. And the parents—what do they eat ?—It is difficult to find out about them. But I think that they live largely on the same kind of thing, and when they want cooked food they buy it. There are fish-shops, and quite decent working people buy the cooked food.

7984. There is hardly any domestic cookery among this class of people ?—Hardly any.

7985. Another point is that the meals are taken at very irregular intervals ?—Yes. They are always eating, more or less ; they are generally nibbling at something, but they do not have a sit-down meal. I know areas where anything like a sit-down meal is unknown. Frequently you go into these houses, and there is not a table where you could have a meal, but generally you see the sisters and cousins eating something and drinking tea.

7986. There is no regular sit-down meal then ?—No.

7987. Another cause of the neglect of children you attribute to the loose kind of family system that prevails in those areas ?—Yes.

7988. A large number of people are not married, you say ?—Yes. I think they live very faithfully together very often, but the person who is not the parent of the child is often negligent or cruel. A woman is very often negligent with the children of the man she is

Miss
Deverell.

living with. Frequently you find that the neglected cases in the school are the children who have not both parents, and the children frequently change their names. A boy will, for instance, be Jones one week, and another week he will come and give somebody else's name, and they say, "Oh, I have got a new father now," if the teacher asks them the reason of this change.

7989. The result of this is that there is very little orderly family life?—I do not know whether this disorderly family life is the result of the loose family system. They are both the results of other causes, such as overcrowding and irregularity of labour.

7990. You say that in some districts regular meals are, in fact unknown?—Yes; and then some of the children are self-supporting. Often the boys are self-supporting. The parents tell you that with pride. I know one school where the master says that they get most of their meals by meeting workmen's trains, and begging scraps from the men, and they earn pennies, and support themselves in various ways.

7991. You do not speak of your own knowledge of meeting workmen's trains, you speak from what you have learned from teachers?—Yes, and from many other people, school attendance officers. I have always wanted to see the trains myself, but I have not been able to meet them at the right time. But, they tell me that the men who give these leavings are often the parents or the neighbours of the children, so that if they provide them with meals in that way they could give them regular meals at home.

7992. And the general result is that the children are very ill-nourished?—Very ill-nourished.

7994. Well, then, your next point is with reference to the want of sleep among children of this class?—Yes.

7995. Will you tell us something about that?—One can see them about the streets at all times, any hour at which grown people are about, and, as far as I learn, they do not take a regular bed-time; they are not put to bed. The parents take them to bed when they go, which is early in the winter and very late in the summer, and very late on Saturdays, and they go many hours after the children of well-to-do people. I think late hours for the children prevail throughout the working classes, but in the slums exceedingly late hours prevail, and they are often ill from want of sleep.

7996. Does that apply to children of all ages?—I think so. When I used to come every night through the Lower Marsh, the streets were crowded with babies on Saturday nights, and other nights rather earlier, but the streets were often full at nine o'clock.

7997. And even the children, if they were put to bed would not be able to get a chance of sleep, would they?—I think the little children would sleep under any conditions if they were put to bed. I have heard of bigger girls being unable to come to school, the children of immoral mothers, from illness produced by want of sleep.

7998. Then your third point is with reference to the clothing of those children?—Yes. There are many households where there is no such thing as needle and cotton. If you would teach the girls, and ask them, "Why don't you mend your pinafores," well they have no needle or cotton in the house and no means of getting it. In many households the mothers make no attempt to mend the clothes, much less to make them. They buy them at second-hand shops, and the children wear them until they drop off, or someone gives them something.

8000. Do their clothes get very dirty?—They are filthy, especially in the case of boys. I do not know much about the condition of the under-clothing; very often there is none, but the outer clothes are in a filthy condition. The smell from the clothes on a wet day is sufficient to make one sick.

8001. You have not noticed any improvement in that respect since you have been an inspector?—I have not been working long enough to see any improvement, and moreover, the character of the districts is changing so rapidly that one could not generalise about it. For instance, the largest slum area, the big area, in my present district is going down rapidly. The respectable people are going further afield, and, therefore, I could not say what the same people are doing, whether they are improving or going down.

8002. But you do notice the fact that a worse class is coming into the district, a poorer class?—In that district. Other districts are going up, of course.

8003. But what do you attribute that change to in the particular district?—It would be the greater facilities of travelling that enable the better families to get out to a distance. But I have had too few opportunities of seeing that for myself. I have not been long enough in the district, and I have not known the families personally.

8004. What are those families that do now live there? What are the people employed in? Is it dock labour?—I should think so, but I do not know the district sufficiently well to generalise about the causes, whether it is poverty or negligence. All that I can do is to state the facts I have seen. I was going last week through a very bad area, where a good many of the men had no regular work, and some of the men who were at work, I was told, were up in town, perhaps working in a fish shop in the city, or something of that kind, and I got the impression (and an attendance officer said it was a correct impression) that a good many of them had come down here because something discreditable had happened. But no doubt the bulk of the population work at the docks there.

8005. (*Colonel Fox.*) Which is the dock area you refer to?—Canning Town Tidal Basin district.

8006. (*Mr. Lindsell.*) Then another cause to which you attribute this state of things is their absolute neglect of small ailments and so on?—Yes; for instance sore eyes, which is eczema on the edge of the eyelids, and it is perfectly easy to cure. It only needs their being properly washed, but it is neglected and it gets worse. They put tea leaves on the eyes, and they have other queer remedies of their own, but they do not get the children what is necessary for this complaint; and their dirty heads—and there again is just the same sort of problem. They are sent home for having these dirty heads, but they never do anything to them when they go home. If they get a scratch they allow the dirt to get into it, and it gets worse and worse, or if they have a bad finger, or heel, or something of that kind, it is not attended to; and they are neglected very much after an illness like measles, and they die at a great rate.

8007. You think that a remedy for this apathy and ignorance on the part of the mothers would not be found in gratuitous assistance to any great extent?—No. Possibly the children grow up better in health for the school meals, and the clothes sent to them, and from the newspaper funds and so forth, but the evidence seems to be that that is always demoralising to the parent. Last year there was extreme poverty and want of employment in West Ham, and some of the teachers having spent almost all they had to relieve it, appealed to the Press and got considerable funds, and the charity was distributed very freely, and the teachers tell me that in some of the schools which got relief the parents have never taken as much interest in their children since. They never keep them so clean nor so tidy as before, and they have been unable to get them back to the same standard of neatness.

8008. You think it simply weakens the little sense of responsibility the parents have?—They think so; and I should think it is very likely the case from what I can see, but I have not been there long enough to speak with assurance about it.

8011. Then we come to another point which is of considerable importance; that is the feeding of children in schools. We should like to hear your views on that subject?—I do not pretend to have a large enough experience to speak with any certainty, but the point I wanted to make was that it does not meet the case; that you cannot feed the children in schools and leave the education of parents untouched, because that only deals with a very small part of the problem. The feeding is only one of the things. The teachers cannot put the children to bed, or take care of them before they are born or up to three years old, and therefore even if you have the school feeding it is just as necessary to educate the parents. I cannot say about the effects of school feeding, what effect the school feeding has upon the parents, because I have not come to any general conclusions about it.

8012. There is a League in London which provides meals for the children in schools?—Yes.

Miss
Deverell.

8013. Does that provide many meals in West Ham in the parts you know?—West Ham is not London; but it has a fund of its own, and there was one at Liverpool—in fact every place I have known has had something of the kind.

8014. Were the meals given purely gratuitously to children in a state of poverty?—In some cases, and in some cases they paid.

8015. It is rather, perhaps, want of system in the way it is done than any fault in the plan itself, you would say?—I cannot assert that there is a want of system, because I have never taken part in it myself. I have only heard of it incidentally, and that is the impression that I have got; in some cases, at any rate, you find them feeding them one day and leaving them unfed the next day or the next week; but I am not at all competent to criticise either the principle or the management of school feeding. I can only say that it does not cover the ground—it does not do all that is necessary to build the children up.

8016. Then of course it does not apply to the case of the children under the school age?—No, and that is very important.

8017. Have you any experience of the establishment of creches or babies' rooms at schools?—I have never seen such a thing.

8018. I suppose in the schools at Liverpool and West Ham the children come to school pretty young?—Yes, three years old, and younger if they can; and occasionally in Liverpool a child would bring a baby to school to take care of rather than stay at home and take care of it.

8019. Have you special rooms for these babies?—No, it sits on the child's lap in school, and the head mistress told me with great pride that it would eat anything.

8020. (*Mr. Struthers.*) Would you consider that disgraceful on the part of the teacher?—It is astonishing the amount of ignorance there is amongst the teachers. In that case I was very solemn and wrote down on a report form that "the baby must be taken into a crèche" and must not be brought to school, and I spoke seriously about its being given anything to eat, but I had no authority to do it you know.

8021. (*Mr. Lindsell.*) The great remedy you would have would be the educating of the mothers?—Yes, one could get up a movement on an extensive scale with that object. There is an immense amount of effort in that direction; but it is not connected—it does not cover the ground. There is nobody who has a survey of the whole situation connecting the various agencies, and making what is done adequate and progressive.

8022. There is a want of concentration in the whole work you think?—Of concentration and of system, and there are many parts of the works and many sides of the work which are left undone almost entirely.

8023. Have you any plan of your own which you suggest for bringing these things into better harmony with each other?—Yes, a plan which I have been thinking about a long time and which I have only not started because of the difficulty of being an official of the Board of Education. My idea is to form committees to concentrate and connect and foster and direct these agencies and to fill the unoccupied ground. They would fill sociological functions between the teacher and the parent, and they would be a very much needed recruiting and training ground for school managers for whom there is no particular training. The school managers ought under the new Act to pay much more attention to the sociological side of their work. My idea is that you could have one or two committees in the chief centres of population and a central committee in London.

8024. Would those local committees be established by purely voluntary effort or under the direction of school authorities?—That is a difficult question, and I have an open mind upon it; but, after thinking it over, it seems to me desirable to have a slight connection, but not a very definite one. You cannot connect them very definitely with a central authority like the Board of Education, because, if you do, your work is extremely limited, and you want those committees to have a very free hand. And then they must be connected more closely with the local authorities, but not too much.

I think that their membership should be of the following classes of persons. The bulk, perhaps, should be educated women of leisure. I know such women in most of the big centres of industry, whom I have thought of as being willing and able to carry out such a plan, and I think that you must have a number of leisurely people on it, because it will mean an immense amount of new work. There should be representatives of the many bordering societies, such as the leaders of Girls' clubs, members of child study societies, of parents' unions, of charity organisation societies, settlement workers, and so on—those who are willing and able to help and who are already in the field. Then medical men in connection with school work, medical officers, medical oculists, or men from eye hospitals, say, very much interested in the schools; and the sanitary inspecting women, whose work is connected with the schools. I think that you should always ask the educational authority to appoint representatives. Probably the people who would naturally form the societies would be many of them school managers and some of them on the educational authority; but they ought to be formally appointed representatives, and the more representatives they would appoint the better.

8026. From what area would you have this committee to work; would you have it one central body whose work would be through sub-committees and workers in different areas, or would you form committees of smaller areas, acting independently of each other?—It would depend upon the size of the place. These committees would put their information and their help at the disposal of the education authority, and it is to be hoped that the education authority would employ them for certain purposes. For instance, it is very important that the education authority should employ them to go into the school and to watch whether the health of the children of the schools is suffering from such things as bad desks, too early use of books, bad methods of sitting in school, and so forth. That, possibly, could only be done by those members of the committee who were actual school managers. I do not think that the teachers would like the interference of people not formally connected with the school, but I think that the school authority might well authorise a small committee carefully selected to watch the teaching of the domestic subjects, domestic economy, and hygiene, cookery, laundry and housewifery.

8027. But would not that be trenching upon the duties of the authority itself and upon the school inspectors?—At present the school inspectors cannot do it. In the first place they are men, and they have got up a wonderful amount of information about these subjects, but they do not know them as a woman does, even a woman not an expert.

8028. There are some ladies, you know, who inspect these things?—A negligible number, such a small number that they could be left out of account, and they are extremely busy. Although I am specially interested in that side of the work just now I can hardly get time to inspect a cookery centre. I know that the cookery centre and the domestic economy are not helping each other sufficiently. They do not know each other's work. They never compare notes, or have a syllabus, or anything of the kind, or hardly ever in my experience.

8029. You want the local authority to authorise certain representatives on this committee to be present in the schools when this kind of instruction is given?—Yes, such representatives as would be acceptable to the teachers, and of high authority, of course, because you want someone to look at things from a height—from a distance—and survey the whole system; and it is extremely important that there should be somebody to do what no teacher can do; and I never heard of an inspector who could do it—to see that the work is carried on from the schools to the continuation school, from the continuation school to the boys' and girls' clubs, for it is very important that boys should learn about hygiene, and that there should be mothers' meetings. There ought to be classes for the care of children, and home work, talks and demonstrations upon it in public houses, and in the houses themselves, because it is in those places that you find people who do not come to classes. The continuation schools do not see such people, and yet they need those classes and lectures and talks most.

8030. The continuation school is rather distinct from teaching the people in their own homes. You appeal to a different audience, but you would still be teaching the young?—But what is so indefinite is that hitherto the teaching of the people in their homes has been left to churches and chapels, and such things, and voluntary charity, and there has been no connection between the two.

8031. Do you think it feasible to have home classes taught by the school authority: is that what you recommend now?—The school authority might say, "We are quite willing to give you all the apparatus for such a class if you will subject your syllabus to us, and let us know what you are doing in order that we may carry on the work that we have been trying to lay the foundation of in the schools."

8032. Is it your opinion that the attendance at evening schools should be in any way made compulsory if they have left the elementary school?—I think it should be tried. I am not sure that it would be successful.

8033-4. At present a girl may pick up a certain amount of knowledge of household management and cookery at the elementary school, and then go away and forget all about it?—She forgets it entirely, and does not learn the thing she wants. She does not learn anything practical about food values, but she gets long names for different kinds of things—nitrogenous and carbonaceous—and words which I can never remember myself. But she cannot tell you how to make a wholesome meal for her little brothers and sisters, as a rule. She learns to do some very beautiful patching and some fancy darning, and so forth, but she might be taught when she gets to her home to be able to put the bottom of her skirt right, or take the collars off her brothers, and put on larger collars, or refoot a stocking.

8035. We should be very glad to hear if you can tell us any way of improving the teaching of domestic subjects?—I think that it is of practical value in making good servants and where the girls have good, respectable homes and where their mothers have taught them. It is in the very poor, the very bad homes where they do not benefit by it at all.

8036. (*Mr. Struthers.*) Not from any part of the instruction: do you think that it is peculiar to cookery?—It was needlework I was talking of.

8037. But even in the needlework do not you think that it applies to the whole instruction?—Certainly I think that they benefit to some extent. I think that they all benefit in certain ways, and here and there you find people benefit more than you expect. For instance, in a very bad street last week, in Agate Street, I was with an attendance officer and going into the homes, which were all of them very dirty and stuffy, and horrible places—I went into one and the floor was scrubbed, and to my immense astonishment the window was open, and possibly the woman thought I was almost frightened at the open window, because it was such a very unexpected thing. The woman said, "I like the window open. I used to go to school in Battersea, and we learned to have the windows open, and I like the feeling of the fresh air." There you get the air very bad when you don't open the windows.

8038. That is an instance of the effectiveness of the teaching of household management?—That was one in a million upon whom it had an effect.

8039. (*Mr. Lindsell.*) You approve of practical teaching. Are there any faults that you see in the system which you think could be remedied?—Oh, yes.

8042. Take the needlework. You said they cannot mend their own pinafores, although they have learned all this in school. How can we remedy that?—What I am trying to get them to try now is to depart from the old system, chiefly the making of stitches—I do not like to disparage the work of sewing, because they take such trouble, but the result of its being inspected by men is that they pay the most attention to the making of stitches, which is the part a man can get up, and he cannot get up alteration in the making-up of garments.

8043. But the needlework is criticised by ladies?—I do not know how much of it.

8044. And there is a report of the needlework by lady inspectors—it is not the criticising of the unconsidered male?—But these ladies do not know the

conditions of each school. The scheme of instruction in needlework needs to be considered in relation to the special conditions of the pupils. It cannot be directed satisfactorily from the central office. Probably the scheme at present in general use suits the bulk of the well-to-do schools very well, though I think that even in their case more self-reliance in the way of cutting out and fixing should be required of the pupils. But there should be, I think, schemes of a quite different sort for poor schools by which the girls would be required, from the beginning in the infant school, or—if they do not begin needlework in the infant school—in Standard I, to do any piece of work which they attempt entirely themselves. In other forms of manual training, *e.g.*, carpentry, it is held that every piece of work should be the pupil's own work from beginning to end. This is held to be essential if the pupil is to get the greatest amount of benefit, psychological and physical, from the work. In the same way, I think if you are going to develop self-reliance, patience, sagacity, manual dexterity in the girls through needlework, you must let them do the work from beginning to end, and learn through failure how to do it well. At present many schools dare not risk failure, because, most unfortunately, a custom prevails of trying to make the needlework self-supporting. The sale of the garments made is supposed to cover the cost of the needlework materials. I believe that local education authorities seldom actually *require* this to be done; but their regulations are often so worded as to suggest that they desire it, and their inspectors sometimes ask the head teachers to try as far as possible to have no deficit on the needlework. Consequently the headmistress or teachers must do the greater part of the cutting out, to avoid waste of material. The garments made also must be those which are most saleable in the neighbourhood, rather than those which are most educational to the child. In order to follow the plan I suggest the headmistress must have liberty to waste a considerable amount of material, and to turn out some garments which will sell for little or nothing. But I believe her girls will develop into practical, capable needlewomen. The plan is already in practice in some schools. Instead of having their "specimen" given to them, with the hem turned down and tacked, those who follow this plan let the beginner turn down her own hem and tack it. This is really an easier way of beginning for little girls than to begin by learning to make small stitches at once; the turning down of a hem is more like their "kinder garten" occupations, *e.g.*, paper folding. They would never be set to work upon a garment which was too difficult for them to cut out and fix, and they would be allowed to make many attempts at cutting out the simple garment in paper and at length in material. Less time would be devoted to the making of beautiful stitches, and the garments turned out would not be of the uniform merit now expected, but they would have learnt to cut out economically and to make garments by themselves. Then much more might be done in the way of renovating garments. This is a very difficult matter for the teachers. In a school in a very poor neighbourhood the children's clothes are too filthy to be mended in school, and the teachers cannot bring their own garments to be mended by children who are generally dirty and sometimes verminous. If ladies who give away their cast off clothing would send the garments to the schools to be mended or altered before being given away it would be a very great help to the teachers. Two or three well-to-do women could provide a school with enough mending and making-over for a whole year. Instead of that we have ladies forming needlework guilds and making things for the poor, and thus, people of great experience tell us, they cause the poor women to take less trouble for themselves. It would probably be far more useful to give the girls old garments to mend and alter under the teacher's direction.

8045. Besides the usefulness of your committee in the school teaching of those domestic subjects you would put other matters in their hands, arrange for domestic lectures and so on. Have you any further work that you would suggest to the committee?—Yes. May I say one more word about the hygiene. They are so young when they leave—fourteen years—they are such children then I think it right to try and instil principles into them, and it would be more useful to give them habits and precepts than scientific knowledge. I do not think they can take

Miss
Deverell.

in very much scientific knowledge of hygiene, but it would be better for them to form habits where possible.

Then about the arranging of talks and little lectures on the care of children, the home, etc. That has been done to some extent, but in a rather loose and desultory way, and I think it wants to be done under the supervision of somebody who sees the whole ground and who has the whole teaching of the subjects in their view. There is an immense field for women to lecture and teach such people. I find whenever I have spoken to anybody who is working among poor people, they say, "Will you send us a lecturer?" It is done in some parts of the country. I hear of a man in Leeds who is going to their haunts and giving lectures on the moral care of children, or such questions as how to tell them decently about the physiology of birth and the relation of the sexes which they learn in very dreadful ways; and I have known intelligent working men doing it, and after their work they go and talk to people about that kind of thing, and there is also a little set of young men, skilled workmen, who get a little library on such subjects and lend to boys who are growing into men, and so forth.

8046. Do you know anything about Manchester? The Ladies' Health Society which practically is doing this work which you have been describing?—No. I just heard of it years ago, but do not know about its work.

8049. They distribute leaflets on matters about the way of dealing with their domestic arrangements; that is part of the work that you would advocate?—Yes, and then committees would probably find themselves driven to advise the school authorities and to supplement it with a doctor—not to do the work but to call at the homes and show how parents should wash the children's eyes and faces, or clean their hair, or wash out a scratch, and a hundred other little things. They have such respect for a woman who would come and show them these things, and many of them would be glad to do it, and would, if somebody would show them. A good number would not—some never would—some are invincibly careless about anything.

8053. But you would do this work not merely through the agency of the committee, but through the Government officials and societies; and you suggest the local authority official?—Yes.

8054. To assist in the matter?—And I think that they would probably want more women sanitary inspectors and if there was no such thing already, a medical inspection in the schools.

8055. But that would be rather trenching on the work of the voluntary committee, if the sanitary authority took it up?—No, I think that there is an ample field for paid as well as unpaid work, and the supply of unpaid work is always limited; the more you can get done by paid visitors the better.

8056. In Manchester I think that the sanitary authority do subsidise the work?—It would work out differently in different places.

8057. Another thing would be the teaching of the teachers themselves?—That is the most important of all, they can do more than anybody.

8058. Let us hear what you have to say on the co-operation of parents with teachers?—I would get the parents into the schools more, that is entirely neglected in some parts of the country. The parents are hardly allowed into the schools.

8059. But would you not be afraid of some of them assaulting the teachers?—Well that is an impression. They do assault the teachers when they can hardly get in, and then only by stealth; but where the teacher asks them to come in in a friendly way they are very often pleased. They are very much pleased to get somebody to teach them anything about their children.

8060. Would you have the parents in during the school hours?—The plan they try in the district which I am working at present is to have an open day sometimes during the year when they let them walk in and see the classes at work. They are immensely interested and pleased, and it has an effect upon the way in which they help their children. One will say "Look at so and so's child. I should not like mine that way," and they feel proud of their own children and sometimes they are ashamed if their children are not looking as well as others.

8061. You would have a sort of visiting day for them?—It is rather a good thing because it interests them in the school work and they are immensely pleased with it. Personally, I think that it would be a very good thing for a head teacher to invite the parents and to have a little intimate talk with them about the training of their children and the co-operation of home work with the school work. She would have to give them tea, you know, they would not come without, but the managers must provide the teacher with the tea. Hitherto the expense of such things has fallen upon the teacher.

8062. Do the teachers attempt to do that sort of thing at all?—Not precisely that—I have not seen it tried, but I have known cases of schools, where they have had an evening so as to get the fathers as well as the mothers, and where they have given them refreshments, and taken them round and shown them the school work, and had a little social intercourse—that is not so interesting to the parents as seeing their children at school.

8063. (*Colonel Fox.*) The school where I once saw them was Michael Faraday's school, is that the sort of at home you are now speaking of, where all the mothers attended?—That is quite the kind of thing.

8064. It struck me as excellent, for the mothers take an enormous interest in the whole work?—Yes.

8065. (*Mr. Lindsell.*) It would rather vary according to the neighbourhood which might be a difficulty?—Well, say in very poor neighbourhoods, there is a very great deal of gratitude and admiration for teachers very commonly on the part of the parents.

8066. Where they have come in contact with the parents?—Yes.

8067. That is one of the things you would advocate?—Yes. Teachers have said to me, if they had some very homely literature that they could send to the parents occasionally—a little literature telling them what to do when the child had grazed its knee or its heel, or had chilblains or sore eyes, or dirty head, or something of the kind, or of the effects of coming to the school without breakfast, and bringing lunch to school and that kind of thing, and for that purpose I thought of a Central Committee affiliating these local committees, and having one or two of the representatives of the Board of Education upon it. I talked to Mr. Morant about it, and he thought it feasible.

8068. And you would get this literature disseminated by the committee to the teachers, and by the teachers to the parents?—Yes, the committee, of course, would often have teachers on it.

8069. Then the hygienic question, the physical condition of the children—would you utilise the teachers with regard to that—you know, eyesight, for instance?—Do you mean to ask the teachers to wash them.

8070. The children's eyesight—that is very important nowadays, is it not?—Yes.

8071. Would you advocate the teachers being taught how to test the children's eyesight, and that sort of thing?—I do not think that anybody but a medical man could pronounce whether there was any use in teachers testing eyesight. Personally, I think there ought to be an annual visit of an oculist.

8072. An oculist has told us that the preliminary work might be done by any person shown how to do it, and that it would be easy, and of course it would save the expense of having skilled persons?—I have seen the preliminary work done by teachers, but what I find very often is that people are taught that Providence sent the complaint and Providence intended it to remain. In the case of eczema, which is catching, and in the case of serious affection of the sight itself which requires serious attention, the children sometimes stay on in school unless the inspector does something, because the teachers do not recognise it, and even in some cases do not see it, they have got so accustomed to it.

8073. How far, in your experience of teachers, would they be ready and willing to do this, because it would be a somewhat considerable addition to their duties?—My experience is that they are always willing to do what is for the good of the children. The slackers are a very small minority. Most of them are very industrious, and they would be perfectly willing. It does not give much trouble. If you observantly look round the children's

Miss
Deverell.

faces every day, you could put down all cases which need attention, and you could give them to the head mistress, who would forward them to the medical officer or managers, or whatever the right authority might be.

8074. You know, of course, the question of extraneous duties has been rather pressed by the teachers' representatives?—The teachers' representatives do not represent the bulk of the teachers. I can rarely find any traces of that feeling in the schools.

8075. They are quite willing not only to perform the strict letter of their engagement, but to interest themselves in the well-being of the child generally, you think?—Very much so.

8076. They do not wish to take their stand on this being an extraneous duty?—Far from it. This morning I received a letter from a Liverpool teacher not more interested than any others, I think, and she says how glad she would be if anybody could be appointed who would do anything to look after the physical condition of these children. The difficulty is that there is a good deal of pressure of work, and a good deal of monotony of work, and consequently some of these teachers working among the children do not look at the children as a newcomer would, they want pointing out the ways in which they could help the children.

8077. Is there any further observation you would like to make on the subject generally, that you have not put down, or have you anything to say which you have omitted?—No, except that I think, if it is not impudent for me to say so, that it would be a good thing if the Committee were to adopt a scheme something on those lines or on some such lines that would commend itself to them as a useful experiment to try. Personally I mean to do something in the matter. I mean to try to get it started in one or two cases where I have friends very well qualified to help me, and also to try to get an affiliation of the committees, but of course it would be a great help to have the recommendation of this Committee.

8078. From what we have heard, what you want is more organisation and co-ordination between those various benevolent bodies rather than the mere establishment of a new one that is wanted to bring them into relationship with each other?—It would have also to cover a new ground and do new work. One would start by affiliating the existing agencies, and connecting and co-ordinating them.

8079. (*Dr. Tatham.*) You were speaking just now of the loose family system as you know it in the slums?—Yes.

Mrs. GREENWOOD, called; and Examined.

8089. (*Chairman.*) You are one of the Sanitary Inspectors of Sheffield?—Yes.

8090. In the course of this work you have been much struck with the high infant death-rate in Sheffield, in common with some other towns, most unfortunately?—Yes.

8091. And you have arrived at the conclusion, supported by medical evidence, that a great many of those deaths are preventable?—A very large number of them.

8092. What is the death-rate in Sheffield?—201 per 1,000.

8093. That represents an enormous waste of human material?—Yes.

8094. To what should you attribute, in the first instance, this high rate of infant mortality?—Do you mean in Sheffield?

8095. Yes, the place with which you are most closely connected. Incidentally, may I ask you how many years' experience you have had in this work?—Four years and nine months, working continuously in the slums.

8096. And previous to that had you had any experience of this kind of work?—Not in slum work. My husband was a doctor, and it was not necessary.

8097. You were not professionally employed?—No.

8098. Let us turn, then, to the causes, as you term them, of infant mortality, which, of course, is higher in the summer months?—Yes, that is a very important factor; you will find the infantile mortality is much higher when the temperature is above the average.

8080. Do you think that intemperance is at the bottom of some of that?—No. I do not think there is necessarily anything wrong at the bottom of it. I think it is just the custom.

8081. Pardon me. I mean to ask, do you think that drunkenness is probably connected to a great extent with this loose system of family life for instance that you spoke of?—You generally find the two things together. The kind of looseness I mean is not positive immorality, although there is a great deal of that in some quarters. It is rather that the custom of the people is not to be very particular either as to the formality of marriage or as to the sexes living together, but they are very faithful while they are together. But the effect on the children is that they are often living with someone who is not their parent.

8082. We have had evidence of a very sad state of things, of intemperance and drunkenness amongst the classes to which you refer. Is that your personal experience to a great extent?—I have not seen very much of it, but one supposes it must be so, because one does not see where the money would go to otherwise.

8083. I thought you were going to give us some such evidence when you spoke of this conspicuous feature of these areas being not poverty but negligence. You said that often sufficient money was coming in for a decent life if the people knew how to use it. I thought you were going to tell us that it was not because they had not the means of providing their children with household necessities, but rather that the parents being intemperate persons spent the money upon themselves?—Some of them do, and others without being particularly self-indulgent waste their money, and do not know how to buy the food, or how to make the best of it. One finds that they have money, because, for instance, when they assault a teacher they can pay the fines. I came across a case where a woman in Southwark had assaulted a teacher, and she was fined 30s., and she said the next time the attendance officer went round: "I do not grudge it, it was worth that to me."

8084. You spoke just now of your personal domiciliary visits amongst the poor. May I ask you whether you think it necessary to go with someone for your personal protection; or do you think that you are safe in making visits amongst the slums?—Perfectly safe, but I should feel it impertinent to go into a house without an excuse. I go with the attendance officer, and it is an introduction to the people.

8099. Is it not also so when temperature is below the mean—in a cold winter, surely, children suffer more from diseases of the respiratory organs?—I was thinking of the third quarter of the year. I think that the summer heat has a greater effect on infant mortality than anything else.

8100. But is not extreme cold fatal to young children?—Not so much as extreme heat. For instance, the ten years—1881 to 1891, were years of rather low temperature, and the death-rate, the infantile mortality, is not marked.

8101. That is the low summer temperature?—From 1891 to 1901 there were seven summers with abnormal heat, and the consequence was that the death-rate rose immensely, so that the temperature in the summer months has an important relation to the infantile mortality.

8102. You do not attach much importance to the employment of mothers in Sheffield?—No, in Sheffield a very small proportion of the married women work.

8103. It is on that ground, not because you think it may not be a cause in other places?—It may be a cause where it obtains, but it does not obtain in Sheffield.

8104. To what do you mainly attribute the infant mortality of Sheffield?—To the insanitary conditions; and conditions more or less within the control of the people themselves.

8105. Under this head, too, would you include habits of life?—I would. Of course unhealthy surroundings have a very important effect on the health of the people, and tend to typhoid and diarrhoea.

Mrs.
Greenwood.

Mrs.
Greenwood.

8106. Is the drainage of Sheffield bad?—It is bad. First of all there are a large number of rubble sewers. Then there is the privy midden system, and a large number of unpaved courts.

8107-8. Which are saturated with all sorts of filth, I suppose?—Yes, the contents of the midden are turned out on to the court, and the surface cannot be cleansed.

8109. It remains there until it has evaporated?—Yes. The sanitary conditions are shocking in that respect.

8110. How far are these sanitary conditions due to municipal neglect?—Well, there are a large number of unwholesome houses.

8111. Is the municipality of Sheffield quite indifferent?—They are very much behind the times.

8112. Are they doing any work?—They are working to get rid of the privy system, but they have been prevented in many instances by the rubble sewers. They are spending large sums of money, and they have recently obtained a loan of £50,000 for the purpose.

8113. And these adverse conditions are in process of being remedied?—Yes.

8114. Is it being done on a sufficiently comprehensive scale?—I think everything is being done.

8115. They are alive to the importance of the work, and putting their backs into it?—We had a very energetic medical officer who has left us to go to Birmingham, but we have another, who is also a good man.

8116. Can you tell me whether the Local Government Board have at any time brought any pressure to bear upon the municipality?—I really do not know. I cannot speak of what happened before I went to Sheffield. Sheffield is essentially a city of small homes, and they have as many as 15,000 back-to-back houses. These are plans of some back-to-back houses (*handing in diagrams*).

8117. Is this a group of four houses?—Yes.

8118. With four rooms each?—They are three-roomed houses, back-to-back, containing, a living room, called "house place" and two bedrooms, called "the chamber and the garret," one above the other. I have had this little plan prepared showing back-to-back houses (*exhibiting*). *This* is the window, and *this* is the door, and *this one* I had made with a little out-kitchen which gives a little more room to the house.

8119. Is this a ground plan of one house?—It is the ground plan of four houses. Where there is a larger family they think that they will have a little more room by taking a house with an out-kitchen.

8120. That is only one house, then?—Yes, there are, perhaps, two houses in the yard, with these out-kitchens. I find that the health of the people in the houses with kitchens is worse because they get no direct air into the house, and they take away both the sunlight and the fresh air, and we find in them anæmic and rickety children.

8121. How many people inhabit them?—Sometimes eight or nine or ten, or even more.

8122. What is the maximum in one of these?—It is difficult to say.

8123. What is the average of occupants in the houses that you are describing?—I have found families of ten or twelve people in these houses.

8124. In three-roomed houses six is the maximum that ought to be permitted?—Yes, some houses are very small, the size varies so.

8125. What would happen if the Town Council proclaimed at the end of six months that not more than six persons were to live in a three-roomed house—what would be the effect?—I do not know what they would do with all the people.

8126. Could not they redistribute them in the suburbs?—Perhaps, yes, in the suburbs; but in the suburbs the rents are high, equal to the rent of two houses in the centre.

8127. Is the rent in the suburbs higher than in the town?—Yes, because they are not allowed to build back to back three-roomed houses. Most of the houses in the suburbs contain two living rooms and two bedrooms, and sometimes a garret.

8128. You mean they are a better class of house?—Yes, and the people cannot afford it.

8129. Are they building upon plans and under building regulations approved by the City Council?—Yes; but the building bye-laws, even now, are not as stringent as they ought to be.

8130. They do not adopt the Model regulations of the Local Government Board?—No, Sheffield is a very peculiar place. It is extremely hilly and has big gradients and other local peculiarities.

8131. The people are very self-opinionated?—Yes, I am not a Sheffield person myself. There is one insanitary area, for which a provisional order was obtained fifteen years ago, and it has not been cleared yet.

8132. Is the City Council doing anything itself?—It has built a few flats and is trying to build a few more houses.

8133. Has it ever submitted a scheme for any clearance?—No, only the one referred to; it is too expensive.

8135. Do you not think it would be a good thing if some pressure were brought to bear upon a Town Council so situated to compel them to act?—I think that it is a very difficult question, the question of housing.

8136. To place a kind of time limit upon those unsavoury and overcrowded tenements?—I think that more might be done to make clearances without sweeping away whole areas, one or two houses might be taken down to admit air. But they won't do it because of that Clause in the Act, that if a house is knocked down it must be bought and maintained as an open space, in which case the landlord would be benefited, and the ratepayers of Sheffield would have a great objection to that.

8138. Does not the infant death rate move them?—They talk about it now and then.

8139. Is the general death rate high in Sheffield?—It is high also. We had until the last two years serious epidemics of typhoid every year.

8140. Is the condition of the health of Sheffield worse than it was?—I should say that it is improving because those conversions are gradually going on.

8141. But up to within the last few years would you say it has deteriorated much?—I have no means of judging.

8142. Do you think that the people are improving?—I understand that Sheffield is improving.

8143. Was the evidence of deterioration four or five years ago one of the causes which stimulated the Town Council to greater activity?—I think that it was the serious outbreaks of infectious disease.

8144. Has any Mayor or Town Councillor died from these diseases?—I do not know, it is these large epidemic diseases which have led them to deal with this as they have done.

8145. There is no reason from its situation why Sheffield should be worse than other places?—Naturally it is extremely well situated.

8146. Yes, you have the moors all round with very fine air?—Yes, the natural advantages are great.

8147. And it is entirely due to municipal neglect?—Yes, in the past.

8148. But you do not seem to think that they are doing as much as they might in regard to this building question?—It is the opinion of a great many that the Corporation are not pushing on things as they ought.

8149. Because they are not remunerative? But the charges for these epidemics must be considerable?—Many people think that the death rates are very high.

8150. But they do not think so much of the high death rate as the high pecuniary rate?—They seem to be doing something now.

8151. Will you turn to the causes that are due to, or more or less within, the control of the people themselves. Do you attach importance to their rooted habits as being among those causes?—I do largely.

8152. Do you see any way to get rid of those habits. Don't they prefer to pig it?—A great many of them do. They would not live in better houses if you provided them. As soon as one very unhealthy area is pulled down containing very insanitary surroundings they move into the next place, a shade better perhaps.

Mrs.
Greenwood.

8153. Where they can maintain their tradition of filth ?—Yes. And often when they go out into the suburbs they carry their habits with them, and they have to be visited.

8154. Have you any feeling towards better things amongst the rising generation in respect of these conditions ?—There is certainly an improvement in Sheffield during the last five years.

8155. Do you think that the young married people when they begin housekeeping, would naturally prefer decent surroundings ?—They desire them more than they used to do. The people complain of things in a way they used not to do. For instance, the abominable smells; they are beginning to realise that they are not obliged to live under such conditions.

8156-7. Is that the effect of training in the elementary schools ?—Do you think that there has been a general elevation of the people from that ?—I have not much opinion of the training in the elementary schools.

8158. You do not think it good ?—Many of the women have forgotten how to read. Before I give a paper of instructions on Infant Feeding, I always ask "Can you read." The doctors at the Children's Hospital always ask the mothers "Can you read," before giving written instructions.

8159. You think that it should be represented to the school authorities to give more attention to these subjects ?—Yes. I should like to see something done.

8160-1. Do the people resent instructions, now ?—No. On the whole it depends entirely how you go about it. I have been working nearly five years in Sheffield.

8162. Do you distribute leaflets ?—Yes; "On the Care of Infants and Children." Also with regard to the cleansing of heads and a warning with regard to fires, showing a picture of a fire guard, but I have never known them to buy the guard recommended.

8163. Could the City Council enforce the use of fire guards ?—I have never heard of such a thing.

8164. Would it be resented if they tried to do it ?—I do not see how that could be done unless it was put into the building bye-laws.

8165. Are many children overlaid in Sheffield ?—Occasionally.

8166. Is that often done intentionally ?—That I should not like to say. It frequently happens on a Saturday night.

8167. When they are drunk, I suppose ?—It is largely due to intemperance.

8168. It would be difficult to insist upon a small child being put into a cot, as it is very often taken into bed for motives of warmth, and whatever the consequences may be that is a praiseworthy object, is it not ?—Yes. The deaths from accident are largely due to burning and drowning in the dolly tubs which are used in Sheffield. When the child overbalances itself there is no chance for it, and it is drowned.

8169. Is there any indifference to the care of their children, or is it more owing to ignorance that this comes about ?—It is largely due to ignorance. Of course there are a large number of cases of neglect. The Society for the Prevention of Cruelty to Children take up those cases.

8170. Have they often to see to those cases ?—There is a great deal of work done. There are two inspectors in Sheffield, and it is considered rather a bad place for cruelty to children and animals.

8171. Have deaths of children been the subject of investigation ?—That is a point I am glad to have an opportunity of speaking about. The number of non-certified deaths is higher than in any other town in England. From 1st January, 1904, to 6th February, 1904, there were 43 non-certified deaths, 16 of children under 1 year, 3 of children from 1-5 years.

8172. And they should be certified ?—Yes. Every child under five years of age.

8173. And still births should be registered, too ?—I should say it would do a great deal of good.

8174. Now do you take any steps to ascertain the fact of babies being born, or is it brought to your knowledge, so that you may correct parental neglect from the

outset ?—Since November last a visit has been paid to every house where a birth has taken place in three districts of the city. Now that the City Council and the Education Authority are one body, they can get the list of births by paying the Registrar for them.

8175. You register them some weeks after birth ?—Generally when they are between five and six weeks old.

8176. A good deal of damage may be done in that time ?—I have not found it so.

8177. Do many of the mothers suckle their children ?—A large proportion. I have advised the Medical Officer and the Health Committee that we should visit the births all over the city, and if possible to give a second visit in three months' time. Out of 725 infants visited within a week of registration, 572, or nearly 79 per cent., were being fed on the breast only; 106, or about 14½ per cent., were having the breast with other food, and 47, or nearly 6½ per cent. were entirely hand-fed. I think you inquired as to whether the mothers went out to work. Well, it is not owing to that that the women were not able to suckle their children, because not more than 1 per cent. of the mothers were working.

8178. Do you think that opportunities of infant insurance operate adversely to infant life ?—I should not like to say. It is very universal, advantage may be taken of it sometimes, but I do not think that it influences the Sheffield mother generally.

8179. What have you to say about water supply ?—We have a beautiful water supply.

8180. Is it easy for the parents of the children of the working classes to get milk if they want it ?—That is a point upon which I should have liked more information. It is wonderful how little milk is used. It is appalling.

8181. Is it because they cannot get hold of it ?—They cannot get it in the way you get milk in London. You see very few dairies in Sheffield. The milk comes in from farms at certain times and the man has a certain amount, you do not find a dairy in every street as in London. I was living in a suburb, and I found that it had to be ordered in the morning.

8182. There is no municipal organisation ?—No.

8183. And no charitable organisation has taken up the work of getting milk for the poor people ?—No, there is a good deal being done to ensure that the milk is supplied clean, but our law is not very stringent.

8184. But you do not think that the children are given much ?—It is rare.

8185. What do they get: is it tea and bread and butter ?—It is tea and bread and butter.

8186. And rancid fish thrown in at times ?—Yes. This is a house I visited the other day: "A back-to-back house, occupied by a man and wife, and five children. Eldest boy, twelve—another boy, ten, diseased spine—girl, three, small—a child, seventeen months, cannot walk—and baby, ten weeks. Diet of child who cannot walk—was weaned at three months, and fed on bread 'pobs,' (that is bread, boiled in water for an hour to get the barn, that is the yeast, out of it, and a little milk added), and a pennyworth of milk daily up to about twelve months, when no more milk was given. Lives on bread and butter and tea—dinner same as others—is always eating bread and butter. A pennyworth of milk now taken daily for the whole family." There are five or six slices of bread given between breakfast and dinner, and perhaps three or four slices in the afternoon.

8187. (Dr. Tatham.) They do get some butter ?—Bread and butter and dripping. It is not uncommon to find three children in one house not able to walk owing to rickets.

8188. (Chairman.) Have you much rickets in Sheffield ?—Yes, the number of deformed people is something terrible.

8189. That is associated by some witnesses with the factory work of mothers ?—It may be so; but it is not so in Sheffield.

8190. It is due to other causes there ?—I am told by the matron of the children's hospital that they are not so bad as they were.

8191. How long have you had your present water supply ?—I do not know.

*Mrs.
Greenwood.*

8192. That ought to have improved it, if there was plenty of lime in the water ?—I do not think that the lime in the soft water has much effect upon rickets ; I think it is lack of sunlight and fresh air, and bad feeding, that is the cause.

8195. I see you say here that one of the things is that the sanitary authorities should ensure the purity of their milk supply ?—I think that they should do that.

8196. But still if children do not drink the milk that would not matter ?—But the children have a certain amount of milk, and of course it is very necessary that they should have it pure.

8197. Do the Sheffield children use that abomination called the indiarubber nipple ?—It is universal.

8198. That has a disastrous effect upon the size of the jaws and upon dentition when the jaws are supple ?—I think that it is a most injurious thing.

8199. Cannot you take steps to prevent that ?—We can only advise, and we are continually advising.

8200. And it has not lessened ?—Unfortunately they do not carry out what we tell them.

8201. They think that they know as much as you do, or more ?—Yes. Sometimes where I see a very bonny baby, I say, “ You give him the breast,” and the mother replies, “ He won’t feed.” They try to make the babies eat.

8202. He won’t eat a beef steak, will he ?—It is the habit to give the baby a taste of whatever is on the father’s plate. There is a superstition that if the baby tastes everything the mother eats her milk will not disagree with the child, and therefore a taste of everything is given and the child’s taste vitiated, so that it will not afterwards take milk.

8203. You are doubtful about the value of municipal crèches apparently ?—I am very doubtful about it, or of anything that will relieve the people of responsibility.

8204. But if you make them pay you can enforce that responsibility ?—Yes.

8205. An eleemosynary treatment of the subject would be disastrous you think ?—We have one crèche, but it is managed in a way I could not approve of by an ignorant midwife, who feeds the children just in the same way as the ignorant mothers do.

8206. Do you find that on the whole there is an improvement in infant diet ?—Yes.

8207. Have you got a sufficient staff to bring it home to the people ?—We are getting rather over worked ; first of all we found the houses so filthy in Sheffield and we had to try to get them cleaned.

8208. Have you tried to bring the responsibility home to the landlord ?—All structural defects are referred to the landlords by the men inspectors. The women inspectors deal with the tenants and endeavour to make them keep the houses clean. The tenants are responsible for whitewashing and papering and cleansing the premises, and we have done a great deal in that way ; there is quite a marked difference in the courts and houses since our work was started.

8209. You can threaten them with penal consequences ?—It is very difficult to enforce it.

8210. Can you enforce it ?—Every tenant of a court would have to be summoned, and it is an extremely difficult matter to enforce such a thing, especially in a large court of thirty houses.

8211. But that court system has been abolished ?—No, the court system still obtains, but they are being better paved, and the sanitary arrangements are better.

8212. You do not believe that much can be done in the way of instilling a knowledge of hygiene in school. You think that should be done afterwards ?—Pardon me. I say what is taught is not having the effect that it should have.

8213. You think that the teaching in the school should result in something better ?—Yes. The children are taught like parrots in the elementary schools. Many of the teachers are ignorant and have a low standard. The schoolrooms are only scoured three times a year, and in the low parts of the town

you can imagine the state of the boards. Personal cleanliness is not insisted upon as it should be. I find children in a most filthy condition going to school, and they are allowed to go with sore heads. Some of the teachers are very fine men and women, but, on the whole, the ability of the average Sheffield elementary school teachers is not high.

8214. A good many things might be done in schools which are not at present done, you think ?—I think so.

8215. Have you any scheme for preventing what is learnt in school being lost before the girl reaches the age when she undertakes family responsibilities ?—It would be a good thing for them to go to continuation classes.

8216. That is a subject we have considered. Could you not make it obligatory upon girls from fourteen to sixteen to attend twice a week continuation classes, where subjects of domestic economy and household management would be taught ?—Yes, I should think that would be very good indeed.

8218. And a great many in their homes might apply during those years the lessons they have learned in the continuation classes ?—Well, they learn them like parrots. They are not taught in a practical way. For instance, the girls are told that nurseries must be ventilated. These people do not know anything about nurseries. They want to be taught in a very simple language.

8219. You want the children to see the principles that they acquire carried out ?—Yes.

8220. Would the school teachers in Sheffield raise any difficulty ?—Many of them do not know how to deal with the dirtiness of the children, or what powers they have to deal with it. They do not even know that they may exclude children from school for that cause.

8221. Will they not be informed about that very shortly ?—That is what I suggest—they ought to have instructions given them.

8222. You think that there is an awakening of the public conscience ?—I do not think there is. I have talked with teachers and others, and a great many of them do not realise the state of the children.

8223. You regard the concentration of all the functions of the municipality in one authority as an improvement ?—It might be better. I do not see this difference.

8224. The same authority is now responsible both for the health of the town and for the education of the town, and surely education will now be made contributory to the health of the community ?—There is the machinery if they would only use it.

8225. You think their being one authority should make it easier ?—It should be easier.

8226. You would expect it to be so at any rate ?—Yes, I should think they would co-operate. But in Sheffield there is a great severance between the people who are doing the work and the different members of those bodies. So far as I know, for instance, there are no means of the head teachers coming in touch with the Educational Committee. There are no managers as in London, and I have known cases where the head teachers have asked to meet the School Management Committee, and it has been refused, everything has to go through the inspectors—there is so much red tape.

8227. This discourages the teachers when they get no sympathy or support ?—Yes, I have known teachers almost break down altogether. Until I went there they said nothing had ever been done to help them in dealing with neglected children. In May last I suggested to the medical officer of health that the Education Committee should be communicated with, and that a circular should be sent out to the head teachers asking them to report to the Health Office cases of neglect and of sore eyes ; some of the teachers have responded, and they have written how thankful they were, others have been quite indifferent and made no response.

8228. Has the school authority had any medical officer ?—Only for the examination of defective children.

8229. You attach importance from this point of view to the medical inspection of schools ?—Yes, children are at school who ought not to be there, and others are at home who ought to be at school.

Mrs.
Greenwood.

8230. (*Dr. Tatham.*) I have one or two questions to ask you about infant mortality, which I believe you have given a considerable amount of attention to?—Yes.

8231. You spoke of the mortality of a single year—1901. You state it to be 201 per 1,000 in Sheffield?—Yes.

8232. That applies to the whole of Sheffield?—Yes. There are parts very much higher.

8233. Very much higher indeed?—Very much higher. It is as low as 112 in one district, and it goes up to 234 in another, in the worst district.

8234. Can you account for that enormous difference?—Yes, one district is in the best part of Sheffield, the residential part, with beautiful houses and gardens, well-cared for children, with nurseries; and the other is in a slum quarter with small back to back houses, and insanitary privy middens, and with the very ignorant mothers. In north Sheffield, behind the Old Church, in the Crofts, and all round Edward Street, and Scotland Street, the death-rate is very high—also off Broad Lane and Ecclesall Road.

8235. There is nothing in the climate that causes this amongst the children?—No, it is healthy.

8236. Otherwise you would not have 112 per 1,000 amongst the well-to-do children?—No.

8237. You spoke of the question of milk. That is a matter we have had a good deal of evidence about here. Do you really think from your experience that practically the children of the poor do get much milk at all?—I do not think they do. I am surprised to find how little milk they take for a whole family. They do not realise that milk is a necessary food for young children. It is very difficult to make them understand it.

8238. Do they use tinned milk?—Frequently they do, and unfortunately machine skimmed milk.

8239. Do you mean separated milk?—Yes.

8240. Now you said that the children do not like the milk?—Yes.

8241. Is that because the milk itself is decomposed?—No, because they are taught to drink tea from infancy, and they lose the taste for milk because their taste is vitiated by the mothers, not intentionally, but ignorantly. I asked the matron of the Children's Hospital, "Do you have any difficulty with the sick children in getting them to take milk?" and she said, "Not after the first day—they take it after the first day or two."

8242. And they get to like it again?—You mentioned about the keeping of the milk. They have no proper pantries in the houses and the food is generally kept in the cellar-head.

8243. Is milk sold at a prohibitive price in Sheffield?—No, about 3½d. per quart for new milk.

8244. So that the ordinary Sheffield artisan who earns comparatively high wages would have no difficulty in getting the milk on the score of expense?—That is so.

8245. Is it simply a bad habit and ignorance?—It is ignorance.

8246. Are there any voluntary associations working in connection with the poor in Sheffield to teach them how to cook?—There is a Neighbours' Guild Association which is working, and the Croft Settlement in Garden Street. Of course, there are mothers' meetings, but there is not any extensive work amongst the poor. There are a certain number of girls' clubs, but there are large tracts in Sheffield which are left—poor neighbourhoods with poor churches—with very little visitation at all by voluntary workers. There is no charity organisation, and no central organisation, and the charities are very apt to overlap.

8247. You have nothing corresponding to what exists in Leeds and Manchester and one or two other towns. Would you welcome them?—I would welcome every voluntary or charitable agency, and it has been my endeavour to get in touch with those that exist and to bring cases to their notice.

8248. Is the age of marriage of young persons very low in Sheffield?—Yes.

8249. What is the age of marriage?—Seventeen to twenty-one years of age.

8250. Are there more at the lower age—do they not marry very early?—Often the husband is not twenty-one.

8251. And even considerably less than that?—From eighteen years of age upwards.

8252. What I have heard is that it is frequently less—Yes, sixteen, and seventeen, and eighteen.

8253. Do you trace any ill effect upon the children to that fact. Are young mothers less able to look after their children?—Yes. When I was tabulating in 1901 the deaths from infant diarrhoea I noticed the large number of first children who died which pointed to maternal inexperience. I could send to you the proportion of first children who died.

8254. That would be very interesting, and we should be very glad to have it?—I will make a note of it.

8255. From what causes did you find those children die—the first children of the young mothers?—The work that I did was in connection with summer diarrhoea, so that I have no statistics with regard to the mortality in other directions—out of the number of children so many were first children. I was very much struck by it.

8256. With regard to the prevalence of rickets in Sheffield, have a very large number of the children died of rickets?—No, comparatively very few. During ten years the deaths were only 114.

8257. Out of what number?—In ten years, under five years of age, there were only 114 deaths from rickets in Sheffield. But they are increasing in number. I think that more attention has been directed to rickets than was the case formerly; but the rickety children die from other things—from bronchitis and convulsions.

8258. They are more easily a prey to diseases like pneumonia and bronchitis, and to infectious diseases?—Oh yes.

8259. Has consumption been very prevalent amongst young children?—No.

8260. Tuberculosis, I mean?—Of course there is meningitis, and what is called consumption of the bowels. There is more care taken in specifying these cases than formerly.

8261. But the notification does not apply to phthisis and consumption?—In Sheffield it is compulsory.

8262. Notification of phthisis?—Yes, for seven years. It has just been started. It was in the last Corporation Act.

8263. That is the first time that it has been done in England then?—Yes.

8264. (*Chairman.*) There are some things in which Sheffield is a pioneer then?—Yes, on that point.

8265. (*Dr. Tatham.*) You do not seem to have a very great opinion of the elementary schools?—No, I find so many children, in visiting from house to house, in a terribly verminous and neglected condition, and I have said to myself, How can the teachers permit it? Then the cases one reads of, as being prosecuted by the Society for Prevention of Cruelty to Children, are all going to school. They are not reported by the teachers, as they should be.

8266. They have got to educate the children. Unless they are so bad that they are a danger to the other children they cannot take steps to prevent their coming to school?—But those children are a danger to the other children. They are not fit for any decent child to sit beside. I read this paper on the mortality of infants and children to some of the head teachers, and asked them to report to me any bad cases they had, and many of them did. My point is this: how can you teach a child the necessity of cleanliness if it is swarming with vermin? Surely the first thing that should be insisted on is personal cleanliness.

8267. They can send them away?—They should be excluded over and over again, and if the mother does not send the child to school in a fit condition she ought to be prosecuted.

8268. (*Chairman.*) Is that often done?—It is not done much.

8269. (*Mr. Lindsell.*) You say the schools are so dirty—are these the board schools?—Yes, the board schools, which now all belong to the Council.

Mrs.
Greenwood.

8270. I thought that they rather prided themselves on the extreme efficiency of their schools?—I do not say anything about the efficiency of the schools, but the schools in the lowest part of the town are not scrubbed more than three times a year.

8271. Do you know that the teachers do not endeavour to impress the value of cleanliness upon them?—I should not like to say that. Some of the teachers are splendid, and the interest they take in the children is wonderful, but I do not think that a great many of them know how to do it. I think that more care should be taken in the training of the teachers. I should like to corroborate what the last Witness said, who recommended that instructions should be given to the teachers about eye complaints and sore heads, and so on. I think that a great many of them do not know how to deal with them. But I do not think it is unwillingness.

8272. But do you not think that the school visitors would do this?—There are no school visitors. There are no managers like you have in London.

8273. Do they not appoint managers?—Now I think of it each member of the committee is supposed to have a district, but I do not fancy that they visit very largely in the schools.

8274. Do you find that occurs in the voluntary schools as well as in the council schools? Do not the voluntary schools take any interest in the children's condition?—I cannot speak generally. My work is in the very poor districts. I think the code enforces the same instruction upon children in rural districts and in towns, and the child of the respectable artisan is taught just exactly the same as the child out of the slums, and it seems to me that the child from the slums requires special care, special instruction, and special means for cleanliness. I should like to see baths in schools in low districts.

8275. Have you swimming baths attached to your schools in Sheffield?—I do not know of any.

8276. (*Chairman.*) Is not the Baths and Wash-houses Act in operation? Are not there free public baths?—Not free. They are having baths in connection with the defective children's centres in the dirty parts of the town.

8280. Is there any improvement in the school children in your experience?—It is only recently that I have taken up any school work, so that I could not say whether there has been any deterioration or improvement.

8281. (*Mr. Legge.*) I only wish to go into a little detail with regard to the point you have already raised, that is to say, having special schools for districts in towns. Are you acquainted with other towns besides Sheffield?—No; not with regard to slum work, I am sorry to say.

8282. Have you lived in any other town?—Only in London and in Surrey. I have not lived in any other provincial town.

8283. You are not aware of a particular class of school known as the Day Industrial School?—No; I am not.

8284. The object of that is to take the very lowest class of children who cannot be got to attend schools, who play truant, and they are subjected to a special curriculum; they are given their meals in the school, special attention is paid to their cleanliness, they are given a half day's schooling and half day's industrial training at simple kinds of trades or employments, the girls at laundry work and cleaning up and helping in the kitchen, with demonstration classes and so on; is that the sort of scheme you have in your mind?—Yes, quite. I have never heard of it before; I should say it was a most excellent thing. That is quite what I should think is wanted in the lowest, the slum districts.

8285. In the lowest districts do you find that there are a number of mothers who keep their houses fairly well?—Yes, in every district, it is curious. I think the children would have to be selected for these schools possibly.

8286. Do you think that it would encourage such mothers to keep on in their good courses if they were allowed to have their girls out for half-time employment at home in domestic occupation for a certain number of days in the week?—Do you mean would it help the untidy mothers if they might have their girls at home?

8287. No, would it help the good mothers to continue in their good courses if, as a reward for keeping a good house, they were allowed to have their older girls of say, thirteen years of age, half-time at home for domestic employment?—I think there are a very great many mothers with large families who would find it a great help if it could be done.

8288. Do you not think there would be a great inducement to a woman to keep a decent house if, after satisfying the managers of the school that she had a decent house, she could obtain this privilege?—It seems to me if the woman keeps her house clean without the help of the girl she probably would not want to have her at home to help.

8289. It must be a very severe strain on many a woman?—Yes.

8290. One wants to remove as far as possible any feeling of prejudice in the minds of parents against school attendance?—Yes, quite so.

8291. And if the girl could attend half-time at school for the literary side of her education she would still learn a good deal?—Yes.

8292. And there is the practical training which she would get in a good home to be considered?—I see what you mean.

8293. It would be better for her than anything you could produce under artificial conditions?—Yes. You mean there should be this other sort of school for the children of mothers who seem incapable either of keeping their own houses clean or of teaching their children?

8294. These would be schools where children have to be dealt with because they come within the meshes of the law for actual truancy in the legal sense of the term?—It would only apply to truant children.

8295. Yes, but this last suggestion of mine is to meet the case of an ordinary school in a poor neighbourhood?—You mean would it induce the women to keep their houses better in order to have their children at home?

8296. Yes, licencees and half-time employment in domestic work?—Yes, I think possibly it might, I think that anything which would induce the mothers to make a special effort to keep their houses better would be a good thing.

8297. (*Colonel Onslow.*) You are described as a sanitary inspector of Sheffield?—Yes.

8298. Are you appointed by the Corporation?—Yes.

8299. To whom do these back-to-back houses which you have given us a plan of belong as a rule?—To various owners—to the city councillors and various private owners.

8300. Are they small or big men?—The women inspectors have no means of finding out. Most of the rents are collected by agents, and it is only when there is some structural work to be done that the sanitary inspector comes in contact with landlords.

8301. What is about the rent of these houses?—They may be from 3s. 6d. up to 4s. 6d. or 5s. 6d., these three-roomed houses.

8302. Are the people who occupy them people earning good wages or of the loafer class?—You will find them all over Sheffield occupied by artisans, and by people of all descriptions.

8303. It is not confined to the poorest?—No, you find some people living in those three-roomed houses who are well-to-do. They have no standard above that. But they are well off.

8304. They are getting from 30s. to 40s. a week?—More than that—£3 or £4.

8305. Iron and steel workers—skilled men?—Yes.

8306. When you have found insanitary conditions prevail do you report them?—Yes, and all structural defects we report to the district inspector.

8307. Such as defective midden privies and so on?—Yes, all those we continually report. As a matter of fact they have the worst of them pretty nearly all in hand. I mean they have an amount of work in the office which will take them several years to get through.

8308. If you report them or they are reported to the Corporation so that the effect on the rates would be serious, surely the Corporation would compel the owners to put

Mrs.
Greenwood.

things into proper repair?—The Corporation pay one-third towards the conversion of these middens.

8309. Need they do so?—I think that has been settled now by a Corporation Act in order to get it done.

8310. Could not the owners of these houses be forced to put them into a sanitary state under the existing law?—I think they could, but they have not done so. The Corporation is paying one-third now.

8311. It appears very unfair on the ratepayers generally that they should have to take their share when it is really the owner of the property who is to blame?—Yes, but that was done before I went to Sheffield. I do not know what circumstances brought it about.

8312. It may be because of the drainage?—I think it is very likely that that has to do with it.

8313. There being practically no main drainage?—Yes.

8314. With regard to the women workers whom you have mentioned in this pamphlet, you lay considerable stress upon their being well instructed?—The workers amongst the poor?—Yes, I do.

8315. The women inspectors, visitors of voluntary associations, etc.?—Yes.

8316. It is also very essential that they should be specially fitted for it from the point of view of tact and so on?—Yes, I do think that.

8317. That is even more important than knowledge which to any educated woman is natural?—No. I think it is better to have an educated woman to talk to them—of course she wants to know with regard to food and so on: she wants to be able to tell the women the reason why they should do this or that.

8318. The most of the married women who have been mothers themselves—or even unmarried women of the upper classes—would have learnt a good deal?—Yes, they would. In Manchester you see the work which is done by the Ladies' Health Society is done by superior working women. There again in Sheffield my assistants are women of the lower middle class. Several of them have only had a board school education, and I know that they have not weight and influence with the mothers; they have not the respect for what they say as they have for an educated woman who comes there.

8319. A lady in fact?—Yes. My colleague and I have found very little difficulty in dealing with the women, and I know that my assistants have had a difficulty. I know they do excellent work. I do not say anything against the work they do; and I know they try to qualify themselves, but it is not the same. I think that no one appreciates the difference so much as the working class people. I think they take very much more notice—I know they do—of what is said to them by a lady.

8320. They take more notice of what is said by a lady than of the best instructed and most tactful woman of their own class or a little superior class to themselves?—Yes. I do not mean that they do not do good work, but it is not to be compared I think. Then again the lady who comes down sees the reason why, and her knowledge is able to be made use of. With other people their knowledge is not available; they do not know how to make use of the experience they have gained.

8321. (*Mr. Struthers.*) The board school visitors that you speak of are paid, I suppose—the women of the lower class that you spoke of as visiting these homes are paid for their work by some association?—I did not speak of any in Sheffield.

8322. You said in Sheffield for the past three years house to house visitation has been going on in certain districts?—Yes, I mean by the women inspectors—my assistants.

8323. I thought perhaps it was some voluntary association, corresponding to the Manchester Ladies' Health Society?—No, this was by the women inspectors.

8324. You do not think that work is enough in itself?—I think that it is very necessary.

8325. Yourself and your assistants visit these houses and instruct these mothers as to how to take care of their children and how to feed them properly?—I think it is very valuable work, and there is no doubt that a great deal has been done in Sheffield. Take, for instance, a

simple thing like the type of bottle the children use. We are always trying to instruct the women not to use the tube bottles, but the others. Chemists now tell me that there is more demand for the boat shaped bottle than before. It is in that way that one can find some notice is being taken of the educational work which is going on.

8326. Have you sufficient staff for that purpose, at present, to do the house to house visitation in really necessitous and slum districts?—No, one cannot do more than a certain amount. Hitherto we have dealt with cleanliness and getting the houses whitewashed and so on. Then there is the feeding of infants and also the care of children and the cleansing of the courts.

8327. Do not you think the feeding of infants and the care of the children is sufficiently important in itself to have a special staff allotted for that purpose?—Yes.

8328. Not to be distributed over a town, but to certain districts?—Yes. That is what I told the Medical Officer of Health—that I thought it was very important work, and we had better direct our attention more to that than to some of the other things.

8329. You think that by a staff which gave its attention mainly to this matter in certain districts of the city, you could effect a very considerable improvement in the habits of the mothers as regards the children?—Yes, I think so. I think if that teaching was enforced in schools in a practical way it would be of advantage.

8330. That is the point I was coming to. You think that all this direct instruction of the mothers in their homes, which you speak of, would be insufficient without some further teaching of the children?—I certainly think it is desirable that the children should be taught in the schools.

8331. Do you know when the children leave school?—Fourteen.

8332. At the latest?—Yes.

8333. They may leave earlier?—Yes.

8334. The children of the classes you are speaking of are probably very irregular in their attendance?—Yes, they are.

8335. And at fourteen they have not acquired any great command of the three R's?—No.

8336. Indeed, you told us, I think, that you had come across in your visitation, mothers who cannot read?—Yes.

8337. Who have, presumably, gone through a Board School education?—Yes.

8338. Would it not be rather a pity to take away from the school time to give practical instruction of this kind in the school when the time is all needed for their ordinary school work, especially when you consider that you are going to have this staff of special visitors visiting the mothers later on?—I think that the early years of the child's life are the most impressionable and I think that the children are taught many things, perhaps, which are not of nearly so much use to them.

8339. Have you made some inquiry on that point, as to what is actually taught in the schools?—Yes; and I had a book sent to me the other day, by one of the head teachers, of a course which is taught in the schools, in which infant feeding was touched on, and the value of foods, and the reason why we take this, that, and the other; and I noticed the long words and the various physiological facts.

8340. Was this book for the use of the children, or for the use of the teacher?—It was a note book of notes which the child had taken during the lessons. It struck me then that it was not as practical as it might have been. There was a good deal of material which was burdening the child's mind, with very little practical use. More practical instruction might be given, and more demonstration.

8341. That is to say, the instruction was good enough but it might have been better done?—Yes.

8342. Was it of the proper kind?—Yes, but there was not enough with regard to the feeding of infants, I do not think that it was full enough, and I do not think there was sufficient reason given.

8343. Have you thought of this point, that a girl leaves school at fourteen, and goes into various odd occupations, and has nothing to do with the keeping of a house until she marries?—That is a very great drawback.

Mrs.
Greenwood.

8344. Then you do think that the school teaching which you would give her in household management would reasonably affect her after-life, or do you think she would forget it all?—She does forget a great deal.

8345. Considering these mothers you speak of have for gotten how to read after, undoubtedly, having been doing very little else for seven years, do not you think it much more probable that they would forget what little household instruction they got?—I have come to the conclusion that these women who cannot read are very largely drawn from that class who have evaded the school. I do not mean that a girl who attends regularly at school would absolutely forget how to read.

8346. You think that is impossible?—I think that she belongs to the careless class which it is so difficult to deal with, who forget absolutely how to read—either they were ill, or something prevented regular attendance.

8347. Those you want to meet are just the careless ones who forget one thing just as much as the other?—Yes. Then there is the point of the value of cow's milk as a food for children, because it contains material which builds up the tissues in a way which no other food does; and there is the object lesson in the kind of bottles to be used. Then the child should know that mothers' milk is the best food for all young—all animals are brought up on it. I cannot help thinking that that would run to their minds afterwards, when the sanitary inspector visits them.

8348. You think it would?—Yes, if the elder girls were taught that.

8349. The house to house visitation is the much more important thing?—I cannot say it is much more important. I think both things are important.

8350. Let us assume that they are both important, but which is of the more practical importance?—I think the house to house work is most important. It cannot be done away with. I should consider every agency—for instance, the utilisation of girls' clubs and mothers' meetings to educate people.

8351. Suppose you had two alternatives, one the house to house visit without the instruction of this kind in the school, and the other the instruction in household management in the school without any house to house visitation; which do you think is likely to produce the better effect?—I think it is better to visit the houses where the births take place.

8352. You speak of the sanitary authority requiring to have their hands strengthened by the passing of the new Public Health Act, which will bring provinces up to date and in line with Scotland. What is the point you referred to there?—There was not any special point, except that the Scottish Act is very much more up to date than the London Act. I would strengthen the hands of the local authorities in dealing with insanitary property.

8353. Can the sanitary authority in Sheffield visit the schools and inquire as to whether they are sanitary or not?—No. At least I do not know whether they would have the power, but hitherto all the visitation of schools has been done by school inspectors appointed by the local authority, and also the Government inspectors. There are three inspectors in Sheffield, I think, who continually visit the schools.

8354. But the sanitary authority has no power to send their official into a school?—I do not know whether they have or not.

8355. That is a point which is worth clearing up?—Yes. I have been wondering whether anything could be done.

8356. If the condition of schools in Sheffield is such as you have told us, I should have thought it was rather a matter for the sanitary authority to have made inquiries about it?—Quite so.

8357. And if they had not the power it would be known that they had not the power and they should try to get it?—I think the inspectors think that cleaning three times a year is sufficient.

8358. But you do not think it is sufficient?—No.

8359. And you, as an official of the sanitary authority, might have reported this fact to your authority, who might have visited the Board School, or instructed you to visit it?—Yes. It is only quite recently that I have found out. I have been making inquiries quite recently about it.

8360. Then as to the actual things you would teach in school. I suppose this special instruction in health and feeding and dressing and washing of infants, you would confine to the older girls?—Of course the teaching of the washing of infants will have to be confined to the older girls, but there are a great many things which can be taught from the very beginning, such as cleanly habits, habits of self-control—things which I know in all well-ordered homes they are taught as babies—they learn them automatically. Amongst the poorer classes that is not so, especially in Sheffield, and I think that a great many things might be taught the children—you could hardly put them down?

8361. You say in good homes the children are brought up to do these things at a very early age automatically?—Yes.

8362. That is because they are in the home all day—or at least in connection with the home all day?—Yes.

8363. Do you think that a teacher with fifty, sixty, or seventy children before her can possibly affect them in the same way as a mother could do at home?—No, I do not think they could.

8364. Do you not think it is a matter of improving the homes again?—I know that in America they deal more in detail at the school. They teach them the necessity of washing the ears, and the teeth, and the reason why they should have their hands washed regularly before meals.

8365. It is very easy to do it as part of the school work, but it simply goes buzzing through the child's head, and becomes like the catechism?—I see the difficulties.

8366. All instruction of that kind is much more effectively done at home than through the school?—I quite agree with you.

8367. But there are some things which might be taught in the school, such as teaching the children the proper methods of breathing, and some attention should be paid to physical culture—I suppose you mean physical exercises in the school?—Yes, and certainly the position in which the child should sit, and that it should breathe through the nose instead of through the mouth.

8368. You would insist upon that?—Yes.

8369. There is a scheme in preparation which I think will make that the rule in all schools—that is to say, if it is carried out. Then you suggest that in connection with every school there should be a model workman's cottage, and every boy and girl should be shown how to keep it clean and to cook plain household dishes: do you suggest an actual cottage?—I feel this, that a small living room and a small bedroom, and a small room with a sink, such as they find in their cottages, would be of advantage, so that the girls and boys could be taught practically. I put that in, because I find very frequently a large family, the father out of work or ill, the mother going to work, and the big boys at home will not do anything; they think it is not manly to do anything in the house. They are making it dirty and have filthy habits, with regard to spitting, and so on. Then there is another point also—the number of widowers that I find with children with no one to look after them, and they have not any notion of how to do anything. The house gets into a deplorable condition. I think there are certain things which a boy might be taught as much as a girl. Also if the fathers know the value of fresh air and the bad habit of spitting, they could help their wives very much.

8370. But look at the practical question: you propose room of this kind in connection with a school of 1,000 or 1,200 children?—Yes.

8371. How do you propose to teach even the boys and girls of even the highest class in the school to do this?—Of course I quite admit that with the Code the whole method of instruction would have to be altered.

8372. How does the Code prevent this?—There is so much crowding of things in.

8373. Have you looked up the Code to see how much is compulsory and how much is voluntary?—No, I cannot say I have. I feel there I would like to know a good deal more.

8374. It is a document which is well worth studying?—In my experience of teachers they always tell me that there is no time—that they would like to devote more attention to certain things but there is no time.

8375. I see you ask here as to whether these things do not bear more relationship to practical things than a knowledge of physiology, the names of muscles and various other useless facts which could be recited by numbers of School Board children. I rather gather that your impression is that that is necessarily taught in a school?—I have been told that a great many subjects are optional.

8376. Do you think this is a compulsory subject; is that your impression?—I am not sure whether physiology is.

8377. (*Mr. Struthers.*) Mr. Lindsell will tell us what is the case in England. Physiology is not compulsory, is it?

8378. (*Mr. Lindsell.*) No.

8379. (*Witness.*) There is what they call science which is taught in the schools, which is a mixture of various things.

8380. Is that obligatory?—I think they have a choice in most of these schools of one thing or the other.

8381. But still I think you will find if this kind of instruction is given in any particular school in Sheffield it is not because the Code says it shall be given, but because the local people will have it so, or because the teachers themselves choose to have it?—A great many of them do learn these things.

8382. Coming back to this room attached to the large school, do you think it is practicable with a room which after all must be a limited place to put perhaps three or four hundred children through in the course of a week? The room having been once cleaned cannot be very well dirtied in order to have another set of children come in. They will see the whole thing is a sham and an unreality?—I think most of these things are taught by demonstrations.

8383. Do you think demonstrations are really much good in the case of children unless backed up by actual practice?—I think practice is necessary.

8384. I think it is found in most school subjects that mere demonstration is very much like a stage show—the children are amused for the time being, but it makes no permanent impression unless followed up by actual cooking—in the case of cookery—by their own hands?—It is no use telling them to keep the sink clean unless you tell them the reason. I should tell them the necessity of keeping the traps clean and all those things.

8385. Do you not think it would be a more effective way if those boys and girls were brought back to the continuation school till they are sixteen and taught things of this kind and nothing else?—Yes, I think that would be a very good thing.

8386. They would devote more time to it and it could be more effectively taught and the children could make better use of it?—I think it would be good for them to be brought back compulsorily. My idea is that with regard to continuation schools at present such a large number will not come.

8387. Would you favour the idea of having the children made to attend the evening school compulsorily?—I think it would be an excellent thing.

8388. What do you think parents in Sheffield would say to that proposal?—I suppose they would be highly indignant.

8389. And you cannot make rules unless with the consent of the people?—No, everything depends upon the public opinion.

8390. (*Colonel Fox.*) You said just now that in Sheffield the proportion of children who were suckled by their mothers was very great?—Yes.

8391. A medical officer in Sheffield states that only one in eight of the infants is brought up at the breast?—I should like to ask him where he got his figures.

8392. And the rest are bottle-fed with consequent ill-health evidenced by rickets, diarrhoea, and high infant mortality?—I can only give you those figures. We have only been visiting the births since November. I have given you the facts relating to those that we have visited so far. Out of 725 infants 572 or nearly 79 per cent. were being fed on the breast only. That bears out my impression. These children were visited when only about two months old. If when they are visited

at four months old a different state of things would be revealed, remains to be seen.

8393. I am speaking now of babies?—Yes, my impression is from the visiting I have done that a very large proportion of mothers suckle their children. There is no reason for them to do otherwise. It is the most economical thing for one reason.

8394. Then he goes on further to say that there is a deplorable spread of the practice of artificial feeding which if not the chief cause of high infant mortality, leads the survivors to continue the struggle for existence with constitutions seriously weakened and impaired; so that it is not only that there is a very small proportion of children suckled, but that number is decreasing. Those are statements made by Doctor Robert Jones in a lecture on physical and mental degeneration?—I think there is quite a wrong impression among medical officers of health and many doctors as to the number of women who refuse to perform their maternal duties, and I am not the only one who thinks so. Dr. Robertson had that impression, and I said I felt sure—I was looking forward to this work of visiting the births in order to really demonstrate this so far as Sheffield is concerned—that the working class woman as a rule wishes and intends and does suckle the child. I do not mean to say there are not exceptions where she might not do so, but a working woman in Sheffield does not wean her child as a rule. It is exceptional for her to do so in order to go out to work. It is the case with illegitimate children where the mother has to go out to support them. I do not know where he got his figures to go upon. There have been no available statistics.

8395. I thought it would interest you to know that he did state that in a lecture, and very recently?—Yes. Is it Dr. Robert Jones of Sheffield?

8396. No. He states that a medical officer in Sheffield said that?—Because there have been no figures available. Dr. Hall of Leeds wrote to me to ask if I had any figures available and would I give him the result of my experience, because I stated in my paper that it was extremely difficult to get any definite information on the subject.

8397. (*Chairman.*) With regard to the condition of a great many of these houses in Sheffield, I understand you to say that they do not come up to what you hold to be the minimum standard of decency?—It is not that there are not houses which they could go to.

8398. A great many of the houses which are occupied by well-to-do working people do not come up to what you consider the minimum standard of decency?—No.

8399. You are inclined to attribute it to a want of legislation enabling the local authority to deal with such conditions; but here we have got section 7 of the Housing of the Working Classes Act of 1885, a section which has not been repealed:—"It shall be the duty of every local authority entrusted with the execution of the laws relating to public health and local government to put in force from time to time as occasion may arise the powers with which they are invested so as to secure the proper sanitary condition of all premises within the area under the control of such authority." That is placing pretty extensive power and laying a pretty strong duty upon the Local Authority is it not?—Yes.

8400. Then as to clearing unhealthy areas. There is an obligation on the local authority on an official representation to proceed to make an improvement scheme. Official representation means representation by the medical officer of Health; and twelve ratepayers or two justices may complain to the medical officer and he is bound to make a representation. Surely if these people will do their duty under the existing law the existing law is strong enough?—It is fifteen years since a provisional order was obtained.

8401. That is because they will not make use of the powers they have. What is the use of entrusting people with further powers if they will not use what they have got?—They find that procedure under the Housing of the Working Classes Act is frightfully expensive.

8402. But the question of expense is no plea for delay. This statute takes no notice of expense. It is a duty?—Why do not the Local Government Board enforce it if the local authority allows it to become a

*Mrs.
Greenwood.*

dead letter? You see public opinion is not strong on that point.

8403. Your complaint is against the central authority for not using its powers for bringing the local authority to a proper sense of its obligations?—Yes. In this scheme in Sheffield why does not the Local Government Board insist upon its being carried out?

8404. Then with regard to the closing of insanitary houses there is an obligation on the medical officer to report to the local authority any dwelling-house unfit for habitation?—Yes.

8405. I understand you to say that there are scores and scores of such houses?—Yes, and the medical officer cannot get the stipendiary magistrate to deal with it.

8406. How does the local authority act?—A great deal depends upon the stipendiary magistrate. All the cases have to come before him.

8408. And after a closing order there may be a demolition order?—They do not do it.

8409. Your point is that they do not make use of the powers which the law confers upon them, not that the law wants strengthening?—I do think the law wants strengthening—at present they are working on the Act of 1875 with a number of amendments.

8410. This a much more recent Act that I am referring to?—I quite agree that they do not do what they could.

Dr. EUSTACE SMITH, M.D., F.R.C.P., called; and Examined.

Dr. Smith.

8419. (*Chairman.*) You have had considerable hospital practice in the East End of London?—Yes.

8420. Which hospital are you connected with?—The East London Children's Hospital.

8421. Does that provide for a very large number of child patients?—An enormous number.

8422. In and out?—Yes.

8423. Therefore you have had exceptional opportunities of studying the causes of malnutrition in infants?—Yes, in the last thirty years.

8424. We had better go through the causes which you think are most prominent—the weakness of the parent is one?—They marry very young.

8425. You know from the Registrar-General's returns that people do not marry so young as they used to do?—They live together very young, then; you see very young mothers going about. I do not think they are particular about marrying.

8426. You must remember that the rate of illegitimate births is diminishing too, so that on both sides the children cannot be born into the world so early in the lives of their parents as they used to be?—There are a great many illegitimate children there. Is that taking the whole of London when you say that there are less illegitimate children and that the parents are at a greater age when they marry?

8427. No, the country generally. Of course, you agree that, where it does take place, the marriage of very young persons is very prejudicial to the physical strength of the infant?—Yes. You must remember the parents themselves are weakly, too.

8428. Do you think that has an important effect? We have been told here that, however feeble or degenerate mothers may be, nature makes a very strong effort to bring a young child into the world as vigorous as possible—Still, I think it stands to reason that, where the parents are weakly, the children must have a bad start, at any rate.

8429. We have heard that it costs a greater effort on the part of a weakly parent to bring a child into the world, and the parent suffers more acutely, but the child is not so prejudiced by what you describe as a bad start as you might suppose?—That is where there is no constitutional disease in the case of the parents, I suppose?

8430. Are many of the cases you refer to cases in which there is constitutional disease in the parents?—The children are very often born with syphilis and strong tendencies to consumption.

8431. Are those causes as prominent as they were?—I think so, quite—more so, perhaps. I am speaking of the East End of London.

8411. With regard to the smoke nuisance, do I understand you to say that the atmosphere of Sheffield is much more polluted by smoke than it should be?—I do not know whether it is more than it should be because there are so many exceptions; there are so many industries in Sheffield which are excepted from that clause of the Public Health Act.

8412. Is that a private Act of Parliament which they have?—I do not know. There is a great deal being done. The corporation have two inspectors.

8413. In that respect do you think that the stipendiary magistrate is not as severe as he might be?—The stipendiary magistrate is not a severe man.

8414. You think he is just as indulgent as any manufacturer himself who might happen to be on the Bench when a case of that sort was brought forward?—I do not know about that.

8415. Do you say this class of case comes always before the stipendiary?—Yes.

8418. (*Dr. Tatham.*) You have some valuable evidence of special cases there. Will you put them in?—Yes, I will. I have also particulars of 100 houses which I have investigated, giving the percentage of people occupying them. (*Documents were handed to the Chairman.*)

8432. We have heard in this room that syphilis is diminishing, both in extent and in virulence?—I do not think there is very much less.

8433. As far as the effect on young children is concerned, you do not find any diminution?—When I first went to East London—I had an experience before of the poor in the West End—it struck me that syphilis was not so prominent in the East End as in the West, but that was only a general impression.

8434. Your opinion does not rest upon any statistical information, at any rate?—No.

8435. Now as to the next cause which you attribute, with regard to the malnutrition of infants, you have heard what was said by the last witness, that the impression which has prevailed as to the suckling of infants in Sheffield is entirely erroneous, and that, whereas Dr. Jones made that statement at the Society of Arts the other day, that only one in eight children in Sheffield are suckled by their parents, she produced statistics showing that the number was 79 per cent.?—Yes. Sometimes they nurse their children for a month or two.

8436. Her impression is that they continue as long as they can?—That is not the case certainly in the East End of London. In fact, it is quite the exception. We have a babies' ward. I am thinking of the babies brought into hospital. A very small proportion of those babies are suckled. We have them from birth in our wards.

8437. Are they fairly representative of the generality of the parents of the East End?—Quite, I think.

8438. Representative of the great bulk of the population?—Yes. Of course they are the very poorest.

8439. One would have thought, from economical motives, the very poorest were those who would suckle their offspring?—So many mothers cannot.

8440. It is inability as a rule you think?—I think so, and I think it is increasing. I think that certainly the proportion of women—both the well-to-do and poor—who can nurse their children is diminishing very much.

8441. I suppose the children of the poorer classes suffer so much more because it is impossible to bring them up by hand with the same care and attention which exist with the children of the upper classes?—Of course in the East End of London so many mothers go out to work.

8442. There is a good deal of factory employment in the case of married women?—I do not know where they work, but they are not at home. They go out and work.

8443. What becomes of the children?—They are put with a neighbour or at one of the crèches.

8444. We had evidence here from a lady from Hoxton who described one of the crèches there?—There is a crèche somewhere near the hospital, but they can only take a limited number, of course.

8445. They are not sufficient in number?—No.

8446. Do you think it would be a good means of dealing with the problem if they could be extended in number?—I think it is much better than being left with some ignorant older girl.

8447. Would you suggest the establishment of municipal crèches to deal with these things?—Yes, I think so under proper medical supervision.

8448. And of course not resting upon any eleemosynary basis?—No.

8449. But the parents should be made to contribute to the full extent of their capacity?—Yes, I think it would be a very good thing.

8450. In regard to the subject of feeding, I suppose the inability to get milk, or ignorance as to its value, is one of the principal causes of the inappropriateness of the food which children get?—In the East End they use tinned things so largely.

8451. Even for very young children?—Yes.

8452. Do you mean tinned milk?—Yes. Then, of course, they are very poor and they go on using it when once it is opened. Of course it is kept in a horribly bad atmosphere and they use it to the very end, and I suppose that a large proportion of it is stale by the time the child takes it.

8453. It is almost poisonous, I suppose?—In very many cases. In the summer I think it is quite poisonous.

8454. Are there any other tinned foods or patent foods which you condemn that are being generally used?—In the East End where my hospital is they cannot afford to buy the more expensive tinned things like Savory & Moore and Bengel's food, and they generally fall back upon sopped bread, sometimes with milk and sometimes without. They give what they call sop, which is merely bread moistened in water and sweetened, with not very much nourishment in it.

8455. To children of what age?—To children of six months and upwards, or even younger than that.

8456. Just at the time they should be weaned in the ordinary course?—Yes.

8457. If they are not suckled what are they fed upon up to six months old?—I think they give the child tinned milk.

8458. Are you aware of any municipal efforts in the East End of London to organise a proper milk supply?—We are going to try ourselves at my hospital.

8459. I believe in some of the children's hospitals in Paris they do organise a system of that sort?—There is a good deal of talk about them. It wants a certain amount of money to start, but we are very anxious to do it ourselves.

8460. I suppose you will be able then to guarantee at the cheapest possible rates the best possible supply of milk to the mothers?—Yes. The milk will be brought from farms kept under strict supervision, and it will be kept under supervision the whole time it is in our hands, and will be sold as cheaply as possible.

8461. After the initial expense of starting a system of that sort are you inclined to think that it would be self-supporting?—Yes; I think so.

8462. If a certain number of parents avail themselves of it?—Yes.

8463. Do you think in the course of a short time a sufficient number would be properly informed of its advantages so as to make full use of it?—I think those who could afford it would certainly do so.

8464. Do you find any reluctance or any slowness on the part of the people to realise what is for the advantage of their children, if they are told?—No. We have leaflets printed at my hospital and these go to the outpatients, the women who come with the children.

8465. Do they use them to light the fire with?—No, I think they make use of them because they have learned a great deal.

8466. You think they have?—Yes. Certainly comparing now with twenty years ago the children are very much better managed.

8467. You think it is more useful to teach the young mothers directly by means of that kind than to attempt

to teach children in school on the chance of their remembering when they come to be mothers?—I do not think that is so good.

8468. How long have you been connected with these hospitals?—Thirty years.

8469. So far as your observation goes do you think the condition of things is less favourable on the whole than it was thirty years ago? Do you think that the rising generation now—the children under five years old—are better or worse than thirty years ago?—I do not think they are getting worse but I do not know that they are any better—I do not think they are.

8470. I suppose as yet they are hardly enjoying the benefits of such improved instruction as has been introduced?—Our difficulty is the poverty of the people. They are far poorer than the same class at the West End. Some of these East End people are horribly poor.

8471. A good many of the parents live on occasional labour?—Yes, and sometimes they do not have anything to do; and they starve till they have.

8472. This is the very poorest class in London—the residuum?—Yes; this and the borough I think are the poorest parts.

8473. That is a standing problem which none of these palliatives would do more than touch the surface of?—I think that is so.

8474. When children grow older and are in a better position to determine their own diet, do they get a better chance of being decently fed?—They do of course if the parents are in work, but it is the common practice amongst the very poorest people when they have a little money to go and buy food and put it on their tables. They never think of clearing it away or anything of that kind. Anybody who feels hungry goes and sits down and takes a meal.

8475. Any member of the family?—Yes. When that is done, if they have no money to buy any more they have to starve till they have. It is a shocking state of things.

8476. Do most of them provide meals in the house when they can or do many of them go and buy cooked food at the cook's shops?—No, I think they provide it in their own homes.

8477. You think a large number of these children are sent half starved to school?—They must be I should think. Of course I have no accurate knowledge of that. It is highly probable I should think.

8478. The food is not only inappropriate and insufficient but of bad quality, when they do get it?—Yes, very often.

8479. I suppose the parents have very little knowledge of what is the best sort of food to give the children?—They are told in this leaflet, and they learn in this way. We find that almost all the babies who are brought to us, if the mothers can afford the expense, are being fed on milk and barley water, which they are told in these leaflets to do.

8480. Is this system of leaflets supplemented by any house to house visitation?—No, we cannot do that.

8481. Could you not enlist voluntary help?—We do not look upon that as our business.

8482. Could not some sort of charitable organisation organise this work side by side with the hospital?—Yes. I think it is done a good deal amongst the Jewish poor.

8483. The Jewish people do look after children?—Yes, much better.

8484. And the well-to-do Jews look after their poorer co-religionists to a much larger extent than is common amongst the other religious communities, except perhaps Catholics?—Yes.

8485. Then as to housing arrangements?—They are awful—the whole family sleeps in one room.

8486. How many children, from your knowledge?—Three or four children and the father and mother.

8487. You think there are many cases of six occupants in one room?—I think so. If they have a very large family, of course the mortality among them is very high. They generally have three or four children.

8488. What is the infant mortality in this particular part of London?—I cannot give you the figures. With

Dr. Smith.

Dr. Smith. every child that comes in we have a history taken, and the family history and the symptoms, and it is common to hear that five or six children have died, and that the one brought to us is perhaps the solitary survivor. It is quite shocking sometimes.

8489. From some points of view it is perhaps the best thing for the poor creatures that they should die?—Yes, but we medical men think it is our business to keep them alive.

8490. Have you any suggestion as to how the problem might be dealt with?—No. For warmth, as a rule, they keep all the windows shut.

8491. The atmosphere is very foul, I suppose?—Yes, shocking.

8492. Does the medical officer in that district attempt to report these conditions which you are describing?—I do not see what he can do. They can only afford to have one room. I do not see what the medical officer of health can do really.

8493. Except that the local authorities are empowered to deal with conditions of this sort, and unless they are prepared to deal with them at whatever cost, it is not easy to see how any amelioration is to come about?—I do not know at all what the medical officer of health would do in a case of that kind.

8494. Would you go so far as to advocate the community in the form of the State, or the local authority taking charge of these children?—Do you mean taking them away from their parents altogether?

8495. Yes, and placing them in nurseries. Of course enforcing, as far as possible, parental responsibility by enforcing payment on the part of the parents wherever possible?—Of course it stands to reason that if these children are taken away and brought up under good conditions, they must be better than when they live in an insanitary way in their own homes.

8496. Would you in extreme cases recommend that such steps should be taken?—Yes, I would certainly.

8497. Do you think there is much of this state of things due to neglect on the part of the parents, or is it due to inability?—I think it is due more to inability than anything else. There are many illegitimate children, and some of the children are insured—of course there is a large system of insurance.

8498. Does that work prejudicially to infant life?—I think it must do. They only pay a halfpenny a week and if the child lives they get nothing for it.

8499. But we understand that if the child dies they get very little more than the expenses of the funeral?—Perhaps they would spend it all over the funeral, because it is their notion to have a grand show at the funeral. But I do not want to make any accusations. I think it makes them a little neglectful; it must do. One of the causes which acts most keenly in these cases in preventing proper nutrition is the bad clothing of the children. They are only half clothed and they live in a state of gastrointestinal derangement; they do not digest what they do eat.

8500. That is due to extreme poverty, I suppose?—Yes, that is due to poverty.

8501. Do they know what is the best thing to spend their money on with a view to warmth in regard to clothing?—Yes, they know flannel is a warm thing to wear.

8502. They do not get flannelette or that sort of thing instead?—I do not think they do.

8503. Do you think that drunkenness has much to say to it?—Yes, the women drink too much.

8504. Do you think that is increasing?—I do not know.

8505. That would be a fruitful cause of parental neglect?—Yes.

8506. And indifference to their duties altogether?—Yes.

8507. Are there many children overlain in the East End of London?—A good many.

8508. That is often due to drunkenness?—Yes. It is one of the reasons why I think the Jewish children are better nurtured than the others, because there is so much less drunkenness amongst them.

8509. They recognise their obligations to their children?—They are very fond of their children.

8510. (*Dr. Tatham.*) Speaking of the causes of mortality and sickness amongst young children, do you notice any difference in the prevalence of tuberculosis amongst them?—It is a very common disease, of course.

8511. Do you think it is commoner now than it was?—I do not think it is. It always was very common.

8512. You know that a great many cases used to be termed *tabes mesenterica* without any evidence of tuberculosis?—Yes.

8513. Do you think that really tuberculous disease is on the increase as evidenced by the post-mortem examinations?—No, I do not think it is on the increase; it was always very common.

8514. I mean amongst children?—We have always got some case which is tuberculous; it is almost always in the hospital.

8515. Either tuberculous meningitis or peritonitis?—Yes, we get a great many, one after the other, and general acute tuberculosis is one of the commonest things possible.

8516. Syphilis, you spoke of, as certainly not much diminishing?—I do not see so much of it now because I do not see out-patients, but I thought it was not so common as in the West End.

8517. Do you know the reason?—They are so poor. They cannot afford to spend money.

8518. You would be of opinion that syphilis is nothing like so virulent now as it was when you and I were students?—No, perhaps not.

8519. Nothing like it?—No, I do not think it is.

8520. In regard to the milk these poor children get for food, do you think it is of fairly good quality?—I do not know. Of course they get it from small shops in the neighbourhood. I do not think they are very particular about cleaning the jugs, and so on, to get it in. I expect by the time the child gets it it is not very clean.

8521. It would be reasonable to suppose that when the infant gets it, what with careless preservation and with filthy feeding bottles, and one thing and another, the milk cannot be very nutritious, and is probably decomposed?—Yes.

8522. With regard to tinned milk, do you know whether or not the use of separated tinned milk is on the increase now? We have heard it is. Evidence has been given to that effect?—I do not know at all.

8523. Of course you would disapprove of that if it were so?—Yes.

8524. You spoke of the superiority, as a rule, of Jewish children over Christian children: Do you think that is very marked in the East End?—The Jewish children are so much fatter and sturdier; you very seldom get a Jewish child who is emaciated. It is curious.

8525. That is quite in keeping with evidence we have got from others?—I have often been struck by that.

8526. Is it your opinion that Jewish mothers are more inclined to take care of their children than Gentile mothers?—They are more at home than the others. When they work they generally work at home, and the others go out to work as a rule, so that there is more personal supervision of their children. I think that is one reason.

8527. That is quite in accord with the evidence that we have from Manchester—where there is rather a large Jewish population—that Jewish mothers do attend to their children, and Christian mothers neglect them?—Yes, it is very much so.

8528. We have also had it in evidence that infants suffer very considerably in health from want of sleep. It is very common in crowded neighbourhoods, especially during the night. Do you think that any nervous diseases are attributable to that?—Except that a child will sleep through almost anything, I do not know whether noise will affect a child.

8529. (*Chairman.*) They sleep in a very bad atmosphere?—The bad atmosphere is the worst thing. They cannot assimilate their food.

8530. (*Dr. Tatham.*) You do not think it is operative to a great extent?—No, not now.

8531. Then you think that whatever improper treatment the children get, it is much more often due to ignorance and to poverty than to actual neglect?—Yes, I think so.

8532. Rather than to wilful neglect?—Certainly, I think so. Because they very often seem very fond of their children. Sometimes, in the case of illegitimate children, they do not seem to care very much about them, but as a rule they do seem interested in them.

8533. With regard to the arrangement you spoke of as being on the eve of accomplishment by your hospital—the attempt to supply pure milk at a reasonable price—do you think that will be carried on on anything like a large scale by voluntary means?—If it were to be self-supporting I think it would be very much increased.

8534. You know, I daresay, that several municipalities have taken up that question?—So I understand, and have made it self-supporting.

8535. The fear, of course, is that as a voluntary association you would be subject to a considerable amount of opposition from the so-called genuine milk trade?—Of course it has to be discovered whether that is so.

8536. As a matter of experience I know of at least one instance where a voluntary association was simply run off the ground by the competition of the ordinary milk trade, and it was found to be a very costly experiment. The municipal authorities certainly are the people who ought to undertake the supply?—Yes. A great deal of that would depend on the scale on which it was done.

Mr. J. LEWIS, called; and Examined.

8542. (*Chairman.*) You are assistant teacher in an elementary school in North London?—Yes, the West Green Board School.

8543. You have given special attention to the effect of the present system of cookery teaching?—In my own particular area and its application in that area.

8544. Its application to the equipment of good housewives?—Yes.

8545. You hold that the present conditions of attendance are unfavourable to instruction in cookery?—Yes.

8546. What you say here is not intended to apply to the district with which you are familiar?—Yes, to the district with which I am familiar, and it applies in other cases too, but I do not mean it to apply in every case, because I know cases where things are very much better managed.

8547. We are dealing with general conditions now. Will you say why you do not think the conditions are favourable? I want you to explain why the conditions of attendance are unfavourable to children obtaining proper instruction in cookery?—In my own particular area it is because the local education authority does not provide sufficient facilities for instruction.

8548. Do you think that is typical of the rest or not? The evidence of one particular area is not of much value?—I have good reason to think it applies in other areas.

8549. What are the conditions which you think are unfavourable?—They do not offer sufficient facilities for instruction of all children eligible by age.

8550. Will you explain how?—The cookery centres are not sufficient, the teaching staff is not sufficient, and children needing the instruction are not taught.

8551. They do not give instruction in the schools themselves?—Instruction is given at centres and by teachers not on any particular school staff, and the head teachers themselves do not take much interest in the matter.

8552. Do you think that the instruction does not cover a sufficiently large class among the children?—No. In my own district, and I should say the same of other parts, Southampton and Bournemouth for instance, where it applies only to selected children.

8553. That is due to the action of the teachers is it not? They might make it much more general if they chose?—They are unable to do so under present conditions.

8554. You mean that the regulations of the Code render it difficult?—They are expected to reach a certain standard in their ordinary elementary subjects, and as only a limited number of children can be accommodated

8537. You do not propose to attempt anything very extensive?—Not at first, but we should hope, of course, to increase it.

8538. (*Mr. Legge.*) There is one question of a general nature. It has been suggested to us by more than one witness that a valuable step would be the appointment of a central anthropometrical bureau which should periodically take certain superficial measurements of children and young persons, and adults throughout the country, and compare the results at different periods, and in different districts. What is your opinion of that, speaking as a medical man? Do you think that it would afford good data for judging of the comparative deterioration of different districts and so on?—You mean comparing the different parts of England?

8539. Yes, and the population of the whole and of parts at different periods?—Yes, I suppose it would afford some ratio. You mean supposing children were brought up differently in different places?

8540. Supposing it came out that in Tyneside, to take one particular district, the physique of the children was extraordinarily below that of London and Edinburgh, then there would be ground for some special inquiry in Tyneside?—Yes. One would have to take into consideration the climatic conditions.

8541. But still there would be grounds for making a special inquiry in that district as to why the children or the adults are so much poorer in physique than in other parts of the country?—Yes.

at the cookery centres only those who are well up in their ordinary work are sent.

8555. I thought individual examination was a thing of the past?—Yes, but the individual examination still exists in the school under the head teachers, and the requirements are such that they must give first attention to the ordinary subjects of instruction at school, and cookery and other domestic subjects come in quite as secondary matters.

8556. You think insufficient importance is attached to those subjects?—I think teachers look upon them as side issues—I mean the head teachers.

8557. Do you think the inspector does not attach sufficient importance to them?—I suppose he has to take things as they are.

8558. But surely it is part of his business to aim at bringing up every school to what should be the best standard, from the point of view of general advantage of children under instruction in it?—The inspector is not responsible for the organisation of a school. He approves the courses of instruction laid down, but as far as I know does not go into the question of general utility. What are you going to do in a case like this?—It is typical of ten or fifteen in the district. A school has about 200 children eligible for cookery lessons by age and standard, the cookery teacher visits the school and finds that at first no children can attend the centre; the headmistress cannot spare them from their ordinary subjects. After a time she sends eighteen out of 200 eligible children to the cookery class, and those eighteen are the best children in that particular school.

8559. There are managers to those schools?—Yes.

8560. Surely they might take the matter in hand?—At present, possibly because of the pressure of other matters, they take no interest in it whatever. I must say that they are to some extent new to the work, because they have been elected under the recent Education Act.

8561. You are inclined to think that may produce a healthier condition of things?—I think under the Act the new members will take more interest if it is pointed out to them—if it is brought more definitely under their notice. At present cookery teachers tell me that the authorities take no notice at all of the instruction.

8562. Are you in the school area of London?—No; a suburban area. I am under the Tottenham District Council.

8563. What is your educational authority?—The Education Committee of the Tottenham District Council.

Dr. Smith.

Mr. Lewis.

Mr. Lewis. 8564. Do you think they are likely to be more alive to the sanitary value of educating children in these things than the old School Board were, as they are responsible for the health of the district?—To some extent I think so, but I think that there is still the question of the rates. The new authority has certainly shown more interest in the physical and sanitary condition of the district, as they have recently appointed a Medical Officer for Health. If these centres can be worked without loss then I think they would encourage them.

8565. The disposal of food enters into that?—Yes. That takes an important place in it.

8566. But if the food were of such a quality that the occupants of cottage homes could purchase it, would not that be a very good thing. Would not that facilitate the arrangements?—But how are you going to get to the cottage homes?

8567. The schools exist in the centre of them. If the cottagers wanted it they could get good soup from the school or vegetables cooked in an appetizing way, and they would take all that the school had to provide, would they not?—It is possible, but I have never heard of it being done.

8568. No effort is made to bring the fact home to the parents and the food as cooked is often not of the character which is consumed in cottage homes?—No. Then I found that even in the districts round where it is perhaps managed a little better there is a general opinion that cookery is not of a very practical nature.

8569. In what respects?—The things which should be taught are not given sufficient attention, and other things which are not really necessary are taught.

8570. What things would you give prominence to?—Just the simpler forms of diet. I mention here stews, bread puddings, fish, and things like these.

8571. You have not mentioned soups, but with regard to all those things, if they were prepared in sufficient quantities, surely the parents of the children would be only too glad to take them off the hands of the school managers for the purpose of consumption at home?—Do you mean the food to be consumed on the school premises?

8572. No, I do not, but it might be. There is no reason why children coming to school, instead of spending their pennies in the way you describe in this *précis*, should not place the money in the hands of the school authorities and receive a decent meal which has been cooked by the scholars?—Yes, that is the point. I thought it would be much better if means could be devised by which the cookery teachers in the centres could obtain information early in the morning as to what meals are required by the children who are attending the school.

8573. Their pennies might be pooled?—The teachers would know what funds were at their disposal and could make use of it. Then there would be no loss.

8574. Could not the parents be induced to give that information with a little organisation?—At present there seems to be no sympathy between parents and head teachers, and head teachers and cookery teachers.

8575. The cookery teacher is employed at a centre, and is looked upon as a person apart, in whose work the head teacher takes no interest?—Yes.

8576. That is the vice of the system?—Yes.

8577. You would advocate, in preference to centres of cookery, that every school of sufficient size at any rate, should teach within its own limits such of its scholars as were qualified to get instruction in cookery?—Yes.

8578. If that were done that might be worked into a system of providing such of the children as came from any distance or preferred to be fed in the school instead of going home, with dinners there?—Exactly.

8579. (*Dr. Tatham.*) At what age do you begin your cooking instruction?—It varies in different districts. We begin at Tottenham at about eleven, but it is not so much the age which fixes it, but the standard; no child is allowed to go to a cookery class until she has passed what we call the fourth standard.

8580. (*Mr. Lindsell.*) Where do you get that from?—That is what holds good in Tottenham. I do not think it is laid down by the Code.

8581. It is what they arbitrarily lay down?—Yes. The head mistresses tell me that they are not allowed to send a child into the cookery room until she has passed the fourth standard.

8582. Whatever their age may be?—Whatever their age may be.

8583. That is, of course, an arbitrary rule of the place. The only restriction in the Code is that attendances made by girls under eleven will not, as a rule, be recognised?—One teacher pointed out to me the advantage, in her opinion, of making it according to the age, and not to the standard.

8584. That is what we have made it. The authority is acting contrary to the intention at any rate of the Code, if they make the standard the condition; it is expressly abolished. It is an age condition only?—I do not know that.

8585. (*Dr. Ta'ham.*) Do you arrange for the cooking of dinners of one kind only during one day, or of various kinds?—In the district to which I am referring at present, the only dinners that are taught, as far as I can find out, are teachers' dinners. There are a certain number of teachers who live out of the district, and they find they can get dinners provided at the centre, and they arrange to have them.

8586. You do not arrange for any variety?—That depends entirely upon the cookery instructresses. There are only two in my district, whereas there are 2,000 children eligible for instruction.

8587. (*Chairman.*) In the whole of Tottenham?—I take it in this way. There are ten large schools, and in one school I estimate there are, even under present conditions, 200 children eligible for instruction, and of these, only between 18 and 30 attend a course. The reason for it is that the head teachers prefer to keep the children at their school work, but the cookery teachers themselves say that if the matter were better organised they could themselves take as many as 500 children per year through the course of instruction, instead of less than half that number as they do now.

8588. In the schools themselves?—Yes.

8589. (*Mr. Lindsell.*) How many centres are there in Tottenham?—I think about eight altogether. I would like to point out that at present several of them are not used at all, for the simple reason that the accommodation there is rather bad, and the cookery centres are used for class rooms.

8590. Cookery itself is not taught?—Cookery has to give way to ordinary school instruction.

8591. Are these centres those of the old School Board?—Yes. They had a good intention, but they never carried it out. I spoke to one head mistress on Saturday last with regard to the attendance of her children at cookery class; she told me they ought to attend a cookery centre at about a mile from the school. She said that that is where she is supposed to send them, but she is not going to send them there because she does not believe in them wasting their time in walking through the streets.

8592. Have any of the schools got a provision for cookery attached to a particular school?—In most cases they have.

8593. It is attached to the school?—Yes, on the school premises; but it is used more as a class-room.

8594. There is the means of doing so if they choose?—Yes.

8595. There is not a cookery class going on there at all?—No. As an instance of that, at the school at which I am engaged at present, we have a cookery class-room fitted up properly, but owing to the school being rather overcrowded the room is used as a class-room, and the children who attend cookery at all go to another centre about a quarter of a mile away.

8596. You think there is more probability of the new school authority improving that matter?—I have come to the conclusion, since I have taken an interest in the matter, that they are not sufficiently aware of the conditions and the circumstances.

8597. Are there more centres in the voluntary schools?—Not so far as I am aware of. The voluntary schools seem to be in a worse condition altogether.

8598. You know the new authority could provide a centre which could be attended by both schools?—Yes; I understand that.

8599. Is it your opinion that the children are not sent young enough or are sent too young to the centres?—It was not that. I thought that facilities were not given to those children that leave early and those who are not well up in their ordinary subjects. So many children are anxious to get away from school at a very early age.

8600. At 12?—Some of them do not reach the fourth standard, and consequently, according to the arrangements there, they do not get the instruction.

8601. Suppose they were allowed to come at the age of eleven, and went away at twelve, it would not be much practical use to them, unless they went on with their instruction.—That is a point I inquired into. We found the first course of instruction is the most practical, as a rule, but, again, it depends upon the cookery instructress. We have no course laid down at all; the teachers are able to do what they like. If the teachers are interested in the work they take it up in a proper manner, but, at the same time, if they wished to let the thing go they could.

8602. Are there any opportunities in Tottenham for continuing this class of cookery after leaving?—No.

8603. No technical schools, or evening schools?—There are evening continuation schools.

8604. But there are no cookery lessons given at them?—There is no cookery at all. In one or two cases they attempt needlework in the evening schools. That is useful, but that needlework class is not attended by those who ought to benefit by the instruction.

8605. You mean they are a better class, who do it more from amusement?—We find married women and young women who really, I should think, could afford to pay for the instruction. The instruction provided is free. In our neighbourhood, I ought to point out, there is a large factory, and girls of the poorest class leave school as early as possible to go to the factory, and these girls finish work about six or seven in the evening. These are the girls I should like to see go to the evening class to learn dressmaking, cookery, and so on; but we do not get them.

8606. You do not think those factory girls come to the evening classes?—No. You find them about the streets in the evening in dozens.

8607. There is nothing to prevent them coming if they choose?—Nothing at all.

8608. Do you think it would be too severe a strain upon them after their day's factory work to go to an evening school?—It would be almost a rest, seeing that most of their work is fairly active. At the same time, they seem lively enough in the streets, and I do not see why they should not be capable of taking up work in the evening schools.

8609. With regard to the food which is cooked, it is bought and used by the teachers who come from a distance?—Yes, in the centres that I refer to.

8610. Do you think, practically speaking, that it would be possible—supposing a large number of children were provided with meals at school at a small payment—do you think the cookery centre could turn out a supply of food?—Decidedly, but not with the present staff. You would have to increase the staff.

8611. It would be very limited instruction to the learners, would it not? They would only learn one or two simple things which were perpetually supplied. What you would give the children would be, I suppose, soup and mutton broth?—Yes, and other cheap dishes.

8612. Do you think there would be a sufficient field?—I have seen them turn out a good variety in the course of a week.

8613. But would that do for the feeding of the children? Are they taught to turn out things which would be of service for the feeding of the children of the school?—I think if they had the means of getting the material for cooking they could make it practical, useful, and varied; but at present they have to rely upon what is required, or else buy very small quantities.

8614. Then the cookery centre would have to be at the school itself in all cases?—I have thought of that, and I think that if a cookery centre was arranged so as to meet the requirements of two schools that were near to each other that would do. Mr. Lewis.

8615. You would get the food for the children?—Yes. That depends, of course, upon the nearness of the two schools. Where there are large schools I think there ought to be a cookery centre at every school, and teachers maintained for that purpose.

8616. That is to say, a really large school of 500 children?—Yes—girls only.

8617. (*Chairman.*) Would it not be better to make the instructor itinerant rather than the children?—I thought it was a question of food—where the children could get their dinners?

8618. (*Mr. Lindsell.*) As far as that is concerned, one centre for two schools would enable food to be got by the children at each school?—Provided the schools were not too far apart. I think, too, in order that this waste of money should not go on, there ought to be some means of checking how the money is spent. Perhaps the teacher could give the children a kind of receipt.

8619. If you did allow the children to purchase their meals, it could be done by some series of checks?—Yes, you would want some check upon them.

8620. And in cases of extreme poverty they may be given free—that might be done by benevolent effort?—Yes.

8621. And in the other cases the children could pay a penny?—Yes.

8622. Have you any other remarks to make with regard to the system of cookery instruction under the code? Is there any other point which strikes you as wanting improvement? You have seen the teaching given?—Yes. I have seen it given in Bournemouth when it was in its first stages, and when the cookery consisted almost entirely of fancy confectionery. What is done there now I cannot say, because I have not been there for some years.

8623. Do you think the children sufficiently learn that kind of cookery which will be useful to them afterwards as wives and mothers?—That depends entirely, it seems to me, upon the instructress. If the instructress likes to make it so, then it is so to a great extent, but my experience is that it is not done in every case.

8624. It could be done?—It could be done; it depends upon what is to be done with the food when it is cooked. If they have no facilities for getting rid of useful dishes, the teachers must cook or prepare something they can get rid of. Pastries and things of that sort they could get rid of—the children would buy them with odd pence when they would not buy a proper meal.

8625. (*Colonel Onslow.*) It is really a matter of organisation in the first place, and obtaining suitable teachers who will get suitable things?—That is so.

8626. And then you could get a meal for the children whose parents are unable to provide food for them at home?—Yes.

8627. If you have the children whose parents were unable to provide for them at home, getting their dinners at the schools, then the cookery teachers would simply cook dishes like soup, suet puddings, stews, and simple things like that which the children would eat, enjoy and benefit by?—Just so.

8628. If you cannot have these cookery centres at every school—perhaps that is impossible—there might be a means of conveying those cooked dinners from the centre to the schools by means of carts, or something? We had evidence before us that it is done in a district of London—it is sent round to the different schools?—Yes. I did not think of anything quite as remote as where you would require a cart.

8629. Or even perhaps the children who are in want of their meals could be sent to the cookery centre to get it?—That is what I thought.

8630. A very large number of children could be employed either in actually doing the work or looking on, could they not, every day?—Yes.

Mr. Lewis. 8631. At present, owing to the difficulty of getting rid of the food, you are confined to dishes which are not suitable to the starving children?—That is so. I mentioned also in my *précis* the way they go about obtaining the materials for cooking.

8632. You say you think the children ought to be instructed how to buy?—Yes.

8633. One difficulty you have is that the staff would have to be increased, but I presume once this was in working order some of the older children could be made part of the staff in the same way as you have pupil teachers. You might entrust them with minor details and superintending the others?—Yes. I daresay they could be appointed monitors, or something of that kind.

8634. And also in buying things. I think you stated that they should be instructed to go out and buy a few ingredients for a meal?—Yes. I find at present that it all depends upon the cookery instructress herself. She tells the tradesmen to call within a certain time, and if she requires anything she gets it.

8635. It would be better if the children could be sent out to buy what was required?—Yes; under supervision, I think. It would hardly be wise to send them out without.

8636. Send them to buy what was required—that would teach them the value and the proper things to get?—Yes, and how to make the best use of the money at their disposal. An attempt is made in one district I know of where they send children out to buy the food, but in that particular district it seems to be done only just in one school; that school is rather a high grade affair, and so it does not touch the class of children where instruction is most needed.

8637. Is the cookery instructor a woman?—Yes.

8638. Specially appointed for the work?—Yes, and specially trained for it.

8639. And she is under whom?—She is appointed by the Education Committee.

8640. She is not under the head of one particular school?—No; that is the difficulty, and for that reason the head mistresses do not take the interest in it which they would otherwise do.

8641. To what age do these children go on with the cookery classes—until they leave school?—It all depends on the centres. Some children would not get to the centres at all. I have come across cases where children have left school at fourteen and have not attended a centre at all.

8642. With regard to those who do attend, do they generally attend until they leave school?—Do you mean do they go through more than one course?

8643. Yes?—I have known them go through two or three and sometimes four classes of instruction. At one school I know, eighteen children went through a course of instruction—what we call Course I. The cookery teachers sent to the school and asked for a second batch of children to be sent. I want you to notice that only eighteen could be taken from this particular school. The head mistress said: “I cannot spare any more at present, so you had better have the same lot for another course; so the teacher took them through a second course within the period immediately following.

8644. That is due to the local regulations that only children of a certain standard ought to be allowed to go to the cookery classes?—Yes; and to the fact that the dull children cannot be spared from their school work.

8645. (*Colonel Fox.*) What is the population of Tottenham?—I have not got it exactly, but I should say about 90,000.

8646. And Hornsey?—That, I think, is slightly less.

8647. Do you know what was the result of the town which was built near Tottenham, which was commenced—the suburb they were to build for the working classes of London?—They are at present building model dwellings.

8648. Is Tottenham a typical poor district?—It is comparatively a poor district; much more so than Hornsey, the neighbouring district.

8649. Have you heard of a housekeeping centre in Hornsey where girls are trained in domestic duties?—There is one which has been recently opened?

8650. Where girls are trained?—Yes, in housekeeping; but that is in connection with a high grade school, not with the ordinary elementary school.

8651. It is not in connection with elementary schools at all?—I believe some of the children in the elementary schools attend this housekeeping centre.

8652. Are there any practical women teachers who can teach cookery now?—Yes, there are women who are appointed for this cookery class and housekeeping class; they are specially qualified for that purpose.

8653. Do you find at Tottenham that there are any facilities for the physical training for young men and women?—There are no facilities whatever. Tottenham suffers more in that way than any other district I know. The Government does not encourage the instruction of physical training in the evening classes, and the evening classes are the only means of working up anything of the kind in the district. Then, of course, subjects which pay, such as book-keeping, shorthand, and so on, must be taken.

8654. Surely there is a great number of halls there which may be used for that purpose?—I think almost every school has a hall. I might say all the schools except one, where evening classes are conducted, have a large hall.

8655. Could not those at times be used for physical training for the young men and women?—Yes; I think they could very well be used, and it is the very thing which is required, provided they could be fitted up with the simple apparatus necessary.

8656. Why are they not used now?—Because there is no grant for the subject. The Government pay a grant for certain subjects, but not for physical training.

8657. There was at one time?—So I understand.

8658. And now it no longer exists?—It no longer exists.

8659. Supposing you got up some kind of organisation, could you not encourage classes to attend there?—I think I could. I think if some grant was made for physical instruction as is made for the other subjects taught in the evening schools it would be an advantage.

8660. The only expense attached to that would be for the gas, would it not?—Yes; and, of course, to pay the instructors.

8661. You said the boys and girls attend evening schools?—Yes.

8662. What do they attend there for? What is their object in attending them?—The nominal object is to acquire the various subjects which are taught, shorthand and book-keeping, and all that sort of thing; but I think the chief object is social intercourse. I think they would attend whatever the subject if they had means of communicating with one another a little. As an illustration of that I may say that teachers will sometimes allow a class to take up musical drill, or physical exercises for half an hour before the ordinary classes start, and then the attendance is ever so much better. They come for that, and not for the other subjects. I know of one or two centres where they allow the pupils to dance for half an hour after the instruction is over, and this materially improves the attendance.

8663. At all events, it has the effect of drawing them away from loafing about the streets?—Yes.

8664. Have you any Boys' Brigades in Tottenham?—There are several Boys' Brigades, but they do not take all the youths.

8665. They might at times use the halls, might they not?—They do in some cases.

8666. They have already commenced to use them?—In very few cases. They generally use the parish room or something like that, on a smaller scale.

SIXTEENTH DAY.

Wednesday, 9th March, 1904

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Mr. J. G. LEGGE.

Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW

Mr. JOHN STRUTHERS.

Dr. J. T. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*.)

Dr. HENRY ASHBY, M.D., F.R.C.P., called; and Examined.

8667. (*Chairman*.) You are connected with a very large hospital in Manchester?—Yes.

8668. And have special knowledge on this subject?—Yes.

8669. Will you please state what you believe to be the principal causes of the weakness of children at the present day. You think that heredity figures largely?—Yes, I do certainly. I believe the three chief causes to be (1) Heredity, (2) Unintelligent Mothering, (3) Effects of improper feeding.

8670. Food comes rather under the heading of the want of intelligent mothering?—Yes; but it is so important that I want to emphasize it by giving it a separate heading.

8671. Will you state what you have to say under the heading "heredity"?—There are a large number of infants born who are weakly from the very first; their start is a bad one; they are perhaps late members of a large family in which the mother is exhausted with child-bearing, as well as from the effects of hard work and poverty. Before the child's birth development has been proceeding badly on account of the illhealth of the mother, and the infant comes into the world really handicapped from the very first.

8672. If the mother and the father are in receipt of good wages there ought to be no marked poverty?—No, it is so often secondary poverty.

8673. Neglect and waste and improvidence?—Yes; wages badly spent. Of course the question of alcohol comes in; the money is not spent on the family as it might be. Under poverty one includes secondary poverty as well as the question of poor wages. An infant with a weakly constitution from the first has a poor chance of withstanding a bad environment and bad feeding.

8674. We have had it stated here that however feeble or debilitated or depressed may be the condition of the parent, by the operation of some law of Nature an exceptional effort appears to be made to bring the child into the world under as favourable conditions as possible, to give it as it were a fresh start, and in the process the debilitated mother suffers more than the mother who is in good health?—That is, no doubt, true to a certain extent, but if there is such a law, the law operates only partially. The mother may suffer too, and nature may make an effort to bring the child into the world strong, but fails to do so.

8675. Then Dr. Cunningham, whose name you probably know, said positively that there is what he called a mean racial type, to which every successive generation made a great effort to conform, and he thought in most cases it did so unless the depressing causes were alcohol or syphilis?—I do not doubt the transmission of the racial type or the depressing effects of alcohol and syphilis; but I feel certain that the depressing effects of the struggle for existence generally on the parents is transmitted to their off-spring.

8676. He admitted the effects of alcoholism and of syphilis did depress the issue?—I have no doubt they do.

8677. And acted as a countervailing influence to this effort of nature back towards the racial type?—I should

only put alcohol and syphilis in a comparatively minor place. I do not doubt that syphilitic children come into the world very weak, and I have seen a case where a mother was continually drunk during pregnancy the child was badly nourished and grew up with a defective brain. But I think also the effects of poverty and hard work and weakness of the mother while the child is being formed in the womb do undoubtedly have the effect of producing weakly children who either grow up weakly or die.

8678. Do you think some restriction should be made upon the labour of mothers during that period?—Most certainly. When you say to what extent legally, I do not know, but there is no doubt the effect is bad.

8679. There is no restriction placed upon the labour of mothers before delivery, but there is for about a month afterwards?—Yes.

8680. Would you extend that restriction?—I would most certainly, because I think it is exceedingly important.

8681. How far back would you put it, how long before the estimated date?—At least two months and as much more as you could get.

8682. You do not think that would be accompanied by any material hardship to the family?—I should not think so.

8683. Would it not give rise to doubt?—I quite understand the difficulties of making such a law, but I do not doubt if it could be done it would be of great advantage.

8684. Could it be done; would not the manufacturer say that he had made such reasonable inquiry as was possible, and it is a matter of speculation as to when the two months begin?—I have no doubt there would be practical difficulties, but I do not doubt it would be beneficial if it can be done.

8685. Would you extend the period beyond the present month?—I should be inclined to most certainly.

8686. You would not prohibit the work in factories of married women with young children?—I should certainly do it if I could, because it is a cause of a great deal of infantile neglect. Put it under the question of food; the woman goes to work and nourishes the infant at the breast during the night, and it is fed in all sorts of ways during the day.

8687. Some people say that the mother who goes to work is very often more regular and methodical in her ways during the time she does spend at home than the mother who is in the house all day and gossips with her neighbours?—It may be she is a more careful woman.

8688. Habits of work give her a trained sense of the value of method?—I should not have thought so. I should have thought there was plenty of work to be done at home.

8689. There is no method about it?—No; but I think going to work leads to neglect at home.

8690. Would it affect the supply of labour very materially if any restriction on married women was made?—I was present at a debate in Ancoats a few weeks ago; a large number of those present were Socialists, and the men were

Dr. Ashby.
———]

Dr. Ashby.

exceedingly strong against the women going to work. An opinion was expressed that there ought to be a law that no married woman should go to work but should stop at home. There were plenty of men out of work.

8691. From that point of view because they think they take the food out of the men's mouths?—That was partly it, but they are very intelligent people, and they were very strong upon the women stopping at home, to mind the baby and the children, and not to go to work. It was the husband's business to wage earn.

8692. Surely those men can enforce their views in their own families?—I believe they do. As a rule they are an intelligent hard working class.

8693. Or has the husband of that class as little influence on his wife as the husbands of most classes?—That is the opinion of that class, and I think they carry it out. It is among the more reckless class that the mother works. With regard to women going to work, a girl goes to work and then she knows nothing about household work, and then she marries a man who is working, and the wages of the two amount to something pretty fairly high—30s. or 35s. a week. Then they can get married early, and then the woman is laid up and goes to work too soon again, or the husband gets out of work and they are nowhere.

8694. Do you think something might be done in order to inculcate some knowledge of the tending of children and so on, in the young; in the case of girls who go to a factory they might be called upon to attend continuation classes twice a week?—Yes.

8695. Would that be putting too great a strain upon them?—No. I think it would be an exceedingly good thing.

8696. They spend their evenings mostly in the street?—Yes.

8697. It would be a very good thing from every point of view?—Yes, I think so, most certainly. A good deal is being done in Manchester by the Education Committee.

8698. But the girl passes away from that influence so early in life that she loses all touch?—I quite understand that.

8699. Efforts are made in that direction, but a great many are wasted?—I quite agree it is not wise to specialise too soon. The nurse does some good at any rate in going round and lecturing to these girls.

8700. Can you mention what you hold to be the particular respects in which mothering of the children is deficient?—Want of cleanliness, badly fitting and insufficient clothing, bad ventilation in the home, exposure to cold in the streets often late at night.

8701. They do not give them enough sleep?—No; and they lie in wet and foul napkins all day and get sore in consequence. The infant is fed whenever it cries, often with stale and improper food.

8702. What is done with the children while the mother is at work: are they sent to a crèche or placed in the hands of a neighbour?—A woman is paid to look after them.

8703. I suppose she generally neglects them?—I will not say that, but she is usually the most ignorant individual you can find anywhere, and makes her living by looking after children. Perhaps she is given a certain sum weekly, and naturally she wants to make as much out of it as she can, and sopped bread is the cheapest thing to be given and always handy.

8704. Would you advocate by charitable or municipal organisation some system of trained nurses or crèches to which they could be sent?—I think the greatest work would be done by educating the mothers.

8705. If the mother has to go to work?—Then no doubt properly managed crèches are a considerable advantage.

8706. Could they be made self-supporting do you think?—It is very difficult to get money out of the parents but they ought to be self-supporting and people ought to be made to pay.

8707. The money paid to these women to look after the children ought to be enough to run a crèche on economical lines?—It ought to be.

8708. You do not bring any charge against Manchester mothers that they decline to suckle their children?—No—I believe it is the universal experience, it is certainly mine—they make a start on it as a rule provided they are not going to work, and then if they are going to work they will do it a little, but they soon stop.

8709. Do they marry young in Manchester?—Yes.

8710. Not so young as they did?—That is difficult to say. The temptation to marry early is great when both are wage earners.

8711. Is the milk supplied good?—Great efforts are made to improve it, but it is not at all what it should be.

8712. Is it deficient in quantity, or is it difficult for mothers to get hold of it, or is it bad when obtained?—A large amount of it comes from a distance, and the evening's milking comes during the night and is sold next morning in Manchester, and there is very careless handling, in the farms and in transit and then there is careless handling again in the household. The consequence is a great deal of the milk which should be fresh milk which is taken, is stale.

8713. Once it gets into those houses there is no means by which it can be kept uncontaminated?—No; unless, of course, they get it in bottles—that would be the best way.

8714. I understand the dealers do not facilitate that distribution in bottles?—No; it costs something. A great deal of the milk is bought in pennyworths for the infant: a child is sent out with a basin or jug to get a pennyworth—half a pint, or something like that.

8715. I should have thought the Ladies Health Society might have done something towards organising the supply of milk?—It is very difficult question. It has been debated in Manchester a good deal. I do not know whether Dr. Niven has told you that pressure has been brought to bear upon the Corporation to supply it as they do in Liverpool. He is I believe opposed to it and personally I agree.

8716. He is opposed to it and you are opposed to it too?—Yes. What I mean is this. The first business of the Corporation is to be a censor I take it; that is to say, to take good care that dirty milk is not sold. If they become traders as well, they are in the double position of censor and trader, and they weaken their position as censor.

8717. Do they discharge their duties as censor?—As much as the public will let them—there is the difficulty. The milk dealers are up in arms. Honestly, I believe, they are doing what they can, I believe they are seeking fresh powers at the present time. I would certainly give the Manchester Corporation credit for very vigorously obtaining powers and applying them.

8718. Are they careful to see milk which comes into the city comes from rural areas where all the protection which the law permits is in operation?—They take samples at the station and they have powers to track back the milk to the cow. That is to say they find tuberculous milk or they find milk with strepto-cocci in it, and they trace it to the diseased cows, as a matter of fact, and stop the milk being used. One knows it is not only tuberculous milk and milk producing disease which is the evil; it is the difficulty of getting it fresh and clean.

8719. Tinned milk used as a substitute?—Yes, there is a great deal of tinned milk used.

8720. When first opened that may be all very well and good but in a very short time it becomes bad?—I prefer for a good many reasons fresh milk to preserved milk for infants.

8722. I suppose the condition of housing has something to say to it?—It is difficult in the centre of the town to get houses at a reasonable rate for the working classes; the price of property goes up and they perhaps pay four or five shillings a week, which perhaps they cannot afford.

8723. I suppose children at home are breathing constantly a very polluted atmosphere?—Yes, no doubt.

8724. Apart from the ordinary atmosphere of the city the atmosphere of the rooms is bad?—Yes, undoubtedly.

8725. I suppose three or four sleep in one room ?—Yes.

8726. Do you think the Corporation is doing what it can to reduce the evils of overcrowding and their effects ? I believe they are most anxious both with regard to open spaces—at any rate, we know the medical adviser is most anxious with regard to open spaces, and also to provide workpeople's dwelling-houses outside the town where there is a tramway connexion.

8727. Would not an expenditure of that sort be remunerative by the improvement in the health of the community ?—I think so, most certainly, I quite agree that airy spaces where the babies in summer time can be wheeled would be a great advantage.

8728. It would attack the evil in the citadel and prevent rooms being occupied where there is not a minimum of cubic air secured to every occupant ?—Yes, that is quite so.

8729. Do you think it is quite a counsel of perfection to hope that some limit might be imposed on the number of occupants of one or two, or three-roomed tenements ?—I don't think so.

8731. You know there is ample power now to prevent overcrowding, to treat it as a nuisance and abate it by the most rigorous means ?—Yes. I was meaning specially for the moment open spaces. In New York they have done a great deal, I believe, in buying property and demolishing the houses, and making a park or open space.

8732. The centre of Manchester is very badly provided in that way, is it not ?—Yes ; in the industrial quarters.

7733. The effects of this bad feeding and careless mothering are very noticeable in the condition of the children, are they not ?—Yes.

8734. Would you explain what the effects are which have come under your knowledge ?—Bad nutrition and the production of rickets ; as a result they are undersized from interference with the growth of the bones, as well as having loose joints and weak muscles. They grow weedy and poorly nourished.

8736. Do they ever recover from that ?—They may, undoubtedly, if they are put under better conditions later.

8737. During which period of a child's life do you think they improve most—during school age or in the period after school life ?—In the worst cases the deformity lasts for life, in the milder cases improvement gradually takes place during the period from, say, four to seven years of age.

8738. I want rather to gather whether you thought the period of school life was a favourable one, on the whole, to development or not ?—Certainly, under favourable circumstances.

8739. Under the average conditions which a child meets with in the elementary school of to-day do you think it is a period of development ?—As far as the school is concerned, but they are probably still under bad conditions at home. I see a good many school children from the fact of examining children for the special schools in Manchester. A good many of these are suffering from the results of rickets.

8740. Do many go to school half starved, do you think ?—I am inclined to think not. I have been associated with a lady (Miss Dendy) who inquires of every child what he has had for breakfast, and I have been struck with the good breakfasts many of them have had.

8741. They have had good breakfasts ?—Yes ; at any rate there has been no want of variety.

8742. With regard to feeding in the middle of the day, we have been told by a Witness that the parents very often give children a penny or three-halfpence or twopence to provide their own meals, and more than half of that sometimes goes in buying marbles, or a top, and they starve themselves ?—I think that is possible.

8743. And sweets they buy in large quantities ?—A meal is provided for a penny in some schools, at the school itself.

8744. Does that pay the cost ?—It does very nearly. It does not pay the cost of the utensils used in cooking, or the fire, or the labour, but it very nearly does cover the cost of the food. In a school in Siddington, in Cheshire, a penny-halfpenny covers the whole cost.

8745. A system of that sort might be adopted to a much greater extent ?—Yes. The girls and boys are made to lay out the table and so on.

8746. It helps to train them in household management ?—Yes. They bring their pennies, and if there is any deficiency it is supplemented from a private fund. But if the place was adapted for the purpose and pots and pans and plates were provided, a penny or three halfpennies would cover the cost. They have Irish stew, rice pudding, or soup and rice pudding.

8747. It might be part of the plant of the school for teaching cookery so that that could be provided ?—Yes. At the school I referred to, Hague Street, Newton Heath, a dinner is provided every day and the pennies are collected. They say that the children, although they may not do the cooking, do the laying of the tables and so on. I have watched them a number of times, and that is far and away the best plan.

8748. You think they are adequately fed on the whole ? They are often badly fed in the sense that they are given improper things.

8749. But a sufficient amount of money has been spent upon their food ?—Yes. They have bread and butter and bacon for breakfast. At least, half of them will say they have had bacon and bread, and sometimes an egg, and so on.

8750. Have you noticed the effects of tea drinking ?—No, I cannot say I have.

8751. What about juvenile smoking ?—I think it is bad, but I do not think it is at all comparable with other influences.

8752. How long have you been in a position to observe the conditions in Manchester ?—Twenty-five years.

8753. Should you say those conditions are aggravated or ameliorated ?—I should say they are better on the whole. I cannot give you statistics. I think the effects of the teaching of the Sanitary Association, and the various agencies with regard to mothers feeding their children on cow's milk instead of artificial foods and bread, and also urging them to nurse their own babies, have had a good effect.

8755. You think the parents meet the efforts made in that direction ?—Yes. I think the generation that has grown up in the last twenty-five years is better than the generation of twenty-five years ago. There is a great deal of ignorance still, but I think it is less.

8756. Therefore, you look to see a further amelioration in the course of the next generation ?—Yes, I do.

8757. You think the worst conditions now are due to causes which are diminishing in intensity ?—I do. A great deal of it turns on this one question of intelligent mothering, including food and hygiene.

8758. And you would concentrate effort upon that ?—Yes I should. It all comes from the little things on which there is ignorance on the part of mothers. There is no patent road.

8759. (*Dr. Tatham.*) You have been for a great many years physician of one of the finest Children's Hospitals in Europe ?—Yes.

8760. That is not an extravagant description, I think. The Chairman has spoken of a little discrepancy between your opinion and that of a gentleman who has given evidence here before with regard to the condition in which infants come into the world. I take it your opinion is based very largely upon your very long experience as a practical physician ?—Yes.

8761. And also based upon experience in a very large Lancashire city ?—Yes.

8762. So that although you may differ with a gentleman who argues entirely on theoretical grounds, the reason is the difference of your kind of experience ?—It is very possible. I believe that a large number of infants are born in a weakly condition resulting from the weak health of the parents.

8763. I am glad to hear you say from your experience in Manchester that you do not think the condition of the infantile portion of the population is deteriorating ?—No, I do not.

8764. You think the reverse ?—I think so. The condition is very bad, of course.

8765. It is a most important thing to get that from

Dr. Ashby.

Dr. Ashby. you?—It is my impression most certainly. Some of my colleagues and myself have stated in our hospital reports that we think we see improvement.

8766. I want rather to take you through the points as you deal with them in your *présis*. You say here that you think that rickets in many ways affects the physique of the young child?—In the worst cases the bones do not grow in length; they remain stunted and curved and bent, and the joints become knock-kneed, the muscles become poorly nourished and the child does not walk till three or four years of age; it digests badly all that time. In the worst cases what is produced in those early years never passes off. They do not necessarily attend at a dispensary, but I see them at the special schools as school children, and I can see very marked rickety defects—knock-knees and so forth.

8767. There has been a statement made here—I am not sure whether by a medical man or not—that rickets is largely produced by the absence of lime salts in the water?—I am entirely sceptical about that. Lime has nothing to do with it. It has been shown over and over again that in the blood of rickety children there is plenty of lime. Rickets occurs in spite of plenty of lime in the food.

8768. You are the author of an important work on physiology, and I think you have dealt with that subject?—Yes.

8769. With regard to knock-knees and flat feet, they are produced mainly by rickets, are they not?—Yes, I have examined candidates for the Post Office. I have seen a number of men with flat feet, who are candidates for postmen, who have been refused by the ordinary attendant of the post office, and therefore referred to an umpire. It is a question of physique, and a certain proportion are refused. You see the effects of rickets again in the flat feet which are likely to prevent a man being a postman on account of his having so much walking to do.

8770. The same effect will probably cause his rejection as a recruit for the army?—Yes.

8771. If children were properly cared for and properly fed, to a very great extent that might be prevented, although it is difficult to cure it?—Yes, it might be prevented, undoubtedly.

8772. You give statistics with regard to admissions to the Manchester Children's Hospital in 1903?—Yes. During 1903, 901 infants and young children were admitted as outpatients to the Manchester Children's Hospital, suffering from rickets in the early stages; in addition to the above, 539, mostly children of over three or four years of age, were admitted for various deformities, as knock-knees and bow-legs, the result of rickets.

8773. Do you think rickets is on the increase or not?—No, I do not think so. With regard to hospital statistics, as a hospital gets larger and as communication with outside towns becomes better it tends to get the chronic cases out of proportion to acute cases, because it is drawing from a larger area.

8774. You examined 750 school children who had been selected for examination on account of their inability to learn in class?—Yes, eighteen were suffering from marked rickety deformities, being much undersized, with knock-knees and flat feet, whilst their mental status was much lower than that of average children, in spite of their having attended school. They were not only backward but had dull brains. Many of the others were of poor physique, with curved or limp spines and flat feet, due to rickets. These have not been selected at all for rickets; they were selected because they were backward. I do not mean that because a child has rickets it is dull and backward, but in the worst cases it often happens that it is. There is a dulness of intellect with it.

8775. There is an association of the two?—Yes; I do not wish to say that there were only eighteen of these suffering from rickets, because I could see traces of rickets in a large number of them, but these were *bona fide* dwarfs.

8776. You say that it is easy to trace in the children of the special schools a poor physique due to infantile disease.—Yes. I was referring to rickets, but also to general weakness—rickets perhaps in the minor degree, loose

limbs and flat feet, and then deafness is produced by ear disease, and hemiplegia and paralysis occurring in infancy.

8777. With regard to tuberculosis, a most important matter, I should like to have your opinion on that as regards its prevalence amongst children?—It is exceedingly prevalent. It is not common in early infancy, that is in the first six or seven months of life, but after that there is a very great deal. There is tuberculous disease of the internal ear and also of the glands. Then we come to the more serious forms in the shape of hip and spine disease. In the Children's Hospital last year there were 275 cases of tuberculous spine disease, and 314 cases of tuberculous hip disease; and this does not include knees and elbows and so on; so that there is a very great deal of deformity being produced by tuberculosis which lasts more or less for life, rendering them unfit for the Army and often from earning their own living.

8778. With regard to the disease popularly known as *tabes mesenterica*, what proportion of the cases do you think are really tuberculous?—Many of them are not. There is no doubt whatever about that. It is a very unfortunate name.

8779. You would agree I am sure that it would be desirable to get rid of that term if possible?—Yes.

8780. Call it tuberculous peritonitis or something of that kind?—Yes.

8781. I think you will agree that the statistics with regard to mortality from *tabes mesenterica* are simply unreliable?—Absolutely so.

8782. Then you come to the question of the milk supply of Manchester; you say that you think the women of the poorer class are more careful in the matter of artificial feeding of their infants than they were?—I think so. They make a greater effort to nurse their own children for a start, and then after that they more often get their pennyworths of milk and dilute it, than the bread sops which used to be so exceedingly common twenty or twenty-five years ago. My own idea with regard to that is that they should be encouraged to nurse as long as possible, supplementing the breast with cow's milk. There used to be a prejudice—and there is now—against mixed feeding, but I think that the best thing a working woman can do when she is feeding an infant at the breast is first of all to take care that she takes plenty of milk herself, and if she finds her breast milk is failing she should give the infant a little diluted milk in addition; and go on in that way as long as she reasonably can.

8783. As regards the condition of the milk which is given to young children in Manchester, do you think that tinned milk is very much used in place of the other?—Yes, I think there is a good deal. I received a communication from the secretary of the Grocers' Association the other day asking whether it was right for them to sell condensed skim milk for infant feeding. They put the question categorically to me. They said a great many grocers did it on account of trade competition, but they always had a sort of feeling that they ought not to recommend it for infant feeding.

8784. We have had it in evidence here that in certain places the use of condensed skim milk is common simply because it costs a halfpenny or a little more than a halfpenny less than condensed whole milk, you do not think in Manchester that is the case to any great extent?—I think there is a great deal of inferior condensed milk, but not perhaps sold openly under the term "skim milk." The ordinary condensed milk would contain 12 or 13 per cent. of fat; I fancy 8 per cent. of fat in condensed milk is a common thing. I think in skim milk there would not be $\frac{1}{2}$ per cent.

8785. With regard to illegitimacy do you think that causes a very great deterioration of physique?—I should think so certainly. The mortality of illegitimate children is very high.

8786. It is about double that of others?—Yes, in so many instances the woman has to work. She is unmarried, and she goes to work in a factory or a warehouse, washing steps, and then, poor wretch, at night she has to give the child the breast, and nurse a crying baby. Then in the day the child is under the care of somebody who is ignorant and careless. One can quite

understand the higher mortality and also the number of those who grow physically unfit.

8787. Is syphilis very prevalent amongst the infantile population of Manchester?—Yes, to some extent. I have here a list of the out-patients of last year, 1903. With regard to the number of congenital syphilis cases admitted I see that out of 18,000 patients we had 124 cases of congenital syphilis with three deaths.

8788. The proportion is not very large?—No. I suppose it is an important item, but I do not think it is widely spread over the population.

8789. Is it your opinion that such syphilis as occurs is less virulent than it was twenty-five years ago?—Yes. Here we have only three deaths out of 124 cases.

8790. With regard to the voluntary agencies at work amongst the poor in Manchester, may I ask you to say what you know of them as existing at the present day?—There is a great deal being done by the Ladies Health Society and the Sanitary Association by means of workers going about among the poor, the ladies themselves personally take a great deal of interest and do personal work among the poor on organised lines in connection with the Corporation, so that there should not be overlapping, they work with and alongside the Corporation lady visitors, so that I think they are doing exceedingly good work. The only thing is there is too little of it.

8791. You think that work might be extended?—Yes, and I think that is the most hopeful method really. I am doubtful on the question of the municipal milk supply, and doubtful to some extent even of philanthropy doing good by giving milk away. For instance, in the municipal milk supplies a certain mixture is made and half-a-dozen bottles are given; the mother puts the nipple on and feeds the child out of the bottle. That is good, but it is not educating. You cannot do that for ever. You will produce more good in the long run by teaching them to help themselves.

8792. (*Mr. Legge.*) I should like to ask you a question or two about the matter of married women working in factories. Do you think that the number of those women working in workshops in Manchester is great?—There is a good deal of it, but it would be very difficult for me to give any statistics at all.

8793. It seems to vary a good deal in different parts of the country, largely, I suppose, according to whether the main occupation is textile or non-textile?—Yes.

8794. In the textile occupations of Manchester or the neighbourhood, I suppose it is likely there would be a considerable number?—I take it a great deal of the weaving in the weaving sheds is done by women, married and unmarried.

8795. In Manchester itself there is not much actual weaving?—No, I am speaking more of the Lancashire district.

8796. It is more warehousing?—Yes, but still there are a great many mills immediately round Manchester, a good deal of cotton cloth is made—what is called grey cloth—by women's labour.

8797. You think perhaps it would be a good thing if the Factory Department got the statistics to show the number of women employed?—Yes.

8798. They get particulars as to the number of persons employed, male and female, and they might, probably without very great difficulty, get additional particulars as to whether the women were married or unmarried?—Yes. Of course, everyone sees the women streaming out out of the mills, and there is also home work.

8799. We should then know what was the extent of the problem which we had to face?—Exactly so.

8800. With regard to this practice with which everyone is well acquainted, of working women paying an old woman or somebody to look after their babies, are you aware whether any attempt has ever been made to provide a licensed class of attendants?—There is a lady inspector on the Board of Guardians going round when children are boarded out, is there not?

8801. Yes.—But there is no inspection, so far as I know, of mere caretakers for a few hours.

8802. But has any attempt been made, within your

knowledge, to provide women with any qualification or licence by any sanitary authority?—I do not think so. *Dr. Ashby.*

8803. The tendency nowadays is strongly in that direction. We have had the registration of midwives recently secured, but do you not think it would be a good thing, if it were practicable, that the sanitary authorities should be enabled to grant licenses to women who show that they have qualifications up to a minimum standard?—Yes, it is possible, it might be done. I suppose the difficulty comes in for how long—that is, a mother may leave some one in charge of her baby for an hour or two, and then the woman who goes to work wants to be relieved from eight till eleven. Then she goes to see the baby in the middle of the day, and then goes to work till six o'clock again. There would be some practical difficulties in defining what was taking care of a baby and what was not; but I do not want to throw any difficulties in the way. It would be a good thing if it could be done.

8804. Baby-farming is under regulation?—Yes.

8805. And this is a form of baby-farming?—Yes. It is only when a woman takes charge of a baby for good that she is looked after; when she looks after it for an hour or two, or six or seven hours, it is much more difficult.

8806. The child is farmed out for that period?—Yes.

8807. You think it would be a good thing?—Yes, if it could be practically done.

8808. If something of that sort were secured, it might be possible to arrange that no married woman should be allowed to work unless she had her children in charge of a licensed person or sent to some such *crèche* as the Chairman was speaking of?—Yes. I think the *crèche*, if it could be done, would be better than the licensing of women—it would be more practicable.

8809. But you do not want all the children of the working class brought up in *crèches*. I am going to a wider question of statistics. We have had represented to us by several witnesses the great advantage of having a central sort of government bureau to collect statistics of an anthropometrical kind covering the country and affording data which would be prepared from period to period?—Yes.

8810. Do you think that would be an advantage?—Certainly, school children and so forth.

8811. School children and young persons. You have not, I suppose, at any time acted as a certifying surgeon?—No, I have not.

8812. In the course of their business they have to be constantly passing children and young persons, and it would be very easy for the certifying surgeons to do that?—Yes, it would be very good.

8813. Besides comparing the population at different periods you could compare the population of one district with another?—Yes, like the comparison between Edinburgh and Aberdeen which has been recently been done.

8814. And a textile with a non-textile district?—Yes, I think so. That is most interesting and important.

8815. It would also have this effect. It would enable the public conscience to be aroused in districts where these figures showed there was something wrong?—Yes, certainly. It would awaken anxiety locally.

8816. You come from Manchester; we have had a number of visitors from other localities where there is an active municipal spirit?—Yes.

8817. My business takes me all over the country, and I know some local authorities which require a charge of dynamite to stir them?—Yes.

8818. I mean they are sunk in a shameful state of apathy?—Yes.

8819. If the Government were suddenly to produce an effective survey of those districts, statistically established, these people would have to make an effort?—Yes, I quite agree; I think it would be splendid.

8820. Have you any special views as to what measurements there should be? One would like them to be as simple as possible?—Yes. My own impression is height, weight, and chest measurement, and maximum circumference of the head. These are all that are wanted. I have my doubts whether the angles and so on are necessary.

Dr. Ashby.

8821. You do attach importance to that last one—the circumference of the head?—I always do it in school children. It is of interest.

8822. Do you prefer the circumference of the head to other measurements of the head?—I generally take the circumference round the temples. I have not attempted anything else, partly because I was not anxious to try too much.

8823. (*Colonel Onslow.*) I take it you are of opinion that with regard to the local authorities, certainly in some cases it might be well for the Government to step in and insist upon better sanitary supervision of houses and so on?—Certainly.

8824. At present, to a great extent, there are classes of sanitary inspectors who are very much in the hands of the Corporation or the local body, and although they may see the facts they are inclined not to report them?—Yes. At any rate, they are unable to take the steps they ought to take.

8825. And that they would naturally wish to take?—Yes. There is the question of the rates going up.

8826. It really wants somebody above the local authority to insist upon its being done?—Yes, certainly.

8827. And with regard to flat feet, in reference to rickets, naturally, of course, rickets is one of the great causes of flat feet; in your opinion, are flat feet caused by the locality, the soil and so on?—No, I do not think so.

8828. A great many medical men have that opinion, I believe—men I have spoken to in different parts of the country?—I should not think so.

8829. In Lincolnshire, from the heavy land, flat feet are very common amongst the recruits presenting themselves and especially amongst young boys; you would attribute that not to the nature of the soil but to bad construction?—Yes, I should think so. I should class that with the story that Jews have flat feet because of their ancestor's forty years' wandering in the wilderness.

8830. There is no doubt we have a number of rejections from the two counties of Lincoln and Devonshire, each of which has heavy soil?—I should not have thought it was due to that; I should have thought it was due to nutritional disorder connected with the muscles and ligaments of the ankle. I can quite imagine that parents may have been foolish in allowing their children to go long expeditions and long walks when they were not fit to do so.

8831. And worked too young?—Yes. When the weakness is there, then too much resting of the weight of the body on the legs and too much fagging can intensify the deformity; instead of getting well it gets worse.

8832. Then with regard to the youngest child of a large number of children, what you have mentioned is a fact which is not confined to the lowest orders?—No.

8833. It is in all classes?—Yes. No doubt too severe child-bearing takes it out of the mother too much and she is unable to form the child as strongly as a healthy woman would. With regard to the first-born it happens in the same way. You might say that nature does not all at once adapt itself, and, consequently, things may not go easily.

8834. Very often, in the upper classes, the first-born is not quite the most intelligent of the family?—That is quite true. The woman has not adapted herself to the conditions of maternity.

8835. (*Mr. Struthers.*) Rickets is a disease of infancy, is it not?—Largely; it makes its start then.

8836. At what age do you detect its first appearance?—The earliest is the fifth or sixth month—sometimes not till a year later.

8837. You think it actually starts then?—Yes, in a number of instances. It may not start for nine or even twelve months, but in many cases, at least, it starts about the end of the first half year.

8838. On the other hand, is its development delayed till late?—Yes, it may be.

8839. How late may you have the first appearance of rickets?—It is very difficult to say. Some of the signs of rickets occur in children of four and five after a severe illness, but it is quite exceptional. The crooked bones

and knock-knees seen so often in older children are the results of infantile rickets and not of the disease commencing at a late period.

8840. So that substantially any appearance of rickets, or diseases such as flat feet and dwarfishness in later life, are due to the way in which the child has been brought up?—Yes, that is a point I very strongly agree with.

8841. Between the ages of three months and four and five years old?—Yes.

8842. And what happens to the child or individual after that does not so much matter as far as that is concerned?—No, but of course the loose joints may be made worse by bad hygiene and overwork.

8843. I gather from you that the cause of the harm was not, in your opinion, the absence of lime in the water?—No.

8844. Can you tell us in general terms what is the cause? It practically amounts to this: when there is bad feeding, or when there is indigestion, the digestive process goes wrong, and certain toxins or deleterious substances are formed in the stomach and intestines and these are absorbed into the blood. Sweating is one of the first signs, later the formation of the bones and muscles are interfered with and nutrition generally. I do not mean to say all the gaps of knowledge have been filled, but I take it roughly that is the outline of it.

8845. Then it is due to defective digestion very often?—Yes, or, of course, improper feeding in some instances.

8846. It may act in two ways—the food may be deleterious in itself, or it may be unsuited to the digestion of the child?—Yes. A child even if properly fed may get rickets if its digestion is weak, but only mildly.

8847. That is a point I was going to put to you. Have you ever found rickets in well-nourished children?—The slighter phenomena of rickets; but you never get severe rickets in children who have good digestions—healthy children. A child may be fat and yet rickety and unhealthy.

8848. And plenty of food to supply the digestive apparatus?—That is so.

8849. In the main it is a question of proper nourishment?—Yes.

8850. And for the children of the age we are discussing the proper nourishment is milk?—Yes. In the first instance the mother should nurse the child and, failing that, she should supplement it with suitable cows' milk properly diluted.

8851. You say that in Manchester fresh milk of a good character is not readily obtainable by the poorest classes; they buy milk by the pennyworth?—Yes.

8852. You also said that you would not favour such a scheme as that adopted in Liverpool or, at any rate, you had no strong opinion in favour of it—the supply of milk through the agency of the corporation?—That is rather a long story. Speaking generally, I am not in favour of Corporations becoming purveyors of milk.

8853. What I wanted to get at was this: On your view of the matter what steps do you think it is possible to take to make a larger supply of good milk available?—That is a very difficult point. I should trust mostly, I think, to regulating trade channels. Then I think that with proper precautions certain grants might be made perhaps by the corporation or, at any rate, by some philanthropic society, to superintend the sale and distribution of good milk for infants. Merely setting up a shop, and giving away or selling milk, would not make the slightest difference in infantile mortality. You have not only to get the milk to the poor, but you have to have the children looked after by the health visitors, to see that the milk is properly used and the infants looked after.

8854. Even if there was an ample supply of good milk sold in the shops in the densely populated parts of Manchester it would not be used by the poorer classes?—You would still want supervision of the mother.

8856. But, as a matter of fact, there is not in your opinion a sufficient supply of good milk?—No, I think that the milk supply of Manchester and all the large towns is still, in spite of all that has been done, in a poor condition. There is a lot of stale milk and contaminated milk which comes in.

8857. Have you any particular ideas as to what might be done to improve it?—I think it can only be done by regulating it by corporations and, at the same time, to bring what influence one can upon farmers.

8858. The Corporation of Manchester, or the sanitary authority, has no power to inspect farms, has it?—Oh, yes.

8859. They have a distinct power of inspection?—Yes, I take it that they have—over every one that is within their district.

8860. But it comes to Manchester, I take it, from 50 miles or 100 miles away, perhaps, and there is no power to deal with the sources of supply there?—Yes, they have power to examine the milk, and take samples at the stations, and if they find that the milk contains tuberculous germs, or if it is dirty milk, or contains disease germs, they have power to oblige that milk dealer to give the names of the farms where the milk comes from, and their inspector goes, no matter how far it is, and traces the milk to the cow, and I believe they can insist upon the cow being slaughtered if diseased.

8861. (*Dr. Tatham.*) As a matter of fact they do—whatever powers they have, that is what they do?—Yes, they have done so, certainly.

8862. (*Mr. Struthers.*) They cannot act directly. They have to act through the local authority of the district?—Directly—they do act directly.

8863. They call upon the farmer to have the tuberculous cow destroyed or, at any rate, that the milk shall not be used?—Yes. It is slaughtered, I believe, in the presence of their own inspector.

8864. (*Dr. Tatham.*) The pressure is indirect?—That may be so.

8865. They say to the farmer, "If you do not get rid of that cow from your herd you shall supply no more milk to Manchester."—Perhaps that is it.

8866. But it is very powerful?—Yes.

8867. (*Mr. Lindsell.*) May I read a passage of the proposed Bill you have now before Parliament on the subject of milk: "When a sample of milk has been taken in transit, or otherwise, for bacteriological examination, the cow-keeper from whose milk the sample has been taken shall be forthwith notified by the medical officer of health that such sample has been taken, and it shall not be lawful for the cowkeeper thereafter to remove any cow from his farm until the result of the examination of such sample has been notified to him by the medical officer of health, unless he shall previously have submitted all his cows for clinical examination by the veterinary surgeon of the Corporation." That is with regard to tuberculosis?—Yes.

8868. (*Mr. Struthers.*) Will that enable them to deal with a farm 100 miles off?

8869. (*Mr. Lindsell.*) Certainly.

8870. (*Witness.*) I know cases of farms in Shropshire—mentioned in Dr. Niven's last report of 1902—where they did trace different cows that were suffering from diseased udders, not only tuberculous udders, but septic diseases—abscesses, and so on; they did actually track them, and found them out from bacteriological examination which they had made at the station. They succeeded in getting the names of the farmers, and if a farmer hid a cow they found the hidden cow.

8871. (*Mr. Struthers.*) This can only be done in the case of bacteriological examination if it disclosed *strepto cocci*, or something of that kind?—I take it they would not do it unless they had strong evidence. Dirty milk they might wish to condemn, but perhaps they would only take the very strongest cases when proceeding in that way.

8872. They could not deal with a farm which was simply dirty?—I do not think they have strong enough powers for that.

8873. At any rate, notwithstanding those powers you have told us about—which seem to be more extensive than I thought—there is still a difficulty in getting good milk in Manchester?—Yes, the milk is not up to what it should be. So much of it comes in by train, and the people buy the afternoon's milk next morning, and it is kept in the house before using it.

8874. That is to say, there is too long a period between the time at which the milk is got from the cow and the

time it is used?—There is no proper means taken to cool the milk and keep it at low temperature.

8875. In your opinion, the most likely means of improving the health of these young children is the instruction of mothers?—Yes—in education.

8876. And that, I gather, you think is best done by health visitors, people who actually go and see them at their homes?—Yes, and I quite agree with continuation schools.

8877. You would lay stress upon the actual visiting of the mothers at the homes?—Yes, coming actually in contact with them. It is all very well to give a printed slip away, but I do not think that is very efficacious.

8878. As regard school, if girls leave school at fourteen, it is very probable, is it not, that any little instruction they could have had on a subject of this kind may have disappeared before they could put it to practical use?—Yes; one does not incline to the view that children should specialise too early, but I think the nurse who gives instruction in hygiene in Manchester does it very well. She has the girls in class, and they have infant feeding bottles and infant clothes to handle.

8879. This is in the actual class?—Yes.

8880. This class you spoke of is in a day school?—Yes, at a Board School under the Education Committee.

8881. Is instruction of that kind commonly given at the Board Schools in Manchester?—There is one nurse in the employ of the Education Committee—only one at the present time—and she goes from school to school and teaches the eldest girls. I do not know what it is substituted for—perhaps some of the sewing or some class of that sort. She gives them a general idea of the home régime, the care of infants, and so on.

8882. It is done in school time?—Yes.

8883. And in substitution for something else?—Yes, I think so.

8884. (*Mr. Lindsell.*) Household management is a special subject now?—It would come under that, probably. Of course, there is no additional time given. It is given in school-time.

8885. It is recognised now, and a grant is made for instruction in household management?—Then it will come in under that. It is instead of sewing perhaps, which is household management.

8886. It is a distinct branch from needlework. Needlework is part of the regular instruction at school, but they may also teach household management and receive a grant?—I understand.

8887. (*Mr. Struthers.*) Household management is distinguished from needlework and cookery?—Yes.

8888. And laundry work, which is allied to it?—Yes.

8889. The special point of this instruction in Manchester is that it is given not by the ordinary school teacher but by a specialist?—Yes.

8890. And that, in your view, would be valuable?—Yes; she does not do anything else.

8891. It is not theoretical instruction, but practical instruction?—Yes.

8892. With, of course, the necessary explanations?—Yes. She has the bottles of milk, and the clothes, and napkins, and so on.

8893. Even if girls have instruction of this kind in a day school you think it is important that instruction should be continued in the evening schools?—Yes, most certainly. I should not rely upon the former only.

8894. I rather gather that you would go the length of favouring compulsory attendance in continuation classes between the ages of fourteen and sixteen and seventeen?—I should, most certainly.

8895. And insist that the girls during that time should attend a couple of nights a week for instruction in domestic subjects?—Yes.

8896. With certain exemptions?—Yes.

8897. At the pleasure of the local authority?—Yes.

8898. You think they should continue the instruction they receive at school to the age at which they begin to give it practical application?—Yes, so many girls go to work as soon as school is over.

Dr. Ashby.

Dr. Ashby. 8899. That scheme is very attractive, but have you considered the possible difficulties?—There are difficulties. It was proposed the other day by Professor Sadler in one of his lectures, and he brought a swarm of hornets about him.

8900. Take the case of shop-girls, of whom there are large numbers, between fourteen and sixteen, in Manchester; would it be possible for those girls to attend evening classes twice a week for subjects of this kind under their present condition of work?—I suppose at most of the shops they would get off at six or seven o'clock.

8901. The class would have to begin at half-past seven if the girls were to get to bed in reasonable time?—No doubt there would be difficulties.

8902. Would you favour employers being called upon or obliged in some way to give the necessary facilities?—I should think so myself.

8903. That would be almost a necessary complement of your scheme of compulsory evening classes?—Yes.

8904. (*Chairman.*) You think twice a week would be sufficient?—Yes. It would not do to overdo it.

8905. (*Mr. Struthers.*) Have you thought of similar compulsory attendance for boys?—I do not know that I have. I was thinking more with regard to infant feeding and infant régime.

8906. (*Chairman.*) It would be good with regard to boys?—Yes.

8907. Do the Manchester mothers use those india-rubber nipples?—Yes.

8908. Do not your Health Society ladies try to prevent them from using those?—Yes.

8909. They are very pernicious?—Yes. You see it drops on the floor and then is taken up and put into the child's mouth straightway.

8910. Do not they also tend to contract the jaw when it is most flexible?—I think the worst harm is done by inoculation from the dust of the floors. In our Out-

patient Department I see the "teat" drop on the floor, where the dust is full of tuberculous germs and all sorts of things, and then the mothers put it straight into the infant's mouth again.

8911. Does it have the effect of contracting the jaw?—One's own impression is that that is comparatively small. The worst effect is inoculation, making sore mouths and enlarged glands. Besides it is a bad habit for the child always to be sucking.

8912. I have here the text of the words which Professor Cunningham used: he said, "In other words these inferior bodily characters, which are the result of poverty and not vice, such as syphilis and alcoholism, and therefore acquired during the lifetime of the individual, are not transmissible from one generation to another"?—If a man loses a limb, his children are born with their limbs complete, mutilations and local diseases are, I believe, never transmitted. But I certainly think weakness, tendency to disease as well as general diseases, may be transmitted from parents to children. Then I do not doubt that the fœtus may suffer from imperfect nutrition in consequence of maternal weakness.

8915. (*Dr. Tatham.*) With regard to the infant mortality in Manchester that is very largely due to the effect of diarrhoea?—Yes.

8916. And you regard infantile diarrhoea as distinctly infectious?—Yes.

8917. Not simply a mere enteritis?—No. It undoubtedly spreads in hospitals. A child with diarrhoea comes in and infects others by inoculation. One does not doubt that the napkins are infected.

8918. And it is very often due to infected food?—No doubt. It comes through the milk or through the india-rubber nipple dropping on the floor and being put back into the mouth again.

8919. The milk itself becomes infected?—Undoubtedly. There is bad handling in the household, and the child may have diarrhoea from contamination.

Dr. JOSEPH WIGLESWORTH, M.D., Lond., F.R.C.P., M.R.C.S., called; and Examined.

Dr. Wiglesworth. 8920. (*Chairman.*) Will you state the character of the experience which enables you to give evidence on the points before us?—My experience has been practically twenty-four years in one of the largest asylums in the country.

8921. In Lancashire?—Yes—first as assistant, and then as superintendent of the Rainhill County Asylum. I have been head of the institution for the last fifteen years. The asylum has been increased very largely, and now contains over 2000 patients.

8922. You are inclined to think there has been a very considerable increase in the number of the insane?—There is no doubt about the whole increase. The question is whether it is due to accumulation, or how far it is due to that, and how far to increased incidence of insanity in the population at large.

8923. That is the more important aspect?—Yes; there is no question about the very large increase.

8924. But the question is whether it is an apparent or a real increase?—It is a real increase in a sense—that is to say, a great many people are sent to asylums that used not to be sent there.

8925. There are more insane people under treatment, but the question is whether relatively to population there are more?—Relatively to population they are largely increased.

8926. There is a larger number under treatment?—Relatively to population. Yes. The question is whether the incidence of insanity among the public is increasing. It is a difficult thing to decide, and I do not think anyone could tell you offhand whether it was so or not.

8927. Statistical information is incomplete?—Yes, and it depends upon how you read it and look at it. I will call attention to one or two points in connection with this. On the whole, I am rather inclined to think that the incidence is increasing, but I would like to express myself with reserve, because it is a question of great difficulty. I have worked out the statistics of Lancashire, having a personal experience of the matter, because it contains about one-eighth part of the population of England and

Wales, and I think it is likely to furnish a reliable indication.

8928. How far do you think the statistics do bear out that there is an absolute increase?—I think they do bear it out, but it will be necessary to go through the evidence a little bit in detail. I have no doubt you are familiar with the report of the Commissioners in Lunacy upon the subject?

8929. Yes.—I think this question has to be decided, so far as it can be, by what are called pauper patients, because, I think, that private patients do not give reliable conclusions owing to the strong objection felt by many persons to having their relatives certified as insane. With regard to the paupers a good many patients are in the County Asylums who are not paupers in the ordinary acceptance of the term—that is to say, they would not be paupers for any ordinary illness. Insanity is one of the most expensive illnesses that a person can have, and many people have to seek the assistance of the rates who are quite in a respectable position. Many people pay rates for those in the asylums, but yet they are classified as paupers. Then—a proviso which ought to be considered with regard to the chief causes of increase—there is, first of all, the much greater tendency which now exists on the part of the unions to send to asylums cases of idiocy, imbecility, and senile weak-mindedness which were formerly cared for in workhouses.

8930. They are collected under one head?—Yes. There is an interesting table here which illustrates that with reference to Lancashire—Table II.—which shows that the percentage in asylums has gone up, and the percentage in workhouses has gone down. If you take it back to 1862, you will find, first of all, those in the care of friends boarded out by the workhouse—that has decreased very much, from 11.79 per cent. of the total number of officially registered lunatics in the county in 1862, to 1.35 in 1902; and then 1.25 in 1903. That refers to those who are under the care of friends. It has gone down very largely. Then

Dr.
Wiglesworth.

if you will refer to those actually in the workhouse in 1862, the percentage was 41.70; in 1872 it had gone up rather to 44.73. Now comes an interesting point, that in the decennium between 1872 and 1882, when there was a Government grant per head for every lunatic maintained in an asylum, almost immediately the percentage drops to 38.88 in 1882, and then down to 23.68 in 1892. Then again there was a very slight increase in 1902, but that was entirely due to the fact that in the county of Lancashire during the latter years of that decennium there was a very great deficiency of accommodation, and the unions could not unburden themselves of all cases; they had to keep more in the workhouse. It is instructive that in the following year there was a fall. The Lancashire Asylum opened with 2,000 patients and in a single year the proportion maintained in the workhouse fell to 20.95. If you will follow the complementary returns for the asylums you will see that in 1862 the proportion maintained was 44.80; in 1872 it was 43.23—a slight drop in harmony with the slight increase in the number in the workhouses. In 1882 there was a big increase to 54.60, and in 1892 there was an enormous increase to 73.65. Between 1882 and 1892 large additions were made to the accommodation in all Lancashire asylums; practically there was plenty of room. All the unions sent all the cases they could. Then in 1902 there was a slight fall to 70.98, because there was not sufficient asylum accommodation. In the next year, when a new asylum was opened, it jumped up to 76.76. Whereas in 1862 the proportion in the asylums was 44.80, in 1903 it is 76.76. Many cases of senile weak-mindedness and slight forms of congenital weakness are sent now which would not formerly have been classified as lunatics at all; they were kept in the workhouses before, but they were kept there as ordinary patients.

8931. Does that affect the returns to any large extent?—It is impossible to say how far it will affect them. There is no doubt that the experience of the cases coming into the asylum shows that many cases are sent in which I consider it is unnecessary to send.

8932. Are there a larger number of recoveries from insanity owing to treatment now?—There is rather a smaller number owing to the fact that the curable cases are diluted down by these large numbers of incurable cases.

8933. Are there more absolutely cured?—I do not know that there are any more or less; I do not know that there are any less.

8934. Would many to any appreciable extent yield to modern methods of treatment?—Certainly. We send out from 30 to 40 per cent. every year cured. Many of those relapse, but not all. But that is like any other bodily disease. If a person has bronchitis, he is more liable to have it again in years to come. The same thing applies to the brain.

8935. But lunacy is more chronic in its characteristics?—Yes, undoubtedly. It is necessary to emphasise that point about so many cases now being certified as lunatics who used not to be so certified, because that accounts for the great increase in proportion to the population at least, to a certain extent. Lunacy has not only largely increased, but the percentage in proportion to the population has also gone up. That is partly accounted for in this way. These cases are poured in upon the unions in larger quantities than they used to be, owing to increased unwillingness or inability on the part of their relations to look after them at home, and very frequently they do not wish to enlarge the accommodation. Therefore they send the cases on to the asylum, which in former years they would not have done.

8936. Are they entitled to keep any cases they like at the workhouse, or is there an obligation to send them on?—There is a certain obligation, but under a magistrate's order they can keep a case for fourteen days. With regard to mild cases, they are under no obligation.

8937. (*Dr. Tatham.*) What do they do with cases of delirium tremens?—Those they always keep; we do not get any of those. They are invariably treated in the workhouse. We get a great deal of drink insanity, but they are cases of a more pronounced character.

8938. Some of the cases of delirium tremens are very troublesome?—Yes, but it is quite of a temporary nature. Very frequently four or five days or a week sees the whole

thing through. Then there are two other causes which operate in the direction of diminished discharge rate from asylums and to a proportionate accumulation therein. First, there is diminution in the death rate caused by the improvement in the sanitary surroundings of the patients, which is an important matter, and then there is the diminution in the recovery rate. I have made an analysis—in fact, it is the only way to do this thing, to work it out, it does not do to trust to personal impressions. I have made analysis of two decennial periods which I think it is necessary to run through. In the decennium, 1882 to 1891, the annual average number of lunatics in Lancashire taken on January 1st of each succeeding year amounted to 8,247. I have taken the averages, of course it does not make much difference if you take the numbers on the 1st January of each decennium; but I have taken the average because it might be more correct. The average of each succeeding year amounted to 8,247, which is equivalent to a rate of 2.221 per thousand on the average population 3,712,422, for that period.

8939. These are individual years?—Yes, but I have taken the averages. I thought it was perhaps more correct to strike an average than to take the 1st January in each year. In the following decennium 1892 to 1901, the average population increased by 475,491, namely to 4,187,913, and the average lunacy rate rose to 2.562 per 1,000. On the 1st January 1902, it was 2.7, but I have taken the average for the decennium. If the average rate of lunacy per 1,000 which obtained in the first decennium remained constant in the second one, the annual average number of lunatics in the latter period, calculated of course on the increased population, would have been 9,301. As a matter of fact, the number amounted to 10,733, an average increase of 1,432 for the decennium, over and above what might have been anticipated from the increase in the population. How far can this increase be accounted for on the theory of accumulation? The chief thing to consider in connection with this point is the discharge rate from the asylums either by deaths or recoveries. Similar returns are unfortunately not available from the workhouses and hence a disturbing factor is introduced. I have no returns to show what it is in the workhouse, though of course the numbers in the asylums enormously preponderate.

8940. (*Chairman.*) It is certainly a fourth?—Yes, but I have no information on the point. The statistics are not published, so far as I know. For the decenniums 1882–1891, the annual average daily number of patients, resident in all the Lancashire asylums was 6278.5, and the total number of deaths in that decade was 6,453, giving a percentage of deaths on the average numbers resident of 10.27. In the following decennium 1892–1901 the average daily number of patients was 8331.9, the actual number of deaths was 7,413, and the percentage on the average numbers resident was 8.89. It will be observed, therefore, that a reduction to the extent of 1.38 per cent. had taken place in the death rate. In consequence of this diminished death rate therefore 1,149 fewer persons died in the asylums during the second decade than would have been the case had the higher death rate of the first named decade continued during the second one. In other words the lowered death rate accounts for an accumulation of 1,149 persons. Turning to the recoveries, however, we find this condition of things reversed, for, calculating the recoveries on the admissions, as is usually done in asylum reports, in harmony with the practice of the Commissioners in Lunacy, it is found that the second decennium gives a higher recovery rate than the first. The reason was that in the first decennium all cases indiscriminately were sent in and in the second decennium there was a restriction placed on the class of patients sent—they could not send so many of their incurable cases. That is a point which is important with regard to recoveries, because it is vital to the question. I have calculated them on the admissions, and I think that is the most correct way of looking at it because the great mass of the chronic insane, of whom the great bulk of the asylum population is composed, takes no part in recoveries. After a certain number of years they pass into a chronic condition and remain permanently insane.

8941. What proportion of cases are amenable to treatment?—The fair average is from 30 to 40 per cent. of recent cases, or even 50 per cent. Amongst the women

Dr. Wiglesworth.—especially we have sent out as many as 50 per cent. of recent acute cases. I refer to this question of calculating the recoveries because it really makes a great difference. That is the reason I think that it gives me a more correct result. I think the Registrar-General in the Report of the Commissioners in Lunacy has calculated it on the average numbers resident. If you do that it brings about an entirely different result, and therefore I wish to point that out to you.

8942. You wish to indicate that the Registrar-General's methods are vicious?—No, I am not a statistician. I do not make any claim to be so. In fact I am not fond of statistics, but it is necessary that one should point out this difference. The Registrar-General may be quite right. He does not say how he has calculated them, but I think he has done so in the way I have suggested. I will come to that in a moment. They are very much diluted down with all this mass of chronic insane which goes on accumulating, and I do not think it gives you a fairly correct result comparing the two decennia. If the recoveries took place like the deaths from the whole number of chronic insane I think it would be a correct method of calculation.

8943. Have you calculated what the difference would be?—Yes.

8944. Is it in your favour or against it?—In the decennium of 1882–1891 there were admitted into the asylums 19,605 cases, and of these 6,226 were discharged as recovered, giving a recovery rate on the total admission of 31.75, whilst in the decennium 1892–1901 there were admitted 17,766 cases, 6,375 of whom recovered, yielding a recovery rate of 35.88. The recovery rate therefore had improved to the extent of 4.13 per cent. Had the recovery rate of the second decennium been at the same low rate as in the first decennium, 735 fewer cases would have been discharged than was actually the fact. It must be pointed out, however, that these figures refer to cases and not persons, as the published statistics do not distinguish between recoveries from first attacks, and recoveries in those who have had previous attacks, and hence the same person may be counted more than once. Probably, however, a reduction of 10 per cent. from the above figures would give fairly accurately the number of persons as distinguished from cases. The comparison between the two decennia would not present much difference. Frequently cases come in many times over, and in the course of a decennium a case might come in several times. I have calculated the recoveries in the manner usually done. If, however, the basis of calculation be made upon the average numbers resident, the recovery rate in the second decennium would show a fall instead of a rise, owing to the fact that though the actual number recovered was slightly larger in the second decennium, the average numbers resident had largely increased. Considering, however, that the great mass of the chronic insane, of which every asylum population is largely composed, takes no part in the recoveries, the calculation upon the admissions appears to afford the most reliable indications. I do not profess to be an expert statistician; in fact, I am not one at all, I just point that out. The deaths and recoveries account for the immense majority of the cases discharged from asylums, and besides these the only cases that need to be considered are those which are sent out to workhouses and to the care of their friends. As regards the workhouses, since the figures in the tables deal with the whole of the pauper lunacy in the county, the mere transfer of cases from the asylums to the workhouses makes no difference in the total number. And as regards the patients discharged to their friends these are comparatively few in number, amounting only to a few hundreds in the course of a decennium, and the difference in the two decennia would be too small to affect the general result.

8946. There is a back-flow from the asylum to the workhouse?—Yes, cases which can be taken charge of in the workhouse. There are not many now because the workhouses object to receive them. It would appear, therefore, that the net gain by accumulation in the second decennium will not account for the whole of the increase in excess of the increase in population in the county of Lancaster, which has taken place during that period, upwards of 900 persons remaining unaccounted for by accumulation. Unfortunately, however,

similar statistics are not available from the workhouses, which contain a considerable proportion of the total insane of the country. Were they so available it is possible that a modification would have to be made in the above figures. A diminution in the death-rate in workhouses, for instance, in harmony with that which took place in the asylums, if such has occurred, would reduce the number unaccounted for still further. Whether such a diminution took place or not, I cannot say, but it probably is in harmony with the generally improved conditions. But I cannot say whether it has happened or has not. If the recovery rate is worked out according to the average numbers resident there is not only no accumulation, but it means that there is a very large decrease in the incidence of insanity which does not seem likely at any rate. If that was so, it would mean that not only was the excess of lunacy over and above the population wiped out, but it would also wipe out what might be called the natural increase of lunacy in proportion to the population, and it would wipe out more besides. In other words, it would mean that there was a very large decrease in the incidence of insanity in the population. I think it would require a very robust faith in the virtue of figures to lead anybody who had to deal with the question of the insane, and the difficulty of providing accommodation for them, to believe that.

8947. Do you say that method of calculation has been adopted in this report?—He does not say how his figures are got, but I do not see how else they can be got.

8948. They do prove a decrease?—Yes, a slight decrease.

8949. You think it is an unreliable method?—I do not say it is unreliable.

8950. But you say it does not justify the conclusions which are drawn from it?—Taking these two decennia for Lancashire, it would mean that there was no increase but a very large decrease in the incidence of insanity in the population calculated according to the average numbers resident. My own view is that is not correct. I have no doubt the Registrar-General would simply take it that it was a discharge—whether it was a recovery or not he did not mind—it was a discharge from the asylum. I think sufficient notice has not been taken of the fact that the great mass of the insane take no part in the recoveries at all. They practically take place on the admissions. That is not absolutely correct, but taking it for the decennium it gives a fairly accurate account.

8951. In the course of the decennium the same person figures in a great number of recoveries?—That might be so. There are certain cases which would do so.

8952. You said a certain number of persons were admitted in a decennium; I presume they have recovered each time?—Yes. If you take off 10 per cent.—we cannot get it exactly—that would give you a very fair, accurate account. Then I formerly referred to the fact that a considerable increase in the number of the officially registered insane had taken place in the county owing to the fact that feeble-minded persons, cases of mild senile dementia, and others showing trivial mental defects were now sent to asylums with much greater frequency than used to be the case, and these cases, though always existent, not having formerly been classified as insane, would represent a definite increase in the number of officially registered lunatics, which would not correspond to any increase in the incidence of insanity in the population, but only to a difference in the interpretation of the degree of mental defect, rendering removal to an asylum for some reason or other desirable. Is there any evidence that such cases have been more largely sent to asylums during the second decennium than during the first? My own impression of the cases admitted under my care in Rainhill Asylum would lead me to think otherwise, but to settle the point I have analysed the cases of congenital and senile insanity (which constitute the great bulk of the above cases) which were admitted into the Lancashire asylums in the two decennia, and find that the proportion so admitted was really larger in the first decennium than in the second. Thus, in the decennium 1882–1891 the proportion of congenital cases upon the total admission into all the Lancashire asylums amounted to 5.55 per cent., whilst in the decennium, 1892–1901, the proportion was only 2.81 per cent. Again, as regards the senile cases (including under this term all patients of sixty years of age and upwards), the percentage of these cases admitted during the first of the above decennia was 9.63, whilst

Dr.
H. iglesworth.

in the second of the two it was only 8·95. Fewer patients of the above classes in proportion to the total admissions were, therefore, admitted during the second decennium than during the first. This did not imply any change in the practice of the unions, but was simply due to the fact that whilst the decennium 1882-1891 was a period in which, owing to large additions having been made to all the Lancashire asylums there was ample asylum accommodation, of which the different unions availed themselves to the utmost, in the following decennium the reverse of these conditions obtained; in the latter years of this decennium, especially, the deficiency in asylum accommodation became acute, in consequence of which restrictions were placed on the class of cases sent to asylums, and the unions were unable to unburden themselves of all cases indiscriminately. That this was the true explanation is clearly shown by the fact that in the year 1902, on the opening of an additional Lancashire asylum, these cases were poured into the asylums with greater frequency than ever, the percentage of the congenital cases on the total admissions during that year alone amounting to no less than 10·40, and of the senile cases to 11·38. The practical point in connection with this is that the increase in the insane in the decennium 1892-1901 was therefore obtained in spite of the fact that the asylum accommodation was deficient, and that many cases were not certified as lunatics and sent to asylums who would have been so sent had opposite conditions prevailed. It must be pointed out, however, that the numbers in the workhouses increased during this decennium. In a question of such complexity one would wish to express oneself with reserve, especially as all the data upon which an opinion should be based are not available; but the facts and figures above adduced seem to point to the conclusion that an actual increase in the incidence of insanity in the population of the county of Lancaster has taken place during the latter of the two decennia above analysed. Then I give you the analyses of the preceding decennia, 1872-1881 and 1881-1891. I may say in that case it happens to be the reverse of the latter one. There were more deaths and fewer recoveries. There were about 400 cases unaccounted for by accumulation, but during the latter of those two decennia there were a great many more congenitals and senile cases in the workhouses, which may have accounted for a good many of them. I cannot say to what extent. It is possible that there was no increase in that period. At any rate if there was an increase in the incidence of insanity, I should think it was slight.

8953. Table III. would show it has been in accordance with the population rather—the more densely populated unions produce the more insane people?—That is what it does show.

8954. That is the general result of the tables you have given?—Yes, but I do not think it has been worked out before.

8955. These tables are very useful, and we will treat them as being put in. That is the general conclusion you draw, that it is the more closely aggregated centres of population that are the forcing beds of lunacy?—Yes, of course there are exceptions. I will just run over these. Table IV shows the different unions classified according to the relative incidence of insanity. In Table V the same unions are classified according to the density of the population as aggregated in towns of different sizes; it is not, of course, implied in this table that the different unions contain only one town of the size indicated, as the larger towns have usually smaller towns grouped around them at varying distances; the classification adopted, however, gives, I think, a very fair idea of the density with which the population is aggregated in the district treated of. Industrialism is, of course, a leading feature of the majority of the towns. A comparison of these two tables brings out clearly the fact that the low lunacy rate corresponds with the smaller aggregations of population, and the higher lunacy rate with the larger ones. There are, of course, exceptions, some of which probably admit of explanation, but the broad fact is as stated. Of the thirteen unions comprised in the first column of Table V which do not contain a town exceeding 50,000 inhabitants, no less than ten have a low lunacy rate, viz., less than two per thousand. Of the remaining three, Stockport is only an apparent exception as this union is mainly in Cheshire, and the aggregate populations of the Lancashire and Cheshire portions comprise a town of over

50,000 inhabitants, and if the district could have been considered as a whole instead of as artificially divided into two unions in separate counties it would have come under the second column in Table V. There remain, therefore, the two unions, Ulverston and Lunesdale, which are both mainly country districts containing comparatively small aggregates of population, but which both have a high lunacy rate (over three per thousand); both of these unions are in the north of the county, and Ulverston belongs geographically to Cumberland and Westmorland. Both are mainly rural and agricultural, but in Ulverston iron mining and iron working are carried on in two centres. Whether that iron mining leads to any large proportion of drink-insanity I cannot say, but it is possible that it might have an influence. Lunesdale is quite small; there are only twenty-three or twenty-four lunatics there. It is significant, however, that both of these unions have declined in population since the Census of 1891, for, speaking generally, there appears to be some relation between a declining population and a high lunacy rate. Then on the other hand three unions with low lunacy rates are included in the larger aggregates of population, viz., Barrow-in-Furness, Prestwich, and Warrington. Those are low lunacy rates, and yet come under the column of a town of over 50,000 inhabitants. Of these the town of Barrow-in-Furness contains about 55,000 inhabitants, so that it is only just excluded from the first column in Table V. Prestwich, however, is one of the larger aggregates comprising a large part of the city of Manchester, and yet shows a very low lunacy rate. It must be pointed out, however, that the population of this union has increased very largely during the last decade, pointing to a large influx of new population—presumably a healthy and vigorous population. This union is also mainly residential, and though containing a large amount of small property comprises also good class residential areas.

8956. That is a suburb of Manchester?—Yes. Of course there is a lot of small property. That, no doubt, largely accounts for it. The only other exception, Warrington, though mainly urban and industrial, comprises also a large rural district. Warrington is very industrial. I alluded just now to an apparent relation between a high lunacy rate and a declining population. This is strikingly illustrated by the parish of Liverpool and the township of Manchester.

8957. Ireland is a case in point?—I am coming to that. Both the parish of Liverpool and the township of Manchester, as will be seen by a reference to Table III., have undergone a large and steady decline in population, the causes of which are indicated in Table V., and a corresponding large and steady rise in the lunacy rate which is now considerably higher than that of any other Lancashire union, the rate in Liverpool being phenomenally so. Take Liverpool—you will see a very large decrease. It has gone down from 269,000 to 147,000, and it has been a steady decrease in each decade. At each decade the lunacy rate has mounted very high. It is 5·9 per thousand. The area comprises a parallelogram of about three square miles in the heart of the city of Liverpool. I give you the particulars in the last table of all. The population has undergone a considerable and steady decline owing to the demolition of residential property, and the substitution of works and public buildings of various kinds, also the opening up of new and wide thoroughfares, and the clearing away on sanitary grounds of many of the more densely populated districts. The extension of the dock system towards the north, outside the parish, has also exercised considerable influence. Hence there has been a shifting of large numbers of the labouring classes outwards into the surrounding districts. It has been a question of larger ships. They have had to get larger docks there to the northward, and the population migrated to the north. The most numerous body of labourers is employed at the docks where the work is to a large extent casual and intermittent. A similar condition of things is well illustrated by the Returns of Lunacy for Ireland as set forth in the report of the Inspectors of Lunatics for Ireland for 1903, which I put in. It is an interesting table showing a steady decrease from 5,202,648 in 1880, to 4,432,287 in 1902, and a rise in the proportion per 100,000 of estimated population from 250 in 1880 to 499 in 1902.

8958. We shall have some evidence on that point from Ireland?—It is a most important matter.

8959. How do you account for it here in Liverpool?—

Dr. Wigglesworth. I account for it in the same way as in Ireland. The explanation of this phenomenon is probably to be sought in the fact that when a population is declining it is, on the whole, the younger, more active and more vigorous, members who comprise the bulk of those who emigrate, whilst the older and less vigorous members remain, and thus the social average tends to a lower plane.

8960. Can you draw a parallel between the shifting of population within an urban area and the removal of large classes of the population to the United States?—I think so. In an urban area it would be the more active members who would go outside.

8961. You say that the diminution of the population in the area under discussion is largely due to the great clearances, the removal of people?—Partly that, and partly in the case of Liverpool the extension of the dock system; the better class labourers apparently move away to the north and leave the more casual ones there. It is the casual labourers they get now in the parish of Liverpool.

8962. If there have been large clearances of houses and so on there must be more open spaces, and one would think that the conditions of health in that area would have been better?—One would think so.

8963. The population has been reduced from 269,000 to 147,000 in a parallelogram of that size, and one would have thought the conditions were made more healthy?—It must be so; there is no question of that. It tends to make it healthy.

8964. (*Mr. Struthers.*) Do you know whether the death rate has fallen or risen?—I am afraid I cannot give you that. I think it is sure to have fallen.

8965. (*Colonel Onslow.*) Do you mean the docks have gone away from Liverpool?—No, but on account of the larger steamers—they have had to go further north.

8966. How about that particular area?—They have had to build these large docks towards the north, and the population has shifted, following the large docks, but there are still smaller docks in the parish of Liverpool, and they are still used, but it is more intermittent labour.

8967. It has left the poorer and more feckless of the population behind?—That is the only explanation I can offer. When industries are flourishing, and the population increasing, there is a constant immigration into such districts of vigorous individuals from other centres where the conditions are less favourable, and thus the vigour of the community is maintained not merely by the actual fresh arrivals themselves but by the new blood thus infused into the population by marriage. I think there is a double agency there—the new blood coming in and taking the place of those dying off, and the inclusion by marriage of the newer members with the older ones. When industries, however, begin to decline and emigration takes place from a district, the loss is doubly felt, not merely by the departure of young and active members of the community, but also by the absence of infusion of new blood. In many country districts close intermarriage is rather a prominent feature of the community, and when such community begins to lose its younger and more vigorous members the evil effects of such intermarriage will tend more quickly to assert themselves. Whether any such explanations will account for the higher lunacy rates of Ulverston and Lunesdale I am unable to say, in the absence of sufficient information concerning these districts, but the point is worth enquiry. I know in Cumberland and Westmoreland, in the Dales there, there is a good deal of intermarriage, and as these districts geographically are very nearly allied—it is possible that may be so—the removal of even a few members will make a difference. I throw that out merely as a suggestion. There may be an entirely different reason.

8968. That is purely speculative?—Yes. I cannot consider it to be a scientific fact. I am endeavouring to account for this remarkable phenomenon.

8969. Is there any direct evidence that the migration from this area has been such as you describe—that the best have gone?—I know nothing of it. I have simply presented these facts, and have to make an explanation, which may be true or not true. This is what I think is the most reasonable. From the foregoing analysis of the lunacy statistics for the county of Lancaster the following conclusions may be tentatively drawn:—(1) That whilst the large and steady increase which has taken place is

mainly due to accumulation, there appears to be evidence that the incidence of insanity in the population has also increased of late years. (2) The low lunacy rates tend to follow the small aggregations of population, whilst the higher ones are more generally found in the large aggregations, which are mainly industrial in character. (3) There appears to be a relation between an exceptionally high lunacy rate and a declining population.

8970. (*Chairman.*) As to the relation of insanity and physical deterioration you are not prepared to establish any direct connection between them?—The two things are really due to the same causes. As a cause of physical deterioration, I think insanity is very slight.

8971. May not insanity be the effect of physical deterioration to some extent?—Do I understand you properly? You mean that the causes which produce physical deterioration act on the brain, and therefore may act on the body as well?

8972. I suppose brain disease is largely due to depressed nervous conditions is it not?—That is perhaps not quite the way to look at it.

8973. I mean nervous elements and nervous maladies tend to produce lunacy in certain cases?—It really is the condition of the brain. They are really symptoms of a disorder of the brain.

8974. Of a morbid condition of the brain?—Yes, it may go on or not to actual insanity.

8975. May not those morbid conditions of brain be associated in the relation of effect to cause with certain tendencies which make for deterioration?—Yes, certainly. Of course even temporary bad health—if a person is at all disposed to it—may tend to produce nervous disorder. But if you look at it from a broad point of view, I think the point is that they really work together—the physical and mental are really part and parcel of brain defects or brain disorders.

8976. You would expect to find an increase of insanity coincident with an increase of physical deterioration?—I think so, certainly. The brain is only a part of the body—it is a mere organ of the body.

8977. Are you inclined to think that granting there is an increase of insanity, there must necessarily be an increase of physical deterioration?—That is not quite the way I should put it.

8978. Put it in your own way?—I want to be clear on the matter. I would expect the two to go together. The same causes which lead to brain disease very often lead to other diseases and defects.

8979. I suppose to some extent an increase of lunacy is a result of civilisation, of over civilising processes?—What do you mean by civilisation? Do you mean the general conditions prevailing in large towns? Do you call that civilisation?

8980. That is one of the effects of civilisation, the aggregation of people in large towns for industrial and general purposes?—Yes.

8981. And, of course, the wear and tear on the system generally?—Yes, no doubt that is so in a general way. Amongst many of the lower classes I do not think they get the same mental strain as people in a higher social position.

8982. Then you attribute the increase of lunacy in some degree to certain special causes, such as alcohol?—Alcohol is an extremely potent cause of lunacy.

8983. Have you any special information on that point?—I can give you statistics on the subject, because I worked this out recently for a different purpose. I recently submitted to a careful analysis all the cases of alcoholic insanity admitted into Rainhill Asylum during a period of eleven years—1891 to 1901 inclusive. These were worked out. Each individual case was carefully reviewed, and in doubtful cases, even if drink was said to be the cause, that was not put down. I was anxious to get at the thing exactly, without any exaggeration. During this period 4,261 persons were admitted, and in no less than 1,248 of these there was clear evidence that the insanity was due wholly or in part to the toxic effects of alcohol. These figures give a percentage of drink cases on the whole number of cases admitted of 29.28. Of course in many of these cases the alcohol merely renders actual a defect potentially existent in the organ-

ism, but it is not by any means always so, for alcohol is quite capable of inducing insanity in persons who shows no hereditary tendency thereto. In 688 of the above total of drink cases—16.14 per cent.—alcohol was the only cause that could be ascertained for the patient's insanity, whereas in the remaining 560 cases—13.14 per cent.—other factors, such as heredity, assisted to bring about the result. Many cases of drink insanity recover and relapse even several times in succession, but in the above figures no person has been counted more than once. These figures give some slight idea of the frightful havoc wrought by alcohol on the nervous system. There is reason to believe also, from the great frequency with which a history of gross parental intemperance is found in the antecedents of persons who become insane, that a habit of excessive drinking tends in some cases to a poisoning of the germ cells of the parent by means of the alcohol circulating in the blood, and a consequent tendency on the part of these germ cells to develop into an organism with an unstable or badly developed brain. This may probably result even if the sperm cells of the father are alone affected.

8984. The effects on the offspring are much worse from a drunken mother?—Yes. You might say it is not proved scientifically, because it is difficult to prove a thing of that kind, but those of us who have seen a great many of these cases have all come to that conclusion, that a very large proportion indeed of cases of insanity have intemperate parents. I worked it out that a sixth part of all the cases had an history of alcoholic intemperance in the parents. That was excluding all cases in which there was any hereditary tendency. It was necessary to exclude those. It is my opinion that the sperm cells of the fathers get so injured by the alcohol that the union of the sperm cell and the germ cell will produce unstable offspring. Of course the mother might be healthy and counteract it and so on—it does not necessarily follow. We know that perfectly healthy children are born of drunken parents, but in many cases it does operate. There is no question with regard to drunken mothers that alcohol exerts an extremely pernicious influence on the young, and poisons the nerve centres when the child is in a very susceptible condition.

8985. That is the time when women do take to drink, because of the depressing effect of pregnancy?—They often do there is no doubt. One must go back to the question of the original constitution of the germ in these cases, that is to say, the hereditary influence is very important indeed. The different stresses of life—whether it is alcohol or anything else—which people are subjected to of course act with greater effect on people who have a tendency to certain conditions. It does not follow necessarily; there may be an actual tendency as reflected in the family history. We know frequently there is a union between germ and sperm cells which produces an unstable offspring for some reason we do not know. Then again there is this special cause, the actual poisoning of the germ cells. I think it is very important to look at the development of insanity from the point of view of the development from the germ. There is no question that amongst exciting causes alcohol is one of the most frequent.

8986. (*Dr. Tatham.*) You have consented to put in the notes you have made?—Yes.

8987. I gather that you said just now that the returns of lunacy are probably less reliable than they might be, because of the difficulty of the definition of what is lunacy?—I did not quite say that. The returns are reliable enough as far as they go. What I said was that the Union now send a good many more cases such as mild senile dementia for instance, where an old person has lost all memory, and therefore is not able to take care of himself or herself properly. They might be looked after in the workhouse, but if they have not room they will often certify the cases to be insane and send them to the asylum. That is what I mean.

8988. I suppose the discharge rate varies very much according to the nature of the nervous disease from which the patient is suffering?—Very largely so—in some cases of a curable character and in some cases of general paralysis it is quite the reverse.

8989. What do you consider the morbid conditions which you would class as insanity? There is by no

means an agreement on the subject?—No, of course it depends upon what you mean by the word insanity; do you mean any form of mental trouble?

Dr. Wigglesworth.

8990. I am asking you if you will define what in your opinion should be included by the term insanity.—You can only say any form of mental trouble that was not due definitely to such causes as fever or anything of that kind. You would exclude them because they are due to the toxin of the fever circulating in the blood. I should take any form of mental disturbance, because I think you can make no distinction which will not embrace all forms of mental disturbance of any kind.

8991. Would you not get more valuable statistics with regard to insanity if you could get a thousand cases of one definite form of insanity and calculate the percentage of discharges for that class, and then take another equally definite but entirely different class of insanity and also calculate the percentage of discharges from that; would not that be the better way to get true statistics?—It would of course assist you as regards a particular type of insanity to see how far that was recoverable or not, but I think in the general run you would not find much difference. I think it would not make much difference in the result. Of course congenital cases are quite strictly classified as insanity. Idiocy represents a more profound degeneration of the brain than cases of mania occurring in people otherwise quite healthy and who may get well in a week or two. I think for purposes of statistics it is rather difficult to do other than embrace all cases.

8992. When you said that the percentage of discharges was something like 30 and 40 per cent., I suppose you meant cases of acute insanity?—Yes, with a fair sprinkling of others. If we took nothing but acute insanity we should have a higher percentage.

8993. General paralysis?—That is fatal.

8995. You are speaking of acute insanity?—Yes. There is mania and melancholia which are curable. If you take nothing but those you would get a higher recovery rate; you would get 40 or 50 per cent.

8996. It was these cases that you were referring to when you said you got a discharge rate of 30 or 40 per cent. was it not?—No, it was all cases together. 35 per cent. was our last decennial discharge rate. That was taking all cases.

8997. The percentage of discharge would be very much higher if you limited your calculations to the so-called curable cases?—Yes.

8998. (*Chairman.*) Have you anything further to add?—Yes. I should like to say something with regard to the influence of syphilis on general paralysis—that is practically speaking a fatal disease. There is a large body of evidence which connects this disease with the occurrence of a previous attack of syphilis and some authorities indeed go so far as to say that without syphilis there would be no general paralysis. Although, however, the evidence at present available does not justify so sweeping an assertion, there can I think be no doubt that syphilis is the most important factor in causing the development of this disease.

8999. Transmitted or acquired syphilis?—Acquired or, very rarely, transmitted. Transmitted syphilis is in but a few cases of juvenile general paralysis; in the great mass of cases it is acquired. The frequency of general paralysis may be gathered from the fact that in a period of fifteen years, 1889 to 1903, there were admitted into Rainhill Asylum, under my care, 7,084 cases of insanity, and out of these no less than 992 were examples of general paralysis—a percentage on the total admissions of 14.00. That, I think, however, is higher than the general rate. We draw a large number of our cases from Liverpool, a seaport town, but that is our actual rate. The importance of this disease in connection with the incidence of insanity is emphasised by the fact that general paralysis cannot be considered as a disease of degeneration. A large number of our cases are purely examples of degeneration, and if they did not get insanity they would be very useless to the community. General paralysis cannot, however, be considered as a disease of degeneration. On the contrary, it attacks very frequently persons of exceptional mental and physical energy, who are valuable members of the community, and though an inherited predisposition to insanity has an influence in causing the development of

Dr.
Wiglesworth.

the disease, it is, nevertheless, less hereditary than other forms of insanity. The causes of general paralysis act more readily if there is a tendency by heredity, but at the same time it is a more strictly acquired disease than any other form of insanity.

9000. (*Colonel Onslow.*) You mentioned just now the intermarriage in certain counties as affecting the condition; do you happen to know anything of the Channel Islands?—Not from that point of view.

9001. Intermarriage has been very common there, especially in former days?—Yes.

9002. It is a rare thing for a Guernsey man to marry anyone but a Guernsey woman, and probably very nearly connected with her?—Yes.

9003. You do not know the statistics?—No.

9004. It is, I believe, very marked, not only in regard to

insanity, but also in defects of all sorts?—Physical defects generally?

9005. Yes. They are a very small race, and the number of deformed people and blind people, and so on, are enormous?—I am acquainted with a good many of the wild portions of the British Isles, which are a good deal isolated, and I have noted that point in other places.

9006. Where intermarriage takes place?—Yes, a great deal. I was surprised not to find such a healthy, vigorous stock as I expected to find. I think that has a great deal to do with it. Of course there are exceptional cases. It is not a question to be treated off-hand. I think intermarriage does have a great effect, and if these people are subject to strain they cannot stand it. As long as they go on in their quiet country district, without any mental strain, they manage all right, but when you remove them to positions of mental stress they break down.

Miss
Garnett.

Miss M. GARNETT, called; and Examined.

9009. (*Chairman.*) You have lived for some time in the Potteries district?—Five years.

9010. During that time you have exercised a general sort of supervision over the health conditions of the district?—I have come very much in contact with them—with boys and girls, and men and women at large classes, as well as in visiting.

9011. They are all engaged in the staple industry of the district?—Yes, they nearly all are.

9012. Fenton House is the name of your settlement?—Yes, the settlement of ladies for working amongst the poor.

9013. How many ladies have you?—There are ten ladies; we have a branch at Stoke as well.

9014. Where is Fenton House?—It is in Fenton, which is the town between Stoke and Longton; it contains 17,000 people.

9015. Among the causes of deterioration which you have noticed what would you mention as the principal ones?—The married women's labour; it is really the root of all.

9016. Do you think that is increasing?—Yes, I think it is. I think they are taking the part of the men in some parts.

9017. Owing to the removal of the male population?—No; rather that the manufacturers can get the women at a cheaper rate.

9018. What do the men do?—They hang about the streets. That is particularly the case at Longton, because that is the home of the china industry, not the earthenware—the trade is lighter.

9019. More suitable to women?—Yes, a little more.

9020. Is it an occupation that you would be disposed to say was unsuitable to women?—Yes, some departments of the work which they are called upon to do, such as carrying heavy weights in the warehouse.

9021. The manufacturers employ the women deliberately because their work is cheaper?—Yes, in some cases, but their work is not always so skilled.

9022. Do not the men resent that?—They seem to be quite willing to stay at home.

9023. We were told only this morning that in Manchester and its neighbourhood there is a strong feeling on the part of the men that women should not be permitted to work in factories at all—that their function was to remain at home and look after the children?—I cannot say what the men really think about it.

9024. They acquiesce in this state of things?—Yes, I think so very much.

9025. What are the results which flow from this condition of things, as far as your observation goes?—The results are the children are born very weakly, and, of course, they are improperly fed; they are put out to be taken care of by incapable people.

9026. That is the provision for them?—Yes; elderly and infirm people take charge of them. We have one woman semi-paralysed who had four children sitting round her on a stone floor

9027. The women are not brought into the house to look after the children?—No, they are all put out. It is a common thing to see a baby in long clothes taken out.

9028. These women have no qualifications?—No, they cannot work in the factory, and they live in that way.

9029. Are they paid exorbitantly?—No, they are paid so little that the food the children get is very little.

9030. What are they paid?—Something like 2s. 6d. a week.

9031. If that 2s. 6d. was devoted to a *crèche* for keeping children, organised on proper lines, it might be almost sufficient?—That was tried. It did not answer, because it was said by the working people that it was taking the bread out of the mouths of the elderly people. It was tried in Fenton—it was before my time.

9032. It had to be given up in consequence?—Yes, they would not send their children there.

9033. Is the prevailing sentiment so foolish still?—I suppose so, because there are no *crèches* in the potteries' district.

9034. It has never been revived?—No. That is some six years ago.

9035. Is the rate of infant mortality abnormally high?—Yes, it is.

9036. I mean compared with other districts where it is high?—I believe it is higher in the potteries than in Yorkshire.

9037. Have you any idea what the exact figure is for the potteries?—No, I have not. I have this statement written out for Fenton—for the last ten years and for last January also.

9038. What is the proportion?—Thirteen in one month out of 34 deaths in January, 1904. That is one-third—and one-third in Longton also. It was made out by the medical officer of health.

9039. None of these cases reach anything like a third. That is in January; in certain periods of the year it is higher?—Yes; Fenton and Longton have the highest rate of infant mortality of the pottery towns.

9040. You find it higher in the winter, but as a rule it is summer that it is highest, when they suffer from infantile diarrhoea?—It is the cold, I think.

9041. They are imperfectly clothed, I suppose?—Yes.

9042. Will you describe how it is that the children are so badly nourished?—The mothers go out about six o'clock to work and very often do not work in their own town, but in a distant factory. That means they leave the children's breakfasts and dinners ready for them, and it is nearly always cold food—bread and jam—insufficiently nourishing food. The teachers say that the children who come from those homes have less stamina, and are less able to do their morning's work.

9043. Has any attempt been made to organise a system of school dinners by the payment of a proper fee?—No, I do not know of any organised scheme. Occasionally they give a free supper.

9044. I am not suggesting a free dinner, but payment. Would it be possible to introduce a system which might be almost self-supporting, to meet the case of this class of child whose mother, owing to the conditions of her employment, cannot look after it?—I think in some schools they arrange to give dinner on a payment of 2d.,

Miss
Garnett.

but they do not find many avail themselves of the privilege—the mothers look at the pennies.

9045. We are told that 1½d. a head is quite sufficient with which to provide dinners, with a margin of profit ?—Yes, if you get the numbers.

9046. But nothing of the sort is done ?—No, nothing that I know of—not on a large scale.

9047. Do you think that your organisation could do anything towards suggesting it ?—Yes, I think it might do so.

9048. I fancy you would discover it could be done for that if you had a sufficient number of children to avail themselves of it ?—Yes.

9049. You do not think the amendment of the Factory Act by which the employers are prohibited from employing a woman within a month after her confinement, has been allowed to operate fairly ?—Not fairly. Every one I consulted said it was evaded.

9050. Do you mean the cases are not taken any notice of ?—They have to pass the doctor, and I suppose they tell a falsehood to him ; he does not investigate the matter properly.

9051. Have there been any prosecutions of manufacturers for employment of women in such circumstances ?—No, the doctor passes them and he is supposed to be responsible.

9052. Is it the factory surgeon ?—Yes. I think it is the factory surgeon they have to pass.

9053. You think women are indisposed to stay at home longer than they can help ?—They like to do the factory work. They have no domestic tastes. The children are a mere accident in their lives. They like to get them put out so that they can return and gossip at the factory.

9054. There is no sense of parental obligation ?—No, there is no home life.

9055. Do you think that that provision in the Factory Act is sufficiently stringent, or would you be disposed to extend it ?—I should extend it to three months.

9056. After child-birth ?—Yes.

9057. Would you make it wrong to employ a woman previous to child-birth for that time too ?—I should like to make it so, but I do not see any way in which it could be done.

9058. It would be difficult to enforce ?—Yes, but I have known cases where they have worked quite up to the time. Of course, the child has suffered and the mother too. That is frequently done. They will not give up the work till the last moment.

9059. A great deal of the work is not of itself of a very exhausting character ?—No, not exhausting, but some of it is unhealthy—the conditions are unhealthy.

9060. You attribute some of the deterioration which exists to the early age at which children enter the factories ?—Yes. Evidence was not unanimous on that point. I went to the poorest school in Longton, in a place known as the Devil's Nook, the streets there are so bad that one policeman cannot go along them alone, they always go in pairs. I went there because I thought the children would be drawn from the poorest class, and the master who had been master for several years, said, in his opinion, his children improved after they went to work, and he thought the reason for that was that they had such very poor food owing to their bad homes and bad parents that when they earned a little money for themselves they were able to get better food.

9061. They supplemented it by things they bought themselves ?—Yes, or they contributed to their support and had better food. But in the parts that I went to I think there was a general opinion that they were dwarfed—smaller than they should be ; they did not grow. In our very large classes, in the boy's clubs and women's classes, they seem to be distinctly under the size and height that you would expect.

9062. Do you think it would be possible with a view to equipping those girls between fourteen and seventeen for their duties when they become mothers, to insist that during that period they should attend at any rate for two hours a week continuation classes which should be mainly devoted to domestic subjects, house management, attention to children, and so on ?—I think it would be an excellent thing if it could be done.

9063. Would you say the work they are called upon to do is of such a character that it would be placing an undue strain upon them physically to attend classes twice a week for that purpose ?—We have a few of the better class girls who do attend evening classes.

9064. Do you think it would involve hardship to any large extent to make it—compulsory ? I think it would on some, perhaps. The hours are long enough—seven to six.

9065. Such instruction as I describe would not be of a severe kind, it would not require any very great amount of mental concentration, and it would be to some extent a change of occupation, and recreative. So far as you have been able to observe, has the physical type of the children got worse within the last few years ?—There seems to be an idea that during the last year or two there has been a slight improvement in the physique, but the conditions of labour are greatly improved and there is not the improvement in physique you would expect considering the way that things are improved for them.

9066. Has there been time for these things to affect the rising generation ?—I think the chief Factory Acts date from some time back.

9067. I understand the Factory Act of 1901 has made perhaps greater improvements in the conditions under which factory operatives work, almost than any other ?—Yes, it has, I think.

9068. There has not been time yet to see the effects. The provisions for ventilation for instance are so much more stringent than have been hitherto known ?—Yes. They lay down rules, but they are not carried out, I am afraid.

9069. One must expect some time to elapse before everything can be done. Are the conditions of labour in the pottery district specially injurious to health ?—Some are ; for instance, what they call the scourers, or those who fettle the ware, who chip off the little bits that will not be smoothed off ; that process brings flint dust, and it is said to affect the eyesight. And also the workers in colour—the blowers of the colour, and the manufacturers of the majolica ware—their employment is also bad ; that affects the throat and the lungs.

9070. You mention injuries to the teeth ; what do those arise from ?—That is supposed to arise from the breathing in of the lead. Lead in the system shows first in the gums and teeth.

9071. That affects the gums too ?—Yes ; the teeth are extremely bad, even in young girls of fourteen or fifteen.

9072. Is that not probably due to improper feeding when young, and want of cleanliness ?—Yes, partly.

9073. I suppose no attempt is ever made to clean the teeth ?—No, I am afraid not ; they are not taught that.

9074. We have been told in this room that, to some extent, smoking is an antidote to bad teeth. You don't find smoking among children of that age ?—No.

9075. There is not much smoking among the girls, is there ?—No, but quite little boys will smoke.

9076. Are the cigarettes given them ?—I think they ask for a penny round about the stations and tramways, and then they get the cigarettes.

9077. You would agree that the sale of cigarettes to young children should be prohibited ?—Yes, if it could be done it would be a very good thing.

9078. Cigarettes are often sold in sweetstuff shops ?—Yes, they go there and get them.

9079. Is intemperance on the increase ?—Yes, especially amongst the women.

9080. That has a very bad effect upon the offspring ?—Yes.

9081. The child of a drunken mother is probably born disabled ?—Yes.

9082. And is it so with the girls too ?—I think so.

9083. As the cares of maternity come upon them ?—Yes ; I think drink among girls is due to the drink clubs. They are called "Footings" in some places, but in the Potteries I think they are called "Drink Clubs." They are in almost every workshop. They are supposed to contribute something. Then they have a sort of jollification. I think that is how the young girls learn to like the drink.

Miss
Garnett.

9084. Are there not any countervailing influences in the Potteries in the shape of clubs based upon more rational and decent principles?—There seem to be very few clubs.

9085. Is not that a branch of usefulness which your Association could take up?—We have one in Fenton; we have about eighty to 100 girls who have joined.

9086. Has not that acted as a model?—There are organisations working for temperance, especially in Hanley, and quiet efforts are made, but I do not think that any efforts have been made to bring it before the manufacturers. These things are carried on in workshops.

9087. I suppose the conditions under which a great number of these people live in their own homes are very adverse to physical well-being?—Yes. You hardly ever find in the Potteries more than two bedrooms, and sometimes you have eight adults. It is extraordinary the number who will be in one house. The relieving officer, and my own experience, told me it was no use having three bedrooms, because they have not the furniture for three bedrooms; they have never more than furniture for two. One object is that if they slip away without paying their rent too much furniture is an obstacle—they are constantly flitting from street to street.

9088. May I ask if the local authorities in the Potteries pay any attention to improving the conditions under which the people live?—No, very little; I should think the local authority in the Potteries was as inefficient as you could find anywhere.

9089. You are aware the local authorities have very stringent powers, if they care to exercise them, for dealing with overcrowding and insanitary premises?—Yes.

9090. But they make no effort?—Very little.

9091. Are there not such people as medical officers of health?—Yes.

9092. Do they pay no attention to the evils they see around them?—I do not know whether they pay the attention they ought to.

9093. Does your organisation deem it its duty to call the attention of the local authority to it?—Yes, when we find any bad cases we do.

9094. Do they take any action?—Very inadequate action, I think.

9095. Have you ever reported them to the Local Government Board for neglecting to do their duty?—No, I never have. Things have been better in Burslem and Longton since there was a lady factory inspector.

9096. I suppose you agree that until you have succeeded in awakening the local authorities to some kind of conception of their duty these matters are almost hopeless?—I am afraid the local authorities in the Potteries own most of the bad houses. That is especially true of Longton, and I believe of Hanley. I think that is the case with the sanitary inspectors—they are in awe of the local authority; they do not carry out their duty as they ought to do.

9097. They hold their appointments subject to the caprice or the vindictiveness of the local authorities?—Yes. I had an example of that at the Settlement. I called in the sanitary inspector to see about the drainage there. He was very alert at first, but he was in awe of the agents who managed the property, so he tailed off, and made a very inadequate report. I was not satisfied, and I had a man from Birmingham, and his report showed that the whole state of things was wrong, and that report was acted upon—the whole of that drainage system was put right. This was the very house where our Settlement is.

9099. There has been no attempt whatever to deal with overcrowding in the Potteries area?—I do not think so. A man of great experience in Hanley told me that it was not more houses that were wanted—there were 400 unoccupied workmen's houses in Hanley—but it was that the people would migrate to the slum part, where they paid less rent.

9100. I suppose the people whom you describe are quite indifferent to the filthy conditions under which they live?—Wholly indifferent.

9101. They probably enjoy them?—They seem never to rise to anything better. The Potteries themselves are very dirty; the dirt is very great.

9102. Do you think no improvement is being effected in the habits of the people? Do you think that the younger generation show a preference for some slightly higher standard of comfort?—I cannot say that I think they do.

9103. You do not see any indication of that?—I do not see any indication of that.

9104. You do not think the work done in elementary schools affects that?—It does not seem to have touched the home life.

9105. It has not done anything towards its improvement?—No, I do not think so. I think it is taught as a science, and they leave it behind them in the schools, and do not take it home. We had a health lecturer in the Settlement, to teach them the care of babies. They showed a knowledge of the terms of physiology and so on, but they did not seem to understand anything practical.

9106. Have these lectures been well attended?—Yes, we have about forty girls.

9107. Do you attempt to bring home to young mothers the principles of attending to children?—Yes, by house to house visitation.

9108. And distributing leaflets?—Yes, telling them about the feeding of babies and so on.

9109. Has that had a good effect?—Yes, but we never know how long they will attend.

9110. No interest has been awakened?—No. One of my ladies went into a house last week. The baby was very ailing. She said, "What have you been giving that child?" The woman said, "Well, you see they said the tinned salmon was not very good, but Bob would give the baby a bit, and a boy gave him some orange juice." Tinned salmon and orange juice at eleven months' old had disastrous effects. That is the sort of thing—an absolute lack of knowledge of what the children can digest.

9111. You have formed some opinion as to the causes of the anæmic condition of the population which is not perhaps generally admitted?—Yes.

9112. You think you have good evidence on that point?—I have the evidence of a chemist and of a doctor, and I also have the evidence of a very good chemist who is now dead. He told me that when he came into the potteries he found in the practice which he had taken over half the receipts came from the selling of certain drugs, and he was horrified.

9113. Do you think that is very general?—I was told by several that they believed it was very general; they believed people got these things very easily.

9114. It is generally winked at?—Yes. There is only one case of prosecution. There was a prosecution in Stoke some years ago. It is the only one known for the actual sale of the things.

9115. Are illegitimate births very frequent in the potteries?—Yes, very. That is so in all factory districts, is it not?

9116. It is diminishing throughout the country, and I believe the factory districts share in the diminution. Now we come to the remedies you suggest. You have already mentioned your wish that the period at which the women should not return to work after confinement should be extended to three months?—Yes, I should like to see it; people who have worked for forty years in factories have said, "Do you think it could be extended to six months?"

9117. You do not think three months is too much?—No, I do not. I think that would answer the purpose of giving the infants a chance at any rate.

9118. You would not suggest the prohibition of the labour of married women in factories?—Yes, I would, but I do not think it could come yet. That would strike at the very root of the whole evil.

9119. You think as a counsel of perfection it might hereafter be found practicable?—Yes. If it came I think everyone would admit that it would strike at the very root of the evil.

9120. What do you say to a prohibition preventing the mothers working in factories unless they take the precaution to place their children during the period they are at work in the hands of some duly certificated person, or in a crèche organised for the purpose, which would provide a

guarantee that the child in its mother's absence should be well looked after?—I think that would be a most admirable thing.

9121. You think under those conditions the labour of married women in factories might still be permitted?—Yes. There is still the question of course that the home is left quite neglected.

9122. But you do provide some kind of efficient substitute for home life so far as infants are concerned?—Yes. I do not think that would affect the case of the food of the older children.

9123. That must be dealt with by the school authorities I think. With regard to the suggestions you have to make for children at school age, you attach some importance to measurements of children being made from time to time?—Yes, I think you would get some valuable information.

9124. That is in your opinion the only efficient way of recording accurate information?—Yes. I think that would be very valuable. You get from time to time the different facts of each standard.

9125. That might be a means of tracing parental neglect?—Yes. I had these children asked the question as to whether their mothers were at work and what kind of food they had by the mistress of the girls' school. We found in nearly every case where the child was deficient in brain it was owing to the mothers being at work and to the lack of proper food.

9126. You think more attention should be paid to physical exercises than is the case now?—I think twenty minutes every alternate day is not enough. I was told that weakly children who had not had much breakfast fell out—five in one morning fell out.

9127. You would have to pay attention to individual cases, for which purpose I suppose you would be inclined to advocate the medical inspection of schools so that the teachers' knowledge of such subjects, which is generally limited, might be reinforced by reference to a doctor in all cases of doubt?—Yes. I should think that would be admirable. The pressure of the inspectors is so great on other subjects that sometimes even this hour a week is not given.

9128. There is no reason why these domestic subjects should not take the place of some of the present subjects?—That is the universal opinion, in place of some of the subjects which are no use to them in after life.

9129. With regard to the enforcement of the Factory Acts, do you believe that in the small workshops there is a great deal of abuse of the proper conditions of labour, which has a very bad effect upon the population?—Yes, I do think so. I think the smaller manufacturers—the men who have risen quickly and got a little capital and want to get their work done on small wages—do abuse the conditions of labour.

9130. Is that rather in workshops than in factories?—By "workshop" I simply mean the departments of a factory.

9131. You know the provisions of the new Act with regard to its application to domestic factories and workshops?—Yes.

9132. Do you think the changes which that Act has introduced will bring about a better state of things?—Yes, I do think so, in time.

9133. Several of these provisions are specially applicable to these smaller manufacturers, to those who let out work to be done in what are really private houses, which for the purposes of the Act become factories?—There are very few of those in the potteries.

9134. Would you suggest a restriction of the sale of cigarettes? Children under twelve is rather too low, is it not?—It would be better if it could be under fourteen.

9135. Or even fifteen—at any rate during school age?—Yes, I think it is fair to say that the workpeople themselves require to be watched about using the precautions, because they do evade them, and I think the poor manufacturers get blamed for the illhealth of the people who will not use the precautions. A girl said to me, "If you work in a factory you would not want to use a respirator," and I must say it was very stuffy, and I do not think I should have liked it. They do evade these things. They

come home in overalls which ought never to be brought back—they ought to be left in the workshop.

9136. You suggest that the sanitary inspectors should be the servants of the Government or the County Councils. That might be necessary in a district like the Potteries, but you are aware that in a great many big towns the Medical Officers of Health are the pioneers of sanitary improvements?—Yes.

9137. And are backed up by very intelligent and very zealous authorities?—Yes. I cannot say that I think that is the case in the Potteries.

9138. You say the Potteries are very bad?—Yes.

9139. At any rate you would be disposed to make the Medical Officer of Health independent of the local authority?—Yes.

9140. So that if he took a strong line of which they disapproved they could not punish him by dismissing him?—I think so far as the housing accommodation, and all these other things are concerned, that would strike at the very root of the matter.

9141. When once appointed he should be independent, and hold security of tenure as against his employers?—Yes.

9142. You think some further knowledge should be published as to who are the owners of slum property?—Yes, I think that would be an admirable thing if it could be done.

9143. What would you describe as slum property—all property which is insanitary or over-crowded?—Yes.

9144. Slum property is a very useful term in general parlance, but when you come to define it, what would you mean by it? Would you include all property where unhealthy conditions prevail?—Where strikingly unhealthy conditions prevail. We have a part in Fenton, Terrace Buildings, which is not fit for anybody to live in, where all the lowest people live.

9145. To what authority would you entrust the definition of what should come under that registration law, if adopted? Would it be the local authority? You say the *personnel* of the local authority very often are themselves interested in the property?—Yes. I do not think the local authority would ever go to the root of it.

9146. There is a difficulty at the outset in doing that?—There is a great difficulty in finding out who owns this property. We had a great difficulty in finding out who owned Terrace Buildings.

9147. The registration of owners would meet that point, and then you would know who owned it?—Yes, if accessible to the public, if it could be seen, then people would know who owned the bad houses.

9148. (*Mr. Struthers.*) It is known to whom the rents are paid?—The rent collectors know. A rent collector said to me: "Of course we know;" but that is different from the public generally knowing.

9149. (*Chairman.*) Mr. Booth recommends the employment of sympathetic women as rent collectors?—I know all about Miss Octavia Hill's work. That is admirable in London. There is nothing like that in the Potteries. There are no lady collectors or anything of that sort.

9150. The collector is interested in concealing as much as possible the bad condition of things that exist?—I am afraid so, or in some cases he feels it useless to protest.

9151. There is power under the existing Public Health Acts in dealing with dirty houses, is there not?—When it can be shown to affect the health of the children, there is. But I do not think they report every house in a thoroughly filthy condition only. I think since the lady sanitary inspector went to Longton, she has reported one or two. It has never been done before. I had a rent collector who told me that. He thought it would be a most excellent thing if the houses were in a wretched, dirty condition, that they should be reported.

9153. Then you mention these chemists and herbalists who are, in your opinion, in the habit of dispensing drugs for improper purposes?—Yes. I suggest there should be some restriction.

9154. Surely the existing law is strong enough if it can only be brought into operation?—Yes.

Miss
Garnett.

Miss
Garnett.

9155. If the whole district is in a conspiracy for this thing to go on there is the difficulty?—Yes. I believe they come under the first schedule of poisons, and anybody buying them ought to sign her name, but I do not think that is done at all.

9156. How would you bring about the formation of a standard of character, to which, no doubt, you attach very great weight, in every factory; I suppose the standard of morals in a factory very largely represents the standard of morals outside it?—Yes, I think so. I think if the manufacturers and managers when choosing their foremen and forewomen chose upright men and women it would be a very great help in keeping down the bad conditions in the workshops.

9157. As the general result of your evidence, in your opinion manufacturers in the potteries are just as indifferent to the moral degradation of the people as they are to their physical conditions?—I would not make it so sweeping as that, but some are; there are some good factories.

9158. But they do not represent the general state of things?—I do not think they do. If you take the small works, the men who have risen to a little power with a small capital, they employ people whom such firms as Minton & Copeland, would not employ; those firms have a standard of character.

9159. To insist on a proper standard of character does not add to the expenses of production?—No, but the small manufacturers are getting women at lower wages because they cannot get work with the others.

9160. And they are perfectly careless about their character?—Yes. A big manufacturer said to me "I employ 600 people. How can I tell their moral character." I said "If you understand the moral character of the fifty who are over the workshops that would be something."

9161. (*Dr. Tatham.*) Is it not true that the owners of factories live somewhere outside in the country?—Yes.

9162. And leave the poor people to take care of themselves?—Yes.

9163. Practically, with very few exceptions, they do not live in the potteries?—No, and many of the big ones do not even drive in; they leave it entirely to be managed by others.

9164. Do you attribute to that fact the general neglect in which the poor people have to live?—I think so.

9165. That is one of the contributing facts?—Yes. I think the managers know that the heads do not often come in contact with the workpeople.

9166. And it is under those circumstances that your excellent settlement has been established right in the midst of one of the most crowded districts?—Yes, that was the idea.

9167. Close to the church?—Yes.

9168. I think I am correct in saying that the vicar of Fenton has been recently engaged in a crusade against the immoral conditions of which you have spoken as existing in the potteries?—Yes.

9169. I believe he has been persecuted in the local press for his action in the matter?—Yes. To a great extent he has, but good has resulted and is resulting. A Social Service Committee is about to be formed, in fact it is in the act of formation now, which will have the power to look into things and deal with some of these things.

9170. It is your opinion that if the owners of factories were careful to employ managers and manageresses of high character that would tend to improve the moral condition of the workpeople?—Yes, it would go a very long way towards it I feel sure.

9171. Do you think that amongst the girls employed in factories there is a great deal of secret drinking?—Yes, I am afraid so—amongst women, generally, I think.

9172. And it even extends to very young girls, does it not?—Yes, it does. During the last year I have seen young girls of sixteen or seventeen drunk at mid-day in the streets, in the dinner hour.

9173. Wages are high in the potteries, comparatively speaking, are they not?—The wages brought in by one family may be high, because so many are working. I do not think the average wage is high.

9174. You do not think the neglect of children is really the result of poverty so much as other things?—Not so much as drink and thriftlessness.

9175. A good many parents neglect their children, because they spend their money in drink?—Yes, I think so. There was a case the other day. A child was found in the cradle, wrapped in a newspaper. All its clothes had been pawned. I thought perhaps the newspaper was better than the rags.

9176. With regard to the housing of the people, you have spoken of a difficulty which is experienced of making landlords keep their property in decent condition. It is due to a great extent, I believe, to the fact that much of the property is owned by members of the town council?—Yes, I think so.

9177. The inspectors and other officers of the council are removable by the local authority?—I imagine so.

9178. That is so, I know. Is that also the case with the officers of the county council?—I was told it would be a great deal better if they were under the county council.

9179. I may tell you, as a matter of fact, that the superior officers of the county council are not removable, and therefore they have a free hand, and it is possible for them, at any rate, to bring pressure to bear upon the local authority, by which I mean the town council, to see they do their duty?—Yes.

9180. You know that under the sanitary law there is an obligation, on the certificate of the medical officer of health, to give notice to an owner or occupier of a filthy house to whitewash and purify it, and if he does not the local authority can do it, and charge the cost to the owner. Did you know that was the law?—I do not think I did, but I am quite sure it is not enforced.

9181. For the reason you have mentioned?—Yes.

9182. It means the expenditure of money and the owner does not choose to expend it?—That is so. If they go into a clean house, in six weeks it is a sort of pig sty, and therefore the landlords get tired of doing these things. The people have really filthy habits.

9183. Are most of the houses dwellings with only two rooms?—The majority have two bedrooms.

9184. Built back to back, without through ventilation?—Yes, in some cases.

9185. Scarcely fit for human habitation, you think?—I would not go so far as that, but it is a rare thing to find a bedroom window opening at the top.

9186. At any rate they are much less healthy than they ought to be?—Yes, considering the numbers who sleep there.

9187. Is consumption prevalent there?—Yes; they call it potter's asthma and potter's rot there.

9188. Is there hospital accommodation?—It is very inadequate.

9189. Is it resorted to?—Chiefly for infectious diseases. In North Staffordshire the big infirmary is so full, very often, that they discharge a man before they ought to, because they have not enough beds for severe cases.

9190. There is no hospital provision for cases of consumption as yet, I think?—No.

9191. Do you think that would be advisable?—Yes.

9192. It is a question of money, is it not?—Yes.

9193. You speak of the recent appointment of a lady at Longton. Is she a sanitary inspector or a factory inspector?—A lady sanitary inspector. There is no factory inspector. There is a lady sent down by the Home Office to look after things a little.

9194. This lady is employed as a sanitary inspector?—Yes. I think the only other one is at Burslem. It was a success there.

9195. Has she a staff under her?—No. I never heard of a staff.

9196. She has to visit practically the whole of Longton—it is a large town, is it not?—Yes, larger than Fenton. Fenton has 17,000 inhabitants; I suppose Longton would be about 20,000.

9197. With regard to the sale of noxious drugs for im-

proper purposes do you think that extends to the sale of drugs to drug children?—They use soothing syrups to an enormous extent.

9198. And paregoric and other dangerous drugs?—Yes.

9199. To any great extent?—Yes. I think the women who take charge of the children get tired of the wailing of the babies, and have something to keep them quiet. It is natural that it should be so.

9200. Is it your experience that the children of the working classes get much milk?—No, very little milk.

9201. What kind of milk is it they get—is it tinned milk?—Sometimes. The ordinary milk is very rarely given.

9202. It is generally tinned milk?—Yes.

9203. Of the kind which is called separated milk?—Yes, I think, they do not even give their babies that—I think it is a sort of water gruel, and bread soaked in water.

9204. Which, of course, the young children cannot digest?—They do not realise that that cannot be digested by infants under ten months old at any rate. That is one of the things we are always teaching.

9205. Is any attempt made by domiciliary visits or otherwise to persuade these poor people that irritant food not only gives no nourishment but is practically poison?—All the Settlement workers keep that in view, but I know of no other body of people who do.

9206. There is nothing corresponding to the Ladies Health Society of Leeds and Manchester, except your own Settlement?—None that I know of. There is no residential leisured class. They are all working people. We are the only body of ladies I know of living in the Potteries at all.

9207. Does your visit extend to other towns in the Potteries besides Fenton?—Yes, Hanley, Tunstall, Stoke, Longton, Fenton, and a part of Burslem known as Sneyd.

9208. Do mothers nurse their children much?—No.

9209. The tendency is to feed them by hand as soon as possible?—Yes.

9210. That is one of the causes of high mortality?—Yes. We thought with three months they would be able to give the proper motherly attention.

9211. Are feeding bottles with indiarubber nipples much used?—Yes.

9212. Very filthy things and utterly unfit for the purpose?—Yes.

9213. They are condemned by every medical man, I think?—Yes.

9214. They are largely used?—I think so.

9215. Do you think that, to any great extent, children are sent to school half starved because of the negligence of their mothers to provide them with proper breakfast?—I asked that question of the schools I went to inspect. They would not say to a large extent, but it occurred in almost every standard. There were some who were badly nourished in almost every standard.

9216. Obviously the children are unfit to acquire knowledge under those circumstances?—Yes.

9217. Is there any arrangement to provide those cases with food?—No. The teachers in various cases sometimes provide both clothes and food, and give them some breakfast at their own homes, if they know that they have not had any, but there is nothing on a large scale.

9218. Would you think it would be desirable that they should have food given?—Yes. Of course it is taking the responsibility off the parents, who ought to do it.

9219. But even that would be better?—It would be better for the children, of course. I came upon a case where the school mistress told me the mother had come to her about a very nice child and said, "Will you punish her for stealing?" She said, "Stealing! I have had her under me for some time, and she is a most upright girl. What does she steal?" The answer was, "She steals food!" The child was asked why she did it, and she said, "Mother does not leave us enough, and we take some of father's supper." The mother was out all day.

9220. We had evidence that in one town in England, at any rate, the children had really acquired a distaste

for milk, because they had been fed on whatever the family happened to be feeding on at the time; they have actually got to prefer all sorts of improper food to milk. Do you think that is the case to any extent in the Potteries?—I think it might be the case. I noticed when I gave milk puddings they were looked upon as luxuries, because milk is very hard to get. They live chiefly on fried fish and potato chips.

9221. The children?—The girls—the people generally. That is the favourite food, it is so easily procured.

9222. The food is seldom cooked at home, I presume?—Very rarely.

9223. I do not remember whether the Chairman asked you the question, but may I ask you whether you think it would be desirable that young girls from fourteen to sixteen years of age should have some course of cookery lessons at a school, or lessons in general housewifery at a school, instead of some of their ordinary book work?—They have cookery centres.

9224. That is so?—Yes. I should have had cookery lessons at the Settlement, but I found that it was done at the schools, and I thought there was no object in it. The cooking is done by a gas stove, and there is every convenience, which, of course, they do not get at their own homes. It is taught scientifically. I am afraid they do not drink it in and use it in their own homes.

9225. Do you think there is room for improvement?—Yes, it should be taught in some simple way.

9226. What do you say with regard to mending clothes—the ordinary duties of a labouring man's wife?—We had a girls' club, and taught them how to make their own clothes. They are most inefficient. Everything is ready-made which they buy; they do not make their own things.

9227. (Mr. Lindsell.) Is there much half-time employment in the factories?—Very little now, I think.

9228. I suppose no child goes to the factory before thirteen years of age now?—No, I think not.

9229. And if they go at thirteen they go as young persons?—Yes, they are apprenticed.

9230. I mean they have left school?—Yes.

9231. There is no going partly to school?—No. I enquired whether there were any half-timers, and they say there are very few indeed. I think the pottery trade does not lend itself to that.

9232. Do you think that thirteen years of age is too young for this sort of work?—I think it would be better if it were a little later on, of course.

9233. You do not think there is conclusive evidence that it injures the development of their health?—Not when they have good health and good food, and are of fairly average strength.

9234. There is not any extreme poverty in this district is there?—Yes, there is extreme poverty.

9235. From want of employment?—I think it is through drink and thriftlessness, but trade is very bad just now, and there is a great want of trade. Trade is extremely bad in the potteries now.

9236. Have you yourself visited the elementary schools?—Yes, I have.

9237. Are they good schools in the pottery district?—Yes, I think most of those I have seen are. Of course they would bear some improvement. There is one thing I wish to mention—a man who had had forty years' experience told me he was sure that the bad eyesight had something to do with the cross light in the schools; there was a conflict of light in the schools, and he thought that was very bad. Whether that was his own fad or not I do not know.

9238. The question of the proper lighting of schools is a matter to which the rules of the Board of Education are particularly directed?—He said that if the light came from the back and the top it would be better than having the light in front. In almost all schools the light is in the front and on either side.

9239. Have you seen the way in which the principal class rooms are lighted?—They were all lighted like that where I have been I think. It is a very good light of course, but almost a glare of light.

9240. Do they attempt the teaching of domestic subjects?—Yes.

Miss
Garnett.

9241. Cookery ?—Yes.

9242. Is that pretty universal ?—I think so.

9243. And the laws of hygiene ?—Yes. It is taught in a very scientific manner ; I do not think it sinks in at all.

9244. Do you not think it gets rather difficult in a school to do otherwise than teach the theory—the practice must come afterwards ?—The practice does not come afterwards in this case because they have no home really to practice what they learn in the school as regards domestic subjects. There is no domesticity.

9245. Are there no efforts made to supplement the school teaching when girls get older ?—Not in the way of teaching health.

9246. No health lectures ?—There is a course of health lectures going on now in Longton. I think the better class attend—not those who would really benefit by it.

9247. There is no attempt to do it by means of social evenings ?—Yes. We have done that in the settlement. We have had health lectures and simple teaching and made them write a few papers about it.

9248. Did not it strike you that the girls who already had some scientific teaching at school showed greater aptitude for picking up the practical side of it than the others ?—I think perhaps so.

9249. You would be in favour of extending the amount of physical drill in the schools ?—Yes. Twenty minutes every other day does not seem very much.

9250. The school hours are somewhat limited and there are a large number of subjects ?—Yes. There is a pressure of other subjects which does not leave much time.

9251. In addition to physical drill they also get ten minutes' interval in the playground for recreation ?—Yes, they do.

9252. You say the pressure of the inspectors is so great that there is little time for health subjects ; what do you understand by that ?—I asked whether they always had this drill, and I was told, "Well, you see the pressure is so great sometimes that we have to let something go"—rather intimating that these health subjects were not so important, or looked upon as so important by the inspectors as the mere brain knowledge.

9253. You know, of course, the curriculum of the school rests not with the inspector, but with the managers and teacher ?—Yes. I suppose it is the managers, probably, but they are very anxious to please the inspectors.

9254. They are also now anxious to please the local authority ?—Yes.

9255. You say that public baths should be provided free for young children under fifteen ?—I found they had been giving free baths to children in Burslem, and children had been taken by the teachers to baths ; and I think it would be a good thing if it could be extended. That is the only place where that takes place that I know of.

9256. The local authority have power under the Baths and Washhouses Act to provide public baths and swimming baths ?—They have to pay for them.

9257. You mean the rates have to pay ?—No, I mean they are not free.

9258. I think they can provide free baths—they have the power, I believe ?—They do not use that power much.

9259. You know swimming is allowed to be taught ?—Yes. In Fenton there are no baths of any kind, although there are 17,000 people. There are only baths in Longton or Stoke for people to go to.

9260. (*Dr. Tatham.*) They use the canal pretty much, do they not ?—Yes.

9261. (*Mr. Lindsell.*) With regard to this question of smoking, have you noticed a very serious increase in it of late years ?—Yes. I never used to observe it. I do observe it frequently, and so do those who take boys' clubs and mix very much with the children.

9262. How far does your experience go that it is very deleterious to the children's health ; have you any actual evidence on that point ?—The head of the school in Longton took out the boys who persistently smoked and said, "Look what poor little things they are—how small they are." I think he was going to take a photograph of these children and others who did not smoke at the same age ; he said that it would be interesting.

9263. Did the difference strike you ?—They did strike me as being very poor little things. I expect they came from drinking homes as well. There were probably other causes besides the smoking.

9264. In the experience of that particular teacher there was a distinct inferiority on the part of the children who smoked ?—Yes ; he was very strong on that subject ; it was his pet subject, I think.

9265. Are the children sent to school clean and tidy ?—Oh, no. I saw some last week who were anything but that. It can hardly be expected ; the mother has gone out of the house before the children go.

9266. They came from homes where both parents were in employment ?—Yes.

9267. It was not merely due to temporary want of work ?—No, I do not think so. I think they would be what you would call merely neglected homes. The teachers told me that sometimes it was insufferable. They had to send a child out for a little time.

9268. It is a common occurrence that both parents are away from home ?—Yes, or the man will be a miner, and although he has good wages the woman will still work in the factory, though his wages ought to be sufficient to keep the family going.

9269. What time do the parents go away to the factory ?—Generally about seven, but if they work in a distant town they leave soon after six. If they live some distance off they do not go back at all.

9270. How are the children kept ?—The children from six to ten or eleven years old will take whatever they can find—anything that is left for them. The infants will be sent out.

9271. The food is always cold ?—I think it must be always cold ; I do not think there is any method of warming it. I do not think they have hot food in the middle of the day. I should doubt if they had hot food at breakfast.

9272. The Potteries is a district in which an attempt to establish some form of school breakfasts and dinners might be very advantageously tried ?—I should think so, especially in the poor districts.

9273. If the father and mother are both away the child cannot be properly looked after in the way of food ?—That is so. Of course, I did not go to any of the National schools—there is a big National school at Fenton—because these children are from the tradesmen class, and they are all pretty well nourished children. I went to the lower class schools.

9274. The children who come from those homes where the father and mother have gone to work ?—Yes.

9275. Has there been any talk of attempting to provide meals for these children at the school—I do not mean gratuitously ?—I think there has been for dinners, but I doubt about breakfasts.

9276. Breakfasts would be almost as valuable as dinners ?—Yes. They have a spasmodic free dinner given by the Town Council during the time when trade is very bad, but there is nothing systematic done.

9277. Free—it is not self-supporting ?—No.

9278. That was merely done to meet a special stress ?—That is so as far as I know. I do not know that I asked that question in Tunstall.

9279. Have you heard of a benevolent institution treating that themselves ?—We are very poor in such associations. There is nothing like those in London, such as the Charity Organisation Society or the Factory Workers' Union.

9280. It might be done if cookery centres were established ?—It would mean an extra room, would it not ?

9281. You say the girls are learning cookery ?—Yes.

9282. It would be more practical if they cooked such things as their own class wanted ?—Yes.

9283. But food might be supplied to the children themselves at a small payment ?—Yes.

9284. (*Mr. Legge.*) You seem to think there are a large number of married women employed in the Potteries ?—Yes, I think so, especially in Longton.

9285. Is there any special branch of the trade there ?—Chiefly china, not earthenware. In the earthenware trade they have to employ men more because it is a very heavy trade.

9286. Are these women employed in the glazing process principally?—No, I should not say principally in the glazing.

9287. You are aware that according to the Factory Department's statistics lead-poisoning has decreased?—Yes, and I think from my own observations I should say so too. We do not get so many cases.

9288. You spoke of a Social Service Committee being in process of formation?—Yes.

9289. Is that a voluntary or municipal enterprise?—Purely voluntary; they are trying to get some of the heads of the factories on that social service committee.

9290. Is there any representation from local authorities?—They are going to try, I fancy, but it is very difficult to get it.

9291. One or two mayors I noticed wrote very violent letters denouncing a clergyman who described the Pottery district as a sort of hell on earth. Have they been invited to join?—I could not say whether they had or not.

9292. Now you expressed to the Chairman your assent to the policy of the local authority stepping in and carrying out certain sanitary improvements, charging the cost to the owner; do you agree that that is a sound policy?—That the local authority should step in—yes.

9293. Would you go further than that and approve of a system under which the Central Government could do work which ought to be done by the local authority which has been neglected and then charge the local authority with the expense?—If it would force the local authority to do their duty.

9294. Supposing the local authority did not do its duty, and the Central Government became aware of that fact, would you approve of power being given to the Central Government to step in and do the work, charging the cost to the local authority?—Yes, I think I should.

9295. The Chairman put to you the question whether you did not agree that it would be a good thing to get some regular physical census of the population, and you agreed?—Yes.

9296. Supposing such physical census showed that the physical condition of the people in a particular area was extraordinarily below that of any other district under even most similar conditions in other parts of the country, that would be a ground for an inquiry by the Central Government into the cause in this particular district of this physical disparity?—Yes, I imagine so.

9297. Following on that, the Central Government might call upon that local authority to carry out certain improvements, and in default do them itself?—Yes.

9298. I am giving that as a practical illustration?—Yes.

9299. You would agree with that?—I think I should.

9300. (*Colonel Onslow.*) Is there anything in the nature of the work in which these women are engaged which incites them to drink?—Yes, I think the stuffy nature of the factory work does.

9301. There is a considerable amount of dust?—Yes, it brings a sort of thirst upon them. There is an enormous amount of beer drunk.

9302. Not worse drinks than beer, not spirits?—Yes. There are out-door beer houses in the potteries where they must drink off the premises. There are heaps of those besides the big public houses.

9304. What is the population of Fenton?—About 17,000.

9305. Has it a corporation?—It has an urban district council. There is no mayor.

9306. And it is in that place that you have noticed very bad housing?—Not only there, but in Hanley and Longton.

9307. I know Hanley is very bad, but is Fenton as bad?—No, I do not think it is as bad. I do not think there is so much slum property in Fenton as in other towns. I should say Longton is as bad, but I do not know the exact population of that place.

9308. Has that a mayor and corporation?—Yes.

9309. Are the houses back to back houses in small slum areas?—I believe there is a good deal of slum pro-

perty in Longton. The bedroom accommodation is very small.

9310. And the accusation that you made against the sanitary authorities is common to all those places?—I think so. I think that is borne out by the evidence.

9311. The sanitary inspectors are not doing their work?—They are in awe.

9312. They are afraid to do their work?—Yes.

9313. However much they may be willing to do so?—Yes, I think so.

9314. You say there is a lady sanitary inspector?—Yes, only quite recently appointed—only two or three months ago.

9315. There are factory inspectors, are there not?—There are men factory inspectors.

9316. For the factories themselves?—Yes. Of course when they come it is known at once; a bell is rung in the factory, and everything is put right as far as possible.

9317. There are no lady factory inspectors there?—No.

9318. Although there are a very large number of women employed in the work?—Yes.

9319. Where a lady factory inspector is more needed than in most cases?—Yes.

9320. (*Mr. Legge.*) It is the fact that a considerable amount of the lady factory inspectors' time has been spent in the Potteries district?—There is one now.

9321. Are you in a position to speak to that, or not?—I had one who was sent down by the Home Office to see me the other day. They have been sent down from time to time.

9322. Are you not aware of long reports by lady factory inspectors?—Yes.

9323. Surely those reports indicate the expenditure of a lot of time, not by one, but by more than one factory inspector?—I do not think the evidence would be so good as from one in residence in the place, because no adequate knowledge of the conditions of labour can be attained without a knowledge of the conditions of life and the habits of the people.

9324. The place has not been forgotten by the Home Office in connection with lady factory inspectors?—No. I think they devoted themselves to the lead question rather than to the other questions.

9325. You mean other factory questions?—Yes.

9326. What other big factory question do you think there is in that district?—I think they might have devoted themselves to the moral question to some extent—the character of those in charge.

9327. I do not know that that comes within the purview of the Act. They might have gone into the question of sanitary conveniences, and so on, you mean?—Yes.

9328. (*Mr. Struthers.*) What is your idea of slum property; how do you distinguish it from other property in the Potteries?—Where the doors are beneath the street, and the water almost runs in, and where the people live in cellars beneath the ground. They call them cellar-houses.

9329. Are there many of them?—Not very many, but there are some, I know.

9330. You do not class the two-roomed houses you spoke of as slum property?—I should not call them slum property, because the majority of the houses have two bedrooms.

9331. Does that mean they have a living room besides?—Yes.

9332. Three rooms?—Yes, they have two bedrooms upstairs.

9333. What is there downstairs?—Downstairs there is a room into which the door opens, and a little back kitchen, and then a yard at the back.

9334. Is there any bed in the room on the ground floor?—Only when there is a case of illness. It is generally the room where they put the best bits of furniture they have in, and which they do not use.

9335. Of course it depends on the number of people living in the house, but for a moderate sized family that might be a good enough house?—Quite.

Miss
Garnett.

9336. Apparently you say that even if the landlord did improve them a great deal, the habits of the people are such that they would bring them down to a very low level again?—Yes, that was the evidence of the relieving officers and rent collectors.

9337. So that more improvement in the sanitation by the authorities would not do much unless you got a change in the habits of the people as well?—If cleanliness could be enforced under a penalty, or something of that sort, there would be an improvement.

9338. It is not simply a question of sanitary regulations?—Not only that, I think.

9339. Manufacturers are not residents, as a rule?—No.

9340. And there is an absence of the middle class?—Yes.

9341. But there are some middle class?—They would be the tradespeople, I should consider.

9342. Now with regard to the pottery workers themselves, you speak of some people who might send their children profitably to the factory at thirteen, because they have good homes and good food?—Yes.

9343. Those are factory people?—Yes, decent factory people, who care for their children, and see that the conditions of their life are good.

9344. Among those people does the mother work in the factories?—In some cases, but not in the majority of cases. In our national school at Fenton the majority of the mothers are at home; they come from the better class. I enquired whether there were many under-fed children there, and I was told only rare cases.

9345. As a rule the other class of factory workers work at the factory?—Yes.

9346. And their children are left at home all day?—Yes.

9347. With nobody to look after them?—In some cases, when the mother works within a reasonable distance she returns in the middle of the day, and then they have better food.

9348. Is there any necessity for these women working in the potteries?—Of course certain departments of the trade perhaps, are done better by women, for instance, the painting—that is done better by women than by men. I should think there would always be women employed in the trade.

9349. Would there not be a sufficient supply of unmarried women?—Yes, and the men could have sufficient work then.

9350. You think to a certain extent the women are cutting the men out of employment at present?—Yes.

9351. Quite apart from work which might be done by unmarried women, without trenching on the married women at all, do you think they are cutting the men out of a certain amount of work?—I think so, because the women's wage is cheaper. One man was asked why he employed a woman, and he said, "She will do it for 8s., and if I have a lad I must pay him 12s."

9352. Very frequently the man does nothing?—Yes.

9353. Does he live on his wife's earnings?—Yes, he looks after the children in a certain way, but he hangs

about the street. In Longton there are whole crowds of men about the station. There are a large number of men out of work.

9354. Are there many cases in which the man stays at home while the woman goes out to work?—Yes, in Longton. I attribute that to the fact that women are mostly employed in the china trade, and the employers can get them to do it at less wages.

9355. Do the men who stay at home look after the children and prepare food for them?—I do not think they do much.

9356. You do not know Dundee, I suppose?—No.

9357. I am told a similar state of things prevails there—that women are employed by preference in the factory, and there is no work for men, and there is a very large class of men who make it their business to marry a woman who is in good employment, who is a good worker, and who earns a good wage. You think there is something of the same class down here?—Yes. You must remember the work in the pits has been bad of late, and therefore a good many men are out of work—men who are not potters.

9358. The real cure for the condition of this district would be to get the married women out of the factories?—Yes, that would do more than anything else for the homes, and for the whole of the conditions.

9359. More than sanitary regulations or education?—More than anything.

9360. Do you see any practical way of bringing that about as a practical measure—the lessening of the number of married women employed in the factories?—I think an extension of the time from one month to three months after child-birth would be the beginning of it. Everyone whom I have consulted has said the radical thing would be to do away with married women labour. But it may be thirty years before it will come; they are not ready for it yet.

9361. In the great majority of cases there is no necessity for it on the ground of want of income in the home.—I think not.

9362. And on the other hand there is no necessity for it because the amount of woman work in the potteries could be done by unmarried women?—Yes.

9363. I refer to the special class of work which could be better done by women than men?—Yes. I think Minton & Copeland do employ more girls than married women. When you go through their workshops you see young women.

9364. What is wanted is the creation of a strong public feeling on the subject?—Yes.

9365. Which would have the support of the leading manufacturers straight away?—Yes.

9366. And might influence the others?—Yes. I believe that one clergyman stated in his sermon that married women's labour was at the root of the evil, and there was a great outcry by people who spoke of men talking of what they did not understand, and venturing to interfere with the conditions of labour.

9367. You will always have to face that in any social reform?—Yes, I think there will always be that.

Mr. SHIRLEY FORSTER MURPHY, M.R.C.S., called; and Examined.

Mr.
Murphy.

9368. (Chairman.) How long have you been in the public health department of the London County Council?—Fifteen years.

9369. You are now at the head of it?—Yes. I have so acted throughout the whole period as Medical Officer of Health.

9370. And therefore you have had exceptional means of forming an opinion upon the problem of the physical condition of the people?—I have seen a great deal of the people.

9371. What general conclusion have you arrived at as to whether there has been deterioration or not so far as the data are available?—The data I have are vital statistics, and they indicate an improvement.

9372. I suppose you must accept them with some reserve, because I suppose improved vital statistics mean a diminution in the elimination of the unfit?—Probably.

9373. That is to be set against it?—I should anticipate

that would be compensated for by the lessening of sickness amongst the population generally.

9374. There has been a very notable diminution of the London death-rate in the last fifty years?—Yes.

9375. From twenty-four in the year ending 1850 to fifteen during the last year?—Yes.

9376. The expectation of life in certain decennia tells the same tale?—Yes; the expectation of life has improved.

9377. You are further in a position to show how that expectation of life varies in two typical districts in London?—Yes, between Hampstead and Southwark.

9378. Very largely in favour of Hampstead?—Yes.

9379. And a comparison of the condition of the people inhabiting certain classes of tenements is also confirmatory of the same view, is it not?—Yes, the people having better accommodation have had lower death-rates from

all causes and from certain diseases than those inhabiting the small accommodation.

9380. Should you say that the proportion is altering in favour of the more wholesome class of tenement, that is to say the larger proportion of the people are occupying a wholesome class of tenement rather than the reverse?—Yes, there are fewer occupations of one-room tenements than there were. There have been two censuses which have given particulars as to the occupation of tenements of less than five rooms, and the Registrar-General has called attention to the diminution in the use of one-roomed tenements in the country. It is very marked in London.

9381. I have here some figures. In London the diminution of one-room tenements inhabited by more than two persons was from 56,622 in 1891 to 40,762 in 1901, but the diminution is not so striking in regard to the next class, that is two-room tenements with more than four persons; they have only diminished from 54,872 to 50,304; and the decrease is still less marked in the next class, three-room tenements occupied by more than six persons, from 24,524 to 23,979. That is not a very marked decrease in those classes?—No. But the direction is distinctly towards diminution. The persons inhabiting one-room tenements have migrated into two rooms. There has been a general improvement all along the scale.

9382. Do you think the time is getting nearly ripe to deal more or less drastically with this condition of overcrowded tenements. Would you see your way in the course of, perhaps, a year or two, to fix a time limit at the expiry of which no one-room tenement should be permitted with more than two occupants, and no two-room tenement with more than four, and no three room tenement with more than six, or any scale you choose to adopt which you think necessary to secure the proper condition of health in the inmates?—I think it would be very difficult to enforce such a requirement at any near time. The difficulty at the present time is to get the law in relation to overcrowding sufficiently enforced on the present basis.

9383. What is the present basis? Do you not regard the occupation of a two-roomed tenement by more than four persons overcrowding?—The overcrowding with which the sanitary authority deals is not the overcrowding given in those figures. These figures take no cognisance of the size of the room. The London sanitary authorities mostly proceed on the standard laid down in bye-laws which they make for houses let in lodgings, under Section 94 of the Public Health (London) Act.

9384. Do they prescribe the number of inhabitants a house can accommodate?—They prescribe the number of cubic feet which each individual should have. It differs in the case of a room occupied by night only and a room occupied by day and night.

9385. Are those conditions laid down and enforced?—They are laid down and partially enforced.

9386. Are they specially careful in the case of houses occupied by children?—I do not think so.

9387. Do you not think it should be so?—That standard, I think, should be rigidly enforced throughout London.

9388. If adults choose to herd themselves like pigs it is their own look out, but in the case of young children it is mortgaging the future?—I think it is more important in the case of young children. I am sure that the standard of 300 cubic feet for a room occupied at night only, and 400 cubic feet for a room occupied by day and night, is so low that it ought to be enforced rigidly throughout London.

9389. Possibly it might be raised?—If we could manage to enforce that first we might hope for something better later on, but until that is enforced we cannot.

9390. Are you aiming at the enforcement of that?—The enforcement of these bye-laws in London is in the hands of the Borough Councils and not of the County Council.

9391. Do they enforce them?—They are enforced in different degrees in different districts. There has been very great difficulty in getting the bye-laws for houses let in lodgings enforced. The London County Council has been making very considerable endeavours for a number of years to get these bye-laws properly enforced throughout London. The Council has always attached great importance to their enforcement.

9392. I suppose you would admit that no standard of domestic decency can be maintained when a lot of people herd together in one room?—Most certainly.

9393. I suppose it is prejudicial to health under any circumstances?—No doubt.

9394. The County Council have done a great deal towards the provision of dwellings?—Yes. They have provided for a considerable number of persons. A recent Return shewed that there were some 22,000 persons living in their buildings.

9395. In the heart of London, or the outskirts?—A great many in the heart of London—in different parts of London.

9396. Do they find much difficulty to get the ground?—A great many of the sites have been acquired under the Housing of the Working Classes Act where improvement schemes have been carried out.

9397. Where insanitary areas have been cleared?—Yes; and that has determined the situation of many of the dwellings which have been erected.

9398. Is there any great difficulty in getting sites?—Yes, very great difficulty, especially in view of the price of land, and it is difficult to provide accommodation for the working classes at rents which they can pay without such accommodation entailing a charge upon the rates.

9399. I suppose the tendency is to place the working classes to a large extent on the outskirts of London, or outside the area of the county of London?—Yes.

9400. And provide for their coming into work by trams or cheap trains?—Yes.

9401. Tottenham and Hornsey, and so on, are full of the working class population, and also West Ham?—Yes, the London County Council has estates on the periphery of the county, and outside.

9402. Are they developed now?—They are being developed at the present time.

9403. Is there any corresponding tendency on the part of manufacturers in the heart of London to move out?—I cannot speak with any precise knowledge of the subject, but I know, as a matter of fact, that there are migrations of certain people—for instance, I have seen myself on the Great Northern line the way in which printers' establishments have grown up outside London.

9404. I suppose you think it a desirable thing that manufacturers who are established in the heart of London should go out?—Undoubtedly.

9405. Are you among those who think that an alteration in the law of rating would assist that materially?—It is not a matter which I think I should be competent to express an opinion upon.

9406. I do not mean what is called the taxation of ground values, but the proposal in the minority report of the Royal Commission on local taxation, which advocated the substitution of site value for the value of buildings as the basis of assessment?—I know of it but I do not think I should be competent to express an opinion worth having upon that.

9407. As tested by the death-rate, I suppose there are certain areas in London which are still very insanitary?—There are undoubtedly insanitary areas.

9408. And you have noted a peculiar exception in connection with the Jewish population who, I believe, live more closely packed than their Christian fellow citizens?—They are certainly as closely packed, but there are counteracting causes which diminish the evil effect, which I think are most important in connection with the high death-rates and diseases among poor persons.

9409. In regard to the additional care they bestow upon their children?—I think that is a very important element in the question, and their temperance is another factor.

9410. They treat themselves better?—Yes.

9411. They do not waste so much money in drink?—No, and they have more money available for wholesome food. Their general care of their lives is, I think, on a higher standard than that of the ordinary population of the same class.

9412. Have you any figures which would compare the infant mortality among the Jewish population in the East

Mr.
Murphy.

Mr. ²
Murphy.

End with the general rates?—I think with regard to one or two Jewish areas, where the populations were not very large, I could give the mortality among young children.

9413. It would be interesting to have those?—There are some figures I gave to the Royal Commission on Alien Immigration which bear a little on this. They show that in parts of Stepney, where alien immigration occurs very largely, there has been an actual falling in the infant mortality.

9414. We should like to see those?—They are in the Commission's Report.

9415. The general infant death-rate in London has not diminished—it might almost be said to have increased in the last fifty years?—It has been undoubtedly maintained.

9416. Notwithstanding the fact, I suppose, that certain of the conditions affecting infant life have improved?—Yes; I think there have been improvements in the conditions affecting the population as a whole.

9417. Which, of course, would react to some extent?—Yes, either they have not touched the conditions which affect the mortality of infants or there have been counter-acting influences prejudicial to infant life which have increased.

9418. How would you suggest that attention to personal hygiene should be brought home to the people at large?—I think a good deal may be done by educational methods.

9419. But not limited to the child's period of school life?—No.

9420. I suppose at that early age such lessons as they do get in these subjects are apt to be forgotten unless their knowledge and interest are maintained?—I think it would be likely, but it would be well to use that opportunity so far as it goes.

9421. To establish a ground work?—To establish a ground work.

9422. What would you say to compelling all girls during the period after they leave school from fourteen to approaching adolescence to attend continuation classes which should be devoted mainly, if not solely, to all the subjects touching domestic hygiene, including attention to infants, household management and cookery, and so on?—I think it would be an excellent thing if during that period of life they were taught those subjects.

9423. Would there be great difficulty about it? Looking to the fact that this class is now taught entirely at the public expense during the years of school life, do not you think that the State has some right to say to them after they leave school: "We will see that, at any rate, during the period intervening between the date of your leaving school and growing up, you shall still continue to learn something which will fit you to undertake the important duties of maternity"?—I quite recognise the right of the State, and if it could be done I think it would be an excellent thing.

9424. Why should it not be done?—I would only suggest twice a week; that would probably be enough, would it not?—I should think that would do.

9425. And it would be a means of keeping some sort of hold over those girls during the critical period of life, and perhaps save them from a great deal of physical and moral contamination?—I should think it would probably be useful in that way.

9426. Is there any other expedient which you would suggest as an alternative?—Not necessarily as an alternative.

9427. Or as supplementary?—I think it might be supplemented by such teaching as could be given by public health officials who have to visit the homes of these people.

9428. That would only touch the mothers; many of these girls are at work during the day. You think that domiciliary visits to the young mothers would be a good thing?—It would not touch the age of which you were speaking.

9429. I am seeking to obviate the risk of the loss of the foundation which is laid down in schools between the expiration of school age and the period of maternity?—I think it would be very valuable if it could be done.

9430. I should say corresponding compulsion should be put upon boys to make them look after their physical condition, to make them attend a physical education class twice a week, unless they produced evidence that they were members of a brigade or a boy's club in the scheme of which physical training took a considerable part?—I think it would be most valuable if the boys could be taught that and kept under supervision.

9431. With regard to influence upon young mothers and the employment of district health visitors for the purpose, that is a thing which might very properly be organised partly by the local authority and partly by charitable agencies, might it not?—Yes, I think so.

9432. Rather on the model of the system in Manchester, which I understand has worked very satisfactorily?—Yes.

9433. And is being copied in other towns?—Yes.

9434. You would not suggest the introduction of the Elberfeld system, where the municipality is entitled to call upon any citizen to give his time to sanitary work?—I do not think it would be necessary. I think voluntary aid would be available. That work could be supplemented by the action of the local authorities who have the right to expend the ratepayers' money for that purpose.

9435. The agents of the Charity Organisation Society could do something—or would not they think that part of their business?—I do not know whether it would come quite within their purview, but I think there would be a great deal of voluntary aid given to work of this sort if it were understood to be necessary.

9436. Do you believe in the value of distributing printed information?—I think it is useful in a degree, undoubtedly.

9437. You think the Midwives' Act may give an opportunity of dealing to some extent with mothers in their obligations to young children?—I think so. The midwives, of course, come into such direct relation with mothers, and if the midwives were properly taught good would be done.

9438. They will be women of some training and some education when the Act comes into full operation?—Yes, and they can be specially trained for this purpose.

9439. As you know, the local authority is the supervisory authority?—Yes.

9440. It is their duty under the Act to see that the midwife gives full directions for securing the comfort and proper dieting of the mother and child during the lying-in period?—I have not looked at their powers in this respect, but if that is so it would meet the requirements of the case. It is an opportunity that ought not to be lost.

9441. I hope you will bring that to the notice of the authority you serve. Then, of course, the condition of the milk supply is a very important element in this problem, and that, I suppose, can be improved?—It leaves much to be desired at the present time.

9442. There have been some sporadic efforts in London to municipalise that supply?—One district has provided a milk dépôt for sterilised milk—Battersea.

9443. And with good results, we are told?—The published results were hopeful, but I do not know the results during the last few months.

9444. I think we were told that if it became a little more general it would become self-supporting?—I think that is very likely to be the case and of course it is very desirable that there should be no charge upon the rates. The whole question of the proper way to feed an infant is being much discussed at the present time.

9445. You doctors do not agree?—There are different views expressed. In Paris, Professor Budin has had results in children's feeding which are very interesting, and from which it would appear that the advantages of a public supply are very great and would be especially great if accompanied by some system of observation of children, that is to say, weighing them and taking stock of the results obtained.

9446. That might also be adopted during the period of school life or later?—As the condition of their receiving milk from a public supply, they should be prepared to bring their children and have observations made as to their progress.

9447. The children's hospitals might do something in that way?—Yes, there is a hospital at the present time which I know has the supply of milk in contemplation.

9448. Do you know Dr. Eustace Smith?—Yes.

9449. He is connected with a hospital in the East End?—Yes.

9450. I think he mentioned some such system is adopted there or about to be?—The question came before me in connection with the point as to whether the hospital was a dairy which came under the regulations of the County Council.

9451. If the hospitals could cover the ground it might be preferable that they should undertake it rather than the municipality?—I think there would be no necessity for the municipality to do it if the ground were covered.

9452. Which do you think would be preferable?—There would be advantage in the hospitals undertaking the work on account of the medical staffs attached to them.

9453. As the case at present stands, I suppose a very small proportion of children get milk at all, and very often in a very indifferent condition?—I think so. I should imagine—and, I think, these figures rather justify it—that infants, on the whole, are worse off than they used to be; they are, probably, less breast fed, and the arrangements for providing them with suitable cow's milk have not made sufficient progress to compensate for that, if it can be compensated for.

9454. You look to some improvements in these respects by the concentration of educational functions in the hands of the County Council?—I do, because the child when it reaches the school age will in future be under the observation of an authority which is not only concerned with education, but which has already important health functions.

9455. It will bring education to bear on the conditions touching the health of the people generally?—Yes.

9456. It will illustrate and emphasise the close connection there is between the two?—Yes.

9457. And it may, very possibly, lead to the more practical training of teachers for work of this kind which would, of course, re-act on the children when taught?—Yes.

9458. The teachers, themselves, are extremely ignorant of the conditions of health?—No doubt they have to be taught as well as the rest of the population.

9459. I suppose you would enforce a system of this sort by the medical inspection of schools?—I think it is most important.

9460. In the last resort I mean?—It seems to me the children should be generally under medical inspection, using the observation of teachers very largely.

9461. If the teachers were very much interested and understood that it was part of their obligation, you would leave it to them to call the attention of the medical officer of health to such abnormal cases or such sickly cases as come under their notice?—Not entirely, but they would play an important part in the matter.

9462. You think there is a great deficiency in personal cleanliness among the children of the poor?—I am sure the question of personal cleanliness is very much bound up with their health, and there is an urgent need for some systematic effort being made for teaching personal cleanliness.

9463. Not only in reference to the teeth but the whole body?—Yes, the whole body.

9464. I suppose the amount of dental caries which we heard of is very largely due to want of personal cleanliness?—I should think it is in part due to that cause. Of course a dentist would tell you better about it than I should.

9465. Of course there are other causes?—Yes,

9466. In regard to verminous children, surely the school authorities do not admit them into the school—they insist upon the parents sending them to school clean, and it is known where the parent is who sends the child?—I think if the educational authority at once excluded all such children from school it would make a considerable difference to the attendance at some schools. The London School Board has, however, recently taken some action in the matter.

9467. Are there powers possessed now by the county council for the cleansing of dwelling houses?—There are general powers possessed by sanitary authorities for the cleansing of houses which are so dirty as to be a nuisance, but it is very doubtful whether technically vermin constitutes such a nuisance as is defined under the Public Health Act.

9468. The question has never been tested?—Very often the two things are associated, but not always. If there are dirty conditions the sanitary authority can serve notice requiring the cleansing of the house, and that is useful not only for the condition of the walls but for the other conditions.

9469. There is a Cleansing of Persons Act in operation, is there not?—Yes, which empowers sanitary authorities to provide for the cleansing of persons who make application to them for that purpose and for the disinfection of their clothing during the time they are being personally cleansed. It has been very little used in London.

9470. I suppose these dirty persons do not see the point of being clean?—I do not think so altogether, because in Marylebone where provision of this sort has been made, and where there is a large Salvation Army shelter, great numbers of these people have gone there for cleansing operations, so that I am hopeful that people of that class would avail themselves of opportunities if they were really given.

9471. You do not wish to see authorities armed with power to hunt out these persons and apply their powers?—I would like to see some power for the purpose. May I give an illustration in connection with the common lodging houses? Some persons among that class will not be received into a common lodging if recognised, because they bring verminous conditions into the house. The inmates who are regular lodgers, people who live for long periods in these houses, very often have rooms allotted to them, so as to prevent association with a newcomer, who may be verminous. It is a condition which is recognised by these people, and is objected to by them, and my impression is that if the sanitary authorities do provide proper opportunities for cleansing, and if there were a power to require that a particularly dirty person should cleanse himself, it would be very useful, and would also meet the approval of the particular class concerned. Of course it would have to be done very carefully, because a power of that sort might be used to the annoyance of individuals, but I think it ought to be in the power of the draughtsman to frame a clause which would answer the purpose.

9472. I understand that the Board of Education have had urged upon them the importance of giving elementary instruction on health subjects?—Yes, and temperance.

9473. I suppose this might take the place of a good deal that is now obligatory in the Department—you could not go on piling up subjects?—There is no doubt there is a limit to the amount of time which can be devoted to education.

9474. Would you say it would be much more useful that education in health subjects should be substituted for grammar, and would be equally good for the mind?—I think I would put health teaching in the forefront. That is one thing there should be no option about. Without health you are nowhere, and even if it has to be done at the sacrifice of some other subjects I think it should be done.

9475. And of course you would attach importance, not only to physical training at the period of school age but after?—Yes, I think it is very important, if it could be managed.

9476. And wherever possible it should be given in the open air, and so you want a sufficient quantity of open spaces and playgrounds?—Yes.

9477. Does the London County Council provide those?—It provides open spaces for the public.

9478. Does it permit them to be the theatre of games?—Yes, and provides gymnasia, and so on. There is one question I should like to speak about, and that is the very strong desire I have to see weekly washing encouraged in the school. Such a system exists on the Continent.

9479. Would you have a bath at every school, or would the ordinary lavatory suffice?—In Christiania and some of the Northern cities, certainly in Berlin and, I think, in Copenhagen—I found some years ago that the basements of some of the schools had been fitted up

Mr.
Murphy.

Mr.
Murphy.

with spray baths, hot and cold water, and I was told that the children were encouraged to take their clothes off one day a week, and have a weekly wash. I spoke to the teachers about this, and asked if there were any difficulties. They said at the beginning that it was looked upon as an innovation and an intrusion upon the liberty of the parent, and it was not altogether approved. But the children tried and liked it; then others wanted it: and in a short time the whole class were regularly washed. I attach very much importance to the periodical cleansing, to the sense of cleanliness and dignity which it gives, and because it inculcates the habit of cleanliness. It seems to me that the educational authorities here might learn what is happening on the Continent, and imitate them.

9480. That is done in a special department for the purpose?—It was really done in the basement rooms, which are partially used for the stoves which heat the hot water pipes, which warm the rooms up above.

9481. The fitting up of the rooms would not cost much?—No. They found they could spare the accommodation which they had below for that purpose.

9482. (*Dr. Tatham.*) We have had an opinion expressed here that although in the population generally it cannot be said that there is any progressive physical deterioration, still amongst certain sections of the population very probably there is very considerable deterioration: Is that in accordance with your experience in London?—I do not quite understand what is in your mind when you speak of "certain sections of the population."

9483. The very poorest, the dock population, costers, and people of that kind—people of the very lowest grade?—I do not know that I should say that those people have deteriorated. That is if you compare them with the same class of a number of years ago. I have worked nearly all my life in London; I began in the year 1866, and I became very intimately connected with the poor of St. Giles in connection with the cholera outbreak of that year, and my impression is that on the whole there has been an improvement in that class. One sees less evidence, I think, of starvation, and certainly people are better clothed than they were.

9484. You will admit that amongst the very lowest class of the population the conditions are sadly inferior to what they ought to be?—Undoubtedly; I have no question about that.

9485. What is your opinion with regard to the connection of intemperance with that?—I think it is a very large cause of the deterioration of the people. In the common lodging-houses of London where people live perhaps as hard and close as you will find anywhere, one finds frequently men who have begun life in decent social circumstances and are brought down by intemperance, and the careless life which grows out of intemperance, men living from hand to mouth, getting daily only a few pence to pay for their night's lodging and their food. I have some Tables here which I thought might interest the Committee, showing the death rates of persons in common lodging-houses as compared with the death rates of the total population of London. These figures were based upon a population of 21,555, and I think may be trusted to give some indication of the direction in which the great mortality lies. I will put in this Table. (*The document was handed to the Chairman.*) It gives the death-rate from all causes at several ages. At twenty-five years of age the death-rate of London in 1901 was 6·74; in the common lodging-houses of London it was 15·24 in 1903. At age thirty-five the death-rate in London was 12·76, and in the common lodging-house population 22·62; at age forty-five the death-rate in London was 21·79, and in the common lodging-house population 42·56. At age fifty-five in London it was 37·82, and in the common lodging-houses 66·30, at age sixty-five and upwards in London it was 70·42, and in the common lodging-houses 144·30. These differences, of course, are very striking. Then the same thing is observable if the death rates from phthisis are shown and also those from alcoholism. At each age the death rate from alcoholism in the common lodging-house population was very greatly in excess of the death rate in the total London population.

9486. Then you have another Table showing for London and the population residing in common lodging-houses the number of deaths from certain causes, and the total deaths from all causes?—Yes. I put that in because the common lodging-house population is a varying one. This

number I have mentioned here was the result of a census taken on the night of the 14th November, a period of the year when the common lodging-houses are rather full. In the summer months there are much fewer people in those houses, because at that time people are in the country house-picking and so on, and it is very difficult therefore to get any population from which to calculate the death rate. I think those figures I have given rather understate the death-rate in common lodging-houses so far as the mean resident population is concerned.

9487. But it points somewhat in the same direction?—Yes. Therefore I put in the other Table which shows the proportion of deaths from different diseases in 1,000 deaths.

9488. These two Tables relate to males?—Yes. The number of females in common lodging houses is not sufficiently large to enable trustworthy results to be obtained.

9489. The figures for one year are not enough?—No.

9490. (*Chairman.*) This comparison is not between the deaths in the same year of two classes but in different years—one year may have been a little more prejudicial to life than the other?—As a matter of fact 1903 has a low death-rate, so that the comparison made would tend to minimise the difference between the two rather than to exaggerate them.

9491. (*Dr. Tatham.*) You have also given a Table here which I am sure the Committee will consider very interesting, showing the proportion of total population living more than two in one room in tenements of fewer than five rooms according to the last census, and you give in subsequent columns the death-rate per 1,000 living, in three separate years, first from all causes, and then from phthisis?—Yes.

9492. And you give several classes?—Yes. Class 1 comprises a group of districts having from 0 to 7½ per cent. of the total population living more than two in a room in tenements of less than five rooms; Class 2, a group of districts having 7½ to 10 per cent.; Class 3, from 10 to 12½ per cent.; Class 4, from 12½ to 15 per cent.; Class 5, from 15 to 20 per cent.; Class 6, from 20 to 25 per cent.; Class 7, from 25 per cent. and upwards.

9493. And as regards the mortality of those classes respectively?—As regards the mortality, perhaps I had better read them in order for each year:—1901, all causes—13·2, 15·2, 16·6, 15·4, 18·1, 19·0, 20·9. 1902, 13·5, 15·3, 16·3, 15·7, 18·1, 19·5, 21·0. 1903, 12·0, 13·3, 14·4, 13·8, 16·2, 16·9, 18·6.

9494. So that from Classes 1 to 7 you have in each case a reduction of the death rate, but comparing Class 1 with Class 7 you have an enormously increased death-rate in all the three years?—Yes.

9495. Then as regards phthisis?—As regards phthisis, the same lesson is taught that the death-rate increased with the proportion of persons in the total of population living more than two in a room in tenements of less than five rooms.

9496. I thought it necessary to ask you to emphasise this question because so far as I know your statistics on this point are exceptional. I know of no others like them. They are very interesting in this connection. Then the next Table you have shows the proportion of the population living in tenements of more than one or two rooms giving like percentages of six classes and also showing the death-rate per 1,000 from all causes and from phthisis?—Yes, that shows that what is true for districts classified on the basis of overcrowded rooms is also true for groups of districts classified on the basis of the number of tenements of one and two rooms irrespective of overcrowding. All causes and phthisis behave in the same way as they did in the districts grouped on the basis of overcrowded tenements.

9497. Then as regards infant mortality, which forms the subject of your next Table, you have the proportion of total population living more than two in a room in tenements of less than five rooms—districts with under 10 per cent., from 10 per cent. to 15 per cent., 15 per cent. to 20 per cent., 20 per cent. to 25 per cent., 25 per cent. to 30 per cent., 30 per cent. to 35 per cent., and over 35 per cent., and then you have the comparative death rates per 1,000 living?—In the seven groups of districts increasing with the amount of population living in overcrowded tenements the infant death rate has followed

the increase, that is to say in districts under 10 per cent. of the population living under those conditions the death-rate was 142, and then as the proportion of population living in those tenements increases so does the infant death-rate, going from 180 to 196 and then to 193, and then going on to 210, 222 and 223.

9498. It is almost steady?—Yes, there is very little interruption to the increase.

9499. Then the last Table to which I would like to draw special attention is the Table relating to persons resident in the artisans' dwellings of the London County Council. That shows the death rates of the working-class population living under favourable circumstances?—Yes.

9500. Have you anything to say on that?—This table enables a comparison to be made between the death-rates of persons living in County Council dwellings and the whole of London during the year 1903. The population dealt with in this table is nearly 13,000. From all causes in the Council's dwellings the death-rate was 11·8; in London, 15·2. At each age, the difference is markedly always in favour of the Council's tenants.

9501. (*Chairman.*) Can it be said to be marked in the case of children under one year old? It is hardly perceptible?—I ought to have made an exception there. The rates are 149·7 and 152·6—practically the same. At the older ages the difference is much more conspicuous, under five years of age, 37·2 and 49·5; five to twenty years, 1·2 and 2·6; above twenty years, 9·9 and 14·9. The principal epidemic diseases, 1·64 and 1·75; phthisis, 1·48 and 1·55. That is a little in favour of the dwellings. Then tuberculous diseases, other than phthisis, 0·55 and 0·60; bronchitis, 0·55 and 1·13; pneumonia, 1·25 and 1·28. I may say that the all causes death-rates, at "all ages," have been corrected for differences in age and sex distribution of the population, so as to make them as comparable as they can be made.

9502. (*Mr. Struthers.*) Seeing you succeeded so well in reducing the death-rate in these buildings, have you any idea as to how you have failed with the children under one year of age?—The view I take of it is that here we have a good class population, having the ability to take care of themselves, but so far as the figures for a single year can be relied upon the infant mortality in this population does not appear to be much below the London average. There is a great deal to be learnt about the means of preventing infant mortality, and even such knowledge as is available has not reached all people having the care of infants.

9503. They do not know enough about it?—No.

9504. Even in classes which are otherwise well-to-do?—Yes.

9505. Are these people in the model lodging-houses more ignorant about the care of infants than, say, the working men of Hampstead—the well-to-do working class?—I cannot say that. I have never discussed this question with them. But these people are of the respectable working class, and I should think they would probably be of the same class you would have in your mind in connection with those at Hampstead.

9506. (*Chairman.*) Earning from 30s. to 35s. a week?—I think I could supply you with information as to their average wages; I think they are in the possession of the County Council.

9507. (*Mr. Struthers.*) To put it shortly, do you think the infant mortality in these County Council's houses could be diminished if the parents were better instructed?—I think that there is a good prospect that infant mortality could be reduced in that class of the population as well as in other classes.

9508. And there is no other cause which you think accounts for it?—The subject of infant feeding is probably the most important. Dr. Budin thinks the mortality of infants in the first year of life could be reduced to 90 or 100 in the 1,000.

9509. What does he feed them on?—He fed his children on whole milk, which I think he sterilised, and this was, in a large number of cases, used to supplement the supply derived from the mother.

9510. (*Dr. Tatham.*) The general teaching of the table seems to be, leaving out the question of infants, that it is at the ages of from five to twenty that the chief saving of life takes place?—Yes, and I think in connection with that it is important to recollect how much cheaper food has got in some respects—for instance, meat. Meat food is much more largely within the reach of the poor than it was in former years. It is to be purchased really at much lower prices. What is wanted, however, is the teaching of the economic expenditure of money on wholesome food.

9511. (*Mr. Struthers.*) We have a medical man coming here who will tell us that increased consumption of flesh food makes against health rather than for it?—I can quite imagine that some people eat too much meat, but I look upon the improved food supply of the population as one of the large causes of the reduction of mortality. I know that babies who would not have shared in this have not materially improved, although their general hygienic surroundings are better than they were a number of years ago.

*Mr.
Murphy.*

SEVENTEENTH DAY.

Monday, 14th March, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LFCGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Dr. ALEXANDER HAIG, M.A., M.D. Oxon., F.R.C.P., called ; and Examined.

Dr. Haig.

9512. (*Chairman.*) You are a physician in general practice?—I am a physician. I only do physician's work.

9513. Are you connected with any hospital in particular?—Yes, the Metropolitan Hospital in Kingsland Road, N.E., it used to be the Metropolitan Free Hospital; also the Royal Hospital for Children and Women, Waterloo Bridge Road.

9514. What led you to think that a large number of people were suffering from food poisoning?—My own experience. I was myself suffering, and should have died if I had not found out the cause.

9515. Up to the date of this discovery you ate the same as other people, I suppose?—Yes. I was a great meat eater.

9516. You suffered from the deleterious effects of the uric acid which is found in all flesh food and other things?—Yes.

9517. How do you attribute to the presence of this poison the physical deterioration which you believe to exist?—Because the poison controls the circulation. It controls the rate of the circulation and the colour of the blood.

9518. It retards the circulation, you think?—It retards the circulation and alters the colour of the blood. Here is a card showing the colour of the gums. It gives an approximate estimate of the blood decimal. Anyone who takes poison never reaches that top colour, and in my book I offer a reward for anyone who takes meat and tea, and has a colour and circulation equal to my own. No one has claimed the reward.

9519. (*Colonel Fox.*) Which do you call the anæmic colour?—The palest colour.

9520. (*Dr. Tatham.*) Is it a question of red corpuscles?—It is a blood decimal or blood fraction.

9521. You say the blood decimal is obtained by dividing the percentage of hæmoglobin by the percentage of cells?—Yes, you get a fraction which is constant and it does not vary with the dilution of the blood.

9522. (*Chairman.*) I suppose there is a certain quantity of uric acid in the human system?—There is in everybody. I have to deal with ten grains myself, and on meat and tea I used to have to deal with twenty or twenty-two grains.

9523. Ten grains is not an excessive quantity?—Everybody must have about that.

9526. (*Colonel Fox.*) Is ten grains normal?—It is for me.

9527. (*Chairman.*) It varies in different persons, I suppose?—It bears a certain relation to body weight. The circulation is shown in this way (*explaining the working of an instrument*). Mine was about two and a half seconds—four or five half seconds is normal, and in cases of disease it is even twenty and thirty seconds. The man whose writings drew my attention to it found cases going up to thirty seconds, that is sixty half-seconds. I

felt sure that the disease he wrote about was due to uric acid, and that therefore in slighter conditions we should get corresponding variations. This (*showing a diagram*) is the daily fluctuation in everybody's circulation. Everybody's circulation is slower in the morning and quicker in the evening. It varies in everybody. Thus eight half seconds in the morning would be about five or six in the evening.

9532. (*Mr. Struthers.*) What is your own?—My own averages five—being six in the morning and below five in the evening.

9533. (*Chairman.*) This is the variation?—The daily variation, and I can make that anything I please by controlling the uric acid.

9534. The greater the consumption of flesh foods and certain other things the greater the amount of uric acid?—Well, that is the fluctuation shown there. It is due to uric acid, of which there is more in the blood in the morning and less in the evening.

9535. (*Colonel Fox.*) Has a large eater of meat more uric acid in his system than a vegetarian?—Not a vegetarian. I am not a vegetarian. A vegetarian will take poisonous things, such as peas and beans and lentils, and may have more uric acid in his blood than a meat eater. I call my diet the uric-acid-free diet.

9536. (*Chairman.*) It rests more or less upon a vegetable diet?—Vegetable diet is the basis, but as it is taken by the vegetarians it is wrong.

9537. You exclude milk and eggs?—I do not exclude milk. Milk and cheese may be taken.

9538. And butter?—No, butter is all right. Those are the things given at the bottom of my scheme for alteration of diet.

9539. (*Dr. Tatham.*) Do you exclude nitrogen?—No, I rely upon nitrogen, and regulate the quantity of albumen in relation to body weight, and I put people on to it gently by a process like that (*exhibiting scheme*).

9540. (*Chairman.*) Well, then, you attribute to these poisons two chief groups of effects which used to be called diseases you say, but are they not still?—They are the effects of the poison.

9542. But they are produced by the morbid conditions of the body?—Yes, but I have ceased to take the poisons, and my circulation is quicker and my colour is better than it used to be, and my body cannot produce disease.

9543. Will you explain how this affects, say, phthisis?—They are merely the results of things which you have already seen. If you have a circulation constantly under difficulties that body is deteriorating. If you have a body with a defective circulation you will have a deterioration from defective nourishment of all the structures of that body, and that being carried on for twenty or thirty years means disease, as we used to call it, and the degeneration of everything, mind and body.

9544. Of course you attach great weight to anything which controls the circulation?—Certainly, the circulation is the life of the tissues.

9545. Do you think it has more effect in the early stages of human life than later?—Yes.

9546. Do you think this is of special value in the case of the young and growing?—Yes, because it is better to grow on foods and not to grow upon poisons. Youth doubles the importance of nutrition, for both growth and nutrition are imperfect.

9547. Amongst which classes do you think there is most abuse of what you conceive to be these unwholesome articles of diet?—Undoubtedly in the rich.

9548. Well, that is rather remote from the point that we have to bear in mind in the course of this investigation. It is not among the rich that deterioration is supposed to exist to any large extent. At any rate it is not so injurious?—But of course one sees it among hospital patients very largely.

9549. But the dietary of the poor, of the industrial classes, does not include any excessive quantity of meat?—Very often in special trades, butchers for instance. My point would be that meat has been increasingly consumed during the last twenty or thirty years.

9550. Do you think that the masses of the people, the poorest of all, get more meat than they did?—Far more, and they suffer from disease. One of my patients in the out-patients room said to me of the time when she was a young woman (and she was speaking of her daughter who was very pale), "When I was young we never used to see that sort of thing." Thirty years before there was not the same amount of meat taken by that class, which was about the time that she was speaking of, and her daughter's colour was the lowest on that card. Labourers in London eat meat twice a day. When I was a boy in the country they had it once a week on market day, and not always then.

9551. I suppose it is the effect of drinking tea that that class would probably suffer most from?—Yes, I think that they take tea because they take meat.

9552. That is not altogether the case, because a great deal of the evidence that we have had is that tea is taken in great quantities and in great strength, and they eat extremely little meat?—But they have eaten it before, probably when they were better off.

9553. Not from what we have heard?—They may take tea as well.

9554. Have you given any special attention to the effects of tea drinking in bringing uric acid into the system?—Tea is uric acid. They are simply swallowing uric acid.

9555. Is there a large proportion of uric acid in a cup of tea?—From a grain to a grain and a half.

9556. Tea of the ordinary strength?—Yes.

9557. We understand that the poorer classes have tea of very abnormal strength which has stood a very long time, and there would be a still larger amount of this uric acid in it I suppose?—You could calculate it by the amount contained in a pound of tea. There are 175 grains of theine in a pound of tea.

9558. It depends upon the preparation of the tea as to the quantity you get, does not it?—Yes, that could be calculated from what is left afterwards. But a person gets about half of what there is in the tea.

9559. (*Colonel Fox.*) When it is only an infusion they do not get much theine?—Yes; theine is the stimulant for which tea is taken.

9560. But is there more theine in quickly brewed tea than there is in stewed, bottled-up tea?—There is much more in the stewed and boiled. If it is cooked for a long time there would be a larger quantity than if quickly infused.

9561. (*Mr. Struthers.*) Of theine, not of tannin?—Yes.

9562. (*Chairman.*) And you think that coffee is just as bad?—Caffeine is uric acid also practically; and theobromine is the same; all those alkaloids are equivalent to uric acid.

9563. What is the model drink for the constitution if you do not drink water?—Well, of course, wine is not very harmful.

9564. (*Colonel Fox.*) What about beer?—Beer is about a grain to the pint, but these facts are all published.

9565. Say a pint of beer: would it contain more uric acid than a large cup of tea?—Just about the same.

Beer contains less than tea, and a cup of tea would be half a pint.

9566. (*Chairman.*) You include peas, beans, and lentils within the scope of condemnation?—They are twice as poisonous as meat.

9567. We have been told that they are of excellent dietetic value?—That is certainly not my experience. Their dietetic or nourishment value and their containing poison are two separate matters.

9568. And there is no means of separating one from the other?—Yes. Most of the poison is in the husk, and you get, say, four-fifths away by taking off the husk. Bean meal contains comparatively little. But still I do not look upon it as a good food, because it still contains some. It would be possible to extract it from meat. You can get most of it out by boiling if you throw away the soup.

9569. Beef tea is much more unwholesome than the meat, you think?—Certainly; it contains all the extract.

9570. Are you not somewhat singular in expounding this doctrine? I mean the profession do not generally attribute it to these causes?—I think that my profession see physical deterioration increasing. Dr. Jones, my fellow student, asserted that physical degeneration was going on and his experience of life is the same as mine. He was reported as saying that the physique of the nation was deteriorating. He attributed it to different causes from me, because he has not had my experience.

9571. In the course of your professional training you were not struck by any of those facts?—I knew nothing about them.

9572. Would you mind stating what your training has been and what your degrees were?—I am Master of Arts of Oxford and Doctor of Medicine of Oxford, and I am a Fellow of the Royal College of Physicians.

9575. (*Mr. Legge.*) Have you studied the question of ventilation much, and the effect of bad ventilation on the blood?—No, I have not studied it specially; I had to study hygiene for my degree.

9576. Your attention has been specially devoted to food?—This food question actually controls the blood from morning to evening, and from year's end to year's end, and the other causes are so very much less important that I have not recently given time to them at all. I am perfectly certain that ventilation and crowding have comparatively small effect as compared with diet. The man is what he eats much more than what he breathes. But by all means get as much fresh air as possible. Food, however, is very much more important. I can live in the centre of London and work as hard as most men and be perfectly healthy, simply because I continue to take proper food.

9577. There is nothing corresponding, I suppose, to uric acid in the air?—No, I think not.

9578. I mean it gives off no gas?—No, it is a very indestructible substance.

9579. (*Mr. Struthers.*) As to the poison in tea, what you call poison is in the theine and not the tannin?—Oh, no, not in the tannin.

9580. The tannin may have a harmful effect on the digestion, but it has not the harmful effect of tea, would you say?—Quite so.

9581. So that fresh-brewed tea is equally bad with stewed tea?—No, you get more theine in the long-standing tea.

9582. But theine is an alkaloid, and not uric acid?—It is an alkaloid, but differs from uric acid by one atom of oxygen, and when it gets into the body it is converted into uric acid. All that I can say is that when you swallow theine you excrete uric acid, and I can swallow three grains with my luncheon, and you could see that circulation of mine slowed this evening, and the circulation would be at least one to two half-seconds slower as that tea was going through the blood.

9583. The effect of taking these poisons in flesh foods or tea shows itself immediately, you think?—Within three or four hours, but it would not show in the average person.

9584. Why?—Because the person who takes tea is not kept awake, but if he leaves the tea off for six months and then takes it again it shows its full effects. It is the same with all poisons; if you take them for a length of

Dr. Haig.

[*Dr. Haig.*

time, you do not feel the effects of them so quickly. A man may learn to take laudanum out of a wineglass or tumbler, but let him leave it off for a year, then a wineglass full will kill him.

9585. What is the explanation of that?—Because it has less and less effect upon the man as he goes on with it. Hence uric acid will show its effect on me in a few hours. This is used by both myself and my pupils, and they can tell how much uric acid there is in the food by the slowing of the circulation. A patient came to me a few days ago, and said, "If I take peas and beans with the shell on I find the circulation slowed much more than with the husks removed."

9586. But that would be taking the uric acid under different conditions from the average person?—But we are told—it is as if we bring the candle into a lighted room, you do not see it, but if you bring it into a dark room you do. A little uric acid will produce an effect in those who are free from it, not in those who are full of it.

9587. But, substantially, your assertion that there is uric acid in tea depends upon the physiological effect?—It depends upon the slowing effect of the uric acid?—It depends upon the chemical composition: theine differs from uric acid merely by one atom of oxygen.

9588. But the difference of one atom may be important?—Yes, one atom of oxygen is replaced in the body. If I swallow theine to-morrow, I shall excrete just exactly so many grains of uric acid as I swallowed theine.

9589. It is a physiological experiment and not a chemical one?—Yes.

9590. And does what you have said as to uric acid in flesh food rest upon your experience, or is it the result of chemical analysis?—The result of both.

9591. But it is a wider term than uric acid?—People have spoken of this group of poisons under various names. I consider that it is xanthine when you swallow it, but it becomes uric acid. If I swallow theine or theobromine I get the same slowing in the circulation and the same effect upon my blood.

9592. Take those pulses which you exclude from the "uric acid free diet," those chemically do not contain xanthine?—I imagine that they do. That has been shown by German chemists.

9593. I rather gather from your own book that on chemical evidence you have not got xanthines?—Is that a recent edition you have got?

9594. It is the fifth edition?—Ah! But there is a sixth edition, it was brought out last year.

9595. Do you think that there are actual xanthines?—There is no doubt that it is so.

9596. But you rest the evidence of there being uric acid poison in pulses upon the result of your physiological experience?—I do not know; physiology is the most accurate test possible, but it can be found by chemical means also.

9597. On the other hand, alcohol does not contain it?—None.

9598. Though beer may?—Beer does.

9599. I believe that these liquors in your opinion are deleterious for another reason, namely, because of the acid?—That is the effect of the acid on the uric acid when it is in excess in the body. That is, it would do harm to people whose blood is full of uric acid.

9600. But all ordinary persons have their body full of uric acid?—Yes, certainly.

9601. So that the taking of beer or any malt liquor would retain the uric acid in the body, and prevent it being excreted, you think?—That is so.

9602. Does that apply to all liquor?—Yes, to all acid liquors, whether made from malt or acid vegetables or fruit.

9603. Beer is an acid drink?—Yes.

9604. All wines?—Yes.

9605. Whiskey?—No.

9606. Whiskey is not acid?—No.

9607. So that it does not have the effect of producing uric acid?—The whiskey drinkers in Scotland are not affected by it and do not get gout, but if they drink beer in England they do.

9608. Is oatmeal free from uric acid?—It is not.

9609. So that it is a dangerous substance?—It has only a small quantity. Xanthine is really the uric acid

of the vegetable, and it is present in all vegetables, more or less.

9610. As a matter of fact, in the ordinary process of digesting food a certain amount of nitrogenous substances are converted into uric acid by the body itself?—Yes.

9611. So that, no matter what source you get the nitrogenous food from you are bound to produce uric acid?—Yes.

9612. What is the importance of excluding it when the body manufactures it from any food?—It means in the ordinary man twenty-two grains a day or more, and in other cases by excluding these things there may be only ten grains a day, to be dealt with.

9613. But if the kidneys are capable of dealing with twenty-one grains, what matters it?—It is not a matter of the kidneys but of the solubility of uric acid in the blood. The acid remains in the body instead of passing out, and from this there results slow circulation and pale colour, as you see.

9614. On your theory, if we propose to feed children at school in any way it would be harmful to give them meats or soups made from meat?—Yes.

9615. Indeed, it would be better to leave them alone rather than to give them a meal of that kind—I mean to let them trust to such meat as they get at home?—Almost. I prefer temporary starvation to taking poison.

9616. But is not that rather a loose way of using the word "poison," to call a thing like a cup of tea poison?—I see no reason to apply it to opium and refuse it to xanthine.

9617. I see in your notes you speak of the poisons in tea and flesh meat, but you only call alcohol and opium stimulants?—They have a stimulant effect, but opium has another effect.

9618. In the ordinary use of those words people consider a stimulant much less harmful than a poison; but you seem to think that fish and meat is poison, and the opium only a stimulant—I am speaking of the ordinary use of the word poison?—Yes, I have not any very strong opinion on the point. I group poisons and stimulants together. Uric acid is a stimulant and also a poison. If I were to swallow uric acid or to administer to you uric acid, you would ask what tonic I had given you.

9619. I mean in the ordinary use of the word poison it means something whose harmful effects are very soon visible from comparatively small quantities, does it not?—I have pointed out in "The Practitioner" last July that if any of my professional brethren were to take uric acid in certain conditions, that to go beyond a certain point is very distinctly dangerous, and I advised them not to partake freely of it.

9620. Then you say that you think that the evil effect is increasing because of taking quantities of those poisons, and this is one of the chief causes of the deterioration of the people?—Yes, because the poisons control the circulation, any organ that is constantly working with a bad circulation must be deteriorating.

9621. But that applies equally to the well-to-do classes as to the poor?—It will affect the circulation more markedly in the poor and under-fed. It would get into the blood sooner, because their blood is in a better condition for dissolving and receiving it. The better classes will not be affected in that way, but they will get gout.

9622. But if the population has been taking more and more poisons then there ought to be an increase in the death rate?—Other things may have had a diminishing effect upon the death rate. So far as I know, as I pointed out in the last edition of my book, certain diseases due to uric acid have increased, as is shown by statistics of insurance offices, which I quote.

9623. Then the diminution of the death rate must be due to the decline of other diseases?—It may have been.

9624. There is no doubt about the fact that there has been a decline in the death rate in spite of this increasing consumption of flesh and tea?—That may be, but other things may account for that. In the statistics that I quote it is not so. All these uric acid diseases have been increasing in fatality.

9625. You wrote an article in the special number of *The Practitioner* in July, 1903, on the subject?—Yes.

9626. But the same subject was treated by many other writers at the same time who were distinguished medical men?—Yes.

9627. Do you find on the whole that their views coincide with yours or are they radically opposed to yours?—They had not had my experience.

9628. But they are different?—Very different at present.

9629. (*Colonel Fox.*) If what you have told us be correct, then the people have very little left to eat. You would like to leave out of their meals tea, meat, bacon and fish. Now fish is one of their principal articles of food and tea is their usual drink. It seems to leave so little for the poorer classes to get nourishment from?—I myself live chiefly on bread, biscuits, and breadstuffs, rice, macaroni, etc.

9630. But do you say leave out meat and bacon?—Yes, and live on bread.

9631. And fish?—I say leave out all these. I live chiefly on bread.

9632. But fish is one of the principal things the poor can get cheap to eat, and especially fried fish?—I am of opinion that they get disease along with it. It is the cheapening of these foods that is the cause of the deterioration.

9633. You would encourage them to drink beer, I see?—No, but I say they may continue it for a time.

9634. "Beer, wine and spirits may be continued"—but they must not touch tea?—As a matter of fact no one who lives on non-uric acid diet for eighteen months or two years will ever take a stimulant again. They never want it. That has been borne out by Mr. Miles, the well-known athlete, who has lived on plain diet. He lived on my diet and he became a very much better athlete and he had a great tendency to take excess of stimulants and he has thrown them up, and now he says "I feel so very well and so improved that I do not even want a glass of stimulant." I know that if they take my diet they can give up those stimulants, therefore I do not think it necessary to cut them off at first.

9635. Is not excessive uric acid in the blood caused by an accumulation as a rule?—Excess of uric acid is due to the accumulation of that which you swallow. When I was a meat eater I had twenty-two grains to deal with every day, and I accumulated sufficient uric acid to cause a very serious illness indeed; to-day I have only to deal with ten grains and am rarely ill, on twenty-two grains I was never well.

9636. Would not a very hard-working man eliminate that by sweating from the skin?—No. I do not think that there is any working man whose blood and circulation is equal to mine, because if it were passing through his blood it would cause anæmia and slow circulation.

9637. I thought that the cause of uric acid was the sedentary life where the skin does not act freely?—I am afraid not. That was what I was told when I was a junior. I used to be treated by other people in that way and they could not cure me, and they said, "Go and cure yourself," and I found that by leaving off meat I was better. Anæmia and slow circulation are universal among the people who take those things.

9638. Are not there three safety valves for the elimination of uric acid, namely, the kidneys, the lungs and the skin?—The kidney is the most important one. But it is not a matter of passing by the kidneys so much as solubility in the blood. But no one swallows uric acid with impunity. All who take it suffer from it either in the blood or in the joints, and you can see when it is in the blood and feel it when it is in the joints.

9639. (*Dr. Tatham.*) You have spoken here of your system. I have no doubt that in your book that system is set forth very thoroughly in detail?—Yes.

9640. But would it be possible in a few words such as we might print in your evidence that you could give a short statement of your system?—My system is simply to leave out all uric acid from the food and swallow none instead of taking twelve or more grains a day. It is included in my private notes which I give to patients and it is also in my book. It simply means swallowing none instead of swallowing twelve grains a day, as most meat and tea takers are doing.

9643. I want to place myself in the position of the man in the street and be able to gather, for instance, from your evidence before this Committee what your system is in detail and what it would be practicable to do?—My system in detail is simply taking those foods which can

be shown chemically to contain no xanthine or uric acid, and the chief of these foods are mentioned in these papers as bread, fruit, nuts, macaroni, rice, all cereal foods, cheese and milk.

9644. (*Mr. Struthers.*) Perhaps you would give a short account of the theory on which you base this system—this physiological theory of yours?—Well, the physiological or pathological theory is that uric acid gets into the blood, and that it blocks the small capillary vessels, and that accounts for the difference in the circulation which you have seen, that it is a mechanical blocking of the vessels by small particles of uric acid floating in the blood. That has two effects—it raises the blood pressure and it prevents the nutrition of all the tissues of the body. The trouble from which I used to suffer was high blood pressure headache. That was due to the blocking of the small vessel, by uric acid, the heart was trying to shove the blood through the small vessels and unable to do so, and the pressure arose between the heart and the small vessels. The rise of pressure caused pressure in my skull which caused the pain in my head. That is one side of the question, namely, the effect of uric acid on the vessels. The other side of the question is when you clear the uric acid out of the blood or drive it out by a pint of beer, it then goes into the knee or the big toe or the thumb and produces what is known as gout or rheumatism, and it produces a local irritation and those are the two great groups of so-called diseases—the circulation group and the local or arthritic group. My treatment, of course, is simply prevention. I do not swallow the poison, and I do not suffer. I could swallow that poison any day, and you would see by the slowing of the circulation that it is passing through the blood, and I could show the hours by those curves of which I showed you specimens.

9645. (*Mr. Legge.*) You said that the removal of the husk of beans &c., took away a considerable amount of poison?—Yes.

9646. Would you say the more refined flour was the better food?—Yes.

9647. And white bread is better than brown bread?—Yes, I always say white bread and biscuits and not brown.

9648. We have heard that a great deal of the salvation of society depends upon eating brown bread?—I think that white bread might be made better than it is, but brown bread contains poison.

9649. But the white bread, so long as it is due only to the refining of the flour, is less poisonous?—There would be less uric acid in it.

9650. Is there any uric acid in sugar?—I am not aware of there being any.

9651. (*Chairman.*) I take it that you do not mean to imply that there is anything special at the present day in these dietetic conditions which are unfavourable to health. I mean, one must not look to any special degeneration in the present day from the things you evidence, because they have always been a principal part of human dietary?—The poison I am speaking of has been taken in increasing quantities in the last thirty years, and in those thirty years my observation coincides with that of others that there has also been an increase of deterioration.

9652. But I should certainly think, as regards the classes that habitually consume meat, less meat is consumed in bulk now than used to be the case—that meat was consumed in greater and grosser quantities fifty and sixty and 100 years ago than now?—Surely the meat per head of the population has increased, because a larger number of the population eat meat? It has enormously increased.

9653. That may be so?—And you must remember that in the case of the upper classes you reckon as meat such things as soup and meat extracts and jellies and things of that kind. It may not be meat. I often get people who say that they do not eat much meat, but when I come to their diet I find that they are taking these other things, which are quite as bad. One of my medical friends told me that he had a patient who was suffering very obviously from uric acid poisoning, and when he went into the diet he said he could not understand where it came from, because he lived almost entirely upon my diet. Later on, however, the patient, who was an hotel keeper, said, "I take a good deal of beef tea; in fact, my house is famed for beef tea."

9654. That was the worst poison he could take?—Yes.

Dr. Haig.
—

Dr. C. R. BROWNE, M.D., B.C., Univ. Dublin, M.R.I.A., called ; and Examined.

Dr. Browne. 9655. (*Chairman.*) What has been the extent of your medical experience ?—I have been in practice for the past thirteen or fourteen years in Dublin.

9656. In connection with any special hospital ?—Well, part of the time, for three years, I was attached to the staff of a military hospital as Civil Surgeon ; I was surgeon to one of the hospitals, and part of the time I was at the Adelaide Hospital in Dublin, out patients' department.

9657. And therefore you have had considerable experience as to the condition of the classes amongst which physical deterioration is alleged to exist ?—Yes, but my main experience and the classes to which I have given most attention is that of the rural population.

9658. Have you formed any opinion as to whether the rural population of Ireland is suffering from deterioration ?—Well, I think, while there is no direct evidence upon the subject, there are reasons from which we may infer that there is a certain amount of decline in it, very slight I think—not so much in the rural as in the urban population. Still I think there is a slight deterioration in the rural population.

9659. Are there actual measurements or data of a kind which would justify that conclusion ?—The only measurements are my own, and those of the Anthropometrical Committee. The Anthropometrical Committee's were only 277 cases in all. My own are something under 1,000, and I am afraid that those are hardly sufficient to draw any definite results from. Besides we have no former standard to go upon.

9660. What do you hold to be the indirect evidence of deterioration, or the causes from which a certain amount of deterioration may be assumed ?—Well, the principal and main cause is, I think, emigration. The sound and the healthy—the young men and young women—from the rural districts emigrate to America in tremendous numbers, and it is only the more enterprising and the more active that go, as a rule.

9661. That would mean that the less able-bodied are left to reproduce themselves ?—They are left to reproduce themselves, and carry on the race.

9662. I suppose the withdrawal from Ireland of a certain section of the population leaves those that remain with more opportunities for employment and advancement within their own country, does it not ?—To a slight extent, but on the whole, it is a very slight extent. There are no industries, you see, except in the north.

9663. Has not Sir Horace Plunkett's organisation introduced some industries ?—That is just beginning to act ; the effect of that has not yet become noticeable.

9664. Have you any means of testing whether it is the case that the people left behind are weak and unsound to any large extent ?—The only things that we can look at are certain diseases—deficiencies—which have increased. I do not know that I can get a word to express my meaning—there has been an increase of insanity.

9665. That is very noticeable, indeed ?—Yes.

9666. And the present ratio has reached now, what ?—One in 173 of the population.

9667. Whereas fifty years ago it was one in 600 ?—One in 730, or something like that.

9668. That is rather an appalling condition of affairs ?—Yes, it has been ascribed to a great many things.

9669. You must make some allowance for some kinds of insanity being better classified now, than they were formerly ?—That is the case to a certain extent, but even allowing for that it is greater.

9670. What is now classed as insanity was merely treated as senile decay, was it not, thirty or forty years ago, and no attention paid to it at all ?—Yes, but taking all these things into account, that increase of insanity is not only relative, but there is an actual increase in the country.

9671. Is it insanity of a bad or incurable type ?—Generally, it takes a religious form amongst the country people, and very often it is very violent.

9672. Have you tested the increase in insanity by the

number of admissions or how—on what basis is it established ?—It is taken from the Lunacy Returns.

9673. The number of admissions ?—The number of admissions.

9674. May it not be the case that a great many of those people admitted undergo remedial treatment, and go out, and are readmitted ?—Yes, but I do not think that they, on the whole, would amount to a very large proportion.

9675. It does not explain the very large amount of increase ?—No.

9676. Have you come to any idea as to what the increase of lunacy in Ireland is due to, besides what you say of the drain of the better types of the population ?—It has been ascribed to a great many things, but I have never been able to satisfy myself as to any real cause. Some of it is ascribed to an increase of alcoholism, I do not think there is an increase of that in Ireland by any means, from what I have noticed during the past twenty years. The Lunacy Commissioners ascribe some of it to the excessive quantity of tea-drinking.

9677. Should you say that there has been a greater increase in the consumption of tea than of spirits ?—I should think so. It is very marked the increase of consumption in districts, where the people took comparatively little a few years ago, and the amount taken now is something tremendous. Only the other day in Queen's County I found that in every cottage for some distance round the place where I was they took it at all meals, and it was generally kept in brew on the hob and taken in sups all day.

9678. The Irish peasant takes very little meat ?—Very little.

9679. So that if you take the view of the last witness they are taking uric acid all day ?—Solely in the shape of tea—a little fish on Fridays and a little bacon or fresh meat on Sundays. In the western populations, among the people on whom my ethnographic surveys have been made, the staple of their diet is fish, round the coast-line and inland it is simply potatoes and tea, instead of barley-meal and oatmeal, which they used to consume in large quantities. That has been banished, and the barley-meal is now used for the cattle mostly.

9680. You have noticed an increase in pulmonary consumption in Ireland ?—Yes, a very considerable increase.

9681. The Registrar-General's Returns prove that ?—Yes.

9682. You are aware that it has diminished in this country ?—Yes ; but at the same time it is increasing in Ireland.

9683. You think on the whole there are reasons for suspecting the decline of national stamina ?—Yes. I do not know that there is any reason to believe that there has been a decrease in the stature which you hear so commonly alleged. I have not seen that. My own observations, so far as they have gone, do not seem to have borne that out.

9684. On the whole, you would think that this decline in stamina is probably due to the change of diet not being beneficial ?—To some extent, added to what I have before mentioned.

9686. Is anything done in Ireland to bring home to the people what dietary is best for their physical development in the schools or by any means ?—I do not think so.

9687. They are left to the light of nature ?—A few efforts have been made by the Dublin Health Society in Dublin and its neighbourhood, but beyond that I do not think so. With the bulk of the rural population in Ireland the question is to get food at all. I think in a very large part of the country that is so.

9688. What do you say generally upon the physique of the Irish population ?—I think on the whole that their physique compares very favourably with that of the other parts of the three Kingdoms.

9689. Would you mind giving us that in greater detail ?—As regards the physique of the rural population of Ireland, taken as a whole, it certainly appears to be far superior to that of the working classes in the towns. The evil influences of town life on the physique of the people have been well established, the effects of squalor, bad ventilation and overcrowding being the stunting of the growth and the blunting of some of the faculties. Another factor which plays an important part in the acknowledged decline in the physique of the town dweller is insufficient nutrition in childhood. The parents are often insufficiently fed, which reacts on their offspring, and even when earning enough to support the family they often find the temptations of the public house so great, that a very insufficient margin is left for food and clothing for themselves and their children.

9690. Do carelessness and intemperance account for more than poverty ?—Carelessness and intemperance do, in my opinion, account for more than poverty, but I may be wrong. Then too especially in the manufacturing towns—I specially refer to Belfast in this connection—the custom of bottle-feeding infants and the use of patent foods, which began with the richer classes, has now spread to the working people. The working mother has no time to suckle her infant, which is generally fed from the old long-tubed feeding bottle, which, being difficult to clean, becomes foul and causes disorders of digestion. As the child grows older it is fed in many cases with insufficient and improper food. Under these circumstances it is not to be wondered at that rickets and delayed dentition become common and that the teeth are of poor quality. Poor teeth decay early, and their loss must have an adverse effect on the growth and development of a young person by causing digestive disturbances and interfering with nutrition.

9691. Should you say that the condition of the urban population of Belfast and Dublin was worse than the large manufacturing centres in England ?—I have not had any experience of large English manufacturing towns, and I carefully left them out. From what I have seen of recruits, however, I should think the conditions are very much about the same.

9693. Would you continue what you were saying about the evil effects of town life ?—Town life, too, has an adverse effect on some of the faculties, the crowded and noisy streets, workshops, and factories giving little range for vision and dulling the hearing. The decrease of the powers of vision and observation have become so noticeable that an Army Order has been recently issued directing attention to the matter and instituting a system of training of the sight designed to improve keenness of vision and powers of observation. The fishermen and small farmers, on whom most of my observations have been made while on my ethnographical surveys, for the most part have astonishingly keen sight and powers of observation due to their mode of life and training from childhood.

The difference in physique between the men of the farming class and the working people of the towns is very striking. The contrast may be noticed especially on the occasion of large political processions in which bands or lodges of farmers and of city artisans are to be seen side by side, when the greater stature and bulk of the farmer are at once noticeable.

9694. Are the Irish population tempted to migrate into the towns to a large extent ?—Not to a large extent, except from Antrim and Down into Belfast and from Donegal and Londonderry into Derry and, to some extent, from the southern towns into Dublin. The other towns, with the exception perhaps of Dundalk, are declining.

9695. What do you take to be the main factor governing the case ?—I take the main factor of the decline in the town populations to be deficient nutrition.

9696. And environment during childhood and youth, you say ?—Yes, and environment.

9697. But you think notwithstanding the superiority of the Irish rural population that there are signs of deterioration, as far as physical character is concerned ?—Well, there is a general opinion to that effect. I have not been able—as I have said in the opening paragraph of my *précis*, to find definite proofs of this. But I have fully satisfied myself that this is the general opinion everywhere.

9698. But still you have evidence the other way ?—*Dr. Browne.* That seems to bear it out.

9699. You have the evidence drawn from the constabulary ?—Well, the Constabulary and the Metropolitan police are mainly drawn from classes and parts of the country which are more or less on the decline in numbers. They are drawn, not from the labouring classes, but from the farming classes of Tipperary and Limerick and Mayo, and those large pastoral counties, but they come from the farming classes, not from the labouring classes. This difference is quite noticeable even to the man in the street.

9700. That class is not deteriorating ?—No, I do not think that it is. It is better fed, and they live a healthy open air life. Milk forms their staple diet in childhood.

9701. Does the Irish peasant get much milk ?—The Irish labourer gets, now that the creamery movement has been established, not so much as he used to, as it is sent to the English and Irish towns and the labourer does not get much. The skimmed milk is largely given to the calves. I happen to know in Queen's County and Tipperary that the farming classes get plenty of milk, as they do everywhere.

9702. They do ?—Yes, except in the extreme west where the small cotter farmer gets comparatively little.

9703. According to your observations has the stature of the Irish peasant materially diminished ?—We have no standard to go back to.

9704. But from observation what would you say ?—I do not think there is any proof that the stature has diminished. I see nothing to indicate that in the past twenty years.

9705. Have their physical characters suffered ?—I think so.

9706. You think that the Irish tenant is not so broad-chested, not so much bulk in proportion to height ?—There is more anæmia about.

9707. That you trace to insufficient diet, or would it be to uric acid as the last witness said ?—I do not know whether he would agree with me there. But there are two districts in County Mayo, where I happen to have stayed, and side by side they contain, one a pastoral population living mainly on vegetable food, and another engaged in fishing. The two districts are the Mullet, North Erris, containing the town of Belmullet, where the staple food of the people is—potatoes and fish ; in Ballycroy district, although the people live in a sea-coast region, they do no fishing at all, they are a separate colony, and they live on tea and Indian meal and potatoes. The potatoes do not in a bad year last beyond Christmas, and then the Indian meal supply has to be fallen back upon, and with the change from the potatoes to the Indian meal there is generally an epidemic of diarrhœa through the whole district.

9708. Their digestions are upset ?—Yes, but the Ballycroy women are noticeable for anæmia, at least a very large proportion of them, while that is not so in the case of the people of the Mullet of Erris.

9709. Who live largely on fish ?—Yes.

9710. (*Mr. Struthers.*) But the Ballycroy people take tea ?—They all take tea at meals to a very large extent.

9711. In excess ?—Yes.

9712. And that might outweigh any difference in other respects ?—Both people take tea.

9713. (*Chairman.*) You attach great importance to the value of an anthropometric survey ?—I do, as the only means of getting at how we actually stand.

9714. You would agree that existing data are wholly insufficient ?—It is wholly insufficient.

9715. Will you describe what you have to say with regard to the value of existing data ? I think it would be useful ?—Certainly. The only existing data are first, the recruiting statistics, second those of the British Association Anthropometric Committee, and our own statistics from the Dublin laboratory.

9716. Which have been intermittent and sporadic ?—Yes, and of certain selected districts which have not covered the country as a whole.

9717. What about the recruiting statistics ?—They are wholly and completely unreliable. They deal only

Dr. Browne. with a certain class, and that class is subject to variation according to the state of the labour market. Then again the recruiting standards vary tremendously, and there could be no comparison between men now and fifty years ago, owing to this variation of standard. You cannot get back to a certain date and say that the minimum standard was such and such on a certain date and it is so and so now, therefore there must be a decline, because the standard will depend a good deal upon demand and supply. If the establishment of the Army is small and the state of the recruiting is brisk they can afford to fix a higher standard, whereas in time of war when there is a big demand the standard must fall.

9718. As to the anthropometric investigations carried out in the country, you think that they are quite insufficient?—Quite insufficient. The British Association only had 270 Irishmen and on that they base their standard of five feet eight and a half inches—the Irish average standard. My own statistics covering only certain districts—the Western and the Northern Districts—not those from which the notoriously big men of the country come, amount to about, roughly speaking, a little over 400 men, and their average runs about five feet seven and a half inches. But I would not like to base on that although they are fair samples of the different districts. The average stature ranges in various districts from five feet eight and a half inches to five feet six inches. It is a racial question, and also one of nutrition. We have absolutely no standard—nothing to fall back upon from the past, and we do not really know where we are at the present time. My other observations have been made on students and the professional classes, and of course they do not come within the view of this inquiry.

9719. Would you just outline your scheme for a thorough and complete anthropometric survey of the nation?—My scheme is hardly worthy of the name of a scheme. It is a mere rough outline. I should think that as complete a survey as possible should be made, and then it should be repeated again after a term of years, so that then we could really have a chart and watch the increase or decline of the different physical characters.

9720. It might be continuous taking certain parts of the country from year to year?—Yes, my idea would be to take a county, then let the surveying party move to the next county, and so on, to work up completely for Ireland; for instance, have the country mapped into the present four divisions roughly—taking the four provinces, and then by the time that one province has been completely finished it will be pretty nearly time to go over it again and get a second series. The whole country might be covered in that way in the course of five or ten years. In Ireland there would be special difficulties that would not be found in England, but I do not think that they are at all insuperable.

9721. Is it the repugnance of the people to submit themselves to examination?—Yes, and I generally find that a little patience and a little tact would overcome the difficulties.

9722. You would connect the whole work with the central bureau, which should organise it and carry it out?—Yes, and taking into consideration the differences of local circumstances it would be better to carry it out separately in each of the three Kingdoms, but on an entirely similar basis and under a head office in London.

9723. You would make your observations, I suppose, on school children?—On school children and adults.

9724. When they have just reached the full period of adolescence?—About twenty to twenty-one years of age.

9725. Twenty to twenty-five, I suppose. Then with regard to school children, once or twice in the course of the school career would be sufficient, would it not, to make notes of them?—Annually, if possible.

9726. You do not think less often would be sufficient?—That is so.

9727. You admit that valuable results would be obtained?—Yes.

9728. But it should be annual, if possible?—Annually, if possible. That would be governed by other considerations.

9729. Have you formed any opinion as to what data should be collected?—Yes, I think that stature, weight, if possible, chest measurement—both after a full in-

spiration and expiration; and the cranial measurements might be taken too with advantage. Length, breadth and height of the auricular radius from a line connecting the two external auditory meati. And then sight and hearing—the sight is important.

9730. Do you attach much value to pigmentation?—That is more a racial question. From my own point of view I would attach value to it.

9732. Racial facts may be good for correcting erroneous impressions?—Yes, from that point of view. And another point, with children there might be a difficulty and with adults, an occasional inspection of the teeth would be of value.

9733. That is a different question. Do you think that the school teachers might be utilised to any extent?—I think they might, for observations upon the pupils.

9734. Could they be trusted to make the measurements and report them to the surveyors?—Well, some of the rougher measurements they might. But for the finer measurements not only would they require careful training but constant inspection to see that they keep right. If I were not in constant practice, I would rather distrust my own results.

9735. Of course you realise the more easily a scheme of this sort can be carried out the more chance there is of it being accepted?—Yes.

9736. One does not want to magnify the difficulties at the outset?—The best results would be got from an itinerant staff; and this staff could be easily got. They would not require a very high rate of pay. There are plenty of men available, men of a class such as pensioners of the Constabulary, or ex-sergeants major or staff sergeants of the R.A.M.C., who have had a certain amount of training in measuring recruits and on the physical characters of men and who are accustomed to keep accounts and registers accurately.

9737. In drawing up your scheme, did you form any estimate of the cost so far as it is applicable to Ireland?—No, in drawing it up the only way in which cost came into my mind was to see that it should not be too expensive a scheme.

9738. That was in your mind?—Yes.

9739. You were associated with Professor Cunningham in some of his investigations carried on in Ireland?—The laboratory in which I have worked for him for the past ten years or more was under Professor Cunningham and I worked with him in it.

9740. Have you seen the scheme of Professor Cunningham?—Yes, since I have sent this memorandum in I have.

9741. May I take it that you are in general concurrence with him?—Yes.

9742. Your scheme is very much the same as his?—We have often discussed the question of whether, if such a thing was adopted, looking upon it as a purely visionary thing, what it should be.

9743. You mean a counsel of perfection?—Yes, we have spoken of our ideals upon the subject.

9744. You are in agreement with Professor Cunningham both as to the value of carrying out some such investigation and in your belief that the general lines of the scheme he recommends are as good as can be adopted, tentatively at any rate?—I think so.

9745. (*Mr. Legge.*) A considerable feeling has been expressed that white bread is not so good as brown bread?—I know that there has.

9747. What do you think of eating this white bread?—As taken by the Irish peasants, this white bread, composed as it is, when it is home-made, of white bread flour mixed with Indian meal, when it is consumed it certainly seems to result in a good deal of flatulence and making the people very dyspeptic.

9748. But you are aware of the recent American experiment, which tends to show that a white bread made of the most refined white flour is really more nutritious than brown bread, that the elements of nutrition are more assimilated?—But in the first place they do not get fine white flour, and the method in which it is prepared is not an ideal one. The baker's cart is now going through the country very largely, even in places where nothing but

home made bread was used, and I am afraid that the baker's bread in the rural districts is not much better than the home made stuff that they consume—it is sour and sometimes sodden.

9749. You prefer the oatmeal if you can get it?—Yes. But in its place there is generally Indian meal.

9750. Have you been struck by the large number of athletic records held by Irishmen, enough I believe to indicate that they are the most athletic race alive?—Well, the athletic class in Ireland is mostly drawn from the class I have referred to which supplies the bulk of our men for the constabulary, practically the farming class.

9751. They seem to be a most prodigious race?—They are well fed, big, brawny, muscular men.

9752. Many Yankee athletes are imported Irishmen?—Yes.

9753. Now a man like the two Davins, Pat and Tom Davin, were they of the farming class?—I should say from the name they probably came from the midland counties. Names are so localised in Ireland that you can generally make a very fair guess.

9754. What do these fellows eat?—They have milk and eggs and potatoes in large quantities and a little meat. Fish or a little meat during the week and meat on Sundays.

9755. Do not you think if the Scotch were to abandon the oatmeal they might succeed against the Irishmen which they never have yet been able to do?—The racial question comes in there, because these men of the mixed breed in the midland counties are probably on the average bigger men. I do not know, but they probably are bigger and heavier. I am judging from men that I know.

9756. About this anthropometric survey, you would not seriously argue that a pensioner from the Irish constabulary or the Dublin police force would make a better and more accurate surveyor than a certified medical practitioner?—By no means.

9757. Nor indeed a trained and certificated teacher who had been through some sort of probation?—But the certificated teachers would have to be paid much more highly. My scheme would provide simply that those should be the men who would do the manual work, the actual measuring and recording, but that they should be under the supervision of inspectors who I think should be medical men and men of some experience on the subject. Of course the very best results I have no doubt would be got if all the observers were trained medical men or trained teachers of a high class, but I am afraid that is out of the question.

9758. You have never been a certifying surgeon under the Factory Act?—No.

9759. In every district in the whole country there is such a person as a certifying surgeon, you know?—I am aware of that.

9760. Whose business it is to see children and young persons to be employed in factories on reaching a certain age and take stock of them. It would be a very slight addition to the examination that they now conduct, to take such measurements as Dr. Cunningham submitted?—I am afraid you hardly realise the extra amount of work it would be.

9761. But we have put it to some of them and they are ready to undertake it?—I have tried the experiment myself. I have tried how many men it was possible to get through in an hour, and it is astonishing how few I could do.

9762. But the certifying surgeon is paid for his work, and he would have to be paid extra for this?—He would have to be, and the staff would probably have to be increased.

9763. Oh, no, when we had a certifying surgeon from a big district in Glasgow he said that he saw and passed a labour certificate for about 2,000 children in the year; that is a considerable number of observations for one man?—It is.

9764. And a very good proportion of the population of his district were the juvenile population of the district?—But then if he went to take the measurements of those himself he would find without a trained assistant that the number that he could get through would be very seriously diminished.

9765. Well, but how long would it take him?—I should say about eight or ten in an hour would be a very creditable rate of work—eight or ten in an hour judging from my own experience.

9766. Dr. Cunningham's is very different?—To take the same set of observations that we have had in Trinity College schedule, it took fully as long as that.

9767. I do not know whether the schedule that he submitted to us contained more than ours, but would pigmentation take a minute to a trained eye?—No, it does not take so long, but it has to be carefully done like everything else.

9768. However, if it was found it was not to be so serious as you anticipate, you would be quite ready to acquiesce in the utilisation of the existing means?—As far as possible, certainly.

9769. Your measurements of the head would be got by the use of calipers?—Yes.

9770. One medical gentleman would take the circumference without the calipers?—I would not agree to that. We tried the circumference in Dublin, and we abandoned it as being inaccurate.

9771. Why?—The amount of hair a person has makes a difference, and another thing is that the tape is so apt to slip and it is so extremely difficult when a considerable number of people are to be got through to get it accurately and on the right place—to get the exact maximum. It is rather a waste of time—it takes longer than with the use of the calipers to get it, and besides, gives no idea of the shape of the head. If such a caliper as Mr. Henry's self-recording instrument is used it can be done pretty rapidly and accurately, and there the difficulties of training are to some extent got over because the personal equation does not come so largely into the matter.

9773. You know, of course, that the existence of this Government Survey would not do away with the necessity of a more detailed investigation in particular localities?—Certainly.

9774. So that one would be quite content to have very few measurements indeed for the general survey?—Certainly.

9775. It would only bring out comparative results which might call for thorough investigations in certain localities?—So far as I understand that is all that Professor Cunningham proposes.

9776. You do not think, to get reasonably adequate results from the general survey, that the list of details could be reduced?—I do not think that it is excessive.

9777. You can clearly see that if one could reduce it to height, weight and chest measurement it would be very much simplified?—It would be very much simplified.

9778. And that was practically considered enough by the old survey of the British Association?—So far as it goes even that would be of value.

9779. (*Mr. Struthers.*) On that point of the factory surgeons, do you say that there are factory surgeons in every district of Ireland?—There are.

9780. Even where there are no factories?—Well, there are factories such as breweries and distilleries more or less in all parts of the country except in the rural districts.

9781. Such places as Donegal, for instance?—Yes, and Mayo and Galway. Even there, Galway, in places, you would have distilleries to deal with.

9782. But still the population to be examined might be at considerable distances from the place where the surgeon lives?—Considerable; the rural population bulks in Ireland, and it is not the town population that makes up the larger total.

9783. Is the factory surgeon a man in practice otherwise?—Yes.

9784. And who generally lives in the immediate neighbourhood of the place where he certifies the people?—Yes.

9785. So that he would not have time to go round?—No. He would need to have a special staff in addition.

9786. There would be a special difficulty in carrying that out in Ireland?—Yes.

9787. On the matter of emigration, is emigration to America and other countries increasing or diminishing

Dr. Browne.

Dr. Browne. at present ?—It has of late years rather diminished. It is not as heavy as it was in the eighties.

9788. But still it is very large ?—It is very large.

9789. Is it general from the whole of Ireland or more marked in particular districts ?—Is it general from the whole of Ireland or more marked in particular districts ?—It is more marked in particular districts. I know of districts even in the most congested parts of Ireland where the flow of emigration is very small. The group of islands at Great Man's Bay where the soil is almost all rock and bog, and where the position is that the people have very little to live upon, and yet the amount of emigration is very slight.

9790. But of course that is a population living on the verge of starvation, so to speak ?—They are on the verge of starvation.

9791. And those are the people who will not emigrate who have brought up the estimate of insanity and so on ?—There is very little insanity in this particular district. They do not pull up the insanity returns, but there is a considerable amount of consumption.

9792. As to the districts where insanity is most prevalent is it more marked in one part of the country than another ?—There are some districts in which there is a considerable quantity. In Wexford it is said to be very prevalent in parts.

9793. That is a rural district ?—Yes.

9794. Is that insanity more prevalent than in the towns do you think ?—I cannot recollect at the present moment whether it is or not. I am under the impression that it is, but I cannot speak positively.

9795. You think that it is more in the rural districts ?—In the rural districts. I may be wrong, but that is my impression.

9796. Because it will be a very important factor as to the effects of emigration upon this insanity ?—It would.

9797. I understand that it is from the country districts and not from the towns that the emigration comes ?—From the towns to some extent. The towns with the exception of four or five are all decreasing.

9798. But those four or five are increasing ?—Yes.

9799. And increasing at the expense of the smaller towns ?—At the expense generally of the rural districts around them. The decrease of the rural populations of Antrim and Down has been considerable, and yet the populations of the counties on the whole have increased owing to an increase in Belfast, part of which is in Antrim and part in Down.

9800. Has the population of Ulster diminished within the last decade ?—Yes, it has declined.

9801. To what extent ?—I forget. All the provinces have declined.

9802. From what districts is the emigration most marked ?—From the rural districts, the pastoral districts, I think.

9803. From Meath and Tipperary ?—Yes, and there are considerable pastoral districts through Connaught.

9804. Not from such districts as Cork ?—There is an emigration there too, but mostly from the farming class. The fishing populations do not emigrate much.

9805. As to the farming class, do they emigrate singly or *en bloc* by family or individuals ?—Generally by individuals now. It is the young unmarried men and the young girls that have gone. One member of a family goes out, and remits home money to a brother and sister to bring them out.

9806. But that means that the whole family will more or less go out ?—Eventually.

9807. And not that the weak still stay at home—there is no conscious selection of the strong ?—No. But it is only the enterprising ones who will go.

9808. But if he is in the habit of sending money, will they not go ?—Even then a good many will not go. I have known of cases where men tried to induce their brothers to go, but they would not go, saying, the hours of work are too long.

9809. But the men who stay at home are physically markedly inferior ?—Not to the naked eye, but certainly in enterprise inferior.

9810. You judge the enterprise by the fact that the other leads ?—Yes, and if that brother returns the difference shown in his business capabilities is very striking, and some of them do return and they are markedly superior to the people round them at home.

9811. But the entire change of living has that educative effect, has it not ?—Decidedly.

9812. About the dietary, you speak of a large consumption of Indian meal ?—Yes.

9813. Does that mean in place of oatmeal ?—It has almost completely ousted oatmeal in Ulster.

9814. What is the reason of that ?—It is cheaper, considerably, and they have taken a fancy to it.

9815. (*Chairman.*) It is sweeter, too, is it not ?—Yes. I was down in a Scotch-settled district in Ulster in a place where oatmeal was once one of the staples of the dietary, and I found, to my surprise, that they were not taking oatmeal but Indian meal.

9816. (*Mr. Struthers.*) Do they grow oats ?—They do.

9817. What do they do with it ?—I am afraid that the oats went largely into the still in that district.

9818. To malt it for making *potheen* instead of barley ?—No, they mix it in the proportion of one-fourth with the barley. It is what they call "backing." Generally where they make *potheen* from malt it is from the barley, backed with oats—generally in the proportion of half and half, and sometimes three parts of barley to one part of oats. Then the oats is sometimes sent to the market, and sold for horse-feeding ; the bulk goes there.

9819. They can sell their oats for more than the equivalent in Indian meal ?—Yes, and that is the reason they sell them. The reason for distilling is because they can make more money out of it than by selling. They find it cheaper to buy Indian meal than to have their oats ground into meal.

9820. In what form do they take the Indian meal ?—In porridge—stirabout.

9821. Do they make cakes at all ?—They make soda bread, with bi-carbonate of soda, a small proportion of white flour and a considerable proportion of Indian meal, and they also use boxty.

9822. What is that ?—It is a bread made from grated potatoes. The raw potato is grated on a nut-grater, the shavings are squeezed to extract the moisture, then Indian meal or white flour is added, and it is made into a kind of damper, and has about the consistency and digestibility of putty.

9823. Is it largely eaten ?—Yes, in Mayo, Donegal, and Galway, and in other counties.

9824. (*Dr. Tatham.*) You were speaking just now of some investigations in conjunction with Professor Cunningham ?—Yes.

9825. Was that at Trinity College ?—Yes.

9826. Are you a graduate of Trinity College ?—Yes.

9827. With regard to the staff that you would propose to employ in the anthropometrical investigations that you spoke of in Ireland, you referred to the class from which the constabulary is drawn. Am I correct in saying that many of those men are highly educated men ?—They are above the average in education. The constabulary men obtain promotion by competitive examination.

9828. As compared with the ordinary policemen elsewhere they are very much superior ?—Yes.

9829. They are university men ?—Very few indeed—there may be a few, but very few. They are the same class of men that might have one brother as a policeman and probably a brother a school teacher.

9830. It used to be otherwise. With regard to the deterioration, you attach great importance to the increase of lunacy. I cannot help saying that I was very glad to hear you say how very unreliable the data are upon which the increase is based. In times gone by, at any rate, you know it was difficult to define very accurately what lunacy was. I suppose opinions differ from year to year, or decade to decade, as to what really constitutes lunacy ?—To some extent.

9831. Even medical opinion changes ?—Yes.

9832. What is the legal definition of lunacy in Ireland ? You have given me rather a poser there. I think that

legal responsibility is based upon a knowledge of the nature of the act.

9833. Under the head of lunacy is there included practically senile imbecility as well as brain disease?—I believe senile decay is included.

9834. In addition to the various forms of brain disease which you and I would recognise as lunacy, there is a good deal of senile imbecility, is there not?—I believe so.

9835. And I may take it that this may vary at one time as compared with another, and so probably invalidate the data for comparison, is that your opinion?—Well, that may vary with an increase of the ages in the population.

9836. You speak of the constant drain of the best blood of Ireland by emigration. Does not that have the effect of very considerably altering the age constitution of the population?—Yes, decidedly.

9837. And that in its turn would alter the statistics of diseases, lunacy amongst others?—Yes, lunacy amongst others.

9838. But certainly lunacy?—To some extent, but I do not think that it accounts for the whole.

9839. Your opinion, based on experience, is that lunacy is really actually on the increase?—Yes.

9840. It is not a question of classification?—Classification accounts for some of it. Undoubtedly in Ireland in older times, in my father's time for instance, the village idiot, or village lunatic, was quite a common character. The wandering lunatic was quite a common character, but he is now registered and locked up.

9841. And generally placed in an institution?—Yes. He is placed under restraint in the workhouse very largely, and in the lunatic asylums.

9842. You think some of the physical deterioration is due to alcoholism in some form?—I do not think that alcoholism has increased.

9843. You think not?—I do not think there is as much the illicit still has practically gone from many parts of the country. There is as much alcohol, but the rural populations do not drink much. In the small country towns there is a great deal of drink, in fact it is a prevailing curse.

9844. I suppose the people that you speak of in the country districts, whom you describe as being very poor indeed, have not the means to spend on drink?—They have not the money. They will spend money on a fair day. Certainly when they have some money in their pockets they will get tremendously drunk on the occasion but perhaps not taste alcoholic drinks for weeks afterwards.

9845. If they cannot pay for the ordinary excise whisky they would not object to take it if it has not contributed to the revenue?—I think that the illicit distillation is on the decrease, but it comes very nearly as expensive as the other.

9846. Really?—They sell it for about 12s. a gallon.

9847. Why is that?—On account of the risk.

9848. Is it the coastguard?—Yes, and the constabulary.

9849. So that really the risk is not worth running?—In a great many districts there is a great deal of it and a great deal more than the people who merely visit the district would suspect, but I do not think, taking the country population all round, that they consume very much of it per head.

9850. I suppose that the stuff sold as distilled liquor is very impure?—It seems very maddening. On the occasion of fairs and big markets it has the name of being bad. I have not drunk it myself.

9851. But one's experience of its effects upon people who do take it would lead one to think so?—I think that it must be very bad.

9852. Probably quite new?—Yes.

9853. Recently distilled?—Yes, probably; I do not know from what sources it is got.

9854. Is illegitimacy on the increase in Ireland?—I do not know how the statistics go. Illegitimacy is not common in Ireland, not outside the towns, in the rural districts it is not common at all.

9855. In the towns it is?—Yes, I think the condition is

pretty much the same as in England, especially I should say that Dublin is not any better than most other large towns as regards morals. *Dr. Browne.*

9856. As regards tuberculosis, you say that pulmonary tuberculosis is increasing in Ireland. Is that a general statement or does it refer to towns?—I took it from the Registrar-General's returns.

9857. Is the increase taking place?—I think it is in the country districts as well as in the towns. I have forgotten the exact figures, but I am speaking on the general impression.

9858. And the other forms of tuberculosis, are they increasing too, do you think?—Speaking again simply from hearsay, and impression, I should say that in the rural districts (from what the older dispensary doctors tell you) it is.

9859. You spoke about cancer: is cancer increasing in Ireland?—As to that I am not certain. I have not looked into the question of malignant disease.

9860. Speaking of the substitution of Indian meal for potatoes as a diet, you spoke of one district in which you found that to take place at a certain period of the year, I think you said at Christmas?—In a great many districts when the potato crop fails, that is to say when they have a bad crop of potatoes. Of course with a good crop it would last a good deal past Christmas.

9861. But when they substitute Indian meal for potato food that causes irritation of the bowels?—Yes, and diarrhoea.

9862. And is it a tractable kind of diarrhoea, or is it an epidemic?—They will tell you that it lasts about a fortnight. If they have a sort of general outbreak of diarrhoea it takes a fortnight before it ceases.

9863. It is simply irritation; it is not fatal?—It does not kill—it is not fatal; it is simply the result of change of diet.

9864. And it subsides of itself?—Yes.

9865. With regard to milk, does that really form any portion of the young children's diet?—In the Midland counties it does, and also in pastoral districts in the West, too.

9866. But in many of the poorer districts with which you are familiar, milk forms a very small proportion of the diet?—In some of the very poorer districts.

9867. They practically do not get it, I suppose?—The labouring classes do not.

9868. Do they suffer in consequence?—I think that they are decidedly less hardy than the farming classes, who get plenty of it.

9869. Is tinned milk used to any extent?—No.

9870. They could not afford it?—They could not. Milk forms a very large part of the dietary even of grown men in the rural districts. In parts of Kerry, Limerick, Cork, and very many of the southern counties if you go into a small cottar-farmer's house at dinner-time you will find a skib of potatoes, or it may be a dish. (The skib is made of wicker work), and there is a tremendous supply of potatoes and some salt and butter. A man will take about a quart of milk and half a stone of potatoes for his dinner.

9871. What price is the milk retailed at in Ireland?—Its retail price is small, and in the cities it is from 3d. to 4d. per quart to 2d. per quart.

9872. In this country, fortunately, we know very little of typhus. Unfortunately, you know more of it in Ireland?—A great deal too much in certain districts of Ireland. It is confined a good deal to certain districts.

9873. You know the district of Donegal?—Yes.

9874. I hope there have been no more sacrifices of medical men since the death of the Hero of Donegal?—Since Dr. Smith's case there was a case of death of a doctor from typhus in Galway, County Connemara. He got it from attending cases of poor, wretched people; and a great many of the houses have no chimneys or windows in that district.

9875. So that the disease tends to spread?—Yes, they are rather overcrowded.

Dr. Browne. 9876. And typhus still retains its virulence ?—Indeed it does.

9877. You think that the recruiting statistics, such as you know them in Ireland, are of small comparative value ?—Whether in Ireland or in England they are of small value.

9878. Is it because you have no standard with which to compare them ?—Exactly, the standard has varied.

9879. Have you attempted to compare the recruiting statistics of Ireland with those of England of the same date ?—I have just glanced over them.

9880. And you think, for many reasons, they are scarcely comparable because of the difference of standard ? They are comparable at the present time, because the recruiting standard is the same.

9881. I was not aware of it ?—The standard will vary with the time, but the minimum standard is the same for the three Kingdoms at any given time.

9882. You spoke of certain special difficulties in Ireland in securing anthropometrical statistics ; what were the special difficulties ?—The special difficulties were mainly two. One was a dread of conscription, put it that way ; and another was a certain amount of superstitious feeling on the subject. However, that is generally easily put right by putting a counter-superstition against it. There is a belief in the efficacy of measuring the head for various forms of headache, and this is practised by the wise women and quacks throughout the country, and I took advantage of that, and, generally, found it successful even when it was passed off as a joke—a laugh generally brought about consent.

9883. (*Chairman.*) In regard to that point of *Dr. Tatham* about the reluctance of the people to submit to the observations necessary for carrying on this anthropometric survey, I suppose you hold that the fact of its being introduced into the schools and being made familiar to the people in that way would tend to diminish the dread that parents might experience ?—Yes, decidedly I think it would.

9884. Would you advocate the use of leaflets on the subject ?—I would.

9885. And information in that form ?—Yes. Because I have found, in making my own small surveys, that the best and surest way to do any work at all in the district is simply to talk to the priests, schoolmasters, and police, and various people, about what the object was on the first day.

9886. To explain it as fully as you can ?—Yes, and the people took it up intelligently very often, and when they began to see their neighbours getting measured they were ambitious to see how they compared with the people of the next district.

9887. In a spirit of competition they took it up ?—Yes, the whole difficulty is beginning. If you once break the ice in the district you can get on all right.

9888. You are satisfied that that would be the surest way of getting any reliable conclusions as to the physique of the country, as to whether ameliorative or deteriorative tendencies were obtaining the upper hand ?—That is the only practical way of getting information.

9889. With regard to insanity in Ireland, is it in any way due to the existence or prevalence of syphilis ?—No.

9890. Ireland is more chaste than any part of the British Islands, you think ?—Well, except Dublin. In the rural districts syphilis is unknown.

9891. That would be one of the causes of insanity ?—In Dublin, syphilis is very prevalent ; it is a place where that disease is rife, but in the rural districts you meet very little of it.

9892. It has been suggested that the continence of the Irish race is one of the causes of insanity, is that so ?—I do not know. I would not like to express an opinion upon the subject.

9893. Do you think that bad housing has much to say in the rural districts to the bad condition of the people ?—To the increase of phthisis, I think that it has something to say, but even there the housing has improved.

9894. My own knowledge of Ireland is not extensive, but I certainly got the impression last summer that it was better than it was some years ago ?—It has improved very markedly in the last twenty years.

9895. You do not think that the present condition of Ireland in the rural districts with regard to housing has much to say to physical debility ?—I do not think so, except that the overcrowding and bad ventilation and some of the bad cottages must tend to the dissemination of phthisis.

9896. Is that in the rural districts ?—Yes. They live a healthy open-air life, but the houses are bad.

9897. Are the houses air-tight ?—I do not know whether I might digress to speak about the construction of many of those houses. There is the kitchen, which you enter by two doors, one from the front and one from the rear. There is often a bed in the recess in the kitchen. Off this is the “room,” sometimes there may be two, but in each bedroom there will be one or two beds. The windows will be small, not made to open in very many cases, and in some instances only about 18 inches by 12 inches in size. I am speaking of the older type of old-fashioned houses.

9898. Is there a chimney shaft ?—Sometimes from the “room,” and always from the kitchen ; except in some of the congested areas, where there is often no chimney, but simply a round hole in the roof.

9899. And that is still to be found ?—Very largely, in Mayo, Galway and parts of Clare.

9900. And some fresh air comes in from that hole ?—Yes. A hot peat fire helps the ventilation. But in these districts, the opposite end of the kitchen from the fireplace is used as the stable and cowhouse, and the fowl roost overhead upon the beams of the roof, so the air at night is not very pure.

9901. (*Dr. Tatham.*) Have they got any pigs there ?—The pig occupies a pen at the side of the fire-place.

9902. It is not in the house ?—Yes, it is in the house in some of the congested districts. The pig-stye outside is a characteristic of the richer and the better farming districts.

9903. (*Mr. Struthers.*) Even when the house is not better, is it any cleaner than it used to be ?—Yes, the houses are kept very much cleaner, and the newer class of house is better ventilated and better lighted. There is a great improvement.

9904. (*Dr. Tatham.*) What do you call those cottages ?—Cabins.

Dr. ROBERT HUTCHISON, M.D., F.R.C.P., called ; and Examined.

9905. (*Chairman.*) You are Assistant Physician to the London Hospital and to the Hospital for Sick Children, Great Ormond Street ?—Yes.

9906. And you have, I suppose, given special attention to the subject of infant nutrition ?—Yes.

9907. You hold that it occupies a very important place in the production of physical deterioration ?—Undoubtedly.

9908. Taking dietetic errors, will you please enumerate what you hold to be the principal ones ?—Artificial feeding of course is the chief cause during infancy that leads to physical deterioration, and the prevailing ignorance amongst mothers of how to use the methods of artificial feeding.

9909. First of all, there is the fact that they do not suckle their children ?—That, of course, is a great pity; but that is not a question of "will not," but a question of "cannot." It would be unfair to say that the average mother at present refuses to suckle her own child; she is unable to do so in quite a large number of cases.

9910. You say a competent authority describes that condition of things as prevalent throughout Europe ?—Quite so, it is certainly not confined to this country alone.

9911. We have been told that mothers do suckle their children habitually in a great many parts of the country. A lady was here from Sheffield sometime ago, and she said it was quite exceptional to find a mother who did not suckle her child, at any rate, for some time ?—What one would like to know is how long it is carried on.

9912. I think she said three or four months ?—It hardly counts, I think, unless a mother can suckle her child for the first six months.

9913. It is better than nothing, I suppose ?—Yes.

9914. What other contributory factors do you consider are to be found ?—As producing physical deterioration ?

9915. Yes.—I have only considered the dietetic question.

9916. This is Dr. Bunge's enumeration which you give here ?—Yes.

9917. I observe that the caries of teeth is a sign of physical deterioration; are you prepared to confirm that from your own observation ?—I really would not like to give an opinion about that.

9918. Do you agree with him that it is found among women who are not able to nurse their children ?—I have not given any attention to it.

9919. Does the inferiority of the substitutes for milk strike you as being a second prominent cause ?—Yes.

9920. What do you say upon that point ?—The large use of patent foods I think is a point much to be regretted in the artificial feeding of infants. Patent foods present certain marked inferiorities to human milk as a means of nourishing children; most of them are deficient in fat.

9921. That is their most characteristic deficiency ?—Yes; and a considerable number of them also contain unaltered starch, which infants are unable to digest at all well.

9922. That produces diarrhoea ?—Yes, and irritation of the bowels generally, and that naturally leads to impairment of growth and consequently defective physique.

9923. You consider cow's milk is the most satisfactory substitute for human milk ?—Undoubtedly.

9924. Have you considered the subject of its distribution amongst the poor ?—Yes; I have considered that.

9925. Can you tell us whether the hospitals have attempted any distribution of it ?—No, they have not.

9926. Do you not think they would be the proper centres from which it might be attempted ?—That question has been mooted, and of course there is the question of expense to be considered.

9927. Could it not be made self-supporting if the hospital were a centre of a large enough scheme

of distribution ?—The hospital I know best is the large Children's Hospital in Great Ormond Street, and there, I think, it would be extremely difficult. The children who come there come from all parts of London. Indeed, many of them come from the surrounding country.

9928. It is not a local hospital in any sense of the word ?—Not in the least.

9929. We understand some hospitals in Paris have become the centres of milk distribution which are of great value ?—Yes. I think the difficulties in London would be very great.

9930. Would you prefer to see efforts made by the municipalities ?—I think something might be done in that respect. I do not see why something should not be done to improve the ordinary commercial milk supply.

9931. Who is to stimulate that improvement ?—I suppose the medical officers of health. By a more systematic inspection of dairies, and so on, something might be done to improve the supply.

9932. If the people do not come to these shops because milk is too expensive or there is not a sufficient quantity of them, or they are not accessible, the mere purification of the supply would not solve the problem ?—I do not find as a matter of fact that many mothers do not feed their children on cow's milk because of the question of expense, because it requires far more money to feed them on patent foods.

9933. Is that so ?—Yes. Patent foods are very much more costly than cow's milk.

9934. You do not think the question of cost has anything to do with the difficulty of getting the poor to use cow's milk for their children ?—No, it is certainly not mainly the question of cost because patent foods are more expensive.

9935. What do you think are the causes which deter them ?—Pure ignorance.

9936. It is only that ?—Yes, they do not know how the child ought to be fed, and they start by giving it cow's milk in an unsuitable form, usually too strong, and that produces colic, and they rush off to a patent food. I have no difficulty in Great Ormond Street in rearing the babies that I see on some modification of cow's milk.

9937. At any rate the hospitals might do a great deal in bringing information to the parents ?—Yes, and so they do; but I think it would be very much better if it were done systematically by distributing leaflets when the birth was registered.

9938. You think the municipality might do that ?—Yes.

9939. Or the Registrar of Births might do that ?—I think that has been done in France. I would not like to speak positively on that point, but I think that is so. When the child's birth is registered these instructions are given.

9940. You look to the systematic instruction of parents in the methods of feeding and rearing as being of the first importance ?—Certainly.

9941. As touching the root of the problem ?—Yes. I believe that a great deal could be done by that. These mothers are very anxious to do their best. It is not a question of money so far as my experience goes in the majority of cases, but many of them are quite young women who have had no children before, and they do not know. If they are unable to feed the children by the breast, they do not know what to do.

9942. But does the withdrawal of the mother from the care of the child, in order to pursue what may be her calling, cause harm to the child ?—That depends in whose care the child is left.

9943. Usually the child is left in the hands of somebody who is utterly incapable of doing her duty to the child ?—That happens in a great many cases.

9944. The usual type of woman is one who desires to make as much as she can out of it ?—Yes. A good many are sent to crèches.

Dr.
Hutchison.

Dr. Hu'chison. 9945. Are crèches of the type which is required pretty numerous?—I do not think they are nearly numerous enough.

9946. Are they organised in connection with hospitals?—No, they are usually in connection with charitable organisations.

9947. There are no municipal crèches so far as you know?—No.

9948. You hold that that would be a very useful thing to see established to a much greater extent?—I am not at all certain about that. It would be an additional encouragement to mothers to go out to work and leave their children.

9949. Do you think they could be made self-supporting?—I should doubt it very much.

9950. We are told that mothers as a rule pay 2s. 6d. a week to those women who look after the children. Do you think a crèche could be run and made to pay upon 2s. 6d. per child per week?—No, because I think the congregation of a large number of babies in a crèche is a dangerous thing.

9951. Therefore you would not agree to any large number in one building?—No, it spreads infectious diseases; and diarrhoeal diseases are much more apt to occur in hot weather—where you have a number of babies congregated together.

9952. There is no alternative in your opinion to the present happy-go-lucky system of leaving the child in the hands of some incompetent woman?—I do not see any really more satisfactory substitute which would work out better on the whole.

9953. Notwithstanding the evils?—Notwithstanding the admitted evils of that happy-go-lucky system.

9954. I suppose in London there is not so much employment of married women as there is in some factory districts?—I do not see a great deal of it. One sees a considerable number of children brought up by people other than their own mother to the hospital, but not a great many in proportion to all the cases one sees.

9955. Turning to the causes later in life, a sufficient diet is required for two reasons is it not?—Yes. One wants it first of all to provide energy to enable a man to do work, and secondly to provide for the upkeep of the tissue of his body.

9956. The proportions which are required for those have been pretty accurately ascertained?—Yes. I think they are fairly well ascertained by physiologists.

9957. Will you give them?—For energy it has been found that a man of average weight requires 3,500 units of energy, and for the upkeep of his body 125 grammes of the chemical substance called proteid, that is to say, nitrogenous material met with in certain foods. These standards have been generally recognised and are accepted as the test of whether the diet is sufficient or not.

9958. With results that show that the present diet is defective?—There are not a great many observations in this country. Probably there are many more in America particularly and many more also on the Continent, but those that have been made in this country tend to show that amongst the labouring classes diet is rather deficient in energy, and is even more deficient in the amount of the nitrogenous material it contains.

9959. Would you call these deficiencies, which you note here, serious?—Yes, I would as applied to certain periods of life. I think as applied to the period of growth, for instance, the deficiency of proteids is a very serious matter. Those deficiencies I should say are much more important as affecting the period of life when growth is still going on.

9960. Have you any knowledge as to whether these deficiencies are greater in this country, supposing this is typical of the whole, than is to be found to be the case in America?—The American results are certainly better.

9961. And the Continental results also, I suppose?—About that I am not quite certain, speaking from memory. I think the Continental results are not so good as the American; the American are best.

9962. Is that due to greater knowledge and greater judgment in the selection of food or in its preparation?—

I should not say it was due to either of those, but it is probably due to spending more money on the food.

9963. But surely it is not altogether a question of bulk, but of selection?—If one has a limited income; but one can improve the diet by more abundant expenditure.

9964. But if one spends more in ill-judged material, that will not be satisfactory?—The bad thing about ill-judged material is when there is only a limited sum to spend upon it. It is then that it is important to get the proper materials.

9965. The classes we are dealing with have but a limited amount to spend?—Yes, and that is why it is so important that they should know how to spend it. In America I think they actually spend more on food.

9966. With regard to the poorer classes in this country, would you say that these defects were in selection or preparation?—They are defects in selection. The preparation of course, unless it is wasteful, is not so important.

9967. But it is very wasteful, is it not?—I would not like to give an opinion whether it is or not. I think one might reasonably suppose we are less economical in the preparation of food than the French are.

9968. I suppose to a very large extent they do not prepare their food themselves; they get it prepared from cooks' shops?—I should not think that was very general.

9969. You think the mass of the poor in the urban districts do prepare their own food?—Yes. I should think there are many people who are more in and out of the houses of the poor than I am who can speak to that.

9970. What have you to say as to the consequence of these defects?—The consequence of the deficient supply of energy is to reduce physical efficiency. If a man is only taking in a limited quantity of energy in the form of food, he can only put out a limited quantity in the form of work.

9971. It renders the system vulnerable to disease also?—Yes, I think that is especially so from the deficiency of nitrogenous material.

9972. Is there any special class of disease to which such persons are subject?—One may mention tuberculosis as one of the most important.

9973. More or less the same applies to all zymotic diseases?—Yes. Again, I should like to emphasise the fact that it is during the period of growth that this deficiency tells most. The critical age is from ten to fifteen.

9974. That is the most critical period?—Yes. If a child has not sufficient food then, it will be permanently stunted.

9975. As that period is more or less co-terminous with school life, it affords a very favourable opportunity for correcting these tendencies, because it is a period when he is most under supervision?—Exactly.

9976. And therefore you would attach very great importance to steps being taken which would secure that every child who was under instruction should be more or less adequately nourished?—Undoubtedly. Of course, looking at it purely scientifically it would be an extremely important thing to insure to every child at school a sufficient and proper sort of meal. It is an economic question. Purely scientifically I have no doubt that it would do a great deal to improve the physique.

9977. It would check the waste of human material?—Yes.

9978. At the most crucial period of its development?—Yes, because an arrest at that time is never made good. That is the difficulty.

9979. What remedies would you suggest with regard to the defects in infant feeding?—The first question is that of milk supply. I think that has been dealt with by a Commission. I gave evidence before a Commission.

9980. Was that with regard to preservatives?—I think so. They took a great deal of evidence upon that point. I gave evidence on the effects of preservatives in milk; the other method is the systematic instruction of mothers in the methods of artificial feeding.

9981. You do that by the distribution of leaflets. Do you think the County Council might organise a system of lectures or instruction for girls between the age of leaving

school and the period when they naturally would become mothers?—No; I do not think it comes home to them until they have a baby of their own. I think the instruction is better postponed till then, and I think the best way is by the distribution of leaflets. That has been done by some County Councils—in Hertfordshire for one. I saw the leaflets they drew up for distribution when births were registered. I think the Hampstead Health Society is doing something in the same direction. I am quite certain that is the best way of doing it.

9982. You do not think that a crèche in which young girls could be got to attend to see what is being done, and so learn the value of it, would be of use?—It could not be made operative on a large scale. You would never get enough to do any real good.

9983. You believe in the leaflet?—Yes. I venture to suggest there that more attention should be given to the kind of feeding bottle which is used.

9984. What is the bottle which you describe here?—It is the feeding bottle with a long india-rubber tube. Its use has been made illegal in some of the States of America.

9985. A bottle with a long nipple?—A long india-rubber tube with a nipple at the end of it. I think its use is illegal in France; it is certainly in some of the States.

9986. What are the bad effects which follow from it?—Specially diarrhœa. It goes to produce a great deal of chronic diarrhœa.

9987. Because it is so apt to get contaminated?—Yes; it is impossible to keep it clean. Every day at the Great Ormond Street Hospital one has to stop the use of those tube bottles.

9988. Would there be an outcry if that were made illegal?—There would be no public outcry. I suppose the makers might object.

9989. Why are they so much in use? Are they inexpensive? What is the advantage of them?—I believe it is mainly because they can lay the bottle beside the child, connect the child with the tube and go away and leave it; whereas with the ordinary bottle they would have to stay by the child while it was being fed.

9990. Is laziness?—Yes. I had to stop its use at the hospital; in every case it produced illness in the child.

9991. In regard to your suggestions dealing with dietary in later life, you attach the greatest importance to an intelligent expenditure on food. You know tea and bread are the principal items?—If I were asked to state the chief fault in the diet of the working classes of this country, I should say it is the excessive use of tea and bread.

9992. Particularly of tea, I suppose—that is distinctly deleterious, but I suppose a bread diet is not?—I should not like to say tea is deleterious.

9993. Is not tea drunk in the form in which the working classes drink it very strong, because it has been standing a long time?—In the London Hospital, where I have good opportunities of judging, I do not see many cases of disease produced from tea-drinking. There is a certain amount of indigestion in women produced by it, but from our present point of view, the question of physical deterioration, I do not think that need be considered serious. It is really that the money spent upon it might be better spent on other things.

9994. I suppose it is rather expensive?—Well, it is not very expensive nowadays.

9995. You do not see so much money spent on tea in London as the Irish mother spends on it—she always gets the best tea she can find?—I would like to see less use of bread and jam and the substitution of porridge and milk, let us say.

9996. We had a witness this morning who told us that porridge and tea were full of uric acid?—I am prepared to swallow that for the sake of the other advantages. In Scotland gout, which is caused by uric acid, is almost unknown. I never saw a case of gout all the time I was in Edinburgh, and yet porridge and milk is a large part of the diet there.

9998. And then when you say again there is much room for the imparting of detailed information as to the choice of foods and the most economical methods of purchasing and cooking them, would you still have recourse

to the leaflet?—There, frankly, I am not prepared to suggest the actual means of getting at the working classes. I have thought a great deal about it, and I really do not know any very satisfactory way. The County Council might do a great deal by organising lectures.

9999. Lectures of a practical type?—Yes. I have lectured myself a good deal in various parts of London on the subject of diet to working class audiences, and I have always found them extremely interested.

10000. Mothers' meetings might be organised on that basis?—Yes, I quite agree; I think something might be done in that line.

10001. Unless the mothers have had some practical knowledge of the preparation of these foods, I suppose a mere theoretical appreciation of the advantages of a change would not do much good?—That is just the difficulty. It is difficult to change people's habits in these things.

10002. You do not attach much importance to the training in that direction during school age; you think the interval is too long before they can make practical use of it?—It seems to me that children at school age are not able to appreciate these things, but I may be wrong about that.

10003. Do you think the compulsory attendance of girls at continuation classes between the period of their leaving school and becoming mothers, say twice a week, should be devoted to domestic economy, in the widest sense of the word, would be of value?—Undoubtedly it would be of value.

10004. Now with regard to the most important question of all, that is the securing that the children at school should be properly fed; would you advocate a general system for the provision of school dinners, not, of course, resting upon an eleemosynary footing at all, but with a view to parents contributing a great part or the whole of the cost?—I think purely from the medical point of view, putting aside all economical and other questions, that, undoubtedly, would do a great deal to improve the physique and development of the children.

10005. You hold that the value of it, from a medical point of view, would be so great that certain sacrifices might very well be accepted?—I admit the advantages would be very great.

10006. Even if they could not be made absolutely self-supporting a certain charge upon the rates might very properly be incurred for the purpose, even at the risk of undermining, or being said to undermine, parental responsibility?—I would rather not enter into the economic aspect of the question. I can only say that I feel certain that the provision of meals would do a great deal to improve the health, and growth, and development of the children of the poorer classes.

10007. Do you think there is much intentional neglect?—No. I should say from my experience of the working classes that they are really very fond of their children, and the great majority of them do the best they can for them according to their lights. I think it is much more want of knowledge than want of thought.

10008. You think they would fall in with any scheme which might be started by the school authorities or charitable agencies, the advantages of which they understood, and that they would contribute towards it so far as they could?—I think that if they thought it was for the good of their children, and that it would not cost them any more, they would do so.

10009. We are told that parents constantly give 1d., 1½d. or even 2d. to the children in order to provide their mid-day meal, but the children are very apt to spend it partly upon sweets, marbles, and tops, and in some cases they never spend it on food at all?—Yes.

10010. So that if parents could be encouraged to place these pennies in the hands of the school authority, who in return would supply children with mid-day meals on that scale of expenditure, a good deal of good might be done, and the parents would not suffer even pecuniarily?—Yes.

10011. Then there is the initial difficulty of the child going to school in the morning badly fed; perhaps from some point of view the morning meal is the most im-

Dr.
Hutchison.

portant of all, is it not?—I do not know. A child has got to get down a certain amount of food in twenty-four hours; I do not think it very much matters how you divide it up. It depends how the day is arranged. If you are going to put a child through physical work it ought to have a meal first.

10012. You must remember that the school attendance in the morning is longer than it is in the afternoon; the principal mental pressure which the child undergoes in the course of his school life is applied to it in the morning?—Yes; but from the point of view of food, mental pressure is far less important than the physical pressure. If the child is romping about in the afternoon it is more important that it should have its meal in the middle of the day.

10013. You think that an inadequate meal in the morning is not of so much consequence, so long as it gets well fed in the middle of the day?—Yes.

10014. What would you describe as a sufficient meal for a child at school age—a good vegetable soup with a certain amount of meat stock in it, and bread?—It is very difficult to answer a question of that sort offhand. I should say that most of the children do require a certain amount of animal food if they are to grow and develop sufficiently. It is extremely difficult to do it in towns on the basis of pure vegetarianism.

10015. When you say animal food you do not mean milk exclusively?—I mean milk and meat also. It is difficult to do it without having recourse to meat. That is my own feeling. But a great deal can be done and has been done by penny dinners, by making suitable vegetable soups, such as those containing peas.

10016. (*Colonel Onslow.*) Is there any reason known to the medical profession why mothers feed their children from the breast less now than formerly?—No; we do not know.

10017. It is common to all classes of society from top to bottom?—Yes; and it is common to all highly civilised peoples. It seems to be one of the indirect consequences of civilisation. A very eminent authority, whom I quote in my *précis*, went most carefully into the statistics for the whole of Central Europe, and he did not succeed in arriving at any very satisfactory reasons for it.

10018. It is not fair to say that it is either due to laziness or even in the case of the lower orders because of the strong desire of the women to get to work?—No; all the motives work the other way. The chief object of a working class woman should be to feed her own child; first, it is more economical, and secondly, it prevents subsequent pregnancies, which is a thing they are often very anxious to do. So that really when they do not feed their own child you may be perfectly certain that it is very rarely because they will not, among the working classes. In the upper classes it may be because they will not trouble. I am certain in regard to the lower classes it is because they cannot. I always correlate that with the birth rate; they go together. The Jewish women in the East-end almost always feed their children at the breast, and they are people with a large number of children. They seem to have greater reproductive powers.

10019. (*Chairman.*) A lady witness we had before us, who is a sanitary inspector at Sheffield, stated that nearly 79 per cent. of children were being fed on the breast alone?—I should like to know how long they were fed on the breast. As I said before, unless the breast feeding can be prolonged for at least six months it is not very important.

10020. (*Colonel Onslow.*) Until that child is ready to be weaned?—A child ought not to be weaned until it is ten months old, but the first six months are the most dangerous. That is the time when the absence of breast feeding is likely to do most harm. I would not call a child breast fed unless it was so fed for six months.

10021. Having breast food and other food as well is very harmful, I take it?—It is never successful. If one tries to feed the child on the mixed method my invariable experience has been that before very long the mother's milk disappears. I have never been able to carry on mixed feeding successfully for more than a few weeks.

10022. You say the Jews have large families: is that at all consequent upon their origin? We have been told here that one explanation why Jewish children are much better developed than Gentile children of the same age is

that they are a tropical race?—I think that a more natural explanation is that they are more naturally fed by the breast in infancy. They are much more attentive to their children. They spend less on drink.

10023. You said that pamphlets giving instructions on feeding should be given by the registrar of births, but births are seldom registered much under six weeks, are they?—No. Still it is better to do it. I am not certain that in France they do not proceed to give instructions to do it when the marriage is registered. I have been told so.

10024. The first few weeks are a very dangerous age?—A great many children are fed at the breast for the first month, so that it is not really so dangerous as you may suppose.

10025. Speaking of tea, you appear not to have the same strong objection to it that many witnesses have, but tea which has been standing on the hob all day long must surely be very harmful?—I have given a great deal of attention to it, and my own feeling is that the harm done by tea is enormously exaggerated. It produces a certain amount of indigestion, particularly among women, but I do not think it does anything more.

10026. I was referring to tea as drunk by the very poor?—I quite understand.

10027. I understand your theory against that, because in Australia and other places it is the custom of all trades, miners and everybody, to drink nothing but tea?—Quite so.

10028. And apparently it has no effect on the constitution?—I think people get accustomed to those things. They get accustomed to tea badly prepared, and I do not think it does much harm. It is the tea and bread and butter meal which I object to particularly, not so much because of the tea element in it as because of the bread and butter, or rather the bread and jam. Bread and butter would be better. If one could get a more nitrogenous meal than that, such as has been suggested, porridge and milk, I am sure it would be a great advantage. It has been calculated by Dr. Noel Paton that one such meal a day would bring the diet of the labourers in Edinburgh up to the physiological standard—the mere substitution at one meal a day of porridge and milk for bread and jam.

10029. (*Mr. Struthers.*) You speak of the physical disability of women to nurse their children. Is that established by statistics, or is it your general impression?—I would not like to say there are definite statistics, but that is the general impression of all medical men. I may say that it is absolutely certain it is increasing.

10030. Women are worse in that respect than a generation or two generations ago?—Yes. Artificial feeding was unheard of before the seventeenth century.

10031. That meant that they fed them on cow's milk, did it not?—No.

10032. What do you mean by artificial feeding?—Any substitute whatever for human milk—cow's milk or anything else.

10033. You say that was unknown before the seventeenth century?—Yes. I think that is the first mention of it.

10034. We have no statistics as to children's deaths before that?—No.

10035. It may be that there were as many not fed by the breast, cases where the mothers tried to feed them and starved the children?—I do not think it is likely.

10036. You speak of Jewish women being an exception?—Yes. Breast feeding is much more prevalent amongst the Jews than amongst the corresponding Gentile population.

10037. Do you connect that with the higher birth rate amongst the Jewish population?—Yes. I think the two things go together. I think the capability of having a number of children and the capability of nursing them are two things which are in some way related.

10038. You think that capability is due not to race or not in any great degree to race; but simply to differences in the care of infants?—I should not like to say that. It may be partially racial and partly the indirect consequence of the Jewish code.

10039. I ask you because I rather gathered from your reply to Colonel Onslow that it was rather a question of the way they brought up their children. But you think the element of race comes in?—I should not like to say it did not, that is all I am prepared to say. One sees the same in the West of Ireland. The Irish women produce enormous families, and I am told nurse most of them. I do not know whether it is a question of race.

10040. But in the West of Ireland they do not feed their children well apparently?—Not after the breast stage, that is true, but during the first period I gather they do. I do not know the conditions of the West of Ireland at all intimately.

10041. You say that Dr. Noel Paton was of opinion that a meal of porridge and milk instead of bread would bring up the diet of the labouring classes to a proper level?—Yes. That was his opinion.

10042. You were asked the question whether the diet of the labouring classes was very insufficient. Do you think it is? As shown by Dr. Noel Paton's investigation in Edinburgh, does it fall seriously short of what is really required?—That is a question to which it is very difficult to give a general reply; it depends so much on the work a man is doing. When he is doing really hard work it would be insufficient, but for a man who is only doing light manual work he could get on with it without suffering from it.

10043. It would be quite insufficient if you include the period of growth?—I think it is during the period of growth that the deficiency is most serious.

10044. These statistics refer to people who are past the period of growth?—No, to the whole family.

10045. The critical period as regards the feeding of young people is in your opinion between the ages of ten and fifteen?—Yes, when growth is most active.

10046. It is more important even than the period of infancy?—It is difficult to estimate their relative importance. I have a general idea that as regards growth and physique ten to fifteen is the important time, but on the other hand, bad feeding during infancy may give a bias to the body which may persist through the whole of life.

10047. We have been told that children come to school with the mischief already done—I think that was the phrase used—that feeding afterwards cannot remedy the evil?—I should not agree to that. I think in the Navy, where boys are taken on board ship and properly fed and where they get exercise and fresh air, one sees the magnificent physique they develop.

10048. You find the same thing in industrial schools?—Yes. I do not think it is at all irreparable until after the age of fifteen or even later than that.

10049. (*Colonel Onslow.*) Do you think it is limited to fifteen? Would it not go on to eighteen?—I agree. I think one could put it at a little later, but I feel that the very critical period is from ten to fifteen.

10050. The reason I referred to it was that we find the recruits when they come to the gymnasium between the ages of seventeen and eighteen improve enormously, but when you get to older men of nineteen there is very little difference. That applies to weight, muscle, height, chest and everything?—Yes. That is just what one would expect, I think. At the age of fifteen one would probably find the increase still greater.

10051. I think you corroborate the statement that the improvement in boys when they first join the training ship is enormous?—Yes. I do not share the pessimistic view that the mischief is hopelessly done by the time a child reaches school age.

10052. (*Mr. Struthers.*) Is there any age which you could roughly fix beyond which it would be impossible by proper feeding to repair the mischief done?—I should say eighteen. After that time the bones are united and it is physically impossible to get growth.

10053. If a rickety condition has been produced in infancy it would be very hard to remedy that?—If the bones have not united, even that is repaired to an extraordinary extent.

10054. So that feeding between the ages of ten to fifteen is an all important matter?—I quite agree.

10055. Even starvation at ten or eleven might be remedied at thirteen to fifteen?—Yes. If it had not led indirectly to disease in the meantime, but a great many children habitually starved succumb to tuberculosis or to some such disease.

10056. Your suggestion is that leaflets should be distributed to mothers when the births of the children are registered. It has been put to you that that might be rather late. But when a child is born the mother has usually been attended by a doctor or midwife, has she not?—Yes.

10057. Could it not be arranged that one or other of these persons should give instructions in the form of a printed leaflet?—If a doctor is in attendance and the mother cannot feed the child naturally he usually gives instructions as to how the child is to be fed.

10058. I think we may leave the doctor out of account, but I am thinking of those cases which are not attended by a doctor?—I doubt if it could be done.

10059. The midwives are registered now?—Yes, but it is difficult to get them to do it, I think.

10060. They must be on a register now: Do you think it might not be possible?—It would be a purely voluntary act on their part if they distributed that circular. Something might be done by the instruction of midwives themselves, but I think the best way is to do it through the registrar of births.

10061. Would not that be far the most effective way of getting at the instruction of the mothers in the feeding of infants, to have properly instructed midwives?—It would certainly help greatly.

[10062. We have been told of a rather successful organisation in Manchester where the Ladies' Committee has paid visitors who go round the houses of certain districts, particularly those with newly born children, and give the mothers instruction: Do you think that would be a good system?—Yes. The National Health Society does a good deal. I have lectured to their visitors more than once on the subject.

10063. That would be much more effective than an early attempt at instruction in the school, or to girls?—My own opinion is that the instruction of girls in the schools is of very little use. I do not think they take the matter sufficiently seriously.

10064. It must, in the nature of things, be of comparatively little use?—Yes.

10065. I mean the instruction in matters of that kind?—Yes.

10066. Because there must be always an element of make believe about it however you do it?—I entirely agree.

10067. As regards the provision of dinners at the school, it would be an absolutely sound proposition from the health point of view?—Certainly.

10068. As regards the actual children who were being fed it would, but might it not have a tendency to discourage the mothers from cooking at home, and so have bad effects on the rest of the family who are not at school?—I do not think my opinion would be of any value upon that.

10069. (*Colonel Fox.*) Has it ever been brought to your notice that children of the working classes are not only badly fed, but also suffer from want of proper rest and sleep. That it is a common complaint that the children of the working classes never get a chance of getting proper sleep at night?—I cannot say that has been brought to my notice.

10070. In support of your statement just now that a very small proportion of mothers suckle their children, I may mention that Dr. Robert Jones, in a lecture on physical deterioration, stated that a Sheffield medical officer informed him that only one infant out of eight in the town is brought up at the breast?—I should not be surprised to hear that.

10071. He further states that not only is a very small

Dr.
Hutchinson.

Dr.
Hutchison.

proportion of children suckled, but that that number is decreasing?—That is my own impression.

10072. (*Dr. Tatham.*) We have had a good deal of very varying evidence with regard to the prevalence or otherwise of certain diseases amongst children, and we have been referred generally speaking to the mortality returns of the Registrar General. As you know, many diseases to which children are subject are not generally fatal; they are frequently recovered from; and therefore the mortality returns of the Registrar General are not much guide. From your experience as physician to the London Hospital would you advocate the establishment if practicable of a registration of sickness?—Yes, if it were practicable; we would get a great deal of valuable information from such a registration, but I do not believe for a moment it is practicable. We cannot define sickness. If a child is a little out of sorts, and stays two days in bed, is that to be registered?

10073. But suppose you merely applied registration to some of the more important diseases, such for instance as tuberculosis and rickets?—That would certainly be valuable.

10074. You would advocate it on scientific principles?—Yes; again purely on scientific principles.

10075. Now, with regard to the question of rickets, that is a disease which very happily is not by any means always fatal. Do you think from your experience at the hospital that rickets is on the increase or not amongst children?—I do not think it is on the increase, but my experience extends over a very short time. I have not been seeing much of the diseases of children for more than ten years, and only part of that time has been in London. I think there was more rickets in Edinburgh than I see in London, but I do not think it is increasing from what I can gather from the experience of men who were working on the subject, men like Sir William Jenner, thirty or forty years ago. I think from the records he has left, and from what I see now, rickets is not increasing much.

10076. Is tuberculosis increasing amongst children?—I should not like to say. There has been a general decline in tuberculosis mortality.

10077. The mortality is scarcely a sufficient measure of its prevalence?—That is so.

10078. With regard to the forms of tuberculosis, is it your experience that the form known as *tabes mesenterica*, or tuberculous peritonitis, is increasing?—No, I think not. Tuberculous peritonitis has always been a common disease in children. It is by no means necessarily a fatal one. I should say the majority of cases recover so long as it is confined to the abdomen. I do not think it is increasing. There again I attach no importance at all to the Registrar General's returns on that point, because you will constantly see cases of what is called *tabes mesenterica* written down. Now *tabes mesenterica* is a disease which hardly exists in reality, and most of the cases so recorded are cases of mistaken diagnosis—chronic diarrhoea, or of true tuberculous peritonitis. I attach no importance whatever to the statistics of *tabes mesenterica*.

10079. It was because I thought you probably would take that view that I asked you the question; it confirms the evidence of several other medical men. With regard to the registration of midwives, of which we were talking, do you think the precautions which are now taken to secure a fair amount of competency on the part of midwives are sufficient?—I think as much is done as one can reasonably expect, and I do not think that really has much bearing on the question of physical deterioration or otherwise. I do not think that physical deterioration is due to injury at birth. It is a much more important question from the point of view of the mothers, they suffer from the want of skilled help, but the children not so much.

10080. Is syphilis in your judgment a very important factor in deterioration?—No, I think it is exaggerated.

10081. And what there is of it is of a much milder type than it was many years ago?—Yes.

10082. With regard to the dietetic value of the present style of white bread as compared with the old fashioned bread that one used to know, the home-made article, do you think the present very white bread which is sold is

comparable to the former?—I am a believer in the white bread.

10083. Supposing it to be really wheat flour?—Yes; it is as a matter of fact.

10084. We had evidence here this morning from a medical man that a great deal of the bread which is sold by bakers as such consists very largely indeed of potato meal?—I do not believe that.

10085. That is not the case here, you mean?—No.

10086. He spoke of a certain part of the country in which to his knowledge it was?—I can only say I do not believe it to be so in London.

10087. We also heard that when Indian meal was substituted for the ordinary food of the very poor it had a tendency to produce diarrhoea. Have you any knowledge of that?—I have no knowledge of that, but I can only say that in America, where they use Indian meal far more than we do, many experts have actually advocated it as a food. I hardly think they would have done so if it tended to produce diarrhoea.

10088. The evidence we had was that in certain parts of Ireland where the ordinary diet consisted almost exclusively of potatoes at certain periods of the year, during the Christmas period, when the potato crop failed, it is the practice of the poor people to resort to Indian meal as their almost exclusive article of diet, and the result of that is uniformly, so that witness stated, to produce an irritative diarrhoea for something like a fortnight?—It may be so, but I have never heard of it.

10089. Do you agree with those who look upon diarrhoea as a specific infection, and not as a simple enteritis?—Not simple; the acute summer diarrhoea has, I believe, a specific infection.

10090. I am speaking of the diarrhoea due to food?—There is a great deal of chronic diarrhoea due to irritation of the bowel by unsuitable food, which cannot be described as infective.

10091. With regard to your objection to bread and jam, is it to bread and jam as such, or to the peculiar article which is sold by the name of jam?—I do not think the peculiar article sold as jam has much influence on the food value of the products. It affects its flavour and so on to some extent, but I do not think it affects the food value. It is bread and jam which I object to. Bread and butter would be better because of its containing fat. To bread and jam the leading objection is that it is very deficient in nitrogenous matter.

10092. You spoke just now of the fact that many of the prepared foods are much more expensive than milk, and, therefore, there is not much inducement to use those prepared foods in place of milk?—Yes.

10093. Do you include tinned milk?—Tinned milk is really more expensive than cow's milk—I should say, roughly, three times as expensive, if you take its true food value. Mothers buy it, so far as I can see, for certain special reasons—one is that it does not so soon go bad. They can open a tin of one of the sweetened condensed milks and keep it without its going bad for a number of days.

10094. Because it contains sugar?—Yes. Then at the end of the week they can buy one or two tins of milk, and make their outlay right away, and then they are provided with milk. If they trust to buying cow's milk from day to day they sometimes have not the money for it. It is such questions that influence them and not the price.

10095. I am glad to get from you that it is more expensive than ordinary milk, because that may have a tendency to diminish the use of it. In certain parts of the country, unquestionably, it is used very largely indeed instead of cow's milk?—It is a large question, but I am not one of those who condemn condensed milk altogether. I frequently recommend it under certain conditions.

10096. I am glad to get from you the fact of its being so much more expensive?—That is the fact.

10097. (*Mr. Legge.*) We have had some conflict of

evidence as to the comparative chances of children from different classes of society, at birth. The chief physician to the Royal Maternity Charity issued a circular to medical gentlemen who assist him in different slum quarters in London, and he put to them this question: "What number per cent. of new born children amongst the poorest classes would be capable of living a normal physical existence were it not for neglect, poverty and ignorance, and what indication of a good physique for coming generations might be anticipated from their conditions?" He got answers giving a percentage for the total of eighty-six. Does that surprise you?—No. I think the raw material one has to work on is very good. It is made bad by injudicious management and rearing.

10098. Then with regard to what has been said about the Navy and industrial schools. I think you will find in the Navy and in the industrial schools there is one physical defect that they cannot make any great impression upon, and that is height; sailors are men who have superb physique but they are not noticeably tall men. I believe the marines are considerably taller than they are?—Yes.

10099. (*Colonel Onslow.*) This simply comes from the standard. The seamen enter at the shortest at 5 feet 3 inches, whereas the shortest marine is 5 feet 5½ inches at seventeen years of age?—I think it is reasonable to suppose that that may arise from the difference of development. If you develop a man's muscles as they do in the Navy, you must stunt his growth; you cannot develop him all round. If you take it out in muscle you have to be content with some deficiency in height.

10100. (*Mr. Legge.*) I am speaking of training boys under fourteen; do not you think the stretching exercises, the back arches, and exercises on apparatus, would stimulate growth in height?—I think growth is the product of two things—it is partly due to causes which we cannot trace, inborn causes, and partly it is a question of feeding. If you feed them well enough they will grow, unless at the same time, you make them develop their muscles so much that everything goes to provide muscle and there is nothing left for height.

10101. You would agree that the men of the poorer classes are continually growing to a later age than the adults of the best nourished classes?—I should not be prepared to agree to that. I should be surprised to hear that there was evidence that that was so.

10102. There is evidence of it?—Of course there is an explanation that occurs to one, that many of them are very badly fed between the ages of, let us say, ten and sixteen; then they start to earn wages for themselves and become better fed, and then they grow, but of course it is physically impossible for anybody to grow after the bones have united, and that takes place short of twenty.

10103. The want of nourishment early in life may retard the date at which the bones unite?—I think not.

10104. There is actual evidence to be found, such as in the case of soldiers growing up to the age of twenty-eight?—That is new to me.

*Dr.
Hutchison.*

10105. (*Colonel Fox.*) Many soldiers say they are eighteen when they are only sixteen?—I should be surprised to hear that they grow up to twenty-eight.

10106. (*Mr. Legge.*) You know that many public school boys stop growing in height sometimes at sixteen?—Yes.

10107. So that they seem to stop early because they have been too much coddled up in their infancy perhaps and so on—they are a sort of hot-house product?—Yes.

10108. From your experience of children and your general experience at the London Hospital have you any strong views with regard to tobacco as an actively deleterious poison?—I do not think there is any scientific evidence that will bear examination about it, one way or another. It is entirely a question of impressions.

10109. Do you think it is desirable that one should get some such evidence, because it is a growing practice among school boys?—Yes, but I think practically the statement that early smoking diminishes growth has no scientific basis at all that I know of. I do not mean to say it is not true, but there is no scientific ground to believe it to be true. The only way that it could do so that I can think of is by affecting their appetite.

10110. We have had a great deal of evidence about an important suggestion, namely, the establishment of a central bureau of anthropometrical statistics to make periodical surveys of certain classes of the population in different districts of the country. Do you think such a survey would be of value in enabling us to take stock of the physique of the country at different periods?—Certainly.

10111. That would have your support?—Undoubtedly.

10112. Would you be satisfied for those general purposes with working at a few general facts?—I think it would be better to work at those general facts over a wide area.

10113. Then they could specialise where they saw any disparity?—Yes.

10114. What would you require?—I suppose you would want height?—I have not given much consideration to it, but one would want height and weight—they are the two chief things.

10115. And chest measurement?—Yes.

10116. Then Professor Cunningham, who gave us some valuable evidence on the point, added certain dimensions of the skeleton—the hips and shoulders, and the depth and width of the cranium. You would agree to that I suppose?—Professor Cunningham is such a high authority on those things that if he says there is use in them I have no doubt there would be.

EIGHTEENTH DAY.

Wednesday, 16th March, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).
Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Mr. C. S. LOCH, called ; and Examined.

Mr. Loch.

10117. (*Chairman.*) You are the Secretary of the Charity Organisation Society?—Yes.

10118. On the general question as to whether physical deterioration is increasing I suppose you agree with most people that there are not many data available?—Certainly not a great many direct data.

10119. And therefore our conclusions, so far as we can draw any, must be largely based on indirect data?—Yes.

10120. And from that point of view there are a great many circumstances which are distinctly adverse to any theory of general deterioration, are there not?—I think so.

10121. Would you say what the most notable features of the situation are from that point of view?—I have tried to take a generation from 1873 to 1903, and of course the first thing that strikes one is the question of money wage. The evidence as to money wages is before the country, and it would seem certainly to show that if you compare 1878 with 1902 you get a distinct advance, roughly, according to index numbers, from about 85·27 up to 97·70, or 100 in 1900. That is the first item of real importance. With regard to the normal wage of unskilled labourers I ascertained a few days ago that in Poplar, where weekly wages are paid, 21s. per week was a common sum for fifty-four hours a week. Of course there are a great many points to be considered in making a general statement; in South London, dealing with builder's labourers, which is a fair test, a man would average 22s. per week. I think one may say that the trend of wage has been, on the whole, satisfactory, without working it out in detail.

10122. When you get to the purchasing power of a wage the balance of advantage which accrues to the wage earner is still more noticeable?—Yes, the point is extremely important in reference to the question whether or not the fall in prices has tended to an upward movement in social ability or competence.

10123. It should have been so?—It should. Therefore, taking the year 1888 as the year in which the prices practically fell to a level which they have retained ever since, one may compare the period after 1888 with the period before it. The retail prices of food for a workman's family is put down for 1877 at 143; in 1888 at 100; so that the period since then should be a period of advance.

10124. Would you expect to find that the increase of education has fitted the working man to make a better use of his resources?—I should not expect to find that it had, except in general terms that it has taught more people how to read and write—whether there is a social education to enable them to use wages better is a different problem to that of the elementary school.

10125. You would expect one to re-act upon the other, to a certain extent?—Yes, that the intelligence should be used. The higher wage and the cheaper prices have been turned to account it would appear in purchasing more food, which is the most important question, and in purchasing food which is particularly good for children. It is shown in the Board of Trade Return that more milk is purchased by the people who have the larger wage. That again seems to be a clear sign of an upward tendency.

10126. But there is a class which is not tapped?—That is below the rise. My point only is that the increased wage meant an increasing expenditure of the right sort.

10127. To set against that, one element is the increase of rent which has taken place, but is not that owing partly to the rise of the wages of persons employed in the building trade?—Yes, the rise in rent has been very remarkable in London in this last decade, due no doubt in part to the rise in wage and cost of material, but also due largely, I think, to the increased demand for accommodation in districts where there are clearances, and also to the increased rates that people have to pay which eventually devolve upon rent.

10128. Has not that a tendency to send the people outside of London into the suburbs, such as Stratford and Tottenham and other places?—Undoubtedly, and some of the easement that is now felt in some districts in this matter, where rents are not so high and overcrowding is somewhat less, is due in part to that.

10129. Do you believe if the means of transit and facilities for expansion were provided that it would have that effect?—Yes, but that coupled with other things. The transit must be to places that have good open spaces and other amenities.

10130. There ought to be opportunities for securing them in these suburban areas?—Certainly, if we have statutory powers to acquire them.

10131. You would make it incumbent upon the local authority to provide a certain minimum of open spaces for the population?—Yes, and particularly with reference to the playgrounds of the schools.

10132. And of recreation grounds for children who have left school?—Certainly. But the question of the playground for children at school seems to me primarily important.

10133. That, I presume, the Board of Education does see to where practicable; or do you think that it does not do it on a large enough scale?—I think that it finds it difficult, as there are not statutory powers independently of the supply of the school accommodation.

10134. You mean something more than the playgrounds attached to the school?—Yes. Some time ago I was interested in the question and wrote to people in different parts of London about it, and I came to the conclusion that the playgrounds were altogether insufficient.

10135. I suppose it is better in London than in many places; for instance, in Manchester it is extremely bad?—I daresay.

10136. You note here the fall of the marriage rate and deduce some serious reflections from it, but the fall of the marriage rate, I suppose, is partly due to early marriages which are not in themselves good things, being less frequent than they were, is it not?—Yes, I think that is quite one reason for the change.

10137. Very early marriages tend to the birth of feeble and sickly children, do they not, and, therefore, the postponement of the age at which people marry is a good thing?—Yes. The general tendency shows that that is one of the causes, and there are fewer earlier marriages.

10138. You think that the figures for London are of more serious import than some people are disposed to believe?—I think that they are. There seems a fall in the birth rate which, in itself, is rather important.

10139. Do you know at all in what class that is most particularly noticeable?—The difficulty is to arrive at that. As far as I know there is no information. We

cannot say what the incidence of it is, so far as I know from information I have at hand.

10140. You are not in a position to say that Dr. Karl Pearson's belief is correct. It is the less numerous and more capable class?—I should have said that one could not say that it is on a statistical basis, but one can surmise a considerable reduction in the well-to-do class. One notices, of course, that the total births per 1,000 has gone down, and then, on the other hand, the infant mortality is less.

10141. Is it materially less in London?—Very little.

10142. It is not less over the country at large?—The figure for 1871 for all ages was 21.4, and it came down to 16.9 in 1901. In 1871 for children aged 0-5, it was 67.0, and from five up to thirty-five it was 7.9. Then in 1901 it fell to 54.1 and 4.0 respectively.

10147. (*Chairman.*) It depends largely where you take the start from, like the tariff reformers when they take 1872?—Yes. But at the same time taking the decades, it is quite fair, because in 1871 you begin with a high pauperism and a great pressure. I mean by general assent. You have had all these phases of change in the decade, and you have the last half in the thirty years on cheap prices and good wages, so that the comparison is very interesting on the point of view of the allegation that there is deterioration.

10148. Have you any other facts upon which you can base your theory as to how the greater resources at the disposal of the working classes have been utilised in this period?—Well, one point is clear, I think. If we take the point of advantageous expenditure, a certain amount have gone to better houses. That is shown under the Inland Revenue Return, and shown also in London by the Report of the Sanitary Inspector of the London County Council.

10149. You mean there has been a decrease in the number of tenements inhabited by more than two or three people, and so on?—Yes.

10150. There has not been a very noticeable diminution in the two-roomed tenements inhabited by more than four persons, or two-roomed tenements inhabited by more than six, not so much as in Lancashire, as a matter of fact?—No, but as a percentage of population it represents a large increase in the number of persons who are now living not more than two in a room in tenements of less than five rooms. The percentage of persons in the Metropolis who were living more than two in a single-room tenement in 1891 has diminished by 1.85 (5.10 to 3.25); and this difference alone represents (say) nearly 68,000 persons who have moved into more healthy quarters. The figures thus stand for a considerable number of persons, and in particular districts they mean a distinct change for the better in a borough.

10151. It is not a very notable diminution?—That is true in a sense, but we must not consider the definitions too rigidly. You may get conditions under which a man and his wife and child—quite a young child—are in one room. They would be reported, but it would not be a case of overcrowding like three adults. I have seen no discriminating investigation as to the actual incidence of overcrowding.

10152. The test that the County Council applies to the dwellings is not occupation of so many in the room, but the amount of cubic feet of air?—That would be for the registered dwellings, but for the class of dwellings that we are dealing with this Return refers simply to the enumeration as so many persons to a room.

10153. But in the instance you gave of a husband and wife and a child you agree that a child should have the proper minimum of air even more than an adult, because its future may be mortgaged by its sleeping in a polluted atmosphere?—Yes, but one must go by degrees. But it is well to discriminate between cases. Where you have open windows that state of things might go on without great injury.

10154. But they never open their windows, I understand?—That is a matter to which I was proposing to refer under the head of Social Education. If we bring those things to the front then the idea will work its way, but only by degrees.

10155. Well, on this subject I should like to have your opinion. You will agree that the great difficulty

in dealing with overcrowding is that improvements are apt to cause an accentuation of the mischief in another place?—That must be so.

10156. And the class you wish to eliminate is the one most reluctant to move and the most incapable of moving—Yes; they probably go to the nearest possible place.

10157. And create and aggravate the conditions of overcrowding in that place?—Yes.

10158. Is not the disposal of these people the most serious obstacle to the exercise by the local authorities of the powers with which they are entrusted?—I think that the powers of the local authorities are sufficient.

10159. No doubt they are, but they hesitate to exercise them because of this difficulty, do they not?—They do. But that is not quite their business. Their business is simply to carry the law out, and if they enforced the law thoroughly I think the supply would right itself quickly, much more quickly than it now does.

10160. With a view to enforce the laws against overcrowding, what would be the effect of the declaration of the local authority that after a given date overcrowding should cease?—I should imagine that it would be better to proceed tentatively, and not at a particular date. I should think that it would be better to proceed rather in group and group.

10161. Taking the worst centres first?—Yes, but taking them firmly and sternly. I should not suggest the application over the whole area, but to apply it as you suggest, piecemeal.

10162. Would it involve the local authority in a problem difficult to solve?—I do not think that they are responsible for overcrowding.

10163. What would become of those people?—That is their affair.

10164. Should not we have an immense increase of the vagrant population?—If we have it we must deal with it. I do not myself think so. I think that you might have an increase in the indoor relief that is going on now, but conditions are very plastic, much more so than people incline to believe. An instance of that, in regard to a rather different condition of things, is this: before common lodging houses were under the London County Council we had returns of them from the whole Police County of London, the larger area, and it is quite extraordinary how quickly in those days the lodging houses grew up with an increasing demand on the part of their *clientele*. That showed how very instantaneous the supply would be when the demand was clearly expressed.

10165. The County Council should use their control to bring life up to some standard of comfort and decency?—I think that it is infinitely better since the County Council took it over, and the supply is based on the conditions of health and sanitation, which were not admitted before.

10166. With regard to the statement of Mr. Charles Booth in his book, that he advocates interference "by administrative action and penalties at each point at which life falls below a minimum accepted standard while offering every opportunity for improvement," or as he elsewhere puts it, "the community will be obliged for its own sake to take charge of the lives of those who, from whatever cause, are incapable of independent existence up to the required standard." I suppose a drastic action on the part of the local authority would create some such problem as Mr. Booth here contemplates?—Yes.

10167. How would you propose to do deal with the residuum that supply and demand does not provide for?—Well, to take a preliminary question in order to answer the further question, it seems to me that if we put ourselves forward as taking charge of any class that class will come under our wing and stay there; and the administrative ability of our people and ourselves is not very great when we come to deal with social problems largely bound up with moral questions, and the ability of dealing with people after a certain age is very small, when they have got ossified. Consequently if we put ourselves in that position we are bound to fail, and our penalties will be of no avail. If we have to deal with the question of the residuum, there

Mr. Loch.

Mr. Lech. is the older view of residuum, namely, that it is residuum, which means that you cannot deal with a—

10168. *De minimis non curat lex*?—All that you can do is to provide it with maintenance, and the Poor Law idea is that a certain number of people who cannot stand upright have to be provided for by the community, and they therefore will remain a charge upon it. I hold, myself, that the present system of haphazard and hesitating treatment of the difficulties where the law allows a plain verdict, has helped to create a class which eventually becomes part of the residuum. You do not stir their will up to make the effort when they might, and they become more and more accustomed to conditions which they ought never to have been allowed to fall into.

10169. And from which they will never emerge?—Yes.

10170. And you strongly advocate the firm grasping the nettle?—Exactly.

10171. How far then should the central authority step in?—Well, there are many conditions for the prevention of which a local authority is working, and in regard to which a central authority could do a great deal to assist. It can inspect, and it can work on the natural method of promoting good conditions by the process of imitation.

10172. Bring them up to the level of the best administration?—Exactly.

10173. We have had evidence that the standard of administration varies enormously. We have had evidence from Tyneside and the Potteries, describing those places as the blackest blots on the civilisation of this country?—Yes, and another point that is worth considering in relation to that is the staff now available, say in London, of sanitary inspectors and men in such positions, used to the greatest advantage. Does that amount of human force produce the proper amount of human result.

10174. You think that the staff is insufficient, and its efforts are perhaps not applied to the best purposes?—Well, I should urge that possibly by a more systematic application of the law on definite lines, in conjunction with the support of the central authority, the staff work could go very much further.

10175. Do you look to the enlistment of volunteer work for assistance?—In certain directions, certainly, I think that it is very desirable that we should have volunteers in connection with this work who would assist the sanitary inspectors. I think that it is very good to have what are called sanitary visitors.

10176. They have them in Manchester—what they call the Ladies' Health Society?—That is very good.

10177. Which does a great deal of excellent work?—Yes, and personally I think in connection with hospitals a great deal might be done.

10178. Now will you resume the general current of your evidence? What conclusions can be drawn as to the figures of pauperism?—These figures from pauperism, I think, deal specially with the period since 1886. In 1887 there was the drop in prices, and I have kept that in view, and there ought to be a change for the fifteen years, dating from a point like that. The first point that strikes one is the large drop in the number of children who are in receipt of relief, and also the drop in the number of able-bodied out-door paupers. Practically the latter has carried the reduction in the former. Taking the figures between 1886 and 1903, and omitting lunatics and vagrants, there is a *plus* of about 65,000 under the heads able-bodied indoor relief, and not able-bodied in and out relief. On the other hand we have a *minus* of 71,600. And this decrease consists of 51,626 children and 19,974 able-bodied adults no longer in receipt of outdoor relief. From this it appears that the balance is being altered steadily, the number of children goes down, and that of the able-bodied indoor paupers and the not able-bodied goes up. And the latter have so gone up that they neutralise all the gains and leave the percentage of pauperism on population almost even. I am inclined to infer, that with these higher wages and lower prices, and so on, there has been an endeavour to get rid of the expense and the responsibilities which are connected with the care of the aged. Otherwise had the not able-bodied pauperism remained at the old figures pauperism

would have gone down immensely. One has wondered why in this good time the pauperism has not gone down, and the answer is there.

10179. And the increase in the number of lunatics points to a similar conclusion, does it not?—Yes, comparing 1903 with 1886 the insane pauper returns show a *plus* of 15,000 and females a *plus* of 16,000 odd.

10180. You have touched upon the evidence there is to show the sources from which the incomes of the working classes have been improved. Is there anything more you would like to say upon that point?—I should like to say one more word about the aged paupers—those over 65 years of age. They have increased—we have important returns in August, 1890, to January, 1st, 1892. Between 1890 to 1892, August compared with January, the increase is 9 per cent., and between 1892 and 1900 it is 6·9; and a very remarkable return obtained by the Departmental Committee on the financial aspects of Mr. Chaplin's proposals showed that out of 5,980 persons in different towns and parts of the country over sixty years of age and not in receipt of Poor Law relief, and all understood to have an income of not more than 10s., 55·62 per cent. who would be assisted by their children, relations, and friends, and 37·1 per cent. by employers. I lay stress upon that, because that indicates the issue from the point of view of what I should call social deterioration. If these figures were to be deleted the effect would be that a large number of persons out of the 5,980, for instance, would be at once thrown upon the public and the whole advantage of the increase of wage and the lowness of prices would be nullified, whereas now in their case, social obligation, which is always educative, is carrying forward an amelioration, moral and social. Questions of that kind, dealing particularly with the lower stratum, say 10 per cent., are most prominent in the minds of the public, and they are, I believe, least understood.

10181. The general conclusion that you have come to is that such deteriorative tendencies as are noticeable affect the conditions of the people late in life?—Yes, one has been struck with the alleged increase of lunacy in Scotland, in the later times of life, whatever it may be due to. But it is said by Dr. Carswell, of Glasgow, "that the number of applications bears no definite relation to the amount of certifiable insanity in the parish; it indicates the desire of the public to get the assistance of public institutions when it is at a loss how to dispose of a difficult or burdensome responsibility arising in connection with mind disorder."—desire to be rid of expense and responsibilities in the case of the dependent. So that there, also, the same factor is working on figures.

10182. That is a deterioration, then, more in the nature of a pauper deterioration than anything else?—Well, yes of course, one is struck also by the life table which Dr. Newsholme, of Brighton, has formed, which shows that the "improvement is great in the early years of life, and very small" later. I do not know whether that would hold good generally. But my feeling is that there is no physical deterioration but an advance, and the advance is shown in part by the lessened pauperism and the lessened lunacy of the early years of life and the greater expectation of life in the earlier years.

10183. And I suppose that the condition of the people at a later period of life is, to some extent, due to causes dating from a period anterior to the introduction of ameliorative tendencies which have since brought about an improvement?—Yes; it is certainly so in the case of the aged, because they grew up under conditions different to those now in force.

10184. Some of the people who have been most impressed with the bad conditions of the present time have said that they believe they are the result of causes diminishing in intensity and that may pass away in the next generation, and your view would be more or less similar to that?—It would.

10185. Have you anything further to say upon the evidence of beneficial expenditure of the surplus income possessed by the working classes, which should tend to ameliorate their condition? You have referred to improved dwellings and increased expenditure upon food; do you think there is a more general sense of responsibility to their children? Do they recognise the duty of devoting their larger resources to bringing up their children worthily and well?—That con-

clusion may be drawn from the large decrease in child pauperism, unless you look for the cause in charitable institutions taking charge of them, instead of the Poor Law, which I do not think is the case—the numbers are too large; at the same time it seems to me that where the higher wage has not been combined with a better power of using the wage the children have not come off better.

10186. I am afraid we have had a lot of evidence to that effect. But how far it is general it is very difficult to determine, but among the countervailing tendencies which have come permanently under your notice, what should you class as the chief?—The countervailing?

10187. I mean those which have prevented improved resources going to the profit of both parent and child?—Of course, I think it must be admitted, and it is said in the House of Lords' Report that betting has largely increased, and I think that anybody with any experience knows that that is an immense consumer of money.

10188. You believe that that is so?—I believe it from talks with men casually.

10189. Does it go in drink, or is it a sort of alternative excitement?—Both. There is a good deal of evidence, judging from talks that I have had, in the way that the children are dragged into it so that it becomes a habit early in life. Then the question of drink is extremely difficult to analyse, but, undoubtedly, the evidence shows that in particular places (and again dealing with our 10 per cent. so to speak) the public-houses make it very difficult for landlords to get their rents and so are affecting the whole condition of the families. There are certain classes of people in those houses who are practically irresponsible, and their money goes in that way.

10190. With the consequence, I suppose, that they have starving children?—Yes; of course all those things lead to want and hunger.

10191. Do you believe that a very large number of children are sent to school in a half-starved condition?—I do not think so. Estimates have varied at different times, and taking them all into account, and allowing that those who make the estimates are very much in the child's interest and very often know very little about the family, I do not think that the actual number is at all large. May I say a word about the system?

10192. Yes?—It seems to me that it is a very foolish method for dealing with the problem; if meals are given they are given only for part of the year, and they do not really touch the needs of the home. They tend very often to break into the domestic habit of providing meals, which is after all a most important thing to keep up, and they are not educative in any way. They do not educate the child and make it think of how he obtains the meal; nor are the children taught to make meals for themselves; nor are the parents led to take any further steps to provide better meals, more suitable for children and so on. The whole movement it seems to me is purely a movement against destitution without regard to education, and that in itself is a strong criticism of it.

10193. But could not it be so modified as to remove the objections to it?—If you handled a few children with a thorough knowledge of the families it could; but a thorough knowledge of the families must be conjoined with an effort to deal with those families *quâ* families. Those are the only conditions in which I think it would be useful.

10194. You do not think a system of contribution on the part of the parents so as to practically get rid of any idea of philanthropy would stimulate the sense of parental responsibility?—When the movement for meals was started that was the proposal, but it has gone to pieces. It is carried on now with regard to crippled children, but it has absolutely broken down otherwise. The number who are put on the lists are not entered on account of hunger, but rather on account of sentiment, or possibly even on account of elections.

10195. You think it has no relation to hunger?—It has no relation to it.

10196. But if the parent is away during the day it is very difficult to provide for the children; what would you do in that case?—If those cases were numerous they might be dealt with on their own merits apart from the general system.

10197. You only advocate the system on a very small scale?—Yes.

10198. And that with special reference to the whole conditions of the child's life?—Yes, and as secretly as possible.

10199. The advertisement of that sort of thing does harm, you think?—Yes, I think so.

10200. You have noted here that the degenerative tendencies you specify have a particularly bad effect upon the young?—Yes, I might say that I have myself inquired into the condition of school cases in the past with special reference to this, tabulating every case, and I have all these tables, which are at your disposal, if you wish.

10201. Yes. You observe that a comparison of the physical conditions in different classes shows what a very large margin there is for improvement in the lower classes, but have you formed any opinion how these improvements are to be brought about?—Yes.

10202. This class, I suppose, is the bed rock of the whole difficulty?—It is. I should work from the school very much more from the point of view of strengthening the physique and giving the children more play, and I should bring social education much more to the front.

10203. By social education you mean social education outside of the school rather than in it. Is not the age at which children leave school almost an insuperable obstacle to anything very considerable being done in the way of such education?—I think that a good deal could be done with the girls before they leave, and a good deal afterwards when they have left if it was begun at the school.

10204. Do you think that compulsory continuation schools for girls, at which attendance might be twice a week, for the subjects of a domestic character, would to any extent meet the evil?—I think it would be quite worth trying, provided that the work was entirely practical.

10205. And then with regard to the boys during the same period, fourteen to sixteen, if it could be made obligatory for them to attend classes for the purpose of physical exercise, do you think that would be useful?—Yes.

10206. And you might exempt from such attendance boys who belonged to any club or brigade in the scheme of which physical exercises formed a prominent part?—Yes.

10207. It is during that period after they leave school and before they grow up that most of the contaminating influences that destroy them come into play?—I think that the habit is earlier in the home.

10208. Except that the deterrent influences of school during five or six years, I suppose, has effect?—Undoubtedly.

10209. It is the danger of lapse after that disciplinary influence is withdrawn?—Yes, but the difficulty that we are speaking of is often due to the fact that their attendance has been very irregular and that they have not been very much in the school. As the teachers have said to me, if we can only get them it would be all right.

10210. And then you go on to deal with the conditions in their home?—That is so.

10211. And the goodwill of their parents?—You get to the root of the evil there.

10212. But by what methods other than school?—I should make the school much more than it is at present the centre of trained voluntary work quite apart from the relief. I should do everything I can to associate it with efforts to provide wholesome exercise quite apart from school—cadet corps, and the like, and all this would help to make it more attractive than teaching proper, and I should be inclined to make it a kind of scholarship to go into the country, so that a boy might go into a good industrial school, not by way of punishment, but as a change, as it were, to a boarding school, where he would see life from a different standpoint. He might have six weeks or six months there, and it would do him an immense amount of good.

10213. But you could not deal with any very large number of children in that way?—No, but you would turn a certain amount of thought amongst the children in that direction.

10214. You think you would create a desire to see the country?—Yes, and would not make the curriculum merely intellectual, which I do not think is always beneficial.

Mr. Loch.

Mr. Loch. 10215. No attempt has been made to do anything of that sort?—None.

10216. And do you attach great importance to the reservation of open spaces?—I think that that ought to be definitely considered for the whole of London and the outer area—certainly the whole police area. I once tried to work it out in that fashion, and I am more and more convinced of the necessity of this reform. Each year is making it more difficult, and it ought to be dealt with summarily.

10217. Has not the time gone by for dealing with it adequately?—I do not think so. If there is any clearance for further artisans' dwellings, I should keep it as an open space.

10218. You would have to compensate the property owner?—That is always done because of the clearances; only I should keep the clearance, and after a time, when the population has migrated, I should sell it at the market value, and, eventually, you would recoup yourself.

10219. But you would destroy your open space eventually?—Yes, but the child population would have gone, at any rate.

10220. The size of London makes it very difficult to carry out that suggestion, but it would be possible in a great many provincial towns if the local authorities were to show some intelligent anticipation of the needs of the community, and to secure an enlargement of borough boundaries in time, so that open spaces might be acquired and worked into the ultimate extensions of the towns?—Certainly, a great deal might be done by that, but I do not despair myself of London.

10221. By the process of demolition?—Yes; but I have seen, myself, the area of Acton, for instance, become covered. Even now something could be done, but ten years ago it was an open problem. And there are places now beyond Acton which are now filling in, but are still quite clear for action. Nothing could be more urgent than the appointment of a small body to take charge of this business in conjunction with the County Council, and the authorities within the police area.

10222. The County Council have not got the powers requisite now, have they?—No.

10223. You know that in Germany most careful precautions are taken against covering the surroundings of a manufacturing centre with houses?—Yes.

10224. Great rings of thinly-peopled spaces with avenues, stretching into the open country, are always preserved, and the density of the population which arises after that is confined to a limited area, and however big the town it always has its lungs and its open area?—Miss Octavia Hill was anxious that that should be done for London, but public opinion was not alive to it. It seems to me that it is good to do it even now. With our easier methods of transit places further away would be within reach now.

10225. Have you any reason for thinking that we are less intelligent than the Germans in these matters?—I do not think that we study them. It is very hard to get a book on English administration on this side, and even for our local administration we have to go to Germany; we commonly use a German book on the Poor Law—Dr. Aschrott's book—and the same may be said of our information as to other countries.

10226. In manufacturing towns where the presumptive conditions are unfavourable to health the Germans are vastly in advance of ourselves, are they not? I cannot speak absolutely. It is too long ago since I went into it, but it struck me that their control from the police point of view and others is much stronger than our own. In that connection I should like to refer to one point with regard to the vagrancy question. The police control in Germany is the saving factor of the position. The rest of their methods could not be carried on without it. It seems to me that it is possible that if some system of general service in the army or anything of the kind were introduced here, many things done in Germany might follow from it.

10227. Do you think that the disciplinary effect of that touches every point of administration?—I think so.

10228. Have you anything to say upon the current classifications of poverty that have been made the basis of certain conclusions in more or less well known books?

—Yes, I have myself taken a view very much in opposition to those who have propounded those systems of classification, but I find it extremely difficult to put before you the rather intricate points which are connected with the matter. I should very much like, if it were wished, to submit some memorandum about it.

10229. We should be very pleased to have it?—I have a great deal of material and it was rather difficult to submit it, and if I took two or three points it would not give their proper value.

10230. If you provide us with that we shall print it *in extenso*, and we shall thus be able to get a clearer and more comprehensive idea of your views?—If you thought that what I send in was in clear opposition to any evidence you have had, I might be allowed to answer questions about it.

10231. Yes. You might come again. That would be a good suggestion?—I shall be pleased to do so.

10232. (*Mr. Lindsell.*) Do you know in your experience anything about the methods adopted for making the schools more attractive to boys and girls during the school hours?—Only from conversations with school managers and people working with the Charity Organisation Society.

10233. Do you know anything about that holiday school, which was started?—Yes. I cannot tell you about the working of it. I have been only told the story of it.

10234. That would be a step in that direction. You were speaking of making school life more attractive?—I should like a holiday school in the country possibly.

10235. You know that there are seaside camps got up?—Yes, and they are all doing very good work I think. But I should like it as a matter of mere routine that they should go there—boys and girls.

10236. You mean that there should be some form of pressure to go?—Yes. And if connected with future service for the army for the boys, I think that it would be a fair expenditure of public money.

10237. You know that the boys go into the camps in some schools?—Yes. That might be largely extended—if the movement would really catch hold of the schools—I believe it might.

10238. At Grantham, in Lincolnshire, I understand that it was a great success. There was a very large volunteer camp in Lord Brownlow's Park where the Grantham boys went with a separate corps of their own, and where we permitted their attendance and gave them a money grant as for school attendance?—I have not heard of it. It would be good.

10239. It was rather a bold experiment, and it is worked with considerable success, and perhaps it may be further extended?—Yes, I see.

10240. You would hardly suggest that the average boy should go to those industrial schools in the country?—Oh, no. My idea is that there is something to be got from aggregate life which these boys do not get in the way of school life. I was not thinking of the industrial school except from that point of view. I thought it would be a good thing for them to have a school of that kind for a short time, and under those circumstances, if possible in the country, and they would go away with different ideas, and possibly strengthened motives.

10241. I suppose the boys hitherto that you get at the seaside camps are not quite from the social stratum of those very poor that we have been speaking about?—I am not sure. To a certain extent they are. But the tendency would be to get the better type—I think that would be the tendency.

10242. (*Mr. Legge.*) I should like to refer to the matter of feeding school children. Am I to understand that you have not heard of what you consider a really sound scheme for the feeding of school children out of their homes?—No. I do not think any, except where there has been quite special care taken in the management of a few children in connection with the families.

10243. But supposing we had a medical inspection of schools, and the medical officer having a child brought before him by a teacher certified that the child was simply suffering from malnutrition, would you object to steps being taken to prosecute the parent for neglecting that child, but in the meantime to feed that child at the

school?—I should feed the child, not necessarily at the school, but with a view to a particular end like that. That is necessary, and I take it for granted all through.

10244. But those cases might not turn out to be 1 per cent. in certain schools, but might turn out to be 25 per cent. in the poorest localities?—I think I should not alter it; it would be better that the feeding was not at the school.

10245. And that really any step taken on behalf of the child should be accompanied by some step taken in relation to the parent?—Yes.

10246. To enforce the feeling of responsibility?—My conclusion from going through a number of cases is that there must be a plan in each case, and that the case considered in that light comes out quite differently. In many of the cases which we dealt with our real trouble naturally was with the parent. We made the plan and they threw it over, and I do not see how you can get over that as long as the parent does nothing criminal. You want a boy apprenticed, but at the last moment the parent says "No." The real issue is in the management of the case, and not in the general issue.

10247. You are aware of the industrial school system?—Yes.

10248. Have you studied at all in particular the day industrial schools, of which there are one or two samples in London, in Drury Lane, for instance?—I did in the early days of its introduction rather than in later years.

10249. Do you think that that is economically sound?—I think that it is a good method decidedly, but I think it too wants particularly to be placed under conditions in which its work will be in relation to the family.

10250. It is the best feature of a really day industrial school, that they bring to bear influence upon the parent?—Yes, and I am not inclined to doubt it on the whole. It would be a point of great importance to work it out in detail.

10251. But there is one special feature of their curriculum, namely, that the boys and girls in those schools do not take the full elementary school curriculum; they have class work as it were for three hours a day, and the rest of the time they are at simple occupations and employments, with once a week or twice a week a technical lesson. Would you approve of that sort of instruction for the class of the population which has to earn its bread by the sweat of its brow, and not by stress of intellect?—Yes. I should myself make the curricula for the public elementary schools according to the class of the children in the district, and I should extend the teaching of domestic economy and subjects of that kind, provided that it is quite practical, and I think that the plan of division of labour in the industrial school is very good.

10252. The only way to work the industrial system in an ordinary elementary school is to make it practical, because you cannot give girls laundry every day in the week for two or three hours at a time; you must give up a good deal of the time to washing, and this scheme could be carried out by enabling girls to bring actually from their homes the week's washing and do it in the school under proper directions?—Yes.

10253. Now what do you think of this suggestion: that also in certain districts mothers who keep decent houses should be allowed to have their girls half time for domestic employment at home after a certain age, say thirteen?—I should be inclined to try that experiment.

10254. Do you think that would have a good effect upon mothers who had not a good home and encourage them to get the home up to the standard, to enable the managers of the school to grant them a license?—I am afraid that is a question one cannot answer without trying it experimentally. There is a great imitative faculty amongst those people.

10255. If Mrs. So-and-so's girl was allowed out because she kept a decent home, do not you think that would have a strong effect on Mrs. B. and C. if they found by a little elbow-grease about the house they could get their girl home?—Yes, it would have an effect, but the question is whether Mrs. B. and C. had not gone too far to care for such things.

10256. I gather from your answer to the Chairman that you think that all these questions of health and

sanitation in particular districts are primarily the business of the local authority?—In this sense, that primarily it is the business of the individual owner, and only the local authority to come in as a kind of police. I am not speaking of the roads—on the public side of the question, but of the inside—the room.

10257. You would not allow them further powers than that of the police; you would not allow them to play the part of the missionary?—We have no data for that. If we ought to do it, we ought to do it as we have done other things. They have mostly been worked to a point on voluntary lines, and then, if useful, turned to account. But it is a question whether, as a local authority, you would have a large enough educational staff for this purpose in addition to the public elementary school staff, for that is what it would come to.

10258. But we gather, from what we have already heard and we know, that local authorities in different parts of the country vary in the most extraordinary degree as to the sense of their duties. Now you would agree that the Central Government might play a very important part in bringing to book any local authority which became notorious for neglecting its duties?—Certainly, in the formation of opinion. I think that the local authority's report should be drafted on definite lines, so that the central authority should have data on certain matters, whatever happens, and if the report shows mismanagement in regard to them as compared with another district, then there is the evidence.

10259. Supposing the facts as to one-roomed and two-roomed tenements were clearly set out in a table for different localities, that would give the sort of indication you are aiming at, would it not?—Yes. There are a whole series of questions which, if you take up those reports, you will find not touched upon. The report often turns upon a special experiment about which the municipality is a little proud.

10260. Back to back dwellings might well be brought out?—That is one of the things.

10261. And another method which has suggested itself to us and one or two witnesses is that there should be a Central Government Bureau to collect from time to time anthropometric facts about the population in different parts of the country. Do you think that would be a valuable indication as to whether there was deterioration going on in one district more than another?—The evidence is very insufficient for answering that question.

10262. We have got practically no data at present?—I have no data.

10263. Do you think it would be a good thing to have anthropometric data?—I should think so. I should have thought that some societies, equipped by the Government, would have led the way.

10264. They have in a measure, the Anthropological Institute, but they go rather upon the principle of asking the Government to take the burden off their shoulders, and they admit that it is too big a job for them?—In that case it becomes a sort of normal sanitary management of the community, and it is within the scope of the community.

10265. It is just as reasonable to have such a thing as to have an ordnance or geological survey?—Yes. I was very much struck with Dr. Newsholme's Brighton Life Table. I do not know whether that system would be generally applicable, but it seemed to me a most suggestive method which would do something in the same direction as an anthropometric survey.

10266. (*Dr. Tatham.*) With regard to the question of vagrancy, I daresay you are aware that the Salvation Army people—the authorities of the Salvation Army—have recently issued a pamphlet on the question of what they call the "Won't works"?—It so happens I have it, but I have not had time to read it; but they are a well-known class.

10267. In general terms they propose that that class of the population, unfortunately a large one, which simply will not work, although they can do so, but prefer to live on the generosity and charity of their neighbours—should be treated by somewhat severe measures. The proposal is that the magistrates should have power to convict persons of that class, and to commit them for periods of three years or more to a labour colony, where they might be made to work, with a hope that they might,

Mr. Loch.

Mr. Loch.

eventually, find it advisable to work on their own account. And the opinion is expressed that the existing charge might be used for the legitimate object of relieving those who can not earn their own living—the residuum you speak of, who are perfectly willing to work if they could, but are unable to do so from circumstances. Would that proposal commend itself to you if it were practicable?—There are one or two things about it. The difficulty of dealing with the vagrant is the magistrate. If the police dealt with the question, as they do in Germany—the question is would the English Public substitute the police for the magistrate? The next question, as to the results: it will depend very much on the age of the person who is committed, whether any result will come. In Germany they have a work or correction house system, and on conviction the Court may order that the prisoner be handed over to the District police authorities for detention in a house of correction or be sent to labour, that is, of public utility for any period up to two years. But their “work”-houses are very full, and they have there “ins and outs” who, at last, settle down in these houses. Your labour colony would be very much the same unless there is discrimination. If you sent a small number there—you may say, roughly, men under thirty-five—you may presumably awaken their power of self-amelioration. But the difficulty is great to deal with those people in the aggregate. The standard of standard of labour amongst them is so low unless you have strict supervision, so as to make idleness impossible. I do not think, myself, judging from the figures, that what you may call reformed vagrants ever form a large proportion of the number. It is true that you may be dealing, not with the vagrant only, but also with the more or less settled labourer who will not work. That leads to another difficulty; who is to look after the wife and children. The children may have to be taken over. Are we prepared to do that for long periods? It would come to a very large charge. The advantage, it might be argued, would be that very likely the father, and possibly the mother, would have to contribute towards their children’s education in some school. Well, of course, you are dealing with numbers, and after all the financial question underlies your scheme. I do not, myself, believe that the number of vagrants is very large. But it is most difficult to deal with the class which are called the “Ins and Outs” of the workhouse, and I should be inclined to adopt a penal system in regard to them; call it a labour colony if you like, with a long detention, with a view to reformation in those cases. But I can see that it is quite likely that after three years or so the results would rather sadden the reformer, and the result of that would be a reaction in favour of merely keeping them. On the other hand there is this to be said, it was one of the results of the Act of 1882 for dealing with casuals and detaining them a longer time—for two nights. The Act had a very remarkable effect. At the time I saw a good many of these cases, and was in communication with some of the officials, workhouse masters, and others, in connection with the Poor Law, and they said that the nett result was that though many of the men could earn only a little, this obstruction, by which they were thrown on their own resources to earn that little, led them to become to that extent supporting and self-respecting members of the community. Now the negative side is always criticised, but it has that positive result, as has been shown quite clearly again and again, and it is a question whether the extension of your machinery will not, after a short time, lead to a reaction which will again necessitate negative treatment, and then you are no better off except that you have imposed upon the community a large new administrative machine which has, after all, failed of its purpose. There is one other point. You have in London a large number of common lodging-houses of all descriptions, of shelters and so on, for the vagrant. The person who inhabits those houses is, to a large extent, the man who prefers idleness. If he has 5s. or 6s. a week he is more or less content. He lives at a low standard constantly. He is a man who does not want much, provided he is comparatively idle. From those shelters and houses, which are often filled with people, a great number pass into the workhouse and the infirmary; and the consequence is that the community pays twice over: first, by voluntary contributions or philanthropic investments for establishments for them, and then, having congregated them in cheap establishments, for their public assistance by the Poor Law in the

infirmary or workhouse—often a very large local charge. I very much fear that if you had a labour colony on a large scale with large numbers of this class in it the same results would follow. Therefore I fall back more and more upon the position dealing with cases individually, and if you desert that principle the reaction following your treatment will very likely upset your plan of reform.

10268. With regard to the persons of the labouring classes who occupy the houses provided for them by the London County Council, is it your experience that those houses are really occupied by the people who have been displaced and who are really intended to occupy them, or are they occupied by a higher class?—I think, undoubtedly, the latter. There is one exception to that in Camberwell. That is, the Borough Council have adopted a plan which is really the old one which commended itself to Lord Shaftesbury and others, of having the houses refitted and made clean, and keeping the tenants in them all the time. That is cheaper. It causes no displacement, and that is the plan on which Miss Octavia Hill has worked. Personally in my opinion I think that is the best for the community.

10269. You think that would be better than large and very expensive labourers’ dwellings which would not be occupied by the persons intended?—Yes, and there is the advantage that you do not create the difficulty of overcrowding by reason of your reform.

10270. You were speaking just now on the question of infant mortality. I have before me the last published Return of the Registrar-General of England. It says that ever since the year 1838 there has been practically no diminution in the infant mortality, that is to say, the proportion of deaths of infants under one year of age per 1,000 of births; and the same thing with regard to the last sixty years, that is from 1841 onwards, obtains in the case of London. From 1841 to 1850, 157 per 1,000; 1891 to 1900, 160 per 1,000; so that practically the figures are identical?—Yes, thank you.

10271. (Colonel Onslow.) We have had stated in this room by at least one witness, I think more, the idea that the State having undertaken free education of the children it is incumbent upon the State to see that those children come to school in a fit state to receive that education; that is to say, that they come well fed. What is your opinion upon it?—I think that it is a *non sequitur*. You might say that of any order of the State.

10272. But surely there are many cases where the parents are, either owing to want of work or to their being “the won’t works” or from being drunken or anything like that, absolutely unable to provide meals for the children before they go to school; but the children must go to school. In those cases would not it be possible to discriminate in giving meals to the children—would not it be wise?—We generalise too hastily. We must have a distinct report in each case, and if that is done the conclusions drawn in regard to the cases are usually found to be different. Some of those cases are Poor Law cases clearly and ought never to come (I mean that the conditions are such that no meals would touch them). The dinners would keep them out of the relief which they ought to have from the Poor Law.

10273. But there might be other cases where parents are entirely neglectful, when they could pay for the meal instead of getting it all free?—I think that you must deal with the parent as he stands. The difficulty of all direct work with the poor is to get the will of the person who is causing the difficulty on your side.

10274. Might not that well be obtained from the first by using force, as formerly when parents had to pay for the schooling of the children. Where parents were poor they got it free, and those who were able and would not pay were brought before the magistrates—could not the same thing be done in the case of meals?—With regard to the past it was said to be a constant cause of complaint; and I always fear myself that magisterial firmness will melt away before the difficulties of the situation. I think that the cases of the type are not numerous. I could not give proportions, but I think that it would be found that they would not be so numerous but that they could be dealt with themselves individually on a great variety of methods.

10275. Granted that the children must be fed, if you do not wish them fed in the school where do you propose that they should be provided for? Have not you formed

any idea?—At times it has been arranged that they should have their food locally outside the school by the plan of coffee houses. That is not altogether satisfactory; and the larger the numbers the more difficult it was for the school to find dining places.

10276. Could not the preparation of the food for those children be co-ordinated with instruction in cookery for others?—I should accept that within the same limits, namely, the careful discrimination of the cases.

10277. You spoke about camps, but I understood you to say that it would be a good thing if they were brought into line as a sort of preliminary for boys going into the Army, or in connection with the Army, and that then the State might be called on to contribute towards them?—Not under present Army conditions. I had not that in my mind, but the possibility of some *quasi* Militia system.

10278. Or some universal service?—Yes.

10279. Is it not your experience that, with the very poor in particular, if they get the idea into their heads that whatever you are doing is with an ultimate idea of bringing the boys into the Army or Navy, they would set their backs up against it at once?—I think so.

10280. And be dead against it?—Yes, judging from particular cases; but I am inclined to think that you would have the young on your side at the ages of fourteen and sixteen.

10281. Undoubtedly. For Admiralty recruiting, after boys have come back from the training ships and have been about the country, all our country officers are over-run by applicants, but out of one hundred who apply we get about fifteen, because the parents won't allow the boys to come in, the boys having reached the time when they are earning wages. Of course that is not sentiment: it is not that they do not want the boys to go into the Navy, but simply because they want the boys to pay for their rent and so on?—Quite so, and it is also to be remembered that the economic position is that of the family. They do not manage their budgets on the individual system of the wage-earner. In every family there is an immense amount of compensation in economic difficulty forthcoming from the members of the family, and that as a matter of course, so that I think that is a good point on one side of the question.

10282. Regarding sanitary questions, you were saying that the report from the local authorities should be based upon a set form. You meant that the local body, the Corporation of a town for instance, should report in a set form to the Local Government Board on certain questions?—Yes.

10283. And that the questions should be quite regardless as to whom the property belongs?—I had not thought of that.

10284. I mean to say it is a fairly well known fact that in some towns they have shockingly bad insanitary dwellings; but they go on from year to year—they go on and no one seems to report upon these dwellings. What do you say?—My opinion is that there ought to be a property map of ownership to each town, and to carry the idea further I think that the central authority should report upon the reports and that should be a public document.

10285. The person who reports upon the sanitary condition is naturally the sanitary inspector, but by whom is he appointed?—By the local authority.

10286. And he is removable by the local authority?—That is true: but we have a county system, and I always hoped myself that the county inspector and the county system would carry with it a county system of supervision.

10287. You would advocate having somebody above the official appointed by the Corporation or the local body?—Yes, in the main so.

10288. To see that they did their work properly?—Yes.

10289. (*Mr. Struthers.*) Do the local authorities at present make a report to the local Government Board in any form?—Not that I am aware of. At any rate I do not see them. Some make very useful reports—small reports.

10290. On special points?—Yes, and some are almost annual reports which would be of great service, but they are not formally made to the Local Government Board.

10291. Nor are they compulsory; they make them when they please?—Yes in form and everything.

10292. They are not required by any Act to report with regard to the sanitary condition of the town?—I understand not. In London they are obliged to report as to certain charities; but that comes incidentally in connection with the older administration of London.

10293. But they are not required to make up an annual statement as to what they are doing in the matter of sanitation and administration of the law relating to overcrowding and so on?—No, the medical officers of health do make a medical report, but I do not think they do it according to any specified requirements. I might add that the poor law authorities do not, and it is most important that they should.

10294. It would require legislation to get what you desire, that there should be a duty imposed upon the local authorities to report in a specified form by the Central Government?—Yes.

10295. But even if you have that, if even the sanitary authority such as you have in certain parts of the country should make any inquiry as to their powers or as to the state of the police of the towns from the point of view of sanitation, would not they be apt to be lax in the matter of the report?—I think that they would. I think that the change would come gradually as in other reforms; with the large amount of conference and association that is now possible it would work upon their imitative faculty.

10296. But if you have not anything stronger than the imitative faculty, would that be sufficient?—I am afraid that it would break in one's hands! In the matter of finance I think that a central audit would be a good thing. I look upon this really as the other side, the audit.

10297. In Scotland the Local Government Board has pretty extensive powers of dealing with the local authority, if necessary, in offences against the law as regards sanitation and such matters, and it exercises that power by presenting a petition to the Court of Session to have a certain local authority compelled to do its duty in a particular matter. You do not think that that would be a desirable power here?—I think that it depends upon how much it succeeds in Scotland. But I do not think it has been tried long enough. I think it was under the last Act. I do not know if it is satisfactory.

10298. Dr. Mackenzie who gave evidence on this point said that they had made use of it in a number of cases and I asked him particularly whether it had been brought to bear upon any large municipality, and he said it had?—Then I think that it is quite worth considering its application to England.

10299. As regards the comparison of municipal administration in Germany, of course you pointed out the essential difference that the administration of Germany rests upon a very complete police system; but there is also the fact that there is a permanent burgo-master for a period of years?—Certainly.

10300. Whose business is local administration?—Certainly.

10301. Who is a trained administrator, and all the local officials are more or less men who, in addition to a good general education, have received a certain special training for their duties; so that there is no analogy between Germany and this country?—Nothing of that kind.

10302. There is no provision for the training of local administrators in this country?—No. The German system seems to me to depend upon the German electoral system, by which the property holder, at any rate the man who has most stake in the community, practically holds the election to a very large extent, and he appoints the best steward he can find as mayor, as has been described. You can get a consistent policy on those lines, which it is almost impossible to get under our conditions.

10303. But even with the best local authority in this country there is an element of permanency wanting, which is secured by the German system?—One would say so.

10304. Permanency and gradual development?—So far as I know Germany, it seems that is so. Perhaps one does not fairly gauge the general movements which go on here, which possibly they do not have in Germany.

Mr. Loch.

Mr. Loch.

10305. Your general impression is that owing to the practical rise in wages and the lowering of the cost of living there has been, as regards the great bulk of the population, a substantial improvement in the last quarter of a century?—I think so.

10306. The question of deterioration only refers to a comparatively small class?—I think so.

10307. But there is one little item as regards cost of living which perhaps has gone up, and that is the cost of house room. It is true that food and clothing have gone down, but may not a man have to pay a larger proportion of his weekly wage, 21s. or 23s., for the mere room to live in?—That is true. But one has to consider some other points in connection with which the rent rises, where there is economic disturbance, for instance, owing to the pressure of the people in turning the dwelling houses into warehouses, and so forth. When you get outside the line of that disturbance you will find that the rents are not excessive, and also you will find, at least so I judge from information I have received, that taking the last four or five years there is a tendency of less crowding in places where you would hardly expect it. That is to say, they have got outside the bounds of disturbance.

10308. But still there are many parts of London where they pay from 5s. and 6s. to 7s. 6d. for two rooms, and that is quite a common charge?—That is so.

10309. That is a very large proportion to pay for mere house room out of an income of £1 or 21s. a week?—A very large proportion. One-third would go in rental, but it would be very difficult for anyone to live in some of these places, unless he were comparatively rich, it would be too expensive; and if the local authority buy land and resell it, and bring the cost of it down to artisans' dwellings' rates, they still charge a rental which considering the older rentals is extreme, very often. So that you interfere, it seems to me, and yet by the very process of the demand you cannot escape from the difficulty of having the population housed at high rentals upon an expensive area.

10310. You do not think that any taxing of land values would have any effect upon that?—It is very difficult to say. I have not myself seen a scheme which would parry this.

10311. But the real difficulty is with a comparatively small portion of the population, and that item you think is swelled unduly to a certain extent by the neglect of old people by the people who ought to support them?—I think that it is.

10312. That is to say that the real proportion of these people, the submerged tenth say, is not really so large as it appears to be?—I think not.

10313. Just because there is a certain proportion of the older people in that class who ought to be at the charge of the younger members of the family and relations?—I think so, when it comes to the question of maintenance upon the rates.

10314. Then as regards the means of dealing with that submerged tenth you seem to lay a great deal of stress upon education?—I do.

10315. And that, of course, would apply chiefly to the younger people?—Yes; but I should try to give the benefits of the school to the younger men and women.

10316. Your conception of education is not simply a matter of the school?—Certainly not.

10317. And what you would like to see take place would be to have the educational means extended far beyond the mere schooling that is given under the code at the present time?—Certainly.

10318. You spoke of what you call social education. What is your idea of that. You say social education, that that is the thing that is very much desired?—To teach the younger women and girls what the nurture of children should be, to arrange that every boy, if possible, should join a friendly society, to show him and let him understand, if possible, what it means; to take the physical question—what it means—that there should be an open-air inlet in the room and so on.

10319. A great part of this health education would be outside of the school?—I think as things stand a great part must be, unless there is a very great difference it will only be begun in the school.

10320. For that purpose we should require another class of teachers, social missionaries, or health visitors?—The problem has not been attacked from that point of view. There is really very little done. I think that the Polytechnics might have served in London in some way, but I think what is wanted is an experiment on very clear lines and with a very clear statement of results and a very careful choice of the teachers. The teachers in many cases I should like to have voluntary, at any rate in part, and I should be very sorry if it became a great State charge.

10321. You speak of the outside teachers?—Yes.

10322. You would have those outside educated in the first place by a voluntary organisation?—I think that I should try that first.

10323. To work in connection with the schools?—With all authorities.

10324. But especially with the schools?—Yes.

10325. To keep in contact with the children from the time of leaving school and trace them to their homes?—Yes. It sounds rather gigantic, but if we consider specially one class I think that it is not so gigantic as it seems.

10326. There are a great many districts that you might practically leave out. The question scarcely arises there to any appreciable extent, but even in the poorer districts it is, after all, only a small proportion of the whole?—That is my view.

10327. It is smaller or larger in districts, but it is not like taking in the whole of the people, but the younger children?—Yes, I very strongly feel that.

10328. What is your view in regard to a medical inspection of children in schools?—I should like the medical inspection of the home—the fulfilment of an already recognised public sanitary duty, and I should like the two to go together—what was done at the home and what was done at the school, and there should be some combined report. I think that the whole man has to be dealt with. I always fear a sort of lopsided assistance or intervention which merely upsets the local plans of the family or individual.

10329. But a local inspection need not give rise to these results?—No.

10330. When it is simply the case of a child whose eyesight is bad or who is defective in hearing, and his parents are told that steps must be taken to put this right, what do you say to that?—I quite agree that is the best to be done. With medical inspection other considerations must come in.

10331. But on the back of the medical inspection such a voluntary organisation might easily get to work?—Yes.

10332. And visit the particular parent whose child is underfed and take steps to get the child fed?—Quite so.

10333. And have it enquired into?—Yes.

10334. You spoke, I think, of the household management teaching given in the schools, with some favour, but you said you would approve of it if practicable. Have you any experience of that kind of instruction given in the schools?—Not directly.

10335. You do not know whether it is practicable or not?—I could not speak with any authority.

10336. Just one question about betting. How does the habit of betting increase the poverty of a given district or class, because presumably if it is fair betting it means the transfer of money from one pocket to another?—I was not thinking of that class, but probably both lose.

10337. If they both lose where does the money go to?—To some third party.

10338. Then the third party is in the district?—But the evils go on; the man has not the money when he wants it when he has lost it. He is also thinking of getting in a speculative way a livelihood, which upsets him morally. After all it has the effect, as in the case of drink, of one man getting what belongs to another.

10339. You mean the accidental upsetting of his income for the time being?—Yes.

10340. Of course a great deal of the money goes to the third person, the bookmaker?—Exactly.

10341. And it is not fairly distributed among the better?—Quite so.

10342. (*Colonel Fox.*) You spoke about ventilation of schools. Do not you think that the best way would be to teach the students all that when they are at the training college?—I entirely agree with you.

10343. You might teach them the management of the household, and physiology, and hygiene, and then you get the thin end of the wedge in the schools?—I should like to teach them under the conditions of a new scheme. I would take them to a single room or two rooms, and I should take them there just as hospital students might be taken.

10344. And you have considered that drink was one of the causes of poverty amongst the working classes?—I think that it is. I think that it is difficult to deal from that point of view in a large general statement, but when you get to particular places that have particular facilities for drink, in those places I think that this is so.

10345. Do you look upon the public-houses as the cause of that principally?—I suppose the actual cause is the desire.

10346. Do not you think that they are educated to it on account of the public-houses being so near at hand?—Yes, I think that the opportunity is too frequent. I think that the whole question is one of public control.

10347. Is there any other place where the working classes can go except a public-house as a meeting house?—I am not in favour of such measures as would prevent the Foresters, for instance, meeting there if they had no better place. I think that there is a great deal of prejudice about their doing so, judging from my experience in these matters. Most of them would prefer another place of meeting.

10348. But I am told by everybody that the only place where they can have a chat is the low public-houses, the beerhouses?—That is partly so. In the case of the better clubs, not with the low ones, but in the case of the better and well-managed clubs there is no particular objection; they have an upper room where they have their meetings and paraphernalia.

10349. But during the time of those meetings there is nothing for them but beer or spirits, which is the cause of all this drunkenness?—Yes; but their difficulty is that there are no other places. We may protest; but I think that many of them are alive to the evil, and are careful that the drinking should be within the bounds of good manners and that there is not a great deal drunk. In some cases that may not be so, but that is according to the tone or temper of the particular Lodge.

10350. Have you been in such places as Whitechapel, in the houses at night?—Yes.

10351. Which are full of women as well as full of men?—Yes.

10352. And more women than men?—Yes.

10353. Surely this drunkenness is due to the public-houses then?—Yes, I think that it is in one sense. All that I am anxious to do is to make it clear that there are a great many who can avoid it. It is only one cause, but a very important one. The particular case in my mind was a district where I think that the public-houses acted as a special temptation to the district; and I was only anxious to make it clear that under those conditions the public-house was particularly harmful. The general issue, the immense amount of poverty and destitution, due to drink either directly or indirectly—that is absolutely certain.

10354. Do you consider that this scheme of Lord Grey's, the Public House Trust, if his suggested establishments took the place of those houses, or if those houses were converted or made into a class of house where they could obtain eatables as well as drink, do not you think that the people would take to them?—I was very much interested in Lord Grey's scheme, but the power of attraction in a public house is very great. I have myself in thirty years found an immense difference in the viands at the public houses from what they used to be, and in a great many of them you will find something to eat. But whether the counter attraction of Lord Grey's public houses will be sufficient I am rather inclined to doubt. It is not a strong enough antidote.

10355. You do not believe in it?—I think that it is good, and it ought to be tried as an experiment, just as I should try several others.

10356. As regards poverty and the food for the children when quite young, we have had evidence from a great number of people that the Jewish mothers feed their children much better, and not only know what is best for them, but know how to cook it, and that they are more thrifty and more abstemious, and that is the reverse with our Christian people?—I believe that is so. I believe that is a true statement.

10357. As the mothers of the poorer class do not know how to feed their children, do not you think that the best way is to teach the children in the schools the art of cooking?—Certainly.

10358. Do you think that they would forget by the time they became mothers all that they had learnt at school?—They forget a good deal, but that might continue with them.

10359. Do you think it would help?—It would help immensely.

10360. You were saying that there should be less mental work in the school and more physical work?—Yes, in one sense, but I really look upon many practical things as being really more mental than what is called so.

10361. But you suggest less mental work and more physical?—Yes.

10362. And reduce the number of subjects of education?—I think I should as far as I understand it.

10363. (*Chairman.*) With regard to the vagrancy question, you let fall that you thought the number of vagrants was exaggerated. There is no system of enumeration?—No.

10364. And that might be done and be very useful, you think?—Yes. In Scotland there is a systematic enumeration of vagrants right through the country, and I have the recent figures here, and it comes to, taking it year by year, about 2·1 per thousand of the population. In England there are only one or two investigations made continuously by night counts both of the vagrants in casual wards and also those in common lodging-houses. These point to the number being, by comparison with estimates frequently made, very small; and the night count of the poor law is very much smaller than the day count, for it excludes the duplication of applications—of the application made by the single vagrant at more than one casual ward or workhouse in the course of a single day. I think it would be very important if we had a useful return of all vagrants, if possible. I should take a return of all vagrants in a single night, taking one winter day and one summer day.

10365. You thus get the minimum and maximum?—Yes, and you take the mean of these.

10366. Do you think the present system manufactures vagrants?—It brings a stress of vagrants to particular places.

10367. In that sense it does?—Yes, and the charities of London to a certain extent manufacture vagrants of the in and out sort, and the Poor Law, too, manufactures these vagrants.

10368. With regard to the allegation that in labour colonies the standard of labour tends to the level of the most idle, would not it be possible to restrict that with a proper classification of labour?—I think that a good deal might be done by cleverness. A great many of the men could only do certain tasks.

10369. But do you think classification would meet that?—Yes.

10370. And you indicate that it is one of the difficulties that in the case of a great many of the men you would have to provide for the wife and children; but it might be the best thing for them to be placed in industrial homes?—Yes, if the country is ready to undertake such a great charge.

10371. You would have to guard yourself against that?—Yes.

10372. Having regard to the interest of the community in the preservation of the young from contaminating and depressing influences, do you think it would become advisable to take charge of the children of all parents who

Mr. Loch.

Mr. Loch. have proved unfit to discharge their obligations to the children they bring into the world?—No, I should deal simply with the ins and outs, and then see what happens. I think that we might upset more than we set right—we have very small foresight—we do not know how things react. I should limit the problem and then try the experiment of a far longer detention with the ins and outs,

10373. Would not it be possible to make the parents the debtor to society on account of the child and to empower the local authority to charge the parent with the cost of suitable maintenance, with the further liability in case of default of being placed in a labour establishment under supervision until the debt is worked off?—Well, that is very difficult to carry through. The money certainly won't come in.

Mr. SHIRLEY MURPHY, re-called ; and further Examined.

Mr. Murphy. 10385. (*Mr. Legge.*) Have you had any experience out of London?—No. I cannot say I have had any experience bearing upon this subject out of London.

10386. You have had no provincial experience before you took up the position in London?—I came in touch with the poor of Manchester years ago as resident medical officer of a hospital there.

10387. How long were you there?—It was under a year—I forget exactly the time.

10388. You are not prepared to say whether the conditions in Manchester are better or worse than those in London?—I could not compare Manchester at the present time with London.

10389. With my experience of the provinces, which is pretty extensive, London seems to me extraordinarily well off for open spaces?—I think London is well off ; and in London many unhealthy areas have been cleared under the Housing of the Working Classes Act.

10390. And the County Council in London has been taking a great deal of pains to secure open spaces in congested districts?—Yes, they have done very much in that direction.

10391. However small those open spaces are?—Some of the open spaces they have acquired are small.

10392. And the Metropolitan Board of Works did something also?—The Metropolitan Board of Works did some important work in that respect. If you remember Hampstead Heath was acquired by them.

10393. And all this embankment?—Yes, that was their work.

10394. Which, I believe, is turning out a very profitable investment?—That I am not able to say. You mean as to the rentals of premises?

10395. Yes?—I have no information on that point.

10396. You informed us last week that you attached great importance to cleanliness?—Yes.

10397. And you mentioned school baths in Sweden?—In Norway.

10398. I thought you mentioned Stockholm?—No, Christiania.

10399. Did you notice a bread hatch, as well as the baths?—No. I have not been in that part of the world for something like six or seven years. They were then making a beginning of altering the schools for the purpose of introducing baths, and it was that operation in certain schools which I saw.

10400. You did not see any arrangements for feeding the children?—No.

10401. I saw some elementary arrangements of that sort at Stockholm—a bread hatch, where the child presented a little money or a ticket and received some bread : you saw nothing of that?—No, I did not see that.

10402. Have you any views about the feeding of school children? You say cleanliness is of enormous importance, but surely that the child should be properly nourished is of almost equal importance?—Undoubtedly. I look upon the feeding of the poorer population of London as being the most important subject matter which is before you.

10403. You are in favour of the medical inspection of school children?—Yes, certainly.

10374. Would it not?—I think not ; I do not know whether it is easy to get the industrial reformatory school money.

10376. (*Mr. Legge.*) I am sorry to say that it is not.

10377. (*Chairman.*) I thought you said it was?

10378. (*Mr. Legge.*) We get in more than is generally imagined ; but we only get at the outside what represents one-tenth part of the maintenance.

10379. (*Witness.*) In the case of those that come on the rates, the ins and outs, their maintenance is accepted already, and that is a great help to the carrying out of an experiment.

10380. (*Chairman.*) You do not object to see such a scheme started experimentally and tentatively?—No.

10404. Supposing a child were brought to the notice of the medical inspector of a school by a teacher and certified by him to be suffering from an amount of improper nutrition, would you be prepared to advocate the feeding of that child at the school?—I see no objection to its being done at the school, but I think what is immediately wanted is full inquiry into the whole of the circumstances of that child's life in connection with the home.

10405. You think the home circumstances are really a more important matter for studying than the condition of that particular child?—I will put it in this way : I am satisfied the child has got to be fed, and the circumstances under which that should be brought about should be made the subject for inquiry as to whether the fault is in the home, or whether it is really a case of poverty which must be remedied at the hands of the proper authority for the purpose.

10406. But pending the result of such inquiries you think steps should be taken to see that the child should not suffer?—Certainly, the child must be fed ; that comes in the first place.

10407. How is that feeding to be done—by a school kitchen?—I believe the supplying of food in the school has been found to work out to be a most convenient way of doing it—using the school premises.

10408. Would you make it an essential condition that the parent should either pay the cost of the food or be punished?—I am certain it is very important that the parent should not be relieved of his responsibility of feeding his own child, and I think, if it becomes necessary to feed the child in the school, every effort should be made to recover the cost from the parent, assuming he is in a position to pay, and that it is not really a case that ought to have the assistance of the Poor Law authority.

10409. Would you allow a child to be fed at all, after a sufficient time had elapsed for inquiries, where the Poor Law authorities could not certify that the parents were not themselves able properly to feed their child?—That is to say, where blame attaches to the parent?

10410. Yes.—That is a class of case which, I presume would from time to time occur, and that would have to be dealt with ; but I should not propose that the child should be deprived of food to its detriment because the parent was a bad parent, but rather that the bad parent should himself be dealt with on other lines.

10411. What would you say to the objection which has been urged before us a good deal, that one of the great causes of physical deterioration is the laziness and incompetence of mothers in the discharge of their domestic duties, an important element of which should be cooking. This feeding of children at school relieves the mother of the necessity of providing a meal for that child, and to that extent it does harm?—Amongst the very poor in London there is a great tendency to buy cooked food. I may mention that recently my attention has been directed to that matter in connection with an observation made by my colleague, Dr. Hamer, that typhoid fever has been spread by the consumption of fried fish. He has gone into this matter carefully to find out what classes of the population eat fried fish, and finds that wherever there is a particularly poor locality the fried, fish vendor pitches his tent there, and the people purchase fried fish for their family.

10412. And you think it is idle to try and resuscitate the state of things which belong to the past?—No, I do not think it is idle to do it, I think it would be most useful and important to teach cooking.

10413. People used to make boots by hand, and so on, now-a-days boots are machine made, and in the same way domestic cookery might very possibly become a thing absolutely of the past; in the next fifty years, except in well-to-do houses where people can keep a decent cook, everything may be machine cooked, so to speak?—Of course, one must be prepared to see changes taking place in the habits of the population, but I feel sure that there would be great advantage if the poor had a good knowledge of cooking which would enable them to do cooking in their own homes. I may say, however, that the very poorest tenements very frequently have no proper cooking stoves. A house which is built for one family comes to be occupied by several families, and very often there is no alteration in the grate, and nothing but an ordinary bed-room grate is available. So that as a matter of fact they have to fall back upon boiling. In some instances gas stoves are put in, but in the one-roomed tenements there is often nothing but a bedroom grate at which people can cook.

10414. I should like to ask you a question or two about ventilation, you agree that that matter is largely bound up with cleanliness?—Yes.

10415. A small room kept scrupulously clean and free from hangings and so on, is better from the point of view of health than a much larger room filthy and infested with rags?—Yes.

10416. Is it not a fact that what are called respiratory changes take place less at night than they do in the day-time?—Respiratory movements are less frequent during sleep.

10417. So that not so much air space is required at night as in the day time?—If there is any difference it is probably in that direction.

10419. But you have not yet secured as an absolute minimum the 300 cubic feet you were speaking of?—No, that is very much wanting in London. There are numbers of rooms at the present time occupied to an extent which would not give 300 cubic feet per person. Even when children are counted less than one.

10420. Do you grant certificates to lodging houses? Not to houses let in lodgings; to common lodging houses?—Yes.

10421. What is your limit there?—We have nothing less than 300 cubic feet in London. When the London County Council took over the administration of the Common Lodging Houses Acts it was found that many houses had been apportioned on the basis of 250 cubic feet. That is altered now, and houses which are coming on to the register anew, that is to say, which have been since licensed for the first time, a higher standard, viz., 350 cubic feet per head has been required.

10422. Do you demand cross ventilation; is that required whether there is cross ventilation or not?—Every endeavour is made to secure cross ventilation, and if you were to go into ordinary dwelling houses which have come to be occupied as common lodging houses, you will find in many instances a door has been cut between the front and the back room, or that a part of the wall has been taken away so as to get through ventilation.

10423. Do you think that an adult requires more room than infants?—I know of no sufficient physiological reason for making any material difference.

10425. You think that really an infant requires as much room as an adult?—I think so practically.

10426. Therefore, you think it is a mistake to allow relaxations in the case of young children?—Yes; in view of the fact that I look upon 300 cubic feet as a very small amount of air space. I should be glad to see that required for each child, but, of course, one has to consider what is practicable. I may say, however, that in two or three districts 300 cubic feet per head is required for children as well as adults in houses let in lodgings.

10427. Where is that?—I will supply that information.

10428. I believe the council took the census lately of those found actually homeless during a particular night; were you associated with that?—Yes. Mr. Murphy.

10429. And what was the result?—We took a limited area involving a considerable part of Stepney and extending up through the City as far as the West End of Hyde Park, and all the people having the appearance of vagrants were counted. They were aggregated in particular places in large numbers for the reason that they went to certain Salvation Army shelters to get a night meal. The total number counted in the streets between half-past one and five was about 1,800. It led me to estimate that probably one person in 2,000 was homeless, that is, was sleeping out in the streets on that night. I may say that our inspectors included in these numbers people found sleeping on stair-cases and landings inside tenement houses, and various places to which the poor resort.

10430. Under some sort of cover?—Yes.

10431. Did you get the number of women as distinct from men?—I think I can give you the figures for women as distinct from men. Of those walking there were 1,463 men, 116 women, 46 boys, and four girls; asleep in different places, 100 men and 68 women, making a total of 1,797 persons, or 1,609 males and 188 females.

10432. I suppose a certain number of those women would be what are called street walkers plying their trade at that hour?—There were people of that class undoubtedly.

10433. Were you alarmed by that; do you think that is an alarming number—I in 2,000?—No.

10434. Was it larger or smaller than you anticipated finding?—I had never formulated any precise notion of what it was; we were absolutely without any guidance as to the number of people.

10435. What led you to make investigation?—A desire was felt in two or three quarters for this information to be available, for some gauging of the numbers, and that is why it was done. The Public Health Committee of the County Council were interested in the matter.

10436. The County Council has been obliged to prohibit, has it not, the system of sleeping in bunks adopted in the Salvation Army and other shelters?—They have not prohibited that at the present time, but they have indicated their view that this should not go on for an unlimited time, and after some years I anticipate the bunks in their present form will practically cease to exist. They have certain disadvantages which make them undesirable.

10437. There has been a suggestion before us which I should like to put to you as a medical man and also as interested in the study of social questions that there should be a central Government Anthropometrical Bureau; what do you think of the value of such an establishment?—I think it would be very valuable to have some arrangement made by which observations of that sort should be kept. We are all feeling the disadvantage at the present time of there having been no antecedent observations covering a considerable period for the purpose of knowing in which way the population is drifting. It occurs to me that the very fact that observation of this sort was being made will be found to be beneficial in a variety of ways. It would focus public opinion upon the question of the condition of the population.

10438. You agree that the results of measurements, even a few superficial measurements which is all you could get when you are dealing with millions, would afford some indication of matters of social importance?—I think they would be of some value, but I may say this, that I believe there are great difficulties in getting measurements made with the precision which is wanted for comparative purposes.

10439. If you cover instances numerous enough will not the tendencies to error on one side or the other balance themselves?—I should think so in a considerable degree. I am perfectly satisfied it would be a desirable thing to do.

10440. (*Dr. Tatham.*) With regard to the question of young men at the age of from sixteen to eighteen, at a time of life when some of them develop into the Hooligan class, I think you have considered what could be done for

Mr. Murphy. them with advantage?—I might mention that what I have seen is this: there is a very large employment of boy labour now, boys employed as messengers and errand boys, which teaches them nothing useful for their future life; and when they have outgrown the age at which they can be employed in this way the risk of drifting into the ranks of the unskilled labourer is a very large one.

If it were in any way possible to make provision for those boys being fitted, say, for military service, it would be an advantage.

10441. Do you mean a cadet corps?—Yes; and if they could be taught a trade upon which they could engage after leaving the Army, if they enter it.

Dr. Frederick Walker Mott, M.D., F.R.C.P., F.R.S., called; and Examined.

Dr. Mott.

10460. (*Chairman.*) You are physician to the Charing Cross Hospital?—Yes.

10461. And pathologist to the asylums of the London County Council?—Yes.

10462. Have you given a great deal of attention to the subject of syphilis?—Yes, I have devoted a great deal of my time to the investigation of the relation of syphilis to nervous disease and certain special forms of insanity, particularly general paralysis.

10463. On the general question should you say there is more syphilis than there was, or less?—I could not answer that.

10464. Would you say it was of a more virulent type, or less virulent?—I could not answer that, because diseases now recognised as syphilitic were not previously recognised as syphilitic. I think myself it is probable that general paralysis is on the increase, not only because of syphilis but also because of the stress, and of people being crowded together in towns. We know that in uncivilised countries, where syphilis is very rife, general paralysis is hardly known.

10465. It is a syphilitic tendency acting on depressed physique?—Yes, there are two conditions, the tendency to stress and excitement combined with alcoholism, and syphilitic poison. I do not think there can be any doubt of this, from my observations.

10466. Do you find many cases of syphilitic taint in the young now?—I can only speak with regard to what I know from going over the cases. I have investigated these cases and I have seen that when the wife is infected with syphilis one finds an extraordinary number of still births, abortions and disease in the children, but if the man is not married for two years after he has been infected—I have records of many instances of this—then it is probable, especially if he has been treated properly, that his wife is not infected and the children do not suffer; but if the wife is infected they certainly will suffer for some time. Two years interval is, however, too short a time for safety.

10467. Great advances have been made in the treatment of syphilis?—Yes, but what strikes me in going through these cases is that the lower orders do not seem to know the dangers of syphilis. Perhaps they may go to the hospital, but as soon as the sore has healed they do not attend any longer.

10468. Is the hospital accommodation sufficient to begin with?—I do not think it is myself, because we do not take cases in a general hospital for syphilis. Unless they have some very serious nervous disease I should not take them into the hospital, because I have not room for them. Then it means a long course of treatment. My general experience is that syphilis is much better treated in the middle and better classes than in the lower classes. As a rule either they are not treated at all or are treated by quacks and chemists, or else as soon as the sore has passed away and they have no further trouble, and when it does not interfere with their work, they go away and do not come back. I think it is more often their own fault.

10469. From that point of view and also for prophylactic reasons would you make syphilis a notifiable disease?—That is a very difficult question to answer. There are many points to be considered. I think the first thing would be really to understand the extent of the disease, to have a thorough inquiry before any system of notification was adopted. It might lead to disease not being divulged, and not being treated.

10470. If they are bound to notify there would be some risk in concealing it surely?—Yes, there would. Personally, of course, if I could see my way to its satisfactory practice I should say it would be a good thing.

10471. But you are afraid the effects might not be what was desired?—I am afraid not.

10472. Do you think an inquiry is wanted as to the extent to which the disease is now prevalent?—Yes, I do. I believe the Registrar General's Returns seem to show that syphilis is very much less than it was, but one must remember that many of these diseases, *e.g.*, softening of the brain, would not have been called syphilitic diseases previously.

10473. (*Dr. Tatham.*) The Registrar General's Returns, I think, only deal with fatal syphilis?—Yes, but supposing I was certifying a patient as to the cause of death from general paralysis, the immediate cause of death would be called broncho pneumonia or something like that, which was the actual cause of his dying; or if he had locomotor ataxy you would not call it syphilitic disease.

10474. Unless you put syphilis afterwards?—That is so. It would not be recognised as syphilis otherwise. Of course, our opportunities of finding out the extent of syphilis and the effect in the production of disease are influenced very much by these facts: If a man gets syphilis he goes to the Lock hospital, perhaps, and is treated there, and if he gets some complication following from the syphilis he does not return to the Lock hospital, but goes to a special hospital where that disease is treated; consequently, the people who are becoming blind, or who see double, or have some eye disease, go to Moorfields, or one of the ophthalmic hospitals, and if they get brain disease they either go to one of the general hospitals, or else to a special hospital, *e.g.*, Queen's Square. In Scandinavian towns, where State regulations require hospital treatment for syphilis, where there is one general hospital, they have perfect records of all cases of syphilis and all cases of the *sequelæ* of syphilis, and one gets the most reliable records. It was in Scandinavian countries where general paralysis was first recognised as being of syphilitic origin by Kjelberg, of Upsala.

10475. (*Chairman.*) That is well ascertained?—That is well ascertained.

10476. And you would advocate a hospital system of that sort applied to the investigation of disease in this country?—Yes, it would lead to more reliable results, there is not the slightest question of it; and it is the same with insanity. When a patient is transferred to the infirmary, no particulars are obtained of his antecedents.

10477. Do you think any large amount of the increase of insanity is to be traced to syphilitic diseases?—I think so with regard to general paralysis, which as a form of insanity is the worst of all; it destroys the best people. The general paralytic is potentially a very useful member of society. He is generally a man both physically and mentally considerably higher potentially than the average man.

10478. It affects the highly organised mentally to a much larger extent than the lower mental organisation?—Yes, I think so myself. One does not get the same history of hereditary insanity in general paralysis that one gets in other forms of insanity.

10479. You trace syphilis as one of the causes of most of the organic diseases of the nervous system?—I would not say most, but I find in a great many of the cases of men between twenty-five and forty-five coming into the hospitals, syphilis is the cause.

10480. Syphilis and syphilitic tendencies transmitted by the parents?—Yes. The great argument in favour of general paralysis being due to syphilis is the fact that congenital syphilitic children suffer from general paralysis; it comes on just after puberty to twenty years of age and it affects the sexes equally, because, of course, the possibility of infection is equal; whereas, in the adult form it affects the males four times more frequently than the females. As you rise in the social scale so it becomes less and less frequent. The whole of the arguments are very strong in favour of that. I find that in 80 per cent. of these cases one can get a history of syphilis.

10481. In regard to your work as pathologist to the asylums of the London County Council, do you observe the effects of venereal disease in respect of the offspring of the poor to a large extent?—Yes.

10482. Do the sterility, and abortion, and still-births, which you have noted, grow out of these effects?—Yes, they do.

10483. On the whole, the chances are against the children?—I think the living offspring is more likely to be stunted and to be bodily and mentally weak.

10484. It makes them, generally, vulnerable?—Yes. Some authorities think rickets is largely due to syphilis.

10485. Have you investigated that at all?—No, I have not.

10486. You agree there is no adequate provision for the proper treatment of disease?—Not among the lower classes.

10487. Sir Alfred Cooper testified to the same deficiency and he thought it was largely due to the fact that the hospital authorities like to keep it in the background?—Yes.

10488. And did not apply their resources to attacking the disease in any serious spirit?—I think a great deal might be done if, when people come to the hospital, the physician or surgeon would warn them that they ought to attend for a prolonged time so as to get thorough treatment, and warn them also against the dangers.

10489. But surely that is quite within the competence of the hospital authorities now?—Yes.

10490. Why do they not do it?—They do in many instances, but it is difficult to make these people believe that it is dangerous. As soon as they have no pain and can get to work again they think they are cured.

10491. They do not believe in the taint?—No. It is a question of the education of the lower classes, I think.

10492. Do you think a great number of cases do not get treated at all?—Yes, I do.

10493. Surely, the notification which I suggest would be a valuable thing?—Yes, but there are great difficulties in the way of notification.

10494. Would not notification be a very serious bar to its communication?—Unquestionably. From that point of view it would certainly be most valuable, with regard to the prevention of the spread of the disease.

10495. Sir Alfred Cooper quite agreed, and I do not think he saw the difficulties in the way of notification which you appear to do?—I wish I could say it was possible.

10496. Have you any other remedial suggestion to make?—I think it would be very valuable to have an inquiry to ascertain how great the evil is now, irrespective of its temporary increase or decrease. These are the suggested terms of reference of Colonel Long's Committee. I daresay you have seen them. (*The document was handed to the Chairman.*)

10497. That, I suppose, was somewhat similar in intention to the resolution adopted by the Brussels Conference?—Yes.

10498. Do you know whether anything has been done to bring the Brussels Conference resolution to the knowledge of the Government of this country?—No, I do not.

10499. You are familiar with its terms, I suppose?—Yes.

10500. Its objects may be said to be the same?—Yes, very similar.

10501. (*Mr. Struthers.*) You spoke of the suggested terms of reference; there has been no actual Committee appointed, I presume?—There is a Committee. It is a voluntary Committee. It was suggested by Sir James Crichton Browne at one of the meetings of the Committee that it would be a good thing to have a Commission to inquire into the whole subject. That is what is really required, I think, more than anything. It should be the subject of a special inquiry. One sees what great good the Tuberculosis Inquiry has done already. On these grounds Sir James Crichton Browne advocated it, and it was certainly supported by Sir Victor Horsley.

10502. (*Dr. Tatham.*) With regard to the virulence of syphilis, do you think there is any doubt that it is much less virulent now than it was twenty years ago?—I was only a student twenty years ago, but my experience is that one does not see the bad skin and bone cases one saw then, but one sees more of the nervous diseases. It seems to attack the part upon which stress is acting, and, of course, the stress of life is greater now on the nervous system.

10503. You are speaking now of untreated syphilis?—No, of treated cases too. I have seen cases in which syphilis has been well treated, and yet they have had these serious nervous affections.

10504. Such as general paralysis?—Yes, and also syphilitic *gummata* of the brain, and so on. There are cases where, in spite of treatment, it seems to go on, but I think, as a rule, the cases are much more likely to be serious if they are not treated. The cases which are neglected are very often the more mild cases, with the soft sores, and not the typical chancre. Those cases are neglected and not treated, and then they may develop those later serious affections of the nervous system, which are invariably fatal.

10505. With regard to the present law as to the dissemination of syphilis, do you think it would be at all practicable that an Act of Parliament should be passed making it penal for a man to infect a woman—I mean, making it a matter of serious consequence to himself if it could be proved that he did so—a criminal act, in fact. It is not so in this country now, as you know?—I think if he really knew that he had this serious disease and had been warned of the dangers, then it would be desirable.

10506. (*Mr. Legge.*) Warned by whom?—By the doctor. A man may very frequently have disease and not know the serious nature of it. A great many of the lower classes do not really recognise that they have a serious disease, because it causes them no pain. In fact that was my experience in going through a great number of these cases. I find they do not attach any importance to it at all.

10507. (*Dr. Tatham.*) But in the case of a man better educated than the class of persons you are speaking of, in the case of men, for instance, about town going among women of the prostitute class and infecting a large number of them?—I do not think they would affect the prostitute class, because I think the prostitutes, probably, are already immune. The danger is, I think, that they would infect the young women who are in shops and so on, who have not got on the streets yet. In fact, that class of person, I think, is more dangerous than the prostitute as regards syphilis, because after two or three years the prostitute has already had the disease and is not likely to infect others with syphilis.

10508. (*Colonel Fox.*) In addition to that, she knows how to take care of herself?—Yes.

10509. Do you not think it would be a difficult thing to bring that home to a man?—Yes, with regard to prostitutes it would, but with regard to a servant or a milliner, where it was known that a man did communicate the disease to her, I think if she brought an action against him for bodily injury she ought to recover.

10510. (*Chairman.*) That would be a civil action, of course?—Yes.

10511. (*Colonel Fox.*) Do you not think in the case of a private individual, a non-professional, she would rather hesitate to make public the fact?—Yes.

10512. She would be rather against advertising herself in that respect?—Yes. That is why I say it would, perhaps, be desirable to leave it open for her to bring an action.

10513. (*Colonel Onslow.*) Would the re-enactment of the C. D. Acts have any effect?—I would not advocate that. I think they have been given up as a failure.

10514. Were not they a failure more because they were only applied to certain towns?—At the Brussels Congress, I believe at the last meeting, the countries where it had been practised for some time were against it.

10515. I understood the other day from a witness that that referred more to the licensed houses and so on, and not so much to the inspection of the regular prostitutes

Dr. Mott. Do you not think that the action of the C. D. Acts prevented a large number both of young men and young women from going on the loose?—No, I should think it did not.

10516. Not young women?—It might young women; it certainly would not young men.

10517. It would have an effect upon the young women for the reason that they saw these C. D. inspectors were on the look-out, and if a girl was seen walking with one man one night, and another man another night, they generally followed her up and gave her a warning; it deterred them in that way?—I cannot say that I know that.

10518. Has it not been the fact that, in those garrison towns where the C. D. Acts were in force for a few years, after their abolition the increase of venereal disease generally was enormous. Did not that come within your practical knowledge?—No. I daresay it is so.

10519. I think that both military and naval doctors at the hospital will inform you that the increase amongst the men was enormous?—I do not think a C. D. Act would ever be passed in England again.

10520. But putting aside all the feeling against it?—

Sir VICTOR HORSLEY, F.R.S., F.R.C.S., called; and Examined.

*Sir V.
Horsley.*

10524. (*Chairman.*) In considering the influence of venereal disease upon the national physique, have you incidentally formed any opinion as to whether venereal disease is more prevalent now than it was?—No, because there are no statistics available at all on the subject.

10525. There is no information gathered in the hospitals which would establish that, more or less?—I do not think so. As regards the current treatment of patients and, of course, as regards the death certification from venereal disease, that is extremely fallacious.

10526. Because the remote consequences are not considered?—It is because the practitioner under the present system of death certification dare not put it on the certificate.

10527. Because of the prejudice it would excite?—Yes, at the present moment The British Medical Association has been for some time engaged on this subject, endeavouring to make the death certificate a private document between the Registrar-General and the doctor, so as to take away the onus of publication. Then, again, unfortunately, especially since the Playfair case, a medical man is open to an action for libel.

10528. You think some such change in the system of certificates is absolutely necessary in order to afford material for any accurate classification of venereal diseases and their effects?—Yes, I do; and I think also there should be protection afforded to a medical man on the ground of libel.

10529. It should be a privileged communication?—Yes. That would have to be determined by a Statute.

10530. Turning to another aspect, which is perhaps more ascertainable, could you say that the character of the disease was more or less virulent than it used to be?—On that I can offer some information. As regards the actual destructive lesions of syphilis, they evidently are not so common. In general hospital practice one used to see more *gummata* and more active destruction of bone than you see nowadays. But with regard to the remoter consequences of syphilis in the second and third generation in nerve diseases, of course we think at the present moment they are more common, but probably it is only that more work has been done on their pathology and we have more correct knowledge of their origin from syphilis, and that syphilis is really a prime factor in many of those diseases.

10531. There is a greater differentiation of disease which the progress of medical science renders possible?—Yes. As regards the general virulence, I think on the whole it must be less.

10532. I suppose the methods of treatment have improved as the disease has become more understood?—Very much so. That, however, cuts both ways unfortunately. Undoubtedly, many syphilitic individuals are preserved to life who are quite capable of reproduction and who, consequently, produce stunted and diseased offspring.

A breath of it is enough to spoil anything that you want to bring forward in the way of reform.

10521. We know how it was abolished and by what Party; it is very difficult to get it again, I know, but I wish to bring out whether medical opinion is in favour of it as a preventive or not?—I think some other measures will have to be adopted, and certainly I think they ought to be adopted.

10522. (*Colonel Fox.*) Can you tell us what measures?—I think the preliminary measure would be to ascertain how much syphilis there is and what provision there is against it. As soon as that is established on a firm basis I think something could be done. We should have strong evidence to go upon for further steps; until that is thoroughly rammed home you will not do anything.

10523. (*Chairman.*) How are you to find out how much syphilis there is if it is not a notifiable disease?—Tuberculosis is not a notifiable disease. I think if we could put this on the same basis as tuberculosis, and get an inquiry, and then show what effect it has on the population, a great deal of good will be done, and that some such treatment and special hospital provision as in the case of tuberculosis would be admitted as necessary by all right-minded people.

10533. You would not propose to sterilise them?—I would not, personally, though I think they deserve to be.

10534. Do you believe the hospital accommodation for treating this class of disease is very defective?—Yes, very.

10535. Is that due to the repugnance of the hospital authorities to deal with this class of case or to any feeling that a person who suffers from syphilis suffers rightly and is not a fit subject for public charity?—Oh, no; there is not only that feeling. We take in cases of syphilis at my hospital. The real trouble is that an ordinary syphilitic patient is not so bodily ill as to consent to enter a hospital in the vast majority of cases. The most dangerous patients are not bodily ill, and therefore they will not enter a hospital; they persist in going on with their occupation and become sources of infection to innocent people.

10536. Could not something be done to stop them?—Yes.

10537. Could not it be made penal in the case of a person who is under treatment for syphilis?—The first step which should be taken is to have a Commission of Inquiry into the prevalence of venereal disease. A committee that I had the honour of belonging to collected information in regard to the hospitals. I understand the reference to this Committee is chiefly to the poorer classes. Now on that point you could begin with the workhouse infirmaries and give the medical officer of the workhouse infirmary statutory power to detain a patient. At the present moment, as soon as a patient enters a workhouse or, by implication, a workhouse infirmary, he can be shifted about between the two institutions; he can be taken out of the workhouse, where he is congregating with innocent people, and put into a Lock ward in the infirmary. But the medical officer has no power to keep him there, and a medical officer, no doubt, ought to have that power.

10538. So long as he found his release would be a detriment to the community?—Exactly.

10539. Would you go so far as to advocate its being made a notifiable disease?—Certainly.

10540. You do not see any difficulty? *Dr. Mott* appeared to think there might be some difficulty?—I think, probably, there would be a great many difficulties, but, I think, they could be overcome. If you have already given a doctor the protection of privilege in his official communication, then, I think, you have made the path perfectly easy.

10541. Do you think it would lead to many persons refusing to be treated for the disease?—That argument has been repeatedly brought forward. It was even brought forward in connection with simple zymotics at the time of the Notification Act, but, we know, it has not had that effect.

10542. People would hardly run the risk of declining to accept any remedial treatment?—I think their natural

fear of the disease would prevent that. The public knows well that syphilis is a very destructive disease.

10543. You do not think that knowledge is so widespread as you might hope?—That is so. Patients seem to be afraid of it at the time. Unfortunately, the treatment is very successful at the start, and they immediately feel very much better, and they get callous. But, undoubtedly at the start when they first come they are very much alarmed. Even the hospital out patient is nervous about his condition.

10544. What is the first effect of syphilis on the adult?—The first effect is simply that they get thinner; they get cachectic.

10545. Wasting?—Yes. They become sallow, but, of course, they can do their work. Then under treatment they immediately improve very much.

10546. What would be the average length of treatment; supposing detention were made obligatory what would it amount to in most cases?—That is a difficult question to answer. Certainly, they ought to be detained six months

10547. As much as that?—They are really infective—some of their secretions are infective—their saliva and so on—after six months. But, I suppose, as a practical measure you could not detain them for longer than that.

10548. (*Colonel Fox.*) Do you find that most of the cases which present themselves are in the primary stage or the secondary stage?—There are a great many primary cases which escape altogether. Supposing you took a row of venereal cases at a general hospital a certain number would actually be complicated with gonorrhœa, and, of course, a still larger number would be confused with soft chancre, and those cases might escape altogether being classified with syphilis. Of the remainder, I think, most of the primary cases, certainly all the external chancres, would come for treatment. It is the internal chancres which escape treatment, as a rule. Then, as regards the cases which come for secondary syphilis, I suppose the majority of cases attending a general hospital are secondaries.

10549. When their systems have been pretty well saturated with the poison?—Yes.

10550. (*Chairman.*) How do you trace the effects of syphilis upon the next generation as a rule; what symptom do you expect to find in a child in the first generation?—You are speaking now, of course, of a viable child, a child who is going to live, who will be a deteriorated member of the community?

10551. Yes?—Soon after birth the child will present snuffles and rashes on the skin; perhaps nothing more.

10552. All the orifices are inflamed?—Yes, the mucous orifices, and perhaps nothing more. Then as it goes on to the time of second dentition you will find that its growth is proceeding slowly; as its teeth appear you find them present the ordinary signs of congenital syphilis.

10553. Irregular and soft?—Notched and peglike. By the time the child has arrived at puberty it is obviously a stunted individual; the bones are small and the muscles are small, and poorly developed.

10554. Is it generally mentally deficient?—As regards changes of the nervous system, if they are present as early as that as mental deficiency, it means they remain mentally deficient. There is a very large class of mentally deficient children whose condition is due to congenital syphilis alone.

10555. Does it render them vulnerable in after life to any particular class of diseases?—As regards after life, as soon as they arrive at puberty, yes; they are liable then to get diseases of the eye, and of the bones.

10556. Caries of the bone?—It is often not actually caries; but it is an inflammatory thickening and often causes destruction of the bone.

10557. (*Colonel Onslow.*) You are speaking of hereditary syphilis?—Yes. Finally when they come to the stress of life when they get about thirty-five they begin to break down from various nervous diseases.

10558. They are incapable of any prolonged stress?—Yes, they suffer from that stress even before thirty—at twenty-five sometimes.

10559. Their expectation of life is very limited, of course?—Yes.

10560. (*Colonel Fox.*) Do you find that syphilis affects the teeth?—Yes, markedly.

10561. Do you think the decay of teeth now which is very prevalent is a good deal due to hereditary syphilis?—I could not assert that; I should not like to say that. I think there are so many other causes of defective teeth at the present day.

10562. It might be one cause?—Certainly.

10563. (*Chairman.*) Is the effect in the members of one family at all selective?—Yes.

10564. There may be perfectly healthy children of syphilitic parents and other children who show the marks of congenital syphilis pretty prominently?—They are all hit more or less. The infection at one end of the family or the other may be slight, but you cannot say that any child of such a family whom you can trace escapes during his whole life and is really a healthy individual.

10565. Are the worst types of the family sterile as a rule?—That I do not know. The mentally deficient ones are.

10566. They do not get the opportunity; they do not marry at any rate. That is what I wanted to get at. Do you think that nature does provide to some extent a cure as far as the second and third generations are concerned, in cases of this sort, by rendering the first generation less fecund than it otherwise might be?—I do not know. I have no facts. I have never enquired into it.

10567. Passing on to the second generation, do I understand you to say that the healthier members of this first syphilitic generation may transmit the disease to the second generation just as effectually as the worst members of it?—No.

10568. That is not so?—No.

10569. But they might transmit it?—Yes, they would probably transmit a tendency to nerve disease.

10570. Is that how it appears in the second generation?—Yes, disease of the nervous system, sclerosis, what is called disseminated sclerosis and degeneration of the nervous system of that kind.

10571. It produces hysteria in women?—It produces actual paralysis. It is an organic disease and a progressive deterioration which ends fatally ultimately after a course of a number of years, perhaps fifteen or twenty.

10572. Does it enfeeble them hopelessly during the earlier stages of life?—Yes.

10573. Even in the second generation?—Yes; in the earlier stages of the disease, not necessarily of life.

10574. Of life I mean. Would a person who suffers from a syphilitic tendency in the second generation have it in a form that you or anybody else might notice?—No, probably not. They might have an absolutely healthy looking child, healthy up to puberty—up to adult life, in fact.

10575. Not knowing of these transmitted tendencies they might marry with a light heart, and transmit the evil to another generation?—That I cannot assert positively. I have no scientific proof myself of syphilis in the third generation, although I believe in its possibility.

10576. When do you think the taint wears itself out?—Of course there is the Scriptural statement of the third and fourth generations. Scientifically, I believe it is impossible to produce positive evidence of the third generation, because of the impossibility of excluding individual infection of either parent in the second generation.

10577. It is only your surmise?—Quite so, having regard to the severity of the disease in the second generation.

10578. You would be prepared to find it in the third generation?—Yes, I think it is quite reasonable to suppose the inherited tendency would not be extinct in the third generation.

10579. Does it create vulnerability to tuberculosis?—I do not know enough about that. My work is chiefly surgical.

10580. Is that the opinion of the medical profession to a certain extent?—I have never heard it expressed. I do not know.

10581. Has it anything to do with cancer?—No, except as regards the tongue; undoubtedly people with a syphilitic tongue are much more liable to get epithelioma.

10582. Is the syphilitic tongue a transmitted thing?—No, it is usually acquired. In fact one might almost say

*Sir V.
Horsley.*

*Sir V.
Horsley.*

it is invariably acquired. The surface of the tongue becomes fissured and corroded and so on, and the virus of cancer can more readily become deposited in it. That is probably the reason.

10583. You enumerate the lesions of congenital syphilis as affecting indirectly physical development?—Yes. I think I have mentioned most with the exception of bronchitis.

10584. Is that one?—Numbers of children die within the first six months of life from what is called bronchitis.

10585. That is syphilitic in its origin?—A number of those are cases of congenital syphilis of the lungs. Of course there is an ordinary infective bronchitis, but a great many of them are syphilitic.

10586. You would agree with the last Witness, I presume, that syphilis in the female is still more prejudicial to the child than in the male?—Certainly; and I think that is a source of general physical deterioration. When a female becomes infected at the child-bearing period the mucous membrane of the womb becomes altered and with the first syphilitic child which is born you find the placenta has actual organic changes in it, consequently the womb must be affected permanently for the rest of that woman's life. From the moment the first syphilitic child is born, you can say that damage is done to that woman as a child-bearing individual for the rest of her life.

10587. (*Colonel Onslow.*) Does that mean that the woman was herself infected beforehand?—Yes.

10588. It is not the effect of her husband having been impregnated, and perhaps cured?—I did not understand you. What I spoke of was the first child being born syphilitic, and that of course only takes us back to the fact that the woman must have been infected nine months before that, either by her husband or before marriage.

10589. (*Chairman.*) You think the effects of alcohol have a considerable aggravation on the effects of syphilis?—Yes. That is very well realised in the profession. Alcohol is a particularly aggravating factor in the progress of syphilis.

10590. And a person who is addicted to alcohol is much more vulnerable to it?—Yes, and if he becomes at all alcoholic he breaks down much more quickly from all forms of syphilitic trouble.

10591. I suppose the congenital effects are still worse upon the children in these cases?—Yes. I think it ought to be brought out in this connection, syphilis as a cause of physical deterioration of the race, that a great number of individuals become infected with venereal disease simply because they are intoxicated. That is a practical working point, so that the alcohol question, quite apart from the effects of alcohol itself, is an abundant source of further syphilitic infection of the nation.

10592. (*Colonel Fox.*) Am I to understand that you mean that a man under the influence of alcohol, more or less drunk, is reckless?—He becomes immoral.

10593. And he is reckless as to what he does?—Yes. Even if he were a decent fellow before he became drunk he would be immoral afterwards.

10595. You mean drink leads to immorality?—Yes, one sees plenty of that medically.

10596. (*Chairman.*) I understand you to think that the first step towards dealing with venereal disease is some special inquiry as to the extent of the disease?—I think so, because at the present time, although the public knows a good deal about it, it has never been brought home to the public at large to what a degree the disease is prevalent, and in the second place to what degree innocent people, those women who marry and others, are infected with it.

10597. You think there is presumptive evidence that it is a very serious factor in physical deterioration at the present time?—Yes. I think it is a very important factor. I do not think it is nearly so important as alcohol, but it is a very important factor indeed.

10598. You do not advocate this from the point of view of any prophylactic systems such as have obtained abroad, and which I believe are likely to be abandoned?—Do you mean registration?

10599. Yes?—No, because I think the registration system is an admitted failure.

10600. That is what I wished to bring out?—I think the notification of venereal disease would be a good thing.

10601. Notification, additional hospital accommodation, and full inquiry are your three suggestions?—Yes, and the inquiry should come first.

10602. (*Dr. Tatham.*) You mentioned just now in connection with the certification of the cause of death, what is unfortunately always present to my mind, that the certificates with regard to syphilis so far as it is fatal are of very small value indeed?—Yes, and also I mention the absence of the mention of syphilis from the secondary cause of death; it is very frequently omitted when it ought to have been put in.

10603. For what reasons?—For social reasons, so called—the character of the family.

10604. And because of the danger?—Yes, the danger of prosecution—of an action for damages.

10605. That would be done away with to some extent by rendering the certificate a privileged communication?—Yes, I think it would.

10606. With regard to the question of rendering the medical certificate of the cause of death a privileged communication, would you kindly tell the Committee your opinion on that matter?—The practical question is this. At the present moment when a medical man gives a certificate of the cause of death, he is writing a document which is for the information of the family, but it is a document which is indirectly to be the scientific basis of statistics for the nation. Those two things are really quite apart, you cannot combine them. Therefore it comes to this, that any document certifying the cause of death ought in the opinion of the British Medical Association to be a scientific document, a Government document, what we may call a State paper and a privileged paper, to be given to the Government official, the Registrar-General, and the contents of that document should only be communicated to the friends or relatives of the patient at the Registrar-General's discretion. Of course he would not refuse it to a relative. If the certificate of death were put into that position it would have a privilege attached to it which would insure its being a completely and accurately filled-up document.

10607. (*Mr. Struthers.*) Do you not think with regard to getting the requisite authority to bury the body, in that case the family must produce it?—There would be no more difficulty, the authority would come from the local Registrar.

10608. The Registrar in the district, not from Somerset House?—Yes, under the direction of the Registrar-General. I do not think the Registrar-General could refuse, to show it to the relatives, however painful it might be to them. I think there is much greater danger done to the nation by covering the facts up.

10609. (*Dr. Tatham.*) It is not only with respect to syphilis that you would require this alteration of the *modus operandi* of registration, but you would extend it to all diseases?—Yes.

10610. So that really the State Register of the cause of death should be a scientific document?—Yes.

10611. And should be therefore useful for medical and other scientific purposes?—Yes.

10612. And I think that opinion is your own very strongly, and it is also that of a large proportion of the medical profession?—Yes, I am right in saying it is the opinion of the British Medical Association which represents at the present moment nearly 20,000 practitioners.

10613. I think I am right in saying that you are the Chairman of the Representative Meeting and of the Medico-Political Committee of that body?—Yes.

10614. Therefore you speak with the authority of that body in addition to your own?—Yes, I am instructed to speak on the authority of the Association.

10615. You are aware, I daresay, that so far as the published statistics of mortality are any measure of the prevalence of syphilis, there is a slight improvement?—Yes, I am aware of that.

10616. You do not attach—and I certainly do not attach—much importance to that particular line?—No.

10617. With regard to the lesions of congenital syphilis as affecting indirectly physical development, you are now speaking of untreated syphilis or badly-treated syphilis?—In congenital cases?

10618. Yes.—Of course as regards the poorer classes undoubtedly one may say “badly treated” cases. Undoubtedly children of syphilitic parents who show signs of disease not only in the cases I have mentioned, but in the alimentary canal for instance, are only occasionally brought up to the hospital for treatment, and therefore they are badly treated as you say. I do refer to those cases chiefly.

10619. In the case of a woman contracting syphilis and being placed under proper treatment, do you consider that she may hope to be thoroughly and permanently cured, so as to produce healthy offspring afterwards?—I am afraid I cannot answer that question. That is more a gynecologist's question. I quite agree with the opinion expressed by Sir William Gowers, that nobody who has had syphilis is ever cured, meaning by that of course that they remain apparently perfectly well for twenty years, but sooner or later some manifestation of syphilis will show itself.

10620. (*Chairman.*) The person may die first?—Yes, of some other disease. As regards the question whether the person not being, strictly speaking, cured would have healthy offspring, I am sorry I cannot answer that. I do not know.

10621. (*Dr. Tatham.*) That is a gynecological question?—I daresay some gynecologists could tell you; they know the histories of families.

10622. With regard to the inquiry which you advocate, would you have that pretty much on the lines of the Royal Commission on Tuberculosis?—Yes, exactly parallel I think.

10623. And you would have it to the same extent?—Yes. I think it would have to be a very large inquiry.

10624. You do not think it is nearly so important a subject as that of tuberculosis?—No.

10625. Quantitatively?—Quantitatively there is a great difference.

10626. You speak of the prevalence of venereal disease here. I suppose in the absence of notification of syphilis it is difficult to measure it, is it not?—It is very difficult to measure it. When I said venereal disease I included also gonorrhœa, because gonorrhœa is an extremely dangerous disease. It does not kill immediately but it produces whole series of secondary effects which ultimately do kill, and its effects on women are disastrous. When you take all forms of venereal disease you cannot but be struck very forcibly in taking the histories of patients how common it is to find that they have had some form of venereal disease. I should say venereal diseases are extremely prevalent undoubtedly.

10627. But as compared with twenty years ago it is impossible without our present data to say whether the prevalence is greater or less?—Quite impossible. I think the only reasonable point on that is the one asked me by the Chairman relative to the virulence. The post mortem room records are so extremely clear now. The relative rarity of *gummata* and the relative diminution of syphilitic caries are undoubted facts.

10628. I asked Dr. Mott just now whether he would impose any serious penalty upon a man who knowingly infected a woman with syphilis: what is your view?—I think that, as the ordinary outcome of a Notification Act, it would be possible to have a statutory penalty on persons of both sexes. I do not think it ought to be only limited to the male sex, but I think certainly there ought to be a penalty as soon as the thing is put upon the ordinary basis of an infectious disease.

10629. (*Chairman.*) Is it more easy for a man to know he has got it than a woman?—Yes; I think it is.

10630. That is a plea for making some little distinction?—Yes; it undoubtedly is so.

10631. (*Dr. Tatham.*) I know that you agree that there are enormous difficulties in the way of insisting upon a notification such as this?—Yes, I think that they are chiefly the alarm which would exist in the mind of a medical practitioner that he was on the one hand revealing the secret of his patient, and on the other that he would lay himself open to an action for damages.

10632. You do not think it would lead to the suppression of the facts?—No, I do not. I was saying just now I think people if they find they have got the disease want to be treated. I think their natural desire to be treated would overcome everything else, at any rate at the start.

10633. And as a consequence of notification, what proceedings would you advocate being taken in the case of an infected person?—Of course as regards that point detention must be the first step. Supposing a person is informed he has smallpox he is detained by a medical man at the present moment. I think that with regard

to syphilis they ought to be detained and sent into the Lock Hospital, or sent into the Lock division of an ordinary hospital for preliminary treatment at any rate. It is quite possible that a certain number of cases could be very rapidly treated in that way.

10634. And how long should he be detained?—As long as the medical man certifies it to be necessary.

10635. (*Mr. Struthers.*) The period of detention would be very different in the case of syphilis from that of small-pox?—Yes; very.

10636. So that it is a much more serious matter to detain a man with syphilis till it is safe for him to be allowed out than in the case of small-pox?—Yes.

10637. That would be an important difference?—Yes; very important. The period of detention ought to be relatively long even up to six months, and even then a syphilitic patient would not be cured; he would still be infective to a certain degree.

10638. Would a shorter period of detention be of practical use in that case?—Yes. It is like any other infective disease; if you can only get a syphilitic patient early and treat him very actively you can cut down the disease very materially.

10639. As regards that, I understand that it would lessen the risk of his communicating the disease to other people?—I think it would. I am only giving an opinion. I have only a few facts to base it upon, but I think if you get a patient like that treated actively by excision of the original focus of infection, by liberal giving of drugs, foods, etc., you would beat down the virulence of the disease in that individual, and it would not be so virulent when he went out into the community. I think you would produce an effect, because undoubtedly you do with other diseases.

10640. Even at the end of three, or it may be six months there is a certain appreciable percentage of risk of his communicating the infection?—Undoubtedly.

10641. And you have only lessened the percentage?—Yes.

10642. (*Dr. Tatham.*) You were speaking just now of the after consequences of syphilis and gonorrhœa; they are entirely different, are they not?—Yes; in a sense they are.

10643. Leading to different *sequelæ*?—Yes; totally different *sequelæ*. I was thinking of it as affecting the efficiency of the individual; they are both very destructive.

10644. And although extremely serious in the case of gonorrhœa, they are not comparable in point of importance to succeeding generations?—No.

10645. It is the individual?—Yes.

10646. (*Chairman.*) Gonorrhœa is very much more easily healed is it not?—Very much more easily treated, and very much better treated at present, so that the remoter consequences, viz., stricture and so on, are rarer now than formerly.

10647. (*Colonel Fox.*) We have been told by a good many men that the majority of children are born sound into the world and start fair in life, and the reason they go wrong is because they are badly fed and do not get sufficient fresh air. If a man contracts syphilis, and goes through primary and secondary syphilis, and is properly treated, and allows two years to elapse before he marries, do you not think his children can be absolutely sound?—I have seen a great many people like that, and by the time they have arrived at forty, fifty, or sixty they begin to show the signs of disease. As regards their children in many cases—I am speaking now of my personal experience—their children are below the average.

10648. Notwithstanding their having been properly treated?—Quite so.

10649. And having allowed time to elapse?—Yes; the usual two years. That is the usual period. I am quite sure that period is too short.

10650. It is too short?—Yes; I am certain there are a great many cases in which people have been told that they could marry with perfect safety, and they have had syphilitic children of a worse type undoubtedly.

10651. (*Chairman.*) Is there any period when you can secure perfect immunity from consequences?—No; but undoubtedly the longer you get away the better—four or five years.

Sir V.
Horsley.
—

NINETEENTH DAY.

Monday, 21st March, 1904.

PRESENT.

Mr. ALMERIO W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. H. M. LINDSELL.
Colonel GEORGE T. ONSLOW.

Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Mr. WILLIAM MCADAM ECCLES, M.S., F.R.C.S., called ; and Examined.

10652. (*Chairman.*) You have something to say by way of preface as to the character of the evidence ?—It is one of those points of extreme difficulty, to be actually, definitely scientific about, because of the want of good statistical data, but the fact has borne itself in upon a considerable number of medical men that there is in alcohol a factor in deterioration, and that it may act directly or indirectly. Probably the weight of evidence is rather in favour of action indirectly than directly.

10653. How has this evidence been collected ?—A number of medical men who have been particularly interested in the action of alcohol upon the living tissues were called together practically by myself, and they met on two occasions, and they discussed first, whether there was any evidence that should be presented, and secondly, as to how that that evidence should be presented, and thirdly, the character of the evidence. I might say these gentlemen who met were fourteen in all.

10654. Their names are given in this document, which is called :—“Statement upon which the evidence on the relationship of alcohol to physical deterioration will be based” ?—Yes, five of them represent the alienist side, four were hospital physicians, two hospital surgeons, one medical officer of health, one a workhouse medical officer, and one the medical officer of a medical mission.

10655. There were certain laymen too ?—There were four laymen ; Mr. J. Y. Henderson, representing the National Temperance League ; Mr. Stafford Howard, director of the United Kingdom Temperance and General Provident Institution, and two secretaries.

10656. What facts can you give us as to the direct action of alcohol in producing physical deterioration ?—The first point is the physiological action of alcohol upon tissues. We felt it was right to put that in as an Appendix, showing the real basis upon which the statements are made, that is to say, that alcohol has an action on the living cell in producing deterioration, and if it acts upon one single cell it was felt that the action upon the cells of the body, as a whole, is similar in nature.

10657. Evidence to that effect is contained on page 25 of this document ?—Yes.

10658. I think it would be best to publish this *in extenso*, as it forms the basis, to a large extent, of the evidence you are giving. It will be best that we should include it in the appendix ?—I think we should look upon that as very desirable.

10661. It would elucidate your evidence apart from the value of the memoranda themselves ? Yes. We have endeavoured not to give too much in the way of details but to lay down fundamental points. Passing from the actual experimental data, we come to the facts so far as children are concerned, the young cell life as one sees it in childhood. Here again no precise statistics can be presented, but there are numerous cases under observation. Sir Thomas Barlow has in the printed evidence given a short statement ; and I might say, as a hospital surgeon, from my own experience I have seen quite a number of cases where direct want of growth seemed to be definitely the outcome of the actual imbibing of alcohol by young children.

10663. Were they given it deliberately ?—First, I think it is given deliberately in infancy on account very often of the apparently beneficial results of alcohol in staying the querulousness of the child from intestinal pains, that is to say, brandy itself does in a certain number of cases produce relief from spasm of an intestinal character, and if a child is badly fed and is given alcohol it does relieve pain to a great extent, with the result, however, that it may be given in increasing quantities and then produces a result directly upon the child.

10664. It is never given by medical advice, I suppose ?—I should not like to say it is not. I think it is given much more frequently apart from medical advice.

10665. If it is once known that any doctor has ever recommended it, it may be often done as the result of that recommendation without any further advice being given ?—That is true. I am speaking more particularly of the lower classes. They do it, I think, entirely of their own accord as a rule. There is no doubt there is a physiological effect of alcohol in deadening sensation, and therefore in a sense it may be useful in that way, but not if it is continued for a length of time, particularly with the young growing cells.

10666. Is it the case that the children's hospitals are familiar with a large number of instances of that sort ?—Not of direct action ; I would not say the instances are large from direct action, but indirectly, as I think we shall see presently, the numbers are considerable. But from the direct giving of alcohol to children, I do not think we can say there is a large proportion.

10667. As to the bodily and mental deterioration which affects adults from similar causes, how do you seek to prove them ?—First of all with regard to the question of the prevalence of intemperance : the word “intemperance” of course is a very comparative word, and what one might say was intemperance others would probably say was moderate.

10668. With reference to this classification on page 5 of this document, so many per cent. of careless, so many per cent. free drinkers, and so many per cent. decidedly intemperate, can you tell me how those sub-divisions are arrived at ?—Merely from the statements of the actual medical men in attendance on those cases. Those are statistics given by medical men to the British Medical Association.

10669. How do you suppose a medical man distinguishes a careless from a free drinker ?—It is a very difficult question.

10670. There are a lot of people on the border line ?—Yes.

10671. It depends on the idiosyncrasy of the medical man which side he puts them on ?—I would not lay great stress on the question of statistics in that way, in fact I think myself they are most misleading in connection with the amount of alcohol taken, but what I do think is an important point is, that there is an undoubted prevalence of intemperance among the lower classes, and if it can be shown that alcohol is a cause of deterioration then that amount of intemperance must be one of the factors in producing deterioration.

10672. The contrast contained here between the publican and the Rechabite, of course, is very effective for the purpose of your comparison?—I think there are a very large bulk of statistics now both in connection with the question of sickness and accident which are an important point in connection with degeneration and also in connection with actual length of life which show that there is an action of alcohol upon the tissue producing a certain amount of deterioration and therefore either inducing sickness or even diminution in the length of life, and, of course, the question of trade and occupation is a matter of extreme interest. I think Dr. Tatham has alluded to that very strongly in some of his papers.

10673. You base your conclusions to a large extent in regard to this branch of the subject on the expectation of life which the insurance offices take?—Yes, from those insurance offices which have for some years past systematically made a division between those who take alcohol, even though in very moderate quantities, and those who definitely year by year state on a certificate that they do not take any alcohol. The statistics derived from these two sections of insurance life work are to my mind absolutely convincing that there is some direct effect in connection with the alcohol taken.

10674. Do the insurance offices give the abstainers better terms?—No; except that they give better terms in the sense that the bonus comes out better, but there is no difference in the actual premiums.

10675. You think that is an absolutely fair comparison?—I will put it in this way: if you take one office, perhaps the largest office that separates the two "lives," in the general section they are good average lives as shown by the present basis of comparison, that is to say the Office Male Table, the newer basis of comparison in contradistinction of the old Healthy Male Table. These are good average lives, as I think we can show by the actual deaths—8,947; the expected deaths by the Office Male Table would have been 8,911, a difference practically of $\frac{1}{2}$ per cent. On the other side in the temperance section the actual deaths were 5,124, being less than 75 per cent. of the expected deaths according to the average mortality of assured lives. Seeing that in the general section they were good average lives, that is to say they were not risky lives in the general section, it would appear that there is some influence at work in the temperance section in producing this smaller death rate than was expected. And seeing that this evidence is borne out by other offices, to one of which I am medical officer myself, it seems to me that there is certainly one factor which is common to them all and that is the abstinence from alcohol.

10676. The lives included in this average list were none of them lives that had been victims of excess in alcohol?—No, probably not; because in insurance offices those are lives which are very carefully excluded; I would not say there were absolutely none.

10677. Is it possible to exclude them so carefully as all that?—By medical examination one can practically exclude one who has had taken alcohol in excess.

10678. You cannot exclude people who perhaps drink more than is good for them without producing any overt symptoms of excess. I am asking for information. You say it is a reliable basis of comparison. It is easy to distinguish?—I think so, certainly. There are certain medical signs which indicate pretty clearly as to whether or not alcohol is having an effect upon the tissues, such as the question of arteries and kidneys and so on. I might say I asked definitely on the question of deaths in the temperance section as to whether there had ever been any death that was certified as due to alcoholism in the sixty years, and so far as one could make out there was only one death which had been from alcoholism in the temperance section.

10679. I presume there are some other facts here which illustrate the lower mortality of temperance lives—taking 100,000 persons aged thirty?—Yes; according to the average rates of mortality some 44,000 would survive to the age of seventy, but according to the experience of the abstainers section over 55,000 reach the age of seventy, or 25 per cent. more.

10680. And the same tale is told by the number of abstainers who survive after thirty?—Yes. We have

merely given this office as an example. There are several other offices which bear out this statement. *Mr. Eccles.*

10681. It is representative of the whole?—Yes, practically it is so.

10682. You think it establishes your point most conclusively?—I think decidedly so.

10683. Have you anything further on that particular point that you would like to say?—No, I think that is all on that particular subject.

10684. What have you to say as to the vulnerability to disease and accident?—I would like to urge very strongly, first of all, the question of indigestion. I take it that the great factor in physical degeneration at the present day is the want of proper assimilation of food, and I think that alcohol is one of the causes—I would particularly lay stress on the word "one"—of gastric irritation and consequent indigestion.

10685. Alcohol taken without food?—I would say even alcohol taken with food if the alcohol is sufficient in amount.

10686. I do not understand you to be contending that any alcohol is prejudicial?—No, what I am speaking of is alcohol either taken without food or taken in such quantities with food as to bring about an actual deleterious action upon the stomach wall. From one's own observations amongst the poorer classes of which one is particularly speaking, there is undoubtedly a considerable quantity of alcohol taken without food.

10687. It is taken merely to stop the craving for food sometimes?—Yes. It is also taken because of the effect alcohol produces in giving a certain amount of *bonhomie*, and so on. I am convinced in my own mind that a considerable amount of the poor physique of some of the lower classes is due to the fact that they cannot assimilate their food properly even if they get the food, because the stomach wall is so damaged by the irritation of alcohol.

10688. From early excess?—From early excess, and from the continuance of taking alcohol.

10689. I do not suppose that is a very common cause of indigestion in the young?—No, it is not, because alcohol is not commonly given to them. But from sixteen years onwards there is a liability from it increasing probably with years up to thirty.

10690. Sixteen is about the age at which the young may begin to be damaged?—After sixteen the young, as a rule, are out of their parents' control, in the lower classes particularly, and they do as they like.

10691. Do you think the parents in the class we are speaking of attempt to exercise any restraint upon them? With a drunken father and a drunken mother, do you not suppose that the children get as much drink as their parents will let them have?—I should think that they would in many families, but my own personal knowledge and actual observations do not go sufficiently far.

10692. You think that the increased drunkenness—if it has increased in this class—would include a good many young people?—I have myself seen young people from sixteen to twenty under the influence of alcohol at the hospitals.

10693. What have you to say as to the predisposition to syphilis arising from alcohol?—That is a subject to which I have given a great deal of attention myself, although I have never actually published anything on the question, but I always make a rule of asking every man who presents himself who is infected with syphilis, as to what condition he was in at the time when he ran the risk of catching it. I have been astonished at the number who were under the influence of alcohol at the time—it is certainly over 75 per cent.

10694. And, therefore, they were less careful of what they did?—Yes, they were less careful of what they did. I think that is a fact of very great importance, seeing that syphilis itself is such a very strong factor in producing deterioration.

10695. I would like to ask you one question which arises from what you have said: would you be in favour of making syphilis a notifiable disease?—Certainly. I should like Dr. Jones to be asked that question also. I am very strongly in favour of it.

Mr. Eccles. 10696. What does the second cause of predisposition arise from?—A person who is actually affected by alcohol is in a state of lowered resistance to almost any virus, particularly syphilis.

10697. I suppose the poison takes hold of him more strongly too?—Yes, he is unable to throw off the poison so well as a healthy person.

10698. The most virulent forms of syphilis are to be found in persons suffering from alcoholic poisoning?—Yes.

10699. It aggravates the disease, and you have adduced evidence to show that in this document?—Yes. Then with regard to the question of militating against successful treatment, I think you may take it that every medical man who treats syphilis tells his patient as one of the first things "you must knock off alcohol." Until alcohol is really totally discontinued, any drug is not likely to have its full action.

10700. And it is the same with a large number of other maladies?—Yes. I have mentioned gonorrhœa particularly, because gonorrhœa is considered by a great many to be not such a serious matter as syphilis. Personally I consider that gonorrhœa leads to more invalidism and deterioration than even syphilis.

10701. Is it not now much more easily treated?—Its treatment is not yet successful. It is better than it was, but it is a most difficult thing to eradicate the virus of gonorrhœa from the body.

10702. If it is treated very early?—If it is treated early and thoroughly well, there is a hope. I would allude here to the question of invalidism and sterility in women, which is a point of very considerable importance in connection with the want of proper provision for children. We get a very large number of cases at the hospitals now where invalidism of the female has been induced by gonorrhœa, and gonorrhœa which has been inoculated while the recipient was under the influence of alcohol.

10703. You mean caught from the husband when in that condition?—Yes. I take it the majority of husbands would not catch gonorrhœa unless they were under the influence of alcohol.

10704. And tuberculosis tells the same tale?—Yes. There has been a very great difference of opinion amongst the medical profession of recent years with regard to the relation of alcohol to tubercle. Now there is almost a unanimous opinion that alcohol does predispose to tubercle in the otherwise healthy body. Dr. Jones will speak as to alcoholic lunatics. So far as enteric fever and pneumonia are concerned, it is a well known fact that both of these diseases in alcoholics tend to very greatly run a fatal course.

10705. I suppose in all diseases which are, in common parlance, called inflammatory, an alcoholic patient always suffers more?—Yes, and in the treatment of these diseases alcohol to a very great extent is not used at the present day, from the very fact that it seems that in alcoholic patients it does very little, if any, good.

10706. They are proof to the medicinal effects of it?—As a surgeon, I have not experience of enteric fever and pneumonia, but several of those who met at my house, who are physicians, are very strong on that point. So far as wounds are concerned, there my experience is very considerable. My own hospital, St. Bartholomew's, is close to the meat market, and, unfortunately, a very large number of the meat porters are very greatly addicted to alcohol, and we have a great difficulty to get their wounds to heal properly, because they are infused with alcohol, and because of the condition of their tissues, due to alcohol. These cases tend to run a very chronic, tedious course, and sometimes even end fatally. Then with regard to actual operations, one fights shy of having to operate upon patients who are alcoholic, because of the degeneration of their tissues; they do not heal well in spite of the asepticism of the present day. One does not get the sound healing in alcoholic tissues, as in others. That I am convinced of, from my own personal experience.

10707. That we are prepared to expect. You also find alcoholic patients are laid up for much longer periods in case of sickness?—Practically it follows from what I have said that any sickness or any wound means that they are longer in convalescence than others.

10708. Remedial measures do not operate so thoroughly?—That is so.

10709. And the consumption of alcohol affects the female in producing sterility, apart from syphilis and gonorrhœa?—There is a direct action of alcohol on the generative organs of the female. I have spoken to several gynecologists, and they agree in that. There is a vicious circle in connection with it. If there is any trouble in connection with the generative apparatus, one of the first things women fly to is alcohol. That does for the time being help them, but it tends to produce an action upon the actual generative apparatus which may produce sterility. I think that is borne out by the case of prostitutes; they are sterile, and they are sterile from two reasons, probably from gonorrhœa and from alcohol. These are the two great causes.

10710. Perhaps it is a good thing that an alcoholic woman should be sterile?—It is an extremely good thing, but it does tend to diminish the birth-rate.

10711. At the same time, I suppose, the worst effects upon the child are those that are obtained through the drunken mother rather than through the drunken father, are they not?—Certainly, that comes from the indirect action of alcohol.

10712. Are the effects of alcohol in the mother brought to bear on the child as a rule?—This is a somewhat difficult subject, but it has been proved distinctly that alcohol circulating in the mother's blood does reach the foetal system, although there is no direct connection between the two circulations; they are absolutely separate. But there is a means whereby fluid may pass from one to the other by a process of filtration. It has been proved that alcohol does find its way to the fetus, and thus would act in two ways, either causing the actual death of the fetus, and therefore a miscarriage on the part of the mother, or a want of proper development of the cells of the fetus. In one sense one may say this is a direct action of alcohol through the mother upon the fetus; that is to say, alcohol may directly affect the cells of the fetus. There would seem to be some evidence for an increase of the consumption of alcohol in women. I know that it has been pointed out that there is not so much actual drunkenness probably among women as there was some fifty or sixty years ago. I think that is perfectly true. One perhaps does not see the actual amount of drunkenness in the streets of women as may have been the case then. But I am quite sure of this, that there is more actual alcohol drunk by women. That is particularly so amongst the upper classes; there is no doubt about that.

10713. The consumption of other things comes in too. Are not narcotics used more frequently, like chloral?—Yes, and cocaine, and various other drugs. But I do not think perhaps that touches the lower classes of which we are speaking. There is no doubt about it if there is alcoholism in the mother it does tend to affect in some way or other the child before that child is born; it has an effect on the embryo which is indirect in one sense and direct in another.

10714. And how does that show itself on the child when born, as a rule?—I would rather leave that to Dr. Jones. Then we come to the most important point of the whole of these things, and that is the indirect action of alcohol in producing physical deterioration through the environment. Personally, I am sure that this is the chief way in which alcohol does act, and that it does act very markedly.

10715. And it has a disastrous effect on the nurture of the child?—Yes, in its early days indirectly. First, with regard to the food, there are two ways of looking at that, the actual want of food, and then the want of proper food. The actual want of food may be brought about in quite the young infant by the fact that the mother's milk is really not food. There are many women who suckle their young whose milk is so poor from want of food themselves, and from alcohol, that, practically speaking, the child is being starved, and unless those children are put on artificial food they either grow up extremely weakly or die. I am convinced in my own mind that this is one of the sources of a large amount of infant mortality. It is often said that if a mother feeds her child, the child is all right. I do not think that statement can be borne out amongst some of the lower classes

where the mother's milk is not itself actually sufficient food. That deals with want of food and then the want of proper food results from the fact that the milk of the mother may actually be tainted with alcohol. Alcohol is excreted in the milk, and therefore the child may be actually taking alcohol with the mother's milk. It may be quite a small amount, but sufficient to react upon the child.

10716. We were told in this room that a child has been born with *delirium tremens*, do you think that is possible?—I would not like to go so far as that. Then another very important factor is the want of proper hours for suckling amongst women who are addicted to alcohol, that is to say the child of a careless mother is liable to have milk at any time and in any way. Another very important factor is that there is a considerable increase in the artificial feeding of infants even amongst the poorer classes, and that this artificial feeding needs very great care in order to prevent dangers arising from it. That is well known even amongst the upper classes. I think we all know that when there is an alcoholic mother who is unable from an alcoholic condition to properly feed her children artificially, the children do suffer very considerably. One sees that, I think, to a very great extent in the extraordinary prevalence of rickets. I am not sufficiently old myself to say whether rickets is more prevalent now than it used to be, but it is terribly prevalent at the present time. One gets a history in many cases that they are hand-fed children, and I think in those cases where the mother says that she has nursed the child it generally means that the mother's milk itself has been so poor that it is tantamount to the child being improperly fed.

10717. The whole thing arises from a want of a proper supply of milk?—Yes, in the mother.

10718. Or if the mother does not happen to have the milk, a proper supply from outside?—That is so. There is no doubt that in towns the question of milk supply and infant feeding is one of the most important matters.

10719. Do the hospitals where a large number of children are treated do anything?—They merely give directions as to how the child is to be fed, but they do not supply the milk.

10720. They have not attempted to organise a supply? I believe that has been done in Paris with good results?—Yes. In Paris and some other cities it has done it very largely. I am afraid we are behind-hand, although some municipalities are now moving in the matter.

10721. Do you not think that it is a thing which children's hospitals should take up?—I would like to answer that in this way; if mothers are unable to feed their children, then certainly the child ought to have proper milk, but I think we want to get a little further back and find out the reason why mothers are not able to feed their children. One does not want, as it were, to provide an easy way for mothers to avoid feeding children, because the mother's milk is the food.

10722. I suppose that would always be the most expensive, and from that point of view they would always prefer to do it if they could, because it must save money?—Yes, they will, but the food given through the mother in the lower classes in towns is often improper. I refer to the towns because I have not had experience elsewhere.

10723. The staple food is fried fish, and very often in a rancid condition?—I have seen a child nine months old eating shrimps.

10724. I suppose you look to some means being brought to bear which would equip mothers for the task of nursing their children to a much greater extent than is the case at present?—One finds a mother who is of poor physique, and who in her earliest days had been a weakly child is never able practically to feed her children. It is not only the case amongst the lower classes but amongst the upper classes that women who desire to feed their children are unable to do so, and I think that this is distinctly increasing in amount.

10725. Still, I presume, there are fewer mothers of families among the lower classes now who suffer from want of food than used to be the case—I mean the amount of money at the disposal of the working classes is greater?—Yes, if that money was really spent on actual food, and particularly on the food of the mother during pregnancy

and during lactation, it would be a very great point in producing thoroughly healthy, efficient children, but I do not think it is. The money is spent to a very great extent on pleasure. There is a vast deal more pleasure amongst the working classes now than there was—I mean pleasure which requires money wasted on it.

10726. They stint their commissariat in order to provide their pleasures?—They do to a very great extent, and they do not understand the proper provision of food, or the question of cooking; they do not understand how to provide themselves with proper food. They may have plenty of food, but it is not proper food; it is tinned food easily got, and badly prepared, and so on.

10727. You do not think the knowledge obtained by girls in schools has been of much value?—I am afraid not.

10728. The knowledge they do acquire is, I suppose, lost in the interval between leaving school and the time when it is necessary to undertake such duties?—Yes. I am afraid I am wandering away from the question of alcohol, although it does come in indirectly.

10729. You deal with the question of bad cooking here?—Yes, that is particularly important in connection with children. Nothing upsets a child's digestion more than badly-cooked food, and food which is sometimes almost decomposing from want of proper care in its keeping. I can quite understand it. These poor people have merely a little fire over which they have to do all their cooking.

10730. They are not resourceful?—They are not.

10731. I fancy one finds that the French housewife, who has, perhaps, very little better apparatus, will do a great deal more?—Yes.

10732. Because she has the resourcefulness which the English woman is devoid of?—Yes. Then with regard to want of clothing and warmth in childhood, in this climate nothing is more important than that children should be properly clothed, and should be housed in pure warmth, not the shut-up window and the heated lamp which are so often the sole way in which the warmth is produced among the lower classes.

10733. Warmth and polluted atmosphere are practically synonymous in the class we are speaking of?—Yes. Then with regard to improper housing, I have merely noticed how alcohol may indirectly affect that. I do not believe, myself, that the actual alcohol drinking is the cause of the poor houses in the majority of cases. But I do believe that if the money spent on alcohol was spent on higher rent, particularly on model dwellings, there would be a great improvement.

10734. In Mr. Booth's book reference is made to the fact that drink is fostered by bad houses, and that crowding is the main cause of drink and vice?—I agree with that entirely. I think there is the other side of the question also, that is the house is poor because the drink is taken. Alcohol does blunt the sensibility of these people to the squalor of their surroundings. Get them away from their alcohol, and they realise at once that they ought to have a better place. One does get a certain number of men who have been addicted to alcohol who go into some of the county council dwellings, and in better surroundings, and they realise that fact, and it is a considerable help to them.

10735. They are weaned from their vice?—Yes.

10736. Alcohol deadens the desire for improvement?—It does.

10737. Of course it is not necessary for you to dilate upon the effect that overcrowding has in producing deterioration; that is, I am afraid, self-evident?—Yes. Then with regard to disease, one does see quite a large number of children brought up to one at the hospitals by alcoholic parents, particularly the mothers. One can tell at once the parent herself is actually intoxicated when she comes to the hospital, and one sees evidence of disease which might have been arrested, and which has progressed simply and solely from the want of the proper care of these children. I will particularly instance the question of tubercle. It is appalling the number of cases of quite young children in which tubercle is allowed to progress slowly, apparently simply from the habits of the parents—paying no attention to the condition of the child. One sees quite a number of joint cases in which a child is just allowed to drift. You ask the mother,

Mr. Eccles.

Mr. Eccles. "Why did not you bring the child before?" and the answer is, "Oh, I have not had time: it was not convenient." That all means that the mother has not been alive to the effects of disease in the child.

10738. Do you think tubercle ought to be made a notifiable disease?—It is practically being made notifiable by many of the authorities now.

10739. They have power to do so, but I understand they only do it in Sheffield?—We are notifying it in St. Bartholomew's Hospital. Every case of phthisis which comes there now is noticed.

10740. (*Dr. Tatham.*) Voluntarily?—Yes. Then, as you know, tubercle does affect so many just about the age when they are becoming efficient members of the community. I take it the contraction of tubercle in public houses is a very important factor, so far as the question of recruits is concerned.

10741. (*Chairman.*) Are there facts to prove that?—Very distinctly so.

10742. What order of facts?—First of all there are the facts that Dr. Tatham has brought forward; the actual workers in public houses are very liable indeed to the incidence of tubercle. I think Dr. Tatham put it in this way, that the mean mortality from tubercle being taken at 100, barmen and other workers in public houses have a mortality of 257.

10743. (*Dr. Tatham.*) Yes, that is ten years ago?—Then Professor Brouardel has proved conclusively that the deposit on the floors of public houses seems to an extraordinary extent with tubercle bacilli, as one would naturally expect from the expectoration in the public houses, combined with the sawdust which is often used. Perhaps one could hardly expect it to be otherwise. I think, myself, that the cleansing and the more strict sanitation of public houses would, to a very great extent, help to prevent the prevalence of tubercle. This is one of the factors in its dissemination.

10744. (*Chairman.*) There is a footnote by Dr. Brouardel in the book before me as to the filthiness of tenements being a factor in the progress of tuberculosis. I daresay you know the name of the author of this book—Dr. Henri Monod. It is a book upon public health in France. He contrasts the efforts which have been made to diminish tuberculosis in this country very favourably with what has been done in France; he holds this country up as a pattern?—May it always be so.

10745. He holds it up as a pattern of what has been done in that direction?—I think we are fully alive to the question now that prophylaxis is the great thing in connection with tubercle.

10746. He says that there is one country which has done more than any other to reduce the mortality from tuberculosis, and that is England?—That is very interesting.

10747. (*Dr. Tatham.*) With regard to this question of tuberculosis so far as it affects children, do you think that it is increasing amongst them?—It is very difficult to say one way or the other with regard to that, but it is an appalling number of cases that one has to deal with. On Saturday I was looking through one of our wards at St. Bartholomew's, in which there were ten children, and out of those seven were suffering from tubercle, which is a very large percentage.

10748. Of what particular form—tubercle of the joints?—They were all surgical—either the glands of the neck, or the joints; there was one case of peritoneal tubercle.

10749. You generally find a connection of so-called *tuberculosis* with joint disease, do you not?—In the later stages it may be present by general infection.

10750. The difficulty in the case of tuberculosis is to know really what is meant by some of the terms used. Take that unfortunate term *tuberculosis*, which may mean tuberculosis, or may mean simple atrophy. Our returns although carefully prepared are not the true measure of the amount of tuberculosis?—That is a very important fact, the question of *tuberculosis*. I am afraid we are entering into the medical question—as to whether or not infection occurs through milk, and therefore directly to the mesenteric gland, and consequently is bovine tubercle, or whether from infected sputum,

through the lungs, and the tubercle in the mesenteric gland is secondary. Some pathologists hold very strongly that it is always secondary to tubercle obtained through the respiratory system.

10751. You are speaking now of genuine mesenteric tuberculosis?—Yes, of tuberculous affection.

10752. I was rather referring to the unreliability of the figures one gets?—Of course, the ordinary term, consumption of the bowels, which is so commonly used amongst the poorer classes very frequently means improper food, and is not tubercle at all.

10753. With regard to the feeding of infants, you speak of the increasing practice of using artificial foods of various kinds in place of milk, and certainly in place of mother's milk?—Yes.

10754. We have had it in evidence here that artificial foods are much more costly than ordinary milk would be for feeding infants; is that generally the case?—You are referring to tinned milk particularly?

10755. Yes?—Tinned milk is distinctly more costly than ordinary milk, but the fact remains that tinned milk is a rule is nothing like such a good nourishment as pure fresh milk.

10756. A great deal of it is separated milk?—Yes, and particularly that supplied to the poorer classes.

10757. And therefore there is no great inducement on the score of cheapness; in fact the inducement is the other way?—The inducement rather is on the score of facility, because tinned milk is so easy to get.

10758. It is through indolence?—Yes.

10759. With regard to milk which is obtainable in the poorer neighbourhoods, do you think there is a sufficient supply of good milk?—I am afraid I am not competent to give evidence upon that; it is beyond my province rather.

10760. We are very anxious to get to know, if we possibly can?—Would you not ask the medical officers of health with regard to that?

10761. We are asking everyone who comes here?—I am afraid my knowledge is not sufficient.

10762. Would you think that, generally speaking, children get any substantial supply of milk—anything approaching a sufficiency of milk?—I do not think the poorer classes understand the value of milk. One often hears a patient who is on milk alone being told that he is having nothing to eat. I do not think the poorer classes realise that milk should be the staple diet of young children. They think that unless a child is given something solid, biscuits or some kind of farinaceous food, it is having no food at all. One hears that a very great deal in hospital work.

10763. In fact they think milk is not sufficient?—It is not considered sufficient to support them.

10764. Is syphilis increasing?—I do not think it is. In the short number of years that I have had experience, I do not think one sees such desperate cases of primary and secondary syphilis as we did fifteen years ago. I can only recall two cases of *rupia* in the last ten years, and I am convinced I used to see a good deal more as a student. I think on the other hand the effects of gonorrhœa are increasing.

10765. You mean the effects upon the adult male?—The adult male and female also. I think one sees more gonorrhœal joints particularly in young men, and these joints tend to make that man incompetent. I have seen this year quite a number of cases of gonorrhœal joints in the hospital, and all have been under twenty-five years of age.

10766. With regard to women the results are even worse. —Yes. You know how it seals up the tubes and produces all kinds of trouble.

10767. These evil effects are all intensified by the use of alcohol?—Undoubtedly.

10768. With regard to rickets, I think you said that you would not care to state from your own experience whether that is increasing or not?—I really could not say. Of course, I happen perhaps to see it more particularly from the point of view of deformity because I have charge of the orthopædic department. One sees

every week from twenty to thirty children badly deformed by rickets, and that impresses itself upon one's mind very markedly.

10769. A great deal of that amongst individuals is due to improper feeding?—I am sure it is due to improper feeding—not by any means to want of food, but to want of proper food.

10770. (*Colonel Fox.*) Have you any remedies to suggest as regards the prevalence of alcoholism?—My great hope is with regard to education. I believe that if the young are educated to understand scientifically and properly the effects of alcohol it will be a very great help, and I think that is the feeling in the minds of the great majority of medical men. You know a memorial is being signed at the present time by the medical profession in England, Scotland, Wales, and Ireland, in favour of there being education in preliminary health and the effects of alcohol and other drugs, such as is being given in some of our colonies, where it has certainly worked with great benefit.

10771. The only places which the working classes have to go to to get any form of refreshment are the beer-houses?—Yes, practically so.

10772. Where they cannot get anything to eat?—Well, where they ought to be able to get something to eat, but where they do not. I think it is a very important point. If they had food with their alcohol it would probably do them far less harm, but I am afraid they would go for the alcohol even if food were present.

10773. Has it been brought to your notice that the cabmen's shelters have had a very good effect on cabmen?—Certainly, it helps them.

10774. In the old days it was a very common thing to meet with a drunken cabman?—Yes.

10775. Because the only place they had to go to for their refreshment was the public-house?—Yes.

10776. Now they have their shelters where they can provide themselves with anything they want?—Yes, with good, decent food.

10777. And tea, coffee, or cocoa. The result is you never see drunken cabmen. Would not the same thing take place amongst the working classes if they had well-conducted restaurants instead of these low public-houses?—I think it would have a very salutary effect.

10778. Would not that be one of the greatest remedies we could provide?—I am a little doubtful as to whether they would use it sufficiently.

10779. If they were there they would go there?—If they were there it would take away a part of the evil.

10780. (*Mr. Lindsell.*) Have you prepared these tables of Norway and Sweden?—They were prepared by Dr. Legrain of Paris, who has been particularly interested in the question of the relationship of alcohol to crime, and the rejection of conscripts. They were translated by Dr. J. J. Ridge of Enfield.

10781. Is the object to show the comparative amount of the consumption of alcohol per head of the population,

or to draw further inferences from it?—It is to show that there is apparently some relationship between the consumption of alcohol and the various crimes, and particularly the question of the rejection of conscripts. That I think is the point I would chiefly allude to, and the actual number comes out very clearly indeed. Perhaps I might be allowed to add that in France the consumption of spirits containing 50 per cent. of alcohol in 1830 was 2·2 litres per head; in 1898 it had risen to 10·16 litres; the rejection of conscripts was 21 per cent. in 1830, and in 1895 it had risen to 32 per cent.

10782. It rose *pari passu* with the increase of the consumption of alcohol?—Yes. It is merely suggested that there is a possibility of relationship between the two. In Sweden the consumption of spirits containing 50 per cent. of alcohol per head in 1830 was 46 litres. But, chiefly by legislation, it has been reduced in 1890 to 6 litres per head. The percentage of rejection of conscripts in 1845 was 34·46 and in 1885 19·61.

10783. In that Swedish table there has been a steady decrease apparently in the consumption of alcohol, judging from the table from 1830?—Yes.

10784. But all of a sudden that rapid decrease of consumption stopped—in 1860?—Yes, and it has since remained pretty steady.

10785. Was that the time when the Gothenburg system was adopted?—I cannot say. I think the Gothenburg system is more recent than that.

10786. I thought so, too, but there seems to be a sudden stoppage in the decline of the consumption in that year, and from that, onwards, it fluctuates within small limits up to the present time?—Yes; there are so many factors in the question of actual causation of the consumption of alcohol that it is very difficult to say what is the cause of the lessening. If you follow our own tables, as published, you will find that whenever there has been an increase in trade, and therefore an increase in the prosperity of the people, the consumption per head increases.

10787. I did not know whether you knew there was any reason for that sudden change in the Swedish people?—No, I do not.

10788. In Norway, although they have also adopted the Gothenburg system now the decrease seems to be continuous?—Yes.

10789. How do you define the alcoholic person—you do not say that anybody who uses alcohol in moderation is alcoholic. Is it merely a question of degree, or is there a stage reached at which the effects of alcoholism become apparent in the system, or is it that they are so slight in a moderate drinker that they are not perceptible?—I think we may take it like this—alcohol does affect individuals differently, but even a comparatively small amount of alcohol in one person may produce effects which can be distinctly recognised by a medical man, such effects being, generally speaking, the want of proper action of the cells. That person is becoming an alcoholic, even in spite of the fact that he may not show any of the grosser effects of alcoholism.

Dr. ROBERT JONES, M.D., M.R.C.P., F.R.C.S., called; and Examined.

10790. (*Chairman.*) You are specially prepared to speak with regard to lunacy statistics in connection with the evils effects of alcohol?—Yes. I was a member of the special committee summoned by Mr. Eccles to consider this aspect of deterioration, but my evidence is necessarily limited, for I deal with the effects of alcohol upon the poorer strata of the population, and I have collated my general experience into a special report which is now presented in this document.

10791. What number of insane persons do you give?—I think I say 114,000, but that is under the mark now. These figures deal with 1st January, 1902. Taking the annual average rate of increase, I believe that on 1st January, 1904, there will not be less than 116,000 insane persons in England and Wales. The proportion of insanity due to the effects of alcohol given in the second paragraph of my report is, for five years 1896–1901, inclusive, and it is calculated to be 21 per cent. of all the males and 9·2 per cent. of all the females admitted into asylums in England and Wales.

10793. Does that show a considerable increase in the number of admissions due to those causes?—When the average for England and Wales for a period of five years 1896–1901 is compared with the average for the last year for which statistics are presented, viz. 1902, there is certainly an increase, for the percentages for the former period are given as 21 per cent. for males and 9·2 per cent. for females, and for the latter 23·1 per cent. for males and 9·6 per cent for females.

10794. That is the five year average, as compared with the figures for one year?—Yes, but the statistics for the London county asylums may be interesting in regard to this, for during the ten years 1893–1902 inclusive, a total of 35,916 persons (16,356 males and 19,560 females) have been admitted as insane of whom 5,727 (3,497 males, 2,320 females) are alleged to owe their insanity to drink as a direct cause; a proportion of 21 per cent. among the men and 11 per cent. among the women. During the period 1893–1904 that the Claybury Asylum has been opened, and of which I have direct experience as medical

Mr. Eccles.

Dr. Jones.

Dr. Jones. officer, out of 9,544 persons admitted insane (4,251 males, 5,393 females) no less than 1,664 persons (965 males and 699 females) owe their insanity to the effects of alcoholic drinks—a proportion of 22·7 of the males and 13·1 of the females. I believe upon the lowest computation, and after making allowances for the improperly called recovery of some cases of drink insanity—and the improvement in many is rapid under proper treatment—also, after making the necessary reduction in respect to the deterioration and deaths in some forms of insanity, such as general paralysis of the insane, a disease which certainly bears an indirect relation to alcohol, I believe that there remain at the present time in asylums for the insane no less than about 11,000 males and 6,000 females—the figures are only approximate, but I think they are fairly correct—who are mentally decrepit directly or indirectly through the effects of alcohol.

10795. You have not any other quinquenniums of an earlier date which could be usefully compared?—No. I have only taken the last few years, but the statistics giving earlier quinquennia may be found in the previous reports from the lunacy commissioners to the Lord Chancellor.

10796. Does it show a progressive increase?—Not quite progressive. The statistics for 1903 in the Claybury Asylum give a higher proportion than in previous years and a careful inquiry into the antecedents of 607 persons admitted insane relate a history of alcohol in 37 per cent. of the men and 22 per cent. of the women as a direct or indirect factor in the causation of their insanity. Insanity from drink in the poorer section of the population depends very much on the state of trade, it fluctuates very much with the condition of the working classes, and it has some bearing upon the occupation and the form of employment as well as having a geographical distribution.

10797. Does the weather have any effect?—The summer is stated to produce more insanity than the winter months, and spring and summer to be more favourable to it than the autumn and winter.

10798. There is not more alcohol consumed in summer, is there?—I should say probably there would be. I think the working classes would be more thirsty in very hot weather.

10799. But in very hot weather they would probably take less stimulating drinks?—Although much spirits is consumed, practically the drink of the working classes is beer. It may be generally stated they do not drink much water.

10800. Is beer itself the cause of much alcoholism? Is it not more spirits which is the cause?—I think that women in proportion to the men drink more spirits, but the chronic indigestion from beer drinking is very common both in men and women. Beer drinkers are liable to a kind of acid fermentation with gastric catarrh, in consequence of which they are often unable to take food, and what they take is indifferently assimilated. This leads to ill-nutrition and to deterioration generally apart from special symptoms.

10801. Then you deal with the admissions into Claybury?—Yes, and I have referred to the relation of alcohol to general paralysis of the insane, which is an absolutely fatal disease. It is now generally accepted by medical men that syphilis in some form is the cause or the main cause of general paralysis; but there are some cases in which it is really absolutely impossible to get either a history or evidence of syphilis, and in these it may be that the syphilis was that of the parent. Even then the relation of alcohol to it is the same, for the loss of self-restraint induced by alcohol is a condition favouring to acquiring syphilis. It is somewhat interesting in this connection that of 296 male patients received into Claybury Asylum in 1903, forty cases being a proportion of 13·5 per cent. were general paralytics; and of 311 female patients fifteen cases, a proportion of 4·8 per cent. were general paralytics. These are the records of cases from London, the centre of civilisation so to speak, and they are higher than the percentage given for the whole of England and Wales, which includes rural as well as urban districts. Further, of the total male admissions 37 per cent. gave a history of drink, and among these the proportion of general paralysis was no less than 20 per cent. as against 13·5 of the total male admissions, showing the incidence of this fatal disease to be much higher

among those in whom there was a previous history of alcoholic indulgence. Also among the drink cases in women general paralysis occurred in the proportion of 12 per cent. as against 4·8 per cent. of the total female admissions. These facts indicate very strongly to my mind that drink is favourable to the cause of general paralysis.

10802. Should you say there was more general paralysis now than used to be the case?—My belief is that there is more, but the apparent increase is in part doubtless due to the fact that it is more accurately diagnosed.

10803. Cases are attributed to it which were previously overlooked?—Yes; and certainly among medical men in ordinary practice there is not sufficient special knowledge through practical experience among insane persons to enable them to diagnose these cases in the early stages. In consequence of this, cases are not infrequently sent for treatment into asylums as epileptics whose seizures indicative of their disease were those of general paralysis. Already the career of the medical student is much overburdened with detail but some of this might be thrown over to gain a practical knowledge of insanity.

10804. Are the seizures of general paralysis occasional?—They are occasional, very much like epilepsy. It really requires some amount of medical education to diagnose them.

10805. You say it is a disease without hope of relief, but surely if it is only spasmodic in its occurrence it cannot be said to be hopeless?—The disease runs a special course, and in this course certain seizures take place. These are only evidence of certain brain disturbances. They are outward manifestations of an internal affection of the brain, inflammatory in character and progressive in its march. The physical and mental deterioration proceed definitely throughout, but as an expression of occasional exacerbations, these fits occur, but unlike epilepsy when the mind may be clear and the health good during the inter-paroxysmal periods there is no alleviation in general paralysis. The disease lasts a year or two years or more, but during this period there may be a series of convulsions much like epilepsy, but the convulsions are those of general paralysis, and there is no relief.

10806. Those would be practically incurable?—Yes, I think absolutely incurable at present.

10807. These attacks become more frequent in number and more severe until total paralysis ensues?—Not quite that; the attacks are the result of a gradual inflammation of the brain and its membranes and some cases of general paralysis may escape these altogether. They are epi-phenomena, and the disease goes on, but not evidenced in all cases by convulsions. I have stated that the disease is especially one of soldiers and sailors. Of the total male cases admitted who were suffering from this disease the occupation in 40 per cent. of these was that of a soldier or a sailor and this in equal proportions; that is, taking the statistics of the Claybury Asylum during 1903.

10808. (*Colonel Onslow.*) Forty per cent. of soldiers and sailors actually serving, or ex-soldiers and sailors?—Some serving and some who have completed their time. I have had some who have been invalided whilst on service and who are still among the reservists.

10809. They are invalided from the Army?—Yes.

10810. Can you discriminate between the Navy and the Army?—No. I get comparatively few naval sailors in the asylum, and I mean sailors generally as belonging either to the Navy or to the Merchant Service, but soldiers I take as service men. I have the last published statistics of the Yarmouth Royal Naval Hospital for lunatics, which has accommodation for 227 patients, and of the 157 then in residence 16 per cent. were cases of general paralysis, whereas 40 per cent. of all the deaths were deaths from this disease, which shows a very high percentage of general paralysis. The Royal Military Lunatic Hospital at Netley has accommodation for eighty-seven patients, but the admissions into this hospital for one year amounted to 442 patients, which shows that they probably change the whole of their population five or six times over every year. Of the deaths in one year at this hospital no less than 25 per cent. died from general paralysis, and I receive a fair number of soldiers into Claybury Asylum as reservists or pensioners and who are general paralytics. As a general statement it may be

taken that general paralysis takes about fifteen years to develop after the onset of syphilis, that is ordinarily speaking, so that a certain number of soldiers would be admitted into the asylum as ex-soldiers, i.e., after their time had expired or during the period of their reserve, and military statistics would not include these, nor probably all those who would be admitted into the public lunatic asylums.

10811. (*Chairman.*) Is that experience representative of most of the hospitals in the country?—It is the general experience, I think.

10812. There is nothing special in the character of the patients treated at Claybury which would make that exceptional?—No. But in regard to the effect of their treatment. Alcohol as a cause of insanity in some cases tends more or less to evaporate as it were, and these cases make a temporary recovery but their condition is always unsatisfactory. They are so unstable that they often soon relapse, and furthermore I have no doubt that drink induces a feebleness in the descendants of these, and that the children of drunken parents become affected.

10813. How far could those effects be got rid of by proper treatment in the case of the children: are they bound to carry those effects to the grave and transmit them to their offspring, or is there some hope from remedial measures in their case?—I think the effects may be very considerably modified in the offspring by the influence of a new environment, and much may be done to assist the elimination of alcohol in the parents by better surroundings and treatment by abstinence. In this way the effects of the alcohol taken by the individual may be modified and to some extent the alcohol itself eliminated.

10814. You mean alcohol taken themselves, not transmitted?—That is so. As to the transmission of acquired characters may be mentioned some very interesting unpublished experiments by Dr. G. A. Watson, of the Claybury Laboratory. He used *ricin*, which is a globulin obtained from the castor oil seeds and which is I believe the most poisonous vegetable substance known. He injected it into guinea pigs which were allowed to breed. The immediate offspring of these guinea pigs were immune to 1,000 lethal doses of *ricin*. Analogically one may reason that there is something similarly transmitted in regard to alcohol or any other poison, and if anything can be done to modify the self-poisoning which occurs when people drink to excess, it must of necessity have a good influence upon the descendants. I think in this respect that the poor often drink to get the effects of a good meal. They mistake the feeling of stimulation after alcohol for the feeling of nutrition.

10815. It gives them a sense of having a good meal?—Yes. It gives them the sense of having had a good meal, but a good meal is expensive to obtain. It is also more difficult to prepare, it gives more trouble to select, to cook and to serve. The poor do not like trouble any more than the rich, although I think that the rich drink from quite other reasons, and the one which seems to me chief is the æsthetic reason. They drink for artistic effects, drink for them makes a good meal a better meal. I think that women are greatly responsible among the poorer classes for the excessive drinking among working class men, and it is an interesting fact that of the women who were admitted into Claybury during 1903 suffering from the insanity of drink, no less than 80 per cent. were married, and many had families dependent upon them; also, a large number, 36 per cent., when the birthplace could be ascertained, were country born. I feel very strongly indeed that the circumstances attending town life weakens the physique and the self-restraint of people who live in the slums.

10816. You have no evidence as to the age at which these women entered the town?—I know the age at which they are admitted into the asylum, and I have found this to be mainly between twenty-five and thirty-five among the women, and thirty-five to forty among the men.

10817. Do you know the age at which they entered the towns?—I have no statistics on that point.

10818. Do you think that the effect of town life upon adults is to reduce their power of self-restraint?—Town life induces artificial desires, and there is less force from public opinion upon the individual in towns than there is in the country; moreover, the life of many women in the

towns is a dull and monotonous indoor one and women reacts sooner to the evil effects of drink. I can speak from actual experience of some of my own country men and women who have come to London. In Wales they attend their little conventicle, and at first in London they attend a Welsh chapel. Gradually this is given up, the husband finds the effect of stimulant an agreeable one, and one which dulls his sense of mental pain. He goes into the public house, but his wife at first remains outside, eventually she joins him inside and this is the commencement of a down grade course.

10819. They are not traceable by their friends and relations, and, therefore, they do not care?—The weight of public opinion does not act upon them as it did before, and they become indifferent. Of course the quest of pleasure is more acute in town than it is in the country, and it is also easier for them to get drink as there are more public houses open to them.

10820. And drink is an important element in the pursuit of pleasure?—It enables them to gratify that want. The feeling for a time after drink is one of well-being and exaltation, and no doubt it is a pleasurable one.

10821. I suppose the life of pleasure seeking is a very exhausting one, and leads to recourse to stimulants?—Yes. Pleasure becomes a want in the towns and there is a consequent enervation as a reaction to pleasure which certainly leads to the taking of stimulants. This further results in the neglect of the family and the home. I have frequently been struck with the ill-nourished condition and the ill-clad look of the children of parents suffering from alcoholic insanity. These are general impressions and I am aware that many of these facts are not definitely measurable and cannot be put into statistics.

10822. That is an index of the class from which the patients come?—And also the condition they get into. They themselves and their offspring are feeble, attenuated, and in poor general health and condition.

10823. Do you think there is a serious increase of alcoholic insanity in women?—I think it is distinctly on the increase. My experience of a quarter of a century ago leads me to believe very strongly indeed that insanity from drink in women is much more marked than it used to be. There is a physical condition which makes it easy to diagnose—they suffer from peripheral paralysis much more commonly than men. My experience is that these local forms of motor paralysis are much more common now in women than they used to be.

10824. (*Dr. Tatham.*) Do you mean peripheral neuritis?—Yes.

10825. (*Chairman.*) To what do you attribute the increase of alcoholism in women?—It is very difficult to say, but my impression is that grocers' licences have had something to do with it. They can get drink in their homes which they could not otherwise get without going to public houses.

10826. You think, to some extent, it is due to the strain upon their physique of factory employment?—Yes.

10827. You adduce certain facts in Nottingham which seem to bear out that view?—Yes. With regard to factory work, I have taken the employment of many of these women under my own care. They are box makers, envelope makers, feather curlers, French polishers, factory hands, leather stitchers, packers, weavers, etc. Those are largely factory hands, and 37 per cent. of the women admitted were single. The factory girls have more pocket money to spend when they begin to work; they have little to occupy their mind in a rational manner. They often live in apartments when single, and have no time to prepare food, or knowledge to guide them. When married they arrange to have no children—that is very often the case. It struck me very much how infertile the patients in Claybury are, compared with the general population.

10828. By design or accident?—It is difficult to say which, but I believe that design has a good deal to do with it.

10829. Do they take drugs?—No. I think the temptation to be without children is a selfish and a financial one, and the means openly advertised in many shop windows in London to ensure this must appeal to them. The man earns money, the wife earns a little, and together they are able to keep themselves fairly comfortably.

Dr. Jones.

Dr. Jones. The women without encumbrance are able to accompany their husbands in their pleasures, when drinking is the principal occupation of their leisure. Dr. Arthur Shadwell recently presented some interesting statistics in regard to this aspect of national degeneration. Some time ago he also investigated the Scandinavian system of licensing.

10830. Is that referred to here?—No, I do not refer to it.

10831. (*Colonel Fox.*) You mean the Gothenberg system of licensing?—Yes.

10832. (*Chairman.*) In Nottingham there is a good deal of alcoholic insanity?—Yes. I take these statistics from the Blue-book of the Lunacy Commissioners' Report, and they indicate what are the statistics of asylums generally. It struck me very much that the same condition of factory life obtain in Nottingham. There is more insanity from drink, which corresponds to the higher average of Claybury, which is the territorial asylum for the East End of London.

10833. You note a very high proportion in an asylum near Glasgow—there is a good deal of factory labour there?—Yes, but all statistics are controlled to some extent by the personal element. The experience in both these localities where there is women labour corresponds to my own.

10834. That factory labour does tend to alcoholism and to insanity as the result of it?—Yes. Their life is more assimilated to that of men, and they take their pleasures and their entertainments in the same way.

10835. And perhaps their organisations are not so strong, and therefore they suffer more?—Quite so, as may be noticed in the rural districts of Kent and Cornwall, where life is simpler, where also there is less excitement, and where there is no lowered physique from excessive drinking.

10836. Where there is much less lunacy?—From drink, yes.

10837. Then you refer to the loss to the community through alcohol?—Yes. I regard alcohol as perverting the moral nature. There is no doubt to my mind that that is so, that it affects the higher states of consciousness, attention, judgment, and discrimination, and it certainly affects the memory.

10838. And it enfeebles the will, I suppose?—Yes, it enfeebles the will. The impairment of memory makes it very difficult for these people to look after their children if they have any, and there is no doubt the children are very much neglected.

10839. It must be a great loss to their employers also?—Yes. With regard to skilled craftsmen, I have noted the occupation of a few under my care. They are mathematical instrument makers, turners; carpenters, joiners, draughtsmen, barometer makers, tailors, watchmakers, printers, file cutters—these men are unable to do any fine work afterwards. They probably sink to a lower grade. They have lost their special skill owing to the affinity there is on the part of alcohol for the highest developed motor aptitudes in the nervous system.

10840. Are they specially addicted to alcohol?—No, but alcohol affects them much more than it would an unskilled craftsman or unskilled mechanic.

10841. It affects the higher class of workman more than it does the lower?—Quite so. With regard to the effects of alcohol upon the descendants, I think I have covered that. There is no doubt in my mind there is a transmitted structural defect through alcohol.

10842. You think there is no chance of recovery in the child? Does it transmit the taint to a third generation?—No, I do not think that. I very strongly believe in the influence of environment, and I have interested myself very much in Dr. Barnardo's Home, which is close to Claybury. There are 1,000 girls there in the village colony and I may quote this from Dr. Barnardo: "My general experience tends to impress this one particular line of thought upon me—I have referred to it elsewhere—that apparently where drinking had begun with the parents of a child prior to its birth, where such drinking had become habitual and had been long continued, the effects seen in many ways on the child's organism were not necessarily permanent. But if the child is placed early enough in a healthy environment, the inherited evil

tendencies and effects appear to diminish year by year. Where, however, drinking began two or three generations ago, say with the grandparent or great-grandparent, so that the child inherited a tendency to deterioration as the result of two or three generations, then the evils manifested were much more permanent, powerful and much more deteriorating."

10843. What age would be sufficient to give the child a chance of recovering?—From my own experience I have examined cases as they came in at seven years of age, and I have been surprised to see so many of those children with enlarged glands and with discharges from the ear; some were unable to wear shoes and slippers owing to chilblains; others had narrow deformed palates. The same children were kept till fourteen years of age and the results were marvellous. I was quite unprepared for them. I know the results of heredity, and how you can very often tell the relations of the patients when these visit the asylum without being previously informed of this from their great resemblance to each other, and although I am a great believer in heredity, yet I cannot help believing more in the great influence of environment.

10844. The period you mention is more or less coincident with the entry of children into school and, therefore, would be a very favourable time for taking stock of the rising generation, and from that point of view you would strongly approve of the medical inspection of schools, so that children of this debilitated type might be got hold of and some effort made to improve their environment?—Precisely so, and I have been greatly struck with the value of the data furnished by Drs. Matthew Hay and Leslie McKenzie, whose investigations in this direction formed the basis, if I may say so, of the conclusions of the Physical Training (Scotland) Commission—a most valuable work.

10845. You attach great value to a system of anthropometric survey?—The greatest possible value. There are practically no statistics of this nature to work upon at the present time, and the need for such a basis is a great want.

10846. You think that is so?—Yes, but I do not think that teachers are the proper persons to carry out these investigations, although this has been suggested, for the details are extensive and they imply accurate measurements and much comparison.

10847. If they are employed to any extent it should be under the most careful medical supervision?—Certainly under special supervision. I do not think, for instance, that a medical man engaged in his own private practice could do it. He has not the time. I also believe it better not to give it to a great number of men, such as, for convenience, medical men who live in the proximity of the schools. The person appointed should devote himself entirely to the work, and if he had one, two, three, or four inspectors under him, these could do the work in a very large town and could collate the information obtained if specially qualified and with the least possible error from the personal equation.

10848. Who are specially selected for the task and who will devote their whole time to it?—Yes.

10849. But you think the results of such an investigation, properly conducted, would be invaluable?—I think they would be invaluable, and this is not my own opinion, but that of all who have taken an interest in the subject of deterioration. I should like now with your permission to answer a question in regard to phthisis, put by the chairman to Mr. Eccles, but only in so far as this pertains to asylums. Dr. Tatham is fully conversant with some statistics collected and published by the medico-psychological association with regard to the prevalence of phthisis in asylums for the insane. These pointed out that there is a good deal of this preventable disease in asylums, and that the ratio of phthisis deaths to total deaths is higher in asylums than it is in the general population.

10850. (*Dr. Tatham.*) Cases to deaths?—No. Deaths from phthisis to total deaths from all causes. In the general population the proportion of tubercular deaths to the total deaths is 10·40 per cent. In the asylums of England and Wales generally for 1902 it was 17 per cent., but the ordinary mortality in asylums is much higher than in the general population, and so the total deaths from phthisis would also be much higher, I believe it is ten times higher, but the relative proportion of deaths

from phthisis to total deaths in asylums is really not so high as is generally believed. In 1903 at Claybury this proportion of phthisis deaths to total deaths was very low, only 11 per cent. as compared with 10·40 in the general population, and some have come into the asylum with phthisis which healed there.

10851. You think it is only a small difference?—I think it is smaller than anticipated, but cases of phthisis in asylums occur to a great extent from among those patients suffering from the varieties of alcoholic insanity, such as forms of melancholia and dementia. Of the male deaths from phthisis at Claybury in 1903, 44 per cent. were from drink cases. Of the females 33 per cent. were drink cases, and in the total cases of phthisis deaths, there was a heredity of drink. Phthisis or insanity in 56 per cent. With regard to deaths from intemperance, although there is a less total amount of drink consumed in this country now than of late years the deaths certified through intemperance as published in the mortality statistics have increased considerably. Since 1877, more especially, is this the case among women and I believe by over 40 per cent. among men and over 100 per cent. among women.

10852. The great difficulty we have to encounter as you will probably know is that it is difficult to get medical men generally to certify intemperance as the cause of death. I need not go into particulars as to why that is; as a medical man you know how difficult that is. Therefore the statistics with regard to the mortality from intemperance at any rate are most untrustworthy?—Quite so.

10853. It is therefore from statistics such as you are presenting to the Committee that we hope to get much more useful information than from the mortality statistics?—Precisely, and a great part of the consumptive death rate is from cases of alcoholic insanity—a rate among this class which is much higher than among the general population.

10854. And amongst this particular class of patients do you think tuberculous phthisis is increasing?—It is very high. It is very much higher among alcoholic cases than any other form of insanity; I am sure of that.

10855. And alcoholic cases of phthisis I suppose are much less amenable to treatment than phthisis occurring in other persons?—They are much less amenable to treatment.

10856. Then again as regards phthisis among general paralytics, is it notably more prevalent amongst them than among the general population?—Much higher than among the general population. During the demented stage such patients are very liable to all forms of lung trouble, bronchitis, pneumonia, gangrene, and so on.

10857. I understood you to say that many of your patients go into the asylums actually suffering from phthisis?—Some do.

10858. Which has been contracted outside?—Yes.

10859. With regard to the relation of syphilis to general paralysis, do you think it more generally follows the acquired form of disease or the hereditary form?—Much more the acquired. Juvenile general paralysis due probably to hereditary syphilis is comparatively rare and was not diagnosed until some few years ago.

10860. Do you think that whether or not a case of syphilis has been properly treated will determine whether or not general paralysis will follow?—I am afraid that is the view, that if syphilis has been properly treated it is something beside syphilis; it is really the result of the syphilis but it does not yield to ordinary anti-syphilitic treatment.

10861. It is syphilis plus something else?—Yes, plus some toxin; it is para-syphilitic rather than syphilitic. I think possibly the toxin may predispose and that stress of some kind may bring on general paralysis, more likely of course in the person who has acquired syphilis.

10862. It has been stated that amongst several of the coloured races where syphilis is very common, general paralysis is by no means common, but is rare; can you explain why that should be so?—I should be rather inclined to question that statement, judging from Dr. Warnock's statistics of the Cairo asylum, where he has to treat Nubians and people like that; he appears to state

that it is not at all uncommon among the black races of the Soudan.

Dr. Jones.

10863. With regard to alcoholic insanity among women is that always fatal or does it yield to treatment?—In many cases it yields to treatment and the patients get well and go out again. I think there is no poison like alcohol for devitalising the nervous system. There is a something lost; they have not the same inhibition, the same self-restraint afterwards. It is a very common form of recurrent insanity.

10864. With regard to the effect of either or both the parents being alcoholic in producing imbeciles and epileptics, will you kindly give us what you have to say upon that?—I was formerly medical officer at Earlswood Asylum, where imbeciles and epileptics and mentally deficient children were received. My experience leads me to think that the condition of imbecility is a somewhat complex one. I should not like to say very definitely that drink in either parent would cause imbecility. There is no doubt that it devitalises the parent, and anything which devitalises the parent does tend to affect the offspring. But I think it has been very well summarised on page 21 of the appended report by Dr. Shuttleworth and I agree with his remarks: "That intemperance *per se* is not so large a factor as has been sometimes assumed in the causation of congenital mental defect; but that in combination with other heritable taints (*e.g.*, tuberculosis, neurotic, insane, and syphilitic), alcoholism is a prevalent though not altogether predominant cause of idiocy, imbecility, and feeble-mindedness." I think that is very temperate and as near as one can go. I agree that intemperance on the part of the mother appears to be more commonly assigned as a cause of imbecility than intemperance on the part of the father.

10865. With regard to epilepsy?—As to the fact that alcohol does cause epilepsy, not in children but I mean in adults, I have had repeated examples of cabmen who have lost their licence through drink and become insane, and have come into the asylum where no drink is given, and have recovered and have gone out. So long as they keep from drink they are all right, but as soon as they take drink, epilepsy comes on and they return to the asylum. It is not an infrequent experience that alcohol is a very definite cause of epilepsy. Alcohol does cause grave pathological conditions in the nervous system, and epilepsy is merely an outcome of them, an expression of them.

10866. With regard to nervous instability; you have mentioned the effect of either or both of the parents being alcoholic in producing that?—Yes, neurotic, thin, and ill-nourished children. That is very marked when the children of these people visit them at the asylum.

10867. (*Colonel Onslow.*) Is lunacy on the increase among the population?—I think there is a disposition on the part of the Lunacy Commissioners to deny that, but I cannot help feeling myself—and I have been in very close touch with lunacy for twenty-five years—that lunacy is on the increase. It is not exactly an impression—I feel very strongly that it is so.

10868. Is it the fact that cases are now certified which twenty or thirty years ago would not have been certified?—There is no doubt that there is more registrable lunacy now than there used to be, but I do not think that is quite a guide. I think the guide is mostly from the practice of alienists that there is more neurosis, there are more cases on the border line of insanity that really do not become registrable insanity unless there is something to precipitate it. There is far more neurosis generally in the practice of alienists than there was, and a larger proportion of cases which exhibit what is called "psychic trouble," cases which are really outside statistics, but which are evidenced more especially at the physiological crises such as puberty, childbirth and even the onset of the climacteric period in both men and women. These so-called "periods" cause many of these unstable and nervous people to be stranded. More, I think than ever occurred before in past years. Moreover, I think statistics show that there are more first cases of insanity, not recurring cases but first cases.

10869. I suppose that in addition to that insanity brought on by drink in some form would also show a tendency to be on the increase?—Undoubtedly.

Dr. Jones.

10870. In reference to your remarks about soldiers and sailors, I have no information at all about the Army, but with regard to the Navy the number of cases treated for alcoholism, nervous diseases, mental diseases, and so on, are very small; therefore I was surprised to gather that you thought they were considerable?—I have referred to a certain form of incurable insanity, viz., general paralysis of the insane, as showing an exceedingly high percentage in both soldiers and sailors, and I have associated the special cause of this disease, viz., syphilis, with the loss of self-restraint caused by alcohol. When referring to sailors I referred to all marines.

10871. You do not mean the actual Royal Navy?—No, but I have quoted the statistics of the Yarmouth Royal Naval Lunatic Hospital as given in the report for 1903 of the Lunacy Commissioners to the Lord Chancellor as supporting my statement in regard to this special form of insanity.

10872. The admissions to the Royal Naval Hospital Yarmouth are not confined to the active list by any means?—I suppose not.

10873. There were only 165 patients in one year altogether—that is 1902, the last report; there were 172 in 1901; and 183 in 1900. That is going down. Then, again, take these cases of alcoholism—the number of cases, the number invalided, and the numbers of those who died in the Royal Navy; the average strength has varied from 99,000 to 120,000 altogether on the whole Navy, and the numbers have been from alcoholism, in 1900, ninety-two cases; in 1901, eighty cases; and in 1902, seventy-seven cases; numbers invalided, in 1900, two; in 1901, none; and in 1902 none. Numbers who have died, in 1900, four; in 1901, two; and in 1902, one.—That seems a very small number?—I do not think that you can take the statistics of this hospital as a reflection of the total illness that occurs in the Royal Navy. Moreover, the statistics of the Royal Naval Lunatic Hospital in respect to lunacy would probably be below what actually occurs, as all cases of occurring insanity would not be sent there, but some would be sent direct to the county or borough asylum of the particular parish to which, when the settlement has been accepted, the patient would be chargeable.

10874. I was really referring more to the effect of alcoholism on men as producing mental diseases?—Are those lunacy statistics?

10875. No, these are simply the Medical Registrar General's Annual Report of the different diseases treated in all ships and hospitals of the Royal Navy during those years. The numbers there appear to be so small that when I read that account of yours I looked these figures up. Now, if you will turn to the nervous diseases just below, you will see the numbers are in 1900, 867; in 1901, 846; and in 1902, 881; mental cases, 147, 140, and 155. Taking the diseases, syphilis, primary and secondary, and gonorrhœa, we have the following figures:—first, taking primary and secondary syphilis together, we have in 1900, 5,543; in 1901, 5,403; and in 1902, 5,530. Those are cases?—It is fairly constant.

10876. Out of those there were 168, 165, and 167 invalided, and three, four, and two died. Then from gonorrhœa, 5,597, 5,790, and 5,951; invalided, fifty-one, fifty-four, and fifty-three?—It is very constant. These are gradual rises—158, 165, and 167.

10877. The total strength has gone up from 99,000 to 127,000, and these refer to all classes—officers and everyone?—Yes; but it is significant that at the Royal Naval Lunatic Hospital at Yarmouth, of the deaths that occur, there is a higher percentage, viz., 40 per cent., due to general paralysis than occurs in any asylum in the country; that is, of the form of insanity which is at present incurable and absolutely irrecoverable. There is also an exceedingly high percentage, 16 per cent., of cases of general paralysis among those actually in residence and under treatment.

10878. These particular cases, alcoholism, syphilitic diseases, and nervous diseases, would all point rather to the theory that alcoholism and mental defects had a great deal to do with each other?—Yes, they certainly have a very intimate relation to each other and a very high percentage of insanity is due to alcoholism. The statistics you have quoted show that alcoholism itself is a fairly constant factor.

10879. It is rather on the wane than otherwise, on the whole?—It may be so in the Navy, but the two services show a very high percentage of general paralysis and especially is this the case among sailors generally.

10880. (*Colonel Fox.*) You have said that the excess of alcohol drinking, especially when the stomach is empty, is one of the main causes of both physical and mental degeneration amongst the lower classes?—I say that the chronic form of indigestion due to drink is a very common element, I should say the most common cause of mal-nutrition among beer drinkers.

10881. It is one of the causes of both physical and mental degeneration in the lower classes?—Certainly, I believe so.

10882. Can you suggest any practical remedy for that?—I think to a great extent you can make men and women sober by Act of Parliament, and legal enactments to some extent will do this, but you may carry restrictive legislation too far, and thus encourage clandestine traffic in drink. The Chairman referred to the notification of contagious disease, you may by notifying defeat your object.

10883. I was speaking more of drink?—I think the same applies to drink. The main point lies in education, especially the education of women, who should be taught how to choose and cook proper food. If the poorer classes were better and sounder fed there would be less drinking. Education might also include a fuller knowledge of alcohol, and that it is not a food. The food question is certainly to my mind very important. I have visited places in remote country districts as well as in congested metropolitan areas, and I have seen provision shops retailing tinned rabbits, tinned fish, tinned vegetables, tinned milk and even tinned "madeira" and other cakes, most of which could be served fresh and clean locally by the house-wives. However good tinned food may be from certain places, it is not of the very best quality for the poor, it is often prepared from poor material, under insanitary conditions and is most often sophisticated with chemicals, which, if not deleterious in small quantities, have certainly been found injurious when long continued.

10884. Do you not think that the working classes are driven to drink owing to their being no other places of attraction for them but public houses where nothing else is sold but alcohol?—I am perfectly sure that many of the working classes go to public houses to get their comforts in the way of light and warmth, and to enjoy a club life, and they would not be induced to drink to excess if proper food were sold to them with drinks.

10885. With varied drinks?—Yes, such an arrangement would greatly tend to modify the evil from alcoholic drinking.

10886. Where they could get beer, coffee, cocoa, and so on—not to draw a line at any particular thing?—Precisely so.

10887. Would not that have the effect of making them much more sober, and start that fashion among them?—Such opportunities would have a very great effect in this way. I believe an out-door life to be a condition favourable to temperance, such as is obtained by athletic and other clubs. I also think the bicycle has had a very beneficial effect this way. It would be a great thing to set the fashion so as to help the people to acquire modified tastes in eating and drinking.

10888. (*Chairman.*) You want the restaurant to supersede the public house?—Quite so.

10889. (*Colonel Fox.*) Going away from the question of alcohol, and turning to the question of the feeding of infants, Mrs. Greenwood, who is one of the lady sanitary inspectors at Sheffield, when giving evidence before the Committee, said that a very large proportion of mothers in that town suckled their children. I see in a lecture which you gave a short time ago on physical and mental degeneration you quoted a statement made by a Sheffield medical officer in which he said that in that town only one in eight of the infants is brought up at the breast. Are you satisfied that that is actually the case, because it was rather disputed when Mrs. Greenwood gave her evidence?—Since I came into this room and you have shown me the special paragraph referring to this, a doubt appears to be thrown upon the statistics I quoted. They are not my own figures and they were made upon the authority of a medical observer. They had not been disputed to

my knowledge and I had taken no personal steps to verify them. I certainly think there is a disposition among certain communities, and statistics support these figures, more especially among those engaged in textile industries to evade the proper duties of motherhood.

10890. (*Chairman.*) It was suggested that that discrepancy might be reconciled by the fact that different periods after childbirth were taken as the basis of the investigations. Mrs. Greenwood's figures might have been on facts collected two or three months afterwards, whereas yours might have been on statistics collected five or six months afterwards?—The statistics I quoted were asquiesced in at the time, although there were present at my lecture those who were in a position to question their accuracy.

10891. Am I to gather from what you said that you are not quite so satisfied in your own mind of the expediency of making syphilis a notifiable disease as Mr. Eccles was?—I am not quite so emphatic upon the value of the recommendation, and I think it behoves me to be very careful in urging such a course. Syphilis is a foul and loathsome disease; it implies a breach of the moral laws, it is indicative of a weakened self-restraint and public knowledge of such a disease will cause shame and reproach. The victim of such a disease, if the fact were known to his employers, would probably lose his vocation, and for fear of such consequences he will refrain from coming under treatment, or will consult quacks, who are unable to give him proper treatment, but will preserve silence and take his money. In consequence of this neglect of treatment the ravages of syphilis will probably work more havoc than they have ever done before and the victim may communicate the disease in a malignant form to innocent persons.

10892. Do you not think that the consideration which you expressed or rather hinted at would act as a most powerful deterrent—that he might lose his employment and so on if he announces the fact that he had a disease of that character?—I think it might certainly prevent his coming under treatment, which is important to consider. I am not in favour of Lock Hospitals for dealing with these special cases. I should very much prefer that every general hospital should deal with these cases.

10893. We have been told there is very inadequate hospital accommodation for such class of cases?—The great majority of such cases are out-patient cases who come to the hospitals for medicine and applications.

10894. We have been told so by everybody who has spoken on the subject—Sir Victor Horsley and Sir Alfred Cooper among others?—My opinion is that any special accommodation which such cases may require should be provided for by general hospitals and I think could be, for some hospitals do it. Those who attend at a particular hospital for this purpose do it more or less clandestinely, and they have to be very careful for the reasons I have already advanced, but they can go to a general hospital without such fear of the consequences.

10895. I think they said the accommodation at large hospitals was inadequate?—That was the opinion expressed by the Conference of Medical Men in Brussels some time ago—that it was important that there should be every opportunity for treating syphilis and that medical officers should make it known that even after a workman has come home from his work he should be able to be treated in the general hospitals, and not as now between certain hours.

10896. You do not deprecate its being made a notifiable disease, but your mind is not quite made up?—I am not so emphatic as to the advantages as Mr. Eccles is.

10897. With a view to making mothers understand the nurture of children, and household management, do you think the attendance of girls at continuation schools, with special regard to such subjects, between the age of leaving school and seventeen, would be a useful thing?—I think it would be most useful. I think this a very important and necessary part of their education. If you educate girls at this age it is a period in which they will take most interest in the subject, but I think the technical training now given is above them. They should be taught what to do with the after-joint, *e.g.*, bones, scraps, and such like. At present many of the poor have not acquired the taste for soup. They want to have the fashion set in it, so to speak, and be taught how to make

savoury and palatable food with the remains of a meal, and with different vegetables. They are not resourceful as to food, and they do not know the qualities of food. This is the proper age to teach them how to bring up their young, for they could apply their teaching to younger members of the home circle. It is surprising how forgetful children are. In some districts in Suffolk when the boys who had reached the required standard were withdrawn from school before they were fourteen, they were found unable to read at eighteen. The training as to domestic work is not to be done at school, but after school.

10898. The ground work might be laid at school, but the superstructure must be built in later life?—Quite so.

10899. Do you think it would be imposing too heavy a burden upon the constitution of factory workers to require them to attend two hours a week? I think could be made so interesting that it might be a pleasure to them.

10900. It might prove recreative?—Yes.

10901. Then with regard to the increase of insanity, which Colonel Onslow asked you about: you are inclined to argue that insanity is increasing because of what you hold to be the increase of those nervous conditions which place people upon the border line of insanity?—I think that is so.

10902. You said there were more cases which came under observation?—Yes, I think there is more general deterioration. That is my firm impression.

10903. Would not the fact of these neurotic coming under observation and under treatment tend to prevent their becoming insane, and to that extent arrest the progress of lunacy?—Do you suggest any special way of dealing with them other than the present?

10904. No, but the mere fact of their coming under treatment would tend to arrest the development of their neurotic malady in the direction of lunacy, would it not?—Yes. This is quite true and an important factor, which has lately been realised more fully than before, as it is in the early or incipient stage of insanity that the disease is most amenable to treatment, I think this is of great weight, as the prevention of insanity is on all issues more important than its cure. Several of the metropolitan hospitals have established special departments, presided over by physicians experienced in mental diseases, where such persons can go for advice as to the ordering of their lives and to practice such precautionary measures as are suggested to prevent the occurrence of insanity. Some public asylums in some of the counties, notably that under Dr. Bevan Lewis, of the West Riding Asylum, give advice and medicines free to those threatened with an attack of mental breakdown.

10905. If that system were generally adopted it would tend to arrest causes of insanity?—I think it would both directly by the treatment of individual cases and also indirectly by calling more attention to the subject.

10906. Is not the supposed increase of insanity to some extent a statistical increase? A great number of cases are dealt with and are cured, and then after a time re-admitted, so that the re-admissions of the same cases appear in the statistics as if they were fresh cases?—My answer to that is that there is more first-case insanity than there has been.

10907. There have been a great many cases treated as first cases which are merely renewed attacks, have there not?—I believe this error to be quite the exception. Of course when nothing is known of a person who is alleged to be a lunatic, and he is brought into the asylum, it may be that for a time he is looked upon as a first case, but probably before long information is forthcoming as to his antecedents, and this would be properly incorporated in the annual returns. Even in London with so many foreigners there are not many whose antecedents do not eventually come to light in this respect or the person be able himself to give this information. Moreover, the statistics of all asylums divide their cases into first, second, or third attack, and when this is unknown it is so stated.

10908. Are they not all classed as admissions in the general statistics?—Yes, as general admissions, but there is this further sub-division, which, when the statistics of all asylums are published in the report of the Com-

Dr. Jones.

Dr. Jones. missioners to the Lord Chancellor, enables the information to be given as to the increase or not in first cases.

10909. You can divide them ?—Yes.

10910. The general result of your evidence is that the abuse of alcoholic stimulants is one of the most operative causes of physical degeneration generally ?—Yes. There is no poison that I know which is capable of inducing—either by alcohol directly or indirectly by un-excreted products—so much arterio-sclerosis, fibroid changes in the organs, and premature senility. By education you might get public opinion to look upon drunkenness more as a vice and a disgrace among the working classes—they should have a black list of their own, so to speak. Now a drunken man is really an object of hilarity and mirth and not a disgrace. If a healthy “public opinion” among the lower classes could be encouraged, as among the middle classes where the effect of social ostracism is more felt, it would help to cultivate a greater inhibition in regard to alcohol. There is certainly less alcoholic insanity recorded among the private class than there is among the poorer classes. Alcohol as a cause of insanity in the former is given as 18·5 per cent. for males, and 8·8 for females, as against the higher figures already quoted among the poor, and there is a less sacrifice of ultimate good for immediate gratification in the better educated. If it could be inculcated that the use of alcohol was a dangerous thing and an improper thing, and if a proper public opinion could be formed among the lower classes it would be certainly operative towards temperance.

10911. (*Dr. Tatham.*) With regard to preventive measures as exercised by the State on the population, are you in agreement with the general opinion expressed at the Brussels Conference that it is not desirable to extend the Contagious Diseases Act to the population ?—When in operation in garrison towns the Act was not a success; many reasons are given for this which it is not expedient that I should repeat here. Moreover, the recognition of vice as a necessity would be strongly

opposed from many quarters. I do not think repressive measures in regard to this question are practical, and I prefer to encourage what is possible, viz., a better knowledge in regard to the injurious agencies upon the individual and a cultivation of higher ideals, with an appeal to reason, self-restraint, and self-respect.

10912. Can you imagine any improved system which would be effective really in reducing the amount of syphilis amongst the population ?—If syphilis were notified it might work in this way, but I think it would prevent those affected by it from risking the penalty of publicity by coming under treatment. Even if you notified you could not prevent the conveying of contagion to another, and in any case such an allegation could neither be proved nor disproved. Prevention has not succeeded in those countries where it is made a notifiable disease.

10913. (*Chairman.*) Surely if they had to notify, there would be a penalty for neglect which they would hesitate to incur ?—If they refused to be treated through the fear of notification they would certainly spread the disease. You would also probably have a great class of quacks ready to levy mail upon the victims of secret diseases. It is a very large question, and I am not prepared to make an emphatic recommendation in regard to notifying.

10914. (*Dr. Tatham.*) Can you conceive any possible arrangement under which you might bring at any rate under observation those persons who are the subject of syphilis ?—Only if you made it possible that the person affected could be treated either by his own medical attendant or by any doctor whatsoever free of charge, but payment from the public purse would of necessity involve publication. I think that every general hospital should be free for the treatment of this disease at any time the sufferer can attend. I am for encouraging early treatment, and I believe if you make it a notifiable disease you run a very considerable risk of preventing the victims from coming under treatment at all.

SIR CHARLES A. CAMERON, C.B., M.D., F.R.C.S.I., called ; and Examined.

Sir C. Cameron.

10915. (*Chairman.*) You have been Medical Officer of Health to Dublin for a considerable period, have you not ?—Yes, for more than thirty years—a long time.

10916. And you have given a good deal of attention to the conditions that prevail among the population ?—I have, and generally on the subject of sociology.

10917. And you have come to the conclusion that there is evidence of some deterioration in the physique of the population ?—Yes, I believe that the physique of the population, taken as a whole, has undergone deterioration.

10918. Mainly owing to one cause ?—Nearly all to that cause.

10919. Is it the aggregation of such a large number of people in the towns ?—To the enormous increase, nearly a quarter of a million, every year added to the urban population, of England and Wales at least, and to the agricultural population either declining or remaining stationary.

10920. When you come to give those figures as to the shifting of the population and you mention the population of London has increased from 800,000 inhabitants in 1801 to nearly 7,000,000 in 1901 ; but that 6,000,000 or 7,000,000 is Greater London, which includes such healthy places as Wimbledon and Hampstead ?—Yes.

10921. But there are no two healthier parts than are to be found in Wimbledon and Hampstead, both of which are included in your area, and, *ex hypothesi*, are condemned as unhealthy ?—I mean as to the concentration of population.

10922. But you must make very considerable deductions from any general conclusions from that transfer of population ?—Yes, and I also acknowledge that in the outer ring there is a very large proportion of the population well-to-do, and they have every comfort and plenty of food, and good houses and live well.

10923. And that is also the case with the suburban working class population to a large extent ; it is not restricted to the suburban conditions of the better class, but also the conditions of the working class living in the suburbs ?—Yes ; making allowances for taking only the

4,000,000 of the more central parts, it shows that there is rather much more rapid increase in the suburban as compared with the rural population, in which practically there is no increase.

10924. But is it not the case that the death rate in London now is less than the death rate in the rural districts in the 18th century ?—Oh, very much. I believe that there is an improvement in the physique even of the town population.

10925. But of course there has not been such a large transfer of the population of the country to the towns in Ireland, has there ?—Not such a transfer of the population.

10926. You have only about four large towns in Ireland ?—That is all. There are only two towns over the 100,000 inhabitants in Ireland.

10927. This diminution of the rural population may arise from other causes rather than the transfer from the country to the towns ?—Yes, it may.

10928. Has not the increase of the population of Belfast been largely due to Scottish immigration ?—To some extent—not very largely. The greater number of the inhabitants of Belfast are not Scotch. In fact it is a comparatively small number. They are recruited from the northern counties of Ireland. There is a rapid growth of Belfast ; the population 100 years ago was not 40,000, and it has increased to nearly thirteen or fourteen times that in 100 years.

10929. What facts have you to lay before us as to the improvement in the physique of the town's people ?—Well, I attribute it to improved water supply, improved systems of main drainage and sewerage, and to better conditions generally from a sanitary point of view of the towns.

10930. I suppose the more careful attention that is paid to the conditions of factory labour would be one of the causes, would it not ?—I am speaking not with regard to Dublin, but generally speaking with regard to towns throughout the United Kingdom ; there are certainly very marked improvements under which the conditions of various factories are carried on, and markedly so.

10931. And I suppose there has been some improvement in the condition of the housing, has there not?—Very considerable improvement.

10932. Though it leaves room for further improvement?—Yes. And there has been a thinning of the density of the population in most of the towns.

10933. Would you say as regards housing Dublin is worse or better situated than the average large towns in England?—No. I think that Dublin has not a much denser population than any other English town. I think it is less dense over the whole area.

10934. But are there parts of it very densely populated?—The old city part of the town would be something like 65 to the acre, which is not so dense a population.

10935. Are there any quarters in Dublin which would come under the designation of rookeries now?—Many. Dublin is to a very large extent a decayed city. There is hardly any city that I know of that is placed in exactly the same circumstances. In Belfast I think the average number of persons per house is not much more than about 5·5, but in the City of Dublin it is about 12 per house.

10936. How many rooms do you suppose there are in those houses?—The number of rooms in a very large number of tenement houses varies from six to twelve. The larger number of tenement houses in Dublin were occupied originally by a single family, and now many of those houses are occupied by eight, ten, or twelve families.

10937. How many rooms to each house?—The number of families in one room in Dublin would be a little over 37 per cent.

10938. You have not 37 per cent. occupying only one room?—Yes.

10939. How many in a family under those conditions?—The average in Dublin would be 4·3 or 4·4; take it in round numbers at 4½.

10940. In one room?—Yes.

10941. And 37 per cent. of the houses in Dublin are so occupied?—What I said was that the average number of persons per family in the city at large would be that. Perhaps there would not be quite so large an average where the 37 odd per cent. are occupying each a single room, because a certain number would have only one person or two persons. The very large families would have to take more than one room, though many of them up to ten in number occupy a single room. Some of the rooms are of an immense size.

10942. Do the council in Dublin attempt to fix any minimum at which houses are considered uninhabitable?—We have not fixed that, which I think we ought to have done, the number of families in a distinct house.

10943. Do you require any number of cubic feet?—Yes. The usual cubic space is 400 cubic feet for adults and 200 for children.

10944. Are you right there? Is not pure air more important for children than adults?—It was the same as the original 300 cubic feet per person; and now we have made it 400 cubic feet for each adult and 200 for a child.

10945. Is that a sensible distinction?—We found it impossible to ask for a large amount of space on account of the enormous number of families living in those houses.

10946. You shrunk from it because of the difficulty of exacting the observance of proper conditions?—It would be better if each individual had 400 cubic feet, undoubtedly.

10947. But you have not attempted to say that any single room should not be occupied by more than three or four people or anything of that sort?—There are rooms of the tenement houses as large as this room. The houses of the nobility—some of them I think larger, as far as I can judge many of them, than the houses of the corresponding periods in London. The houses of the nobility were of immense size, with five and six windows in extent, and the rooms are as large and even larger than this, and they are now occupied as tenement houses; for instance, the house where the Countess of Blessington wrote some of her novels, has about a dozen families in it; that is in Henrietta Street, and the houses in that street are of an

enormous size, and are now all converted into tenement houses.

10948. Are the sanitary arrangements adequate for the occupants?—It is extremely difficult to provide proper sanitary arrangements in the case of a large house for one family being converted into a residence for a dozen families.

10949. Is any attempt made to do it?—We are attempting as far as possible to increase sanitary accommodation.

10950. Are the statutory powers in operation in Dublin on all fours with the Public Health Act which is operative here?—With the London Public Health Act?

10951. Is that Act in operation in Ireland?—It is not.

10952. You have a similar Act?—We have a Public Health Act, and the Dublin Corporation Act is to a certain extent ahead in sanitary matters and it contains some provisions which are not in the general Acts.

10953. Should you say that the public Health Acts which are in operation in Dublin exact the observance of similar precautions as the English Acts?—In the main they do; but there are some exceptions. For example under the English Public Health Act you can deal with the abuse of sanitary accommodation in a house where there are two or more families occupying the same sanitary accommodation, but there are houses in Dublin with twelve or fourteen families occupying each house, and if there is an abuse of the sanitary condition we cannot deal with the tenements, whereas if there were two small houses but having sanitary accommodation in common we hold them both responsible. We require to have powers to deal with that, and I have suggested over and over again that in an abuse of sanitary accommodation in any place where there was more than one family residing they should be held responsible.

10954. I suppose the conditions, such as you describe would be unfavourable to the health of the younger children?—Very. We have a very large mortality.

10955. In your memorandum you have not given us any figures as to the mortality of children under one year of age?—No.

10956. Do you know what the mortality of children in Dublin is, under one year?—Yes. The mortality of children under a year old for the last ten years has been slightly under the average of thirty-three English towns—thirty-two excluding London.

10957. What is it?—About 160 per 1,000.

10958. Not more than that?—No, I can say positively what it is in relation to English towns. It is not quite so good as London; but it is something better than the big towns excluding London.

10959. It was 160 in London in 1900?—Yes. It is frequently more than that in London.

10960. And 175 in Paris?—We never go up to 180. You may take it for the last ten years that the death-rate of the children in the Dublin metropolitan area is well below that of the average of the large English towns excluding London—decidedly below, and very little above that of London.

10961. But the fact that such a mortality exists, as you indicate here, among the children of the poor, suggests that a large proportion of the survivors are deficient?—They are undoubtedly. I think I mentioned here that last year the mortality of the children of labourers under five was 13·3 per 1,000 of the population of that class.

10962. It is 13·3 of the population in your memorandum?—Yes, as against 1·6 per 1,000 amongst the well-to-do class—an enormous difference. I believe that the children are not thoroughly fed. I find that their food is not only deficient in quality, but not sufficient in quantity.

10963. Have you any figures showing that there is more infant mortality in rooms that are occupied by the whole family than where the family is distributed in two or three rooms?—No.

10964. You are not so certain about the condition of the rural population, you do not feel absolutely certain that there is a deterioration with them?—No; but it is far below the figure that I have mentioned, it is very moderate. The rural death-rate in Ireland is a very moderate death-rate, it is lower than in England.

Sir C.
Cameron.

10965. But still you are inclined to think that the physique of the rural population has diminished?—Well, if it has, it is very slight.

10966. But you do note certain changes in the dietary of the Irish peasant which is not favourable to the nurture of the children?—There is a remarkable change.

10967. You do not think it favourable?—I do not. I think that the substitution for food which used to be baked upon what are called griddles in Ireland, and in Scotland girdles, which is merely a sheet of iron, is not good. They take the bakers' bread and take tea, which is generally very inferior, very washy and boiled out, and everything taken out of it during the long time that it has been drawing, that constitutes the practice very largely throughout Ireland. In Dublin, amongst the children of the poorer classes, and partly amongst the children of the better classes too, they are nearly all fed upon bread and tea and very little animal food.

10968. We were told by one witness who came from Ireland that Indian meal had taken the place of porridge in the rural districts, at any rate in the West of Ireland?—Yes, but it is not liked.

10969. Is it merely taken because it is cheaper?—It is cheaper but it is not liked, and very often when farm labourers are offered it they resent it. There is less Indian meal used now than formerly.

10970. You think so?—I am certain of it.

10971. And then we were told that there was a kind of cake made of a combination of potato flour and Indian meal very largely used?—Yes, the better class of people take it, it is rather a favourite. It is a hot cake—a sticky kind of cake and it sticks to the palate. I have often eaten it myself.

10972. Is that a useful article of diet?—I cannot think that it is as useful as the ordinary cake. There is less nutriment in it. I do not approve of potato cake.

10973. Is there any attempt to instil into the Irish people a knowledge of the articles of food that are best suited to them?—There is very little attempt to do that. There is an attempt in the primary schools, especially those managed by the Roman Catholic sisters. In some of the Dublin schools they have kitchens in which they have cookery, and they show the best way of cooking things, and the most nutritious articles, having regard to price. But it has not been on a sufficiently large scale to be worth much.

10974. Does not that new department which is under Sir Horace Plunkett's supervision take it up?—Yes.

10975. Because it might be considered a very important branch of education; could they not give the young women and mothers some knowledge of the duties of housewifery?—I am sorry to say that in Dublin cookery amongst the working classes is at an extremely low ebb, you can hardly call it cookery at all. In the first place they have no means of baking articles. The vast majority in fact of the tenement houses only have a little fireplace and no oven, and no way of baking, and their food is very monotonous. They have nothing except cabbage and Swedish turnips, and they hardly ever use peas or beans, or celery, or any of those things, it is always cabbage. In fact for the Sunday dinner, very often, the meal consists of bacon and cabbage. I do not know any country in the world where so much bacon and cabbage is eaten.

10976. Bacon is not a bad food, is it?—Not at all. My idea is a physiological one, that the desire for fat bacon which is found all over Ireland—servants in the farmhouses would infinitely prefer it to beef steak or cutlets—is due to the fact that the potato contains no ready formed fat—it has something like .2 per cent. as against 4.5 per cent. of fats in oatmeal; and therefore the dry potato destitute of ready formed fat naturally produces a desire to have a properly formed substitute, which is the fat of bacon, and that desire for bacon has become a kind of instinct now, as it was when the potato diet was almost the exclusive diet of the greater number of the people.

10977. The potato does not form a prominent part?—No, bread stuffs have increased enormously in Ireland. I remember a time in my youth when a farm labourer would take three meals of potatoes—potatoes for breakfast, potatoes for dinner, and potatoes for his evening meal.

10978. But that is all in favour of physical development, is it not?—Well, it was said that it was a deficient food, and that it was deficient in albuminoids, but as a matter of fact it is not deficient in albuminoids.

10979. But it is in fatty matter?—The experiments show that in the majority of foods used by the lower animals and which have an analagous composition to food taken by man, albuminoids are in excess instead of being deficient—there is not an excess of the carbohydrates and other fat-forming food. It is found that there is an accumulation of a larger percentage of carbohydrates stored up in the animals than of the albuminoids, showing that there is not a deficiency of the albuminoids. I think myself that the potato is a very fine article of food, especially when, as in the good old days, Cobden described the potato in one of his works as being floury and dry.

10980. Does fish enter largely into the food of the people?—Yes, and it is supplemented by milk and butter.

10981. Do they get much milk now?—They do. They use the separated milk a good deal.

10983. Is that of value?—It is very valuable except for young children.

10984. Do the children suffer from the absence of a proper milk supply in big towns?—I think that they do. In the city of Dublin I think that the children do not get sufficient milk.

10985. Are the Irish mothers unwilling or unable to suckle their own children?—The vast majority suckle their own children and many of them suckle them till they are over a year old.

10986. Is their milk of good enough quality?—I do not think that it is, and I am sorry to say that many of the women are taking a great deal of whisky and porter.

10987. That must be extremely deleterious to the child?—Yes, I remember as a boy a drunken woman would attract a crowd and be considered a *rara avis*, and now a large number of drunkards, nearly one-third, are women.

10988. And are they generally mothers?—They are generally mothers that are drunkards.

10989. Is it the care of the family that drives them to drink?—Yes, sometimes. I am sorry to say that there is a great deal of intemperance in Dublin.

10990. And do you say they live in advance of their wages?—Yes. Many of the working people in Dublin, by far the larger proportion of them, spend much of their wages in drink.

10991. Men and women?—Many of them do, the greater portion.

10992. But if, as you say, there is not much female labour how do the women get hold of independent resources on which to drink?—They drink the money given to them by their husbands for household purposes and deprive their children of it. There are constantly cases in the police courts where you find domestic affairs come up. The man is charged with beating his wife, and his excuse was "that she was drunk and she had no dinner for him the other day; a man said every article in his house was pawned."

10993. That is a great evil?—I should say the same thing prevails in English towns, but is on an alarming increase in Dublin.

10994. You give some facts as to the extent of pawning of clothes. Will you tell us about that?—It is a very common practice. A large proportion of the working classes, especially those engaged in trades, live in advance of their wages. I made an inquiry some years ago in reference to the procedure of pawning the clothes of the tradesmen and other workers. I ascertained that it was a common practice to pawn the man's clothes on Monday or Tuesday every week, and to redeem them the following Saturday night. Up to twelve o'clock on Saturday nights the pawn offices are crowded with females "releasing" (that is the word they use for redeeming) their own or relatives' clothes so that they may be able to wear them on Sunday. In one year 2,866,084 pawnbrokers' tickets were issued in Dublin to a population of less than a 250,000. The loans to which they referred amounted

Sir C.
Cameron.

to £547,453. I have gone myself into those places on a Saturday night and seen the struggle to get near the counter to get out the bundles of clothes, and I have seen over and over again the women bringing in on Mondays or Tuesdays clothes tied up in a handkerchief, or clothing of some kind, and the pawnbroker's assistant did not open them to see what was inside—it was the usual weekly customer, and he took the bundle of goods without looking at it, and gave the money—10s. or 15s., and sometimes £1, and that would go on until the clothes were not worth one-half the money.

10995. (*Colonel Fox.*) You know they take a month's interest for a day?—Yes, for an hour. In fact, for enabling them to live one week in advance of their income they have to pay a sum of several pounds in the year, and that is going on still at the present time in Dublin.

10996. (*Chairman.*) Having got into that way of living it is almost impossible to extricate themselves, is it not?—Yes, but even if some kind friends would give them money and say; "Do not pawn any more," they would simply spend more in drink. It would not go into keeping them out of the pawn shop.

10997. It is hopeless improvidence?—Yes.

10998. (*Colonel Fox.*) And the same thing exists amongst the English people?—Yes, I am sure that it does.

10999. It is a common thing to get them out on a Saturday night and put them in on Mondays?—It is to a very large extent in Dublin.

11000. (*Chairman.*) You have been concerned in a good many anthropometrical records on your own account?—That was some years ago.

11001. That was to establish some sort of comparison between the urban and rural population?—Yes. The most unfortunate thing happened to these weights and measures. I had an immense number which I took in the schools, and other places, and I intended to have published the records of the results some years ago; I kept on accumulating them, and unfortunately the book in which they were recorded, a good thick book, disappeared—was taken away, and I have searched in vain for it. I remember perfectly well weighing and measuring the boys in the Agricultural Institution of Glasnevin—a Government institution—and comparing their weights and heights with the town boys of the same age in the national schools, and there was a most decided difference in favour of the country boys.

11002. Did you find, yourself, the height and weight?—Yes.

11003. Not chest measurement?—No, merely height and weight. There were some thousands in fact.

11004. You mention some similar records that have been taken lately in the Royal Hibernian Elementary School, Phoenix Park?—Yes.

11005. Will you state the results?—I was asked some time ago to inquire into the sanitary condition of the Royal Hibernian Institution for the sons of soldiers, and I made inquiries. I am not going to refer to anything except the one point which is before this Committee, because my investigations were mainly with regard to other points in connection with the schools, the drainage, and the disposal of sewage and so on. But inquiring into the physique of the boys at different times, I found the records kept for a very long period of time as to the height and weight of the boys. I found for thirty years past the height and weight had been declining, and a little more than a year ago it had fallen by 0·8 of an inch as regards height, and 7·5 pounds as regards weight. That is the boys at the last, weighing 74·7 pounds, on the average, fourteen years being the age selected; and the former weight thirty years ago was eighty-three pounds; so the falling off was a very serious one as regards weight; and besides that, the whole of the conditions of the school had been improved; the diet has not fallen off.

11006. To what do you attribute it?—To hereditary causes, to the fathers of those boys not being as tall or as heavy as they were formerly.

11007. Do you think that they were drawn from a lower class?—I do. I believe if men and women are placed for a long period of time under unfavourable circumstances, as has been proved over and over again, there would be

deterioration of physique and their children, then, will suffer corresponding deterioration.

11008. But what I want to get at is this. Is it the case that those children whose later measurements were recorded are, in all respects, a fair subject for comparison with the children whose measurements were recorded thirty years ago? May it not be as they were the sons of soldiers in both cases, that latterly the soldiers, themselves, have been drawn from an inferior class?—That is what I do mean.

11009. So that it does not imply a general deterioration so much as the fact that they are drawn from another class?—Not at all.

11010. That the soldier is recruited from a lower type of man than was the case thirty years ago; that is what you want to establish?—Yes. My theory is that the soldiers of modern times are recruited chiefly in the towns, whereas in the Peninsula War at the time my own father served, I have often heard him say that nearly all the men were countrymen.

11011. They are the wastrels of the big towns?—Yes, they are the wastrels of the big towns, and their children, therefore, will not be as vigorous as the children of a person who is brought up in the country, in the purer and better air of the country.

11012. You have some suggestion to make as to the improvement of this state of things, have you not?—I do not think that the population of towns is deteriorating.

11013. No, but there is a class on the lowest rung of the social ladder which is more depressed than ever by poverty, and from that class the army is largely recruited?—Yes, and that lowers the general average of the country at large. Might I get this figure down, which is rather interesting, because my whole theory is based upon the facts?

11014. Yes?—In 1851, the population of the urban and rural districts were almost exactly equal. I need not say that from my friend Dr. Tatham I have got these statistics, and, therefore, they are easily checked. In 1901 the population of the urban districts was 25,058,355, and of the rural districts only 7,257,239. There is a rapid increase in some years—a quarter of a million of people added in a single year to the towns of England and Wales alone—last year it was over 200,000.

11015. The urban population in England is now 77 per cent., whereas 100 years ago it was only 50 per cent.?—Yes. It is simply in the towns the population is increasing rapidly, and the other is remaining stationary, and that, at all times, the townsman was not physically equal to the countryman.

11016. And the dregs of the town are even worse than they were fifty years ago?—Yes.

11017. Because the effects of heredity are more fully felt?—Yes. And I am greatly afraid that there is a greater increase in the lowest stratum than in the well-to-do portion.

11018. But surely the conditions under which those people live tends more to sterility or to the early deaths of such children as are born?—I know as a fact, in Dublin, that the portion of the population which is the very lowest, notwithstanding the enormous death rate amongst their children, are increasing to a far greater extent than is the case with regard to the upper classes.

11019. And multiplying more?—Yes. That proves that this population is increasing. Why, in Dublin 100 years ago there were very few slums. I see by the residences of people in the early part of the last century they were living over nearly the whole of Dublin, and now they are confined to a very small portion and the purlieus are everywhere. You cannot go a hundred yards in any direction from the most fashionable quarter without passing through the slums. They are at the backs of squares which were formerly mews, and now they all nearly are tenements with an enormous increasing population.

11020. Are there many back to back dwellings in Dublin?—Not many.

11021. Are there any people still left in cellars?—Very few, hardly any. There are some still where the bye-laws can be complied with, that is, the height above the ground being sufficient, and sanitary accommodation provided, but, speaking generally, that is not so. We closed 500 of them. Since I became medical officer we have closed

*Sir C.
Cameron.*

as unfit for human habitation 3,500 houses, of which about 1,000 have not been rebuilt. Under local conditions there is not sufficient space on which to rebuild the houses. About 700 houses closed as insanitary remain in ruins.

11022. They have not been demolished?—No. I am urging the Corporation to get powers to deal with those places, to take possession of them and make decent houses.

11023. Or leave them as open spaces?—Yes. All through the streets of Dublin the insanitary houses have been closed.

11024. Should you say that the municipal authority in Dublin is as active as it might be in the pursuit of public sanitation?—If I said that of that corporation, it would be very doubtful, or of any other corporation which exists, that they were as active as they might be; but they have done a great deal.

11025. The standard of competence varies very greatly in the different towns?—I think that they have done a great deal considering the resources of the city. They have expended a great deal of money in providing dwellings. I have said, and it is a very grave thing to state, but I have not hesitated to do so, although I am a servant of the corporation, that they have done very wrong in providing dwellings and for which they charge 5s., 6s., and 7s. per week.

11026. They charge too much you think?—I would not provide that class at all. Of the clearances made in Dublin—a great many of them—I have never known any instance where the families who have been cleared away ever went back again. A different class of persons occupied the houses that were put up instead of the insanitary houses, and that is what I have been publicly declaiming against; you improve the actual purview but not the people.

11027. What becomes of them?—They go to demoralise other places.

11028. No clearance could have the effect that it should have unless a provision is made, you think, for placing the people elsewhere under conditions where they need to live in accordance with higher standards of decency and comfort?—I take this view of that question. I find that there are 300 or 400 people occupying an insanitary area. I would like to keep those people on that area under proper sanitary conditions.

11029. You would improve the conditions but not sweep the people away?—I would not sweep the people away, but keep them under better sanitary conditions.

11030. Are not the conditions so bad that such an alternative is not open to the authorities?—I do not know of any such case.

11031. From the view of expense it would naturally be the preferable alternative?—The expense would be a little greater no doubt in providing for the very squalid people in those insanitary areas. There might be a little more loss by putting up a better class of dwellings than those you displace. But you are not doing any good to that class by replacing the insanitary houses by dwellings suitable for a higher class of persons, because they can provide it themselves, but the people that you drive away have not that power; they are placed in exactly the same insanitary conditions elsewhere, and you do no good. If you lose a little money you at any rate promote the health of the population.

11032. Are there open spaces outside Dublin which are within the administration of the local authorities, so that the population which is removed from those central rookeries could be resettled in the suburbs?—Yes. There has been an increase in the area of the city by the annexation of three suburban townships; there are plenty of places now.

11033. They are under the administration of the Corporation of Dublin?—Yes. People do not like going out far, they like to be near their work.

11034. Have not you a system of tramways radiating from the town?—We have—and very cheap too—and you can get a long way for a penny. I am not at all in favour of sending the very poor people out of the city, I would rather have them placed near their work in proper dwellings. I do not want more waste spaces through

Dublin, as some do who are arguing in favour of sending those people into the country.

11035. Do not you attempt to take action against the owners of insanitary properties?—I think to a greater extent than almost any other corporation, as you may gather from the closing of the houses that I have spoken of. All those houses have been closed under the provisions of the Public Health Act and without any compensation to owners.

11036. The owners would not rebuild?—It is the last remedy. We serve notices and notices, and summonses and summonses on the owners of those houses, and they will do nothing; and the last means is to get a magistrate's closing order; now nearly 700 houses are closed in that way in Dublin; they soon become ruins, and they are taken away. They are generally stolen; as a rule the roughs of the neighbourhood carry them away in a few months, and they will disappear, and every brick and door will be taken away.

11037. Have you any difficulty in identifying who the owners of this class of property are?—Yes. A great many of them live abroad, some in Australia and some in America.

11038. Would not it be a very good thing if in all big towns a register of property owners were made, right through the length and breadth of the town?—It would. In Dublin this is a general state of things. There is a ground landlord, and a man who represents the man who built the house originally, and he lets it to somebody else, and somebody else lets it to somebody else, and very often we find four persons interested.

11039. If the register indicated the conditions of tenure, it would be a good thing, you think?—Well, you see, we have a register. The law can only deal with those where the rack rent is two-thirds of the valuation. We go against the person who receives the rack rent.

11040. Is it always easy to discover him?—No; sometimes it is not easy. We cannot find out where he lives very often. In that case we go against the occupying tenants, and, if you cannot get a closing order upon the owner, you can serve the closing order upon every individual tenant, and we have to do that very frequently and turn out every individual family.

11041. It would be preferable to get at the owner if you could, would it not?—Yes.

11042. Besides what may be done in the direction of public sanitation, you look to the cultivation of the physique of the people, do you not?—Yes.

11043. As offering great opportunities for improvement?—I think that it does.

11044. I mean public gymnasia and swimming baths; and so on?—Yes.

11045. Is there any lack of such provision in Dublin?—We have swimming baths. They do not pay. They hardly pay anywhere.

11046. You do not expect them to pay?—We lose a little by them; we have two very large swimming baths and other baths, and reclining baths are very much used. I made a strong recommendation to the Public Health Committee to convert those swimming baths into gymnasia for the winter, and they have adopted that suggestion, and I hope next winter we shall use them for gymnasia.

11047. Is enough done in the schools to form the basis for physical training afterwards?—There is the ordinary work done.

11048. Is it under systematic instruction?—Not very much; but we have playgrounds through various parts of the town, and Lord Meath has got up several in the part of the city where he is ground landlord, and there are then the usual fixtures for the children.

11049. You do not believe that school life has anything to say to increased deterioration?—I think that it has not.

11051. You say that "I believe that the greater education of children in recent years has been assigned as one of the causes of the physical deterioration. I cannot subscribe to this belief"?—No.

Sir C.
Cameron.

11053. You do not think that there is anything in the conditions of school life which is one of the causes of physical deterioration?—I think they have improved. I do not think the deterioration of the children is due to that cause. But at all times I think that school life was not a healthy life. The children are all crowded together in school and stooping over desks, which certainly is not calculated to improve their condition physically. I mean that there is an improvement in the schools now with regard to space, but I do not think that school life is calculated to develop the muscular system.

11054. If sufficient attention was paid to the physical side of it, it might be?—Quite so. I remember reading a paper by Mr. Darwin showing that the most successful men at Oxford were the most successful in athletics, sports, and boating.

11055. Do the children attend the school too early?—I do not think so in Dublin.

11056. You have no compulsory system in Ireland?—Yes, we have.

11057. We had it stated by a witness who knew the rural districts that it would be much better for the children if they did not attend till they were five years old?—I quite agree.

11058. That they would be better running about and opening their lungs than being in school?—I think that a child from five to ten would learn as much as a child from four to ten, if not more.

11059. Or even six to ten?—Yes, I am not in favour of children being taught too early.

11060. (*Dr. Tatham.*) With regard to the sanitary condition of Dublin, you have been working for its amendment very hard for the last thirty years?—Yes.

11061. The result of your work there with the approval of the corporation has been to vastly improve the sanitary condition of the city?—There is no question of that. Every one now admits that the sanitation of the city is greatly improved; even hostile critics of the corporation admit that.

11062. So that the death rate of the city of Dublin, which used to be (I hope I am not libelling it when I say this) very high indeed, you have reduced to what is fairly normal in large towns?—I think that we are still in excess of English towns; our general death rate is certainly in excess of English towns—it was lower last year than ever it was before. Our infantile death rate is slightly below that of towns in England; our zymotic death rate is slightly below that of the large towns; but the adult death rate amongst the 85,000 or 90,000 of the class belonging to what is described by our Registrar-General as the labourers and porters class is very high. We have a very high adult death rate amongst that class.

11063. You have a system of estimating the mortality amongst classes of the population?—We have, and it is very high among that class.

11064. And that does not obtain in England at present?—No.

11065. With regard to the birth rate, is that rapidly falling or not?—No, it remains much the same, twenty-eight to twenty-nine per 1,000.

11066. And it is not falling?—Oh, no, it is almost stationary.

11067. You were speaking just now of the closed houses in Dublin, 700 or 800 under the Public Health Act?—There were 3,400 altogether closed, but many are rebuilt and repaired and re-opened; but still there are 600 to 700 which remain in ruins. The ground on which they existed is there, but there are no complete buildings.

11068. And is your experience that of many other gentlemen, that sometimes the closed houses are a greater nuisance than those not closed?—Yes, they are places for all kinds of filth to be dumped in.

11069. That is also my experience. But hitherto the corporation of Dublin has not dealt with those areas by a scheme like that under the various Acts put into operation in England—I mean the housing of the working classes?—Oh, yes, they have very largely. They began with a scheme that cost £26,000—the Coombe area; and then the Plunkett's area, which cost very much the same;

and the Bride's Alley, which has cost £90,000; and then the King Street area, which has cost about £20,000; an area off Dorset Street, Eccles Lane and White's Lane, which cost about £24,000, and another big scheme costing about £70,000 now going on in one of the worst parts of the city; altogether getting on towards a quarter of a million.

11070. But your objection to those schemes for what is called the rehousing of the working classes is, that though you may turn poor people out of those wretched areas, when the new houses are built, ostensibly for their use, they are not occupied by them at all, but by a superior class who can take care of themselves?—Yes, and the rent is doubled or trebled.

11071. And the very poor are driven into the other crowded districts and make the condition of those places even worse?—That is the invariable rule in Dublin. But there is a great improvement now for the very poor, the rents having been brought down to 1s. 6d. and 2s. per week.

11072. You spoke of having advised that some scheme should be adopted whereby suitable houses should be provided?—Yes, on the derelict places.

11073. Do you mean by that that the existing tenements should be repaired and put in order?—What I mean is, dealing with the 600 or 700 places actually in Dublin now, that where a place has been derelict, say, for ten years, I would not give compensation to the owner. We have had to light and clean in front of these houses for years without getting any return, for there is no unoccupied house tax. I would put houses on these sites to be occupied by the very poorest people.

11074. Such houses as the poor people could afford to pay for, 2s. per week say?—Yes, and only that kind of people I think should be provided for at the expense of the municipality.

11075. With regard to the prevalence of infectious disease, you were saying that the mortality from the chief epidemic diseases is considerably reduced in recent years?—Yes. When I became first medical officer of health in the first two years it was 9 to 11 per thousand of zymotic diseases, and last year it was 1·5, but still we have too high a death rate in Dublin. I mean the general rate last year was 24·5; or 23·8, taking out some deaths that were not chargeable—that is too high.

11076. With regard to the disease which used to be called the disease peculiar to Ireland, typhus, what do you say?—That is very rarely to be seen now; and smallpox only occurs now and then; we had it as an epidemic last year, and we stamped it out in about three months.

11077. To what cause do you attribute the practical disappearance of typhus. Dublin used to be called the home of typhus?—Yes. I attribute it to the greatly improved condition of the tenement houses. Wherever it does occur now it is always in a crowded tenement house, in which the people of the very poorest and most degraded class live.

11078. And you mean where there is most poverty and destitution?—Yes. I do not know any tradesman who has had typhus fever in Dublin. It is confined to the poorest and half-starved people.

11079. The representatives of destitution?—The representatives of destitution and overcrowding.

11080. With regard to pulmonary phthisis. We have heard here that pulmonary phthisis is very prevalent in Dublin. I mean tuberculous phthisis?—It is. We have a very high death rate from phthisis—3 per thousand. It is very high and very largely amongst the poorer classes.

11081. Is it amongst the men?—Men and women. You see poor fellows working in nearly the last stage of consumption.

11082. Infant mortality you say is not so high?—No.

11083. Can you account for it?—The mothers nurse their children; that is one way of accounting for it.

11084. There is very little hand feeding in Dublin?—There is very little hand feeding. The large majority of women suckle their children, and that is the only thing that makes for the moderate death rate, but the death rate is very moderate amongst the well-to-do classes—

Sir C.
Cameron.

very moderate. But amongst the very poor, as I mentioned already, there is a very high death rate of children under five.

11085. Is that due to a large extent to forms of tuberculosis other than phthisis?—Yes, meningitis and tubercular meningitis—that is very common—we have some hundreds of cases in the year.

11086. Is rickets increasing?—I very seldom see any rickets, notwithstanding that we have very soft water. It was predicted that in Dublin, with its water containing two degrees of hardness, the children would be full of rickets, but you do not very often see rickety children.

11087. You can get lime from food as well as from water?—I never believed that theory.

11088. Is syphilis on the increase?—There is a great deal of venereal disease in Dublin.

11089. Is it hereditary syphilis as well as the primary?—Yes. I am a governor of the Lock Hospital where the disease is treated, and the wards are always full. There is a large garrison in Dublin.

11090. Does your experience agree with that of several other witnesses that wherever syphilis exists it is not of the same virulent order that it used to be?—That is so. The terrible chancres of my student days you do not see now.

11091. Have you the notification of diseases?—We adopted it the moment it came out and we had measles and whooping cough, but have given up both now. We found there was no use in their notification, as is the case all through the United Kingdom.

11092. Was notification applied to measles and whooping cough?—Yes. It was applied for three years to whooping cough, but for the last seven or eight years it has been dropped, and I never found any results from it. Measles has just ceased to be notifiable. We made the epidemic meningitis notifiable for a year, and chickenpox notifiable when smallpox is apprehended.

11093. But it is not ordinarily notifiable?—No. chickenpox is not.

11094. Is smallpox?—Oh, that is in the Act, but I mean we have made from time to time additions to the scheduled diseases.

11095. With regard to the substitution of very white bread, the baker's bread, for the old fashioned rather browner bread that one used to have in one's earlier days baked in one's own house—do you think that the substitution is good or not?—I cannot really agree to what are rather extravagant statements made as to the removal of the phosphates. If I were a prisoner and had to live on bread and water, and the weighed measure of the bread was limited, I would rather take the white bread than the brown.

11096. Even irrespective of what it is made of. You see a great deal of the white bread is not made of wheaten flour; there are other things besides wheaten flour in it?—The Public Analyst ought to be down upon them. We examined the bread, and I never found anything wrong with the Dublin bread. I know that rice used to be put in, and Indian corn.

11097. And potatoes?—No, potatoes are dearer than bread. We examine annually about 3,000 articles of food, and there has been no adulteration of bread for twenty years past. I cannot agree that the brown bread is very superior to the white bread. The poor people in Dublin do not like the brown bread, but the whitest bread they can get. Brown bread and second class flour will not go down in Dublin at all.

11098. You spoke just now of the practice being very common in Dublin, amongst the very poor, of pawning their clothes once a week?—It is very common.

11099. And you gave figures to show the enormous extent to which that practice obtains in Dublin?—Yes.

11100. Can you trace the spread of infectious disease through it?—Yes, in the last epidemic it was traced in a most remarkable way. There was an epidemic of smallpox, and we had a prosecution. A woman pawned the clothes of a boy who had smallpox, and the result was that the attendant in the pawnbroker's shop, in a part of the city where there was no smallpox, got smallpox, and the same thing occurred in a second pawnbroker's—there were two cases that occurred which were traced to the clothes that had been pawned. The case was

brought into a police court, and convictions were got, so that we were able to establish the fact that those cases were due to infected clothes.

11101. I suppose that the pawnbroking business is a profitable one?—It is profitable. But Lord Iveagh, to whom we are indebted for a great many improvements in Dublin, and who, lately, spent nearly a quarter of a million in improving the slums, and gave a quarter of a million some years ago for the same purpose, is now providing an old clothes market in Dublin, and the place is to be provided with a disinfectant so that all the old clothes will be disinfected. I should like to mention an interesting thing—it has nothing to do with the physical degeneration of the population, but it has something to do with this particular matter that we are on. The recruits in the *dépôt* of the Royal Irish Constabulary, in Phoenix Park, Dublin, have been for years past peculiarly liable to scarlet fever, and there is a ward in the Dr. Stevenson Hospital, in Dublin, which is set apart for the Constabulary, and it is paid for, and is always there for the service of the Constabulary. For more than thirty years there has been an average of twelve to fourteen, and sometimes nearly twenty cases in a month admitted into the hospital. No month ever passed without there being some cases—it might go down to as low as two, and even go up to fifteen and sixteen. About three years ago I was consulted, amongst other things, as to the extraordinary occurrence of scarlet fever amongst the recruits, and not amongst the men stationed permanently, and ultimately I came to the conclusion that it was due to the new clothes supplied to the recruits, which were furnished by a contractor residing in Dublin, who gave out nearly all the work, which was done at home. I found several cases of scarlet fever in the places where clothes were being made. I spoke to the authorities of the *dépôt*—the Inspector-General—and said it would be desirable to sterilise all the new clothes before admission to the *dépôt*, and that was done, and in April, 1900, the last cases occurred. We began to disinfect, or sterilise rather, so that there might be no infection of clothes; this was at the end of April—no case occurred during the rest of that year, nor the next year—not a single case occurred. But last year two or three cases did occur. That might occur under any circumstances, but the fact remains that, with the exception of two or three cases which perhaps occurred by the recruits going to see friends, there has not been any case since. The authorities pay so much a year to the Public Health Department to sterilise all the clothes. I sent round a circular to all our tailors in Dublin, suggesting the same, because I have got a suit of clothes with a smell of bad tobacco on them. If you get clothes saturated with the smell of tobacco, might there not be infection as well in them. Only two or three tailors have adopted the suggestion, but, I think, it is not a bad suggestion, for it would be a desirable thing that all new clothes, before being sent home, should be subjected to sterilisation. It has, and completely stopped scores of cases that would have occurred within the last three or four years.

11102. With the view of preventing disease, would it be any hardship to compulsorily sterilise all their clothes?—No. We are trying to get them to do that in Dublin. I am now so impressed with the results of that experiment with the constabulary *dépôt*, that, I think, a great deal of disease might be prevented by disinfecting new clothing, and especially second-hand clothing.

11103. We have heard from, at least, one witness that lunacy is unquestionably increasing in Ireland; is that your opinion?—There cannot be a shadow of a doubt that there is an increase, and there is an increase in one form of insanity. I remember, as a student, I hardly ever saw it, but I saw plenty in England—the general paralysis of the insane. I remember, in St. Patrick's Asylum for the insane, commonly known as "Dean Swift's," there was not a single case of paralysis of the insane, whereas in the Bethlehem, Dr. Savage's, in London, nearly every fourth case appeared to be general paralysis of the insane. I mentioned to Dr. Savage, who was treating a friend of mine suffering from that disease, that there was hardly a single case in St. Patrick's Hospital for the insane, and there were 150 cases of insanity, but now I notice that it is increasing.

11104. To what cause do you attribute that?—I say it with some hesitation that it is partly owing to excitement going on in Ireland, on the question about the land

and politics, that causes a considerable amount of cerebral excitement, and that is a new cause.

11105. (*Chairman.*) That is a new cause?—Yes.

11106. (*Dr. Tatham.*) Do you think that it is due to syphilis?—No, I do not think so.

11107. It has been said that the increase of lunacy may be to some extent due to the fact of emigration?—That the people do not want to support their lunatics?

11108. No. The general deterioration of the people of the population of Ireland by emigration; that the very best blood of Ireland goes to other countries, and therefore what remains behind of the population is of a very inferior character, and in that way lunacy is more prevalent?—I do not think that there is much in that theory. Dealing with my own limited experience, personally, I have found that the most stupid people were the least likely to become insane, while some of my most talented friends have gone off their heads.

11109. You do not think there is anything in it?—I do not think so.

11110. (*Colonel Fox.*) Don't you think that the most talented are the most addicted to drink—both amongst the lower and upper classes?—Undoubtedly the best workmen are the greatest drinkers.

11111. Are not the greatest drinkers the best workmen?—Well—

11112. (*Dr. Tatham.*) That portion of insanity which is regarded as alcoholic—is that owing to the consumption of inferior spirits or liquors?—No. I do not think so. I do not think it is. I think it is due to taking too much of the spirit, for I think that there is a great deal of insanity due to alcoholism. I know lots of good workmen that have gone into asylums from repeated attacks of *delirium tremens*, and they often become permanently insane.

11113. Is a very large quantity of illicitly distilled liquor consumed in Ireland?—I do not think that there is very much, I do not think that potheen is consumed on a large scale. The police are too watchful.

11114. We have had a witness who told us that it was not generally consumed, for the simple reason that it was more expensive than excise spirit?—Yes.

11115. That's your own opinion too?—Yes. It is a very bad kind of spirit. I have recorded in one of the medical journals the case of a whole family becoming insane, through drink. One was a clergyman—I will not say of what particular denomination—but he and his whole family, in an obscure part of Ireland—the west of Ireland—getting the spirit in the neighbourhood, and the habit of drinking growing upon them, they ultimately, every one of them, became insane. I published the case. The whisky was of an awfully vile quality, and a specimen was submitted to me. The alcohol that was found was the propyl and amyl kinds—it was shocking whisky. I do not know how anyone could like potheen. It was described, you know, as like a torchlight procession down the throat.

11116. With regard to the beer, do you think that that is very largely adulterated now?—I do not think that beer adulteration is worth speaking of in Ireland.

11117. Have you no substitution for hops?—In Ireland there is not much beer used. Porter is the principal thing. I know as a matter of fact that the ingredients in making porter in the breweries consists simply of malt and hops, really nothing more than that. They do not use treacle, or rice, or glucose.

11118. They do not use glucose?—No. The quantity of glucose is quite insignificant, and it is used in making jams. Nearly all the jam makers use glucose. They say the jam won't keep without a little glucose.

11119. But as regards the Dublin porter and stout; you believe that is simply pure?—Simply pure. I have examined hundreds of specimens.

11120. (*Colonel Onslow.*) In your statistics about the boys of the Government Agricultural Institution, Glasnevin, you took the weight and height, not the chest measurements?—Quite so.

11121. Is that because you did not lay sufficient stress upon the chest measurement?—Indeed I did not. I took some, but in general merely the height and weight.

11122. You had not time to take it?—I had not the time; that was it principally.

11123. About the height of the chest, how do they compare relatively. Do you think that weight follows height?—Weight does follow height.

11124. Necessarily?—On the whole, undoubtedly.

11125. You might have a short, sturdy man?—It followed in the case of the boys of the Royal Hibernian Military School, as they decreased in height they decreased in weight, and the two went together, *pari passu*. I have no doubt. I think that a little man might be as heavy and as strong as a big man.

11126. That is what I was coming to. Is the little dapper, the sturdy thickset small man, say of an average height of five feet six inches, on the whole better than the long, thin, and perhaps broad-chested man of five feet ten inches?—I think for many purposes he would be.

11127. So that the matter of actual height is not such a serious consideration?—No.

11128. Provided the growth in other ways is sufficient?—Yes.

11129. The fact that, as a race, we are shorter than our forefathers—take the army recruit; it has been necessary to lower the standard—that is no proof that there is physical deterioration in the race, is it?—We know that the Japs were able to beat a much bigger people; but then the Japs have been always like that. I do not, at all, think that a race shorter and lighter than another race might not be in physique far superior.

11130. The smaller man, as a rule, can stand the strain better than the big man?—Well, my father was a soldier, and he always said that the big men in the Cameron Highlanders were always the first to fall out on the march.

11131. That is the general experience?—That is the general experience, and very tall men do not live so long as men of moderate height—that is well known.

11132. So that if you have got, say, 100 men of an average height of five feet nine inches and 100 men of five feet six inches, there is no reason why the latter should not be as good, if not better, than the former?—It would depend upon other conditions—upon their muscles, for instance; but it always appears to me that too much stress is laid upon the fact of height.

11133. It is admitted, generally, that amongst the general classes the race is growing bigger?—I am absolutely certain that the girls of the middle and upper classes are quite unlike what they were in my boyhood—pale, anæmic girls, not allowed to take any outside exercise under the penalty of being called tomboys, and now they are almost excelling the men in all kinds of outdoor games.

11134. And even the shopboys and young clerks are better than they used to be?—They are better than they were.

11135. You think they are much better than they were?—I think that they are. I said so to the Chairman—that I believed that the town population shows no deterioration. On the contrary, they show an improvement.

11136. But at the same time the lowest orders, who are badly fed, appear to be going down the hill?—They are the very lowest part of the population, but I think that that class is increasing.

11137. Now, at the first stage of the inquiry, we had much evidence of children not improving in height in the Board Schools, but that the Jews, up to a certain period, did improve in height; it was said that at twelve years of age the Jewish boy was invariably taller than the Gentile boy and better nourished; but at sixteen the Jew boy stopped, and the Gentile boy would go on more or less on the average. Have you had any experience of Jews?—We have little experience of them. I think the Jews appear, in London, to be physically in a very much better state. We have nearly 3,000. They are mostly Polish and Russian Jews. I gave the prizes away to the schools, and there were about 500 or 600 little boys, and I was astonished at the gymnastic exercises, and at their intelligence and the performances they went through.

11138. Were they better than the Irish boys of the same class?—I think they were.

Sir C.
Cameron.

Sir C
Cameron.

11139. If those little fellows are so small, even then, provided their weight and chest measurements were fairly good, there would be no reason why they should not turn out as physically fit in after life as to grow up to a fair standard of height?—That is perhaps true, but on the other hand, let us take the population of a country of a certain height and a certain weight, and physically a good population—take the case of the Swedes, say, who are the tallest men in Europe. Supposing we find that the Swedes were steadily going down in weight and height, would not we think that a sign of decay? If the race were originally a small race like the Japs it would be different.

11140. Take some of the Irish Militia—some Militia that I happen to know that came from the north of County Cork. They were not a big lot of men, but essentially country people—thick-set, good physique. Now, has County Cork always produced that class of men or were they a taller race in the north of County Cork—what is called the North Cork Militia?—The North Cork Militia I know, for they were stationed in Dublin at one time.

11141. They came from the north part of County Cork. They are thick-set men and not tall?—No, they are not as tall as the Tipperary men.

11142. Are they typical of that part of Ireland; is that the reputation of that part of Ireland, that they are rather thick-set men?—Yes. They have big, pale, long faces and big noses. The Tipperary men were so tall that they were the same height as the Foot Guards, and strong representations were made some years ago to convert them into a regiment of the Irish Guards on account of their great height. Look at the police recruited for the constabulary; many of them are over six feet.

11143. They do not come from one part of Ireland?—No, they come from all parts of Ireland. They are very tall; I quite agree that height and weight are not everything. The only thing is that when you have a race declining in height and weight I assume that they decline generally, and for the same reason, when the longevity of a people is increasing and they also increase in size, I assume that they must be improving physically in every way. It has been noticed when people have been placed under very bad hygienic conditions and when not supplied with sufficient food they deteriorate in size. For instance, about the Bosjesmans a very large amount of scientific evidence has been produced to show that originally they were a tall people; they belonged to a tall race; the Hottentot race were rather big men, and yet they dwarfed down because of bad conditions with regard to food and lodging. I have read several essays with regard to the degeneration of the Bosjesmans, and it was always attributed to bad conditions of life.

11144. (Colonel Fox.) You were saying just now that you found that the physique of the boys of the Hibernian School was not as good as it was thirty years ago, I think?—Only the statistics show that.

11145. That is according to the statistics?—Yes.
