11146. And you attribute that to the decline in the physique of the recruits of the present day as compared with those of times past?—Yes.

11147. Now I happen to have got those statistics for the last thirty years back of the Hibernian School for boys, and I have compared them with the statistics taken more than thirty years ago of the Duke of York's School, and I find that in the latter school the physique was decidedly better than that of the Hibernian School; notwithstanding that they came from the same stock. The physique of the boys of the Duke of York's School

was decidedly better than that of the Hibernian School in every way, although they came from the same class?—Not from the same race; they are all the sons of Irish soldiers.

11148. Consequently, they ought to be bigger, because we find the Irish race is bigger—the Irish boys ought to be bigger because they come from a bigger race?—In the Duke of York's school are the children of the same social position?

11149. Yes?—And they show no deterioration?

11150. There is no deterioration even going back thirty years. Latterly they have filled out; they have fluctuated, but now they are just as good as they were thirty years ago, and they have better physique than the Hibernian boys, and very markedly so?—Quite so.

11151. That rather tends to show that it is their mode of living. For instance, there was a time when they had more work and less play and less sleep; and now they go out into the air more and have more sleep and less hard work, and they find that the physique has gone up in consequence in the Duke of York's School?—I know. I read the Report of the Commission on the Duke of York's School some years ago. There was a sameness in food, and their health improved when the diet was altered.

11152. I had a letter from the Commandant of the Hibernian School, and they are going to give them more sleep and less hard work, and milk instead of tea?—I am aware of that.

11153. They found that there was no nourishment in the tea, and they were going to give them milk for their breakfast, and they considered that by these means they would bring them up to the standard of the Duke of York's boys?—Yes.

11154. Therefore I do not think the falling off in the physique of the Hibernian boys is due to the decline of the recruit?—No.

11155. The men who are the fathers of those boys—either they or their wives—must be short-lived people?—But still if the decline of the Hibernian School boys is regularly going on—and that it goes on practically every year for thirty years, and every couple of years there is a decline, the diet and the hygienic conditions could not be steadily deteriorating in the same way.

11156. It is more the way they have been treated than the way their fathers have been degenerating?—Yes, but they must be treated worse and worse every year. That is what I understand. With all the improvement in connection with the school and its drainage and the water supply, and the increased space, the boys that came in there and then were less. It is only when they are there a short time that they are weighed or measured. I cannot think that it is due to local causes in the schools.

11157. That is what the Commandant seems to think—that they have not had enough food and sleep and periods of rest, which has stopped rather their growth. Then you stated just now that so far physical training has not been made compulsory in the schools of Ireland?—Perhaps the result of your Commission will be the means of doing it.

11158. Is there any possibility of large gymnasias being built in the principal towns where instruction in physical training could be given?—If it was shown to be that there was decided benefit to be derived from it, I think they would be established.

11159. People would take an interest in it and push it?—Yes, I am sure that would be the case.

TWENTIETH DAY.

Wednesday, 23rd March, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.

Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.

Mr. JOHN STRUTHERS.

Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Dr. KELLY, Lord Bishop of Ross, called; and Examined.

11160. (*Chairman.*) I suppose you have lived in the rural districts of Ireland all your life?—Practically all my life in rural districts and small urban centres.

11161. Your observation covers about thirty or forty years?—Yes, my observation will cover fully forty years.

11162. You have come to some definite conclusions as to the existence of deterioration and its causes?—Yes.

11163. You think that there is ground for believing in the deterioration of certain classes in Ireland?—Yes.

11164. Do you think it is very general, or only partial?—Amongst the classes concerned, which are considerably more than half the population in Ireland, I fear it is rather general.

11165. You think it is rather general?—Yes.

11166. And you say it is much worse now than thirty years ago?—Yes; and considerably on the increase.

11167. You do not think any ameliorative tendencies are coming into play, the effect of which has not yet been fully felt?—I do not think so; on the contrary, I do think that the degeneration causes are only now commencing to produce their effects, and that in some years to come the effects will be much more marked than they are at present.

11168. Coming to the causes, would you kindly enumerate what you think are the principal ones?—With your permission, I would wish to give some reasons why I think there is deterioration; some illustrations of what I consider to be the deterioration, and that course will fit in, to some extent, both with the causes and the facts. I fear I shall have to lay down what will appear at first to be contradictory propositions, and yet they work themselves together as a harmonious whole, and I think I shall be able to satisfy the Committee that there is harmony in my position. No doubt in Ireland we have amongst the peasantry and the working classes a very large proportion of fine specimens of manhood and womanhood, also in feats of athleticism the Irish have been more remarkable, in my opinion, in recent years than at any period in the past. The death-rate has not risen in Ireland.

11169. It has rather fallen, has it not?—Yes; and some evidence which I shall have to give would show that it ought rather to rise than to fall, and this is one of my paradoxes. Typhus fever, and scarlet fever, and smallpox, and some other diseases of that class, the class of zymotic diseases, have very largely decreased in Ireland. Those observations tend to show that there was considerable physical improvement. With regard to the zymotic diseases, the decrease, in my opinion, is attributable to the fact that there is much more care taken in recent years to isolate those cases. When typhus fever or scarlet fever breaks out in a rural district at present the dispensary doctor is very particular in having the cases removed to the neighbouring hospital.

11170. Is the hospital accommodation in Ireland insufficient?—Well, it is reasonably sufficient. There is a hospital attached in Ireland to each workhouse, and we have 158 unions in Ireland, and therefore we have 158 of those what I may call rural hospitals.

11171. Infirmarys we should call them in this country?

—Yes. Then in our cities and towns, the larger cities, and what we call cities in Ireland, but what you would only call towns in England, we are particularly well equipped with hospitals. Dublin, Cork, Limerick, and Waterford are perhaps better equipped in proportion to the population than any centre in England. We have a great many charitable agencies in Ireland and a great deal has been done in the way of hospital accommodation. The cases of scarlet fever and typhus, smallpox, and other such cases are isolated at present.

11172. There is very little typhus in Ireland?—Very little, and in the year 1902 we had only one case of smallpox in the whole of the country.

11173. Both those diseases were great scourges some years ago?—They were great scourges. I attribute decrease in those cases to the isolation and to the more careful attention to them, not to any improvement in the physique of the people, and as to smallpox it has been got under, in my opinion, by vaccination. I think it is true that the Irish are the best vaccinated people in the world.

11174. But the effects of these diseases in times past must have tended to depress the condition of the population. If they do not suffer from those diseases to any extent now there may be some reason to hope that there is some improvement?—No doubt one cause of deterioration, and a serious cause, has been removed, but you may have other causes that would counterbalance the removal of that cause.

11175. Quite so?—The symptoms which I observe as an ordinary layman of deterioration are first amongst the children; as a bishop I have to go round my diocese confirming the children.

11176. At what age do you confirm them?—Between eleven and fourteen, as a rule; those are the ages that I have prescribed. Of course there will be some variation beyond those limits, but as a rule I try to have them between eleven and fourteen. The confirmations occur once in three years, and I suggest that no child should be presented to me under eleven, and therefore no child ought to be over fourteen.

11177. You have opportunities triennially of comparing the children of Ireland?—Yes. Of course this opportunity of comparison does not date back very far, for I have been a bishop only seven years, and consequently that opportunity of observation does not carry me to any very distinct conclusion. I have been dealing, of course, as priest with children in schools, and boys at school, and girls.

11178. Where were you a priest, where was your cure of souls before?—In the town of Ennis, the capital of the County of Clare. I was born in the County of Tipperary, and reared in that county up to the age of fourteen or fifteen, when I went away to school, and then during my vacations, both as a schoolboy and afterwards when I was at college, I returned annually for my vacation, so that I was able to observe the peasantry there pretty intimately up to my ordination, which was at twenty-five years of age. Then I spent twenty years in the County of Clare, and I have been seven years now Bishop of

*Bishop of
Ross.*

*Bishop of
Ross.*

Ross; my diocese lies along the south-west sea border of the County of Cork. Of the children present, both at the confirmations and in schools (I frequently visit the schools) a large number are very pale and have a washy, unhealthy appearance.

11179. Anaemic?—Yes, anaemic, and this is more marked amongst the girls than the boys. A great many little girls look red and chubby up to eleven or twelve years of age; after that when they go on to be fourteen, fifteen or sixteen they appear particularly pale and washy, and the lines come out on their features as if they were old women rather than girls.

11180. It is not want of fresh air they suffer from in Ireland?—No; there is plenty of fresh air in Ireland, and it is not want of fresh air. Then the teeth of a large number of the children are exceedingly bad; it is not an unusual thing to see a child whose teeth are all perfectly rotten. Then amongst the grown up population there is a growing disinclination in Ireland for hard manual work. No doubt there are plenty of causes for that, but in my opinion one of the causes is that there is really less capacity, less endurance for severe toil.

11181. Is it not partly due to the fact that subsistence is easier, and therefore they do not think it is necessary?—I regret to say subsistence is not easier; a portion of my evidence will go to show the reverse is the case. There are a considerable number that live to an old age, in fact the country is rather remarkable for longevity: there were 665 persons that died in 1902 who were over 95 years of age, and 160 of those were over 100. While that is so, still when disease breaks out, in my opinion they resist the disease less than they have done in the past.

11182. Have you noted the effect of any recent epidemics which confirms that impression?—Influenza since 1890 rushed through them with very great rapidity. We had a severe outbreak of influenza in Ireland in 1890, and it has recurred almost every year since. It rushes through them with very great rapidity. When measles break out it seems to rush through the people more rapidly than formerly, and I have been told by medical men that they believe there is less power of resisting disease now than formerly.

11183. You are talking of the rural poor?—Yes, I am talking of the rural portions of the country. I do not speak of the cities, for I am not familiar with the city life of Ireland. Then consumption in Ireland has been greatly on the increase. In some parts of the country it is quite alarming. In the part of the country where I live there is real danger of consumption blotting out the entire population. I know families in the district where I live which have been practically blotted out in the last few years by consumption. In one case the father and mother and three or four children died. A young man a member of the family came back from America and took up the little holding. He married, and within twelve months his wife died. There is an island in my diocese called Hare Island with a population of about 200 people. I do not think there is a single family in the island that has not got infected with consumption, so that it is fearfully on the increase, more perhaps in my district than in other parts of the country, but in the whole of the country it is considerably on the increase. I see that by the returns—

11184. (*Dr. Tatham.*) Are you speaking of the Registrar General's returns?—Yes.

11185. Have you them here?—No, but I have the notes from them here.

11186. (*Chairman.*) Will you give us the increase in tuberculosis?—I can give you the number of deaths from tuberculosis in 1902. The population has been decreasing.

11187. (*Dr. Tatham.*) The increase will be sufficiently near?—Yes. I have not had the Registrar-General's return for all those years, but I have the figure which will give you the increase. Between 1864 and 1902—that is a pretty long period—deaths in Ireland from tuberculosis worked up gradually from 2·4 to 2·7 out of a population of 1,000—2·4 to 2·7 died of tuberculosis out of each 1,000. In England, during the same period, the figures worked down from 2·3 to 1·9; and in Scotland the figures worked down during the same period from 3·6 to 2·3. In Ireland in the year 1902, the total deaths in

the country were 78,000; of those 10,000 died from old age; and of the 68,000 who died from disease, 12,000 died from tuberculosis.

11188. Will you allow me to ask you one question with regard to that. You speak of a large number of persons, 10,000 out of 78,000, dying of old age?—Yes.

11189. Have you reason to believe that at least some of those who were returned as dying from old age really died from some other disease, but inasmuch as they were not attended by medical men, the deaths were returned as old age?—That is quite possible; but tuberculosis, as popularly understood, means the death of rather youngish people. I know tuberculosis may break out in very old people, but as we popularly understand the thing, perhaps wrongly, we regard it as affecting rather youngish people.

11190. But as a matter of fact that is not so, if you take the country generally; tuberculosis increases in fatality as age increases?—I can quite understand its increasing in fatality, but does the susceptibility to catch the disease increase?

11191. That cannot be proved, because we have no registration of sickness?—That is the idea I have in my mind, that susceptibility does not increase, but on the contrary decreases. I speak merely as a layman, but that is what one observes as one goes through.

11192. You think it is quite possible at any rate that a great many of the deaths which were returned as from old age were really deaths from some definite disease?—That is possible. In the Registrar-General's returns, you have the figure 12,000 as dying from tuberculosis and 8,000 from bronchitis.

11193. Some of the deaths from bronchitis may be really deaths from tuberculosis, may they not?—Yes; I suppose there is a connection.

11194. (*Chairman.*) Do you know the total number of deaths of those children under five and under one year old, respectively?—10 per cent. of the deaths are of children under one year old; I do not remember the exact figure between one and five.

11195. Are the deaths of very young children increasing in proportion to the total deaths?—I do not think so, though a number of young children get diarrhoea.

11196. From improper feeding?—Yes; or something of that sort; 3,500 died of pneumonia, and 7,500 of heart disease, so that nearly half the deaths were set down as attributable to tuberculosis, bronchitis, heart disease and pneumonia; it would seem to me that the prevalence of those diseases would go to show a lessening of the vitality and the physical stamina of the people.

11197. Have you anything further to say in illustration of that point?—Insanity is greatly on the increase in Ireland.

11198. Yes, we have had evidence before us to prove that. That you take to be a sign of deterioration?—All nervous diseases seem to be on the increase, such as neuralgia. A number of young children suffer from neuralgic pains; of course this may come partly from bad teeth, but the face gets inflamed and pains run up into the head.

11199. We have been told that the ferment of political agitation through which the country has passed has had something to say to that; do you think so?—I do not think so at all. Insanity is very much on the increase. I am a member of the Asylum Committee of the County and City of Cork, which is the third largest asylum in Ireland. We have, unhappily, to provide for 1,700 patients, and have recently established an auxiliary asylum to accommodate 400; and we still will be in want of accommodation.

11200. You agree that a large number of persons are now classified as insane who, twenty, thirty, or forty years ago would not have been considered as insane?—Yes; they are classified as insane, and also a number of persons are taken into asylums who in former years were left at large.

11201. What extent of increase do you think that accounts for?—Within my own recollection, if a case of insanity broke out in a family, everything possible was done to conceal the fact. Now that sentiment has dis-

appeared, and the people quite freely, in the immense majority of cases, send the patient to the asylum. That will account for a considerable increase in the population of the asylums, but this change of sentiment that I speak of has been in existence for several years now—this willingness to commit people has been in existence for several years—in my opinion practically the number of lunatics at large was committed many years ago, say ten, twelve, or fifteen years ago, and yet within the last ten years the increase has gone up quite as much, the increase is quite as rapid as it had been for thirty or forty years before, and therefore I think there is a real increase. As far as one can judge from one's own observations amongst the people, the number of families that are affected is constantly on the increase.

11202. (*Dr. Tatham.*) At what ages do you observe the greatest increase?—There is a very considerable increase in young people.

11203. Idiots?—No, young girls.

11204. Acute insanity?—Yes, among young girls from eighteen to twenty years of age: a large number of them.

11205. Not connected with child-birth?—Oh, no.

11206. Because there is a form of insanity, as you know, unfortunately very common amongst girls under those circumstances?—No; I mean the cases of unmarried women of that class.

11207. (*Chairman.*) Are a large proportion of those cases incurable?—Unfortunately the return of cured cases is very small.

11208. (*Dr. Tatham.*) Is general paralysis of the insane the type of insanity frequently returned—it is a common term in lunatic asylums?—The number returned from that cause is not very great. In 1880 the total number of lunatics under detention in Ireland was 12,982, and that worked out at one in every 400 of the population.

11209. That is in 1880?—Yes.

11210. Have you corresponding figures for 1902?—Yes.

11211. (*Chairman.*) That is 1 in 170, is it not?—Yes. In 1902 there were 22,138 under detention, and that works out at one in 200. And, furthermore, there were lunatics still at large which were returned in the census of 1901; and including those lunatics who were at large the figure works out at one in 170.

11212. (*Dr. Tatham.*) That is a decided increase?—Yes; that increase cannot be accounted for, or even any substantial portion of it, in my opinion, during those twenty years, by the committal of cases at large.

11213. (*Chairman.*) Except that the returns for the last year have been pulled up from one in 200 to one in 170 by the inclusion of persons who were at large?—Yes.

11214. So that there may have been in previous years a good many at large of which we know nothing, who were in subsequent years brought into the returns?—I rely on my own observation with regard to the sentiment of the people: forty years ago there was a decided disinclination to admit that there was a lunatic in the family.

11215. (*Dr. Tatham.*) Was that for fear that the lunatic would be removed to an asylum and there be unkindly treated?—No; that was not the idea; the idea was that it brought considerable disgrace and discredit on the family to have a lunatic in the family, and that it interfered with the prospects of the other members of the family, the prospects of the female members with regard to marriage, and the prospects of the male members with regard to various positions in life.

11216. (*Mr. Struthers.*) Has that feeling really died out?—It has practically died out, even amongst the poorest people. Lunacy has become so common that it is, practically, no longer a disgrace; there are so many families affected.

11217. Is there a feeling that there is a certain risk in having a person from a family in which lunacy has manifested itself?—Yes, there is still that feeling, but there are so many families affected, and it is so difficult to get a family that is not affected that the men are practically compelled to marry into affected families. I have a very serious difficulty in that way, because, according to the Canon Law, I am bound, as a bishop, not to admit amongst the clergy any person who is affected with insanity, and if I draw a line very strictly I would exclude

practically all the applicants, so that I cannot draw the line too strictly.

11218. (*Chairman.*) Do you say that you are admitting lunatics into the priesthood very largely?—You misunderstand me. I said that I am bound by the Canon Law to exclude from the priesthood any young man whose family—that is, not merely the immediate family, his father and mother, and brothers and sisters, but near relatives, cousins, and so on—would be affected by lunacy. I say that I cannot draw the line very tightly. If I find a family where the father and mother, or brother and sisters, are affected I exclude the candidate, but I have to admit candidates whose uncles and immediate relatives are affected, otherwise there would be practically nobody left.

11219. Would you say that there is not a family in Ireland who has not some near relative mad?—I am not quite prepared to say that, but I do say that in the part of the country where I live myself the larger proportion of the families have some immediate relatives, relatives within the second degree, who are affected with insanity. As the figures have increased for the whole of Ireland, though things may not be so bad as in my particular district, yet evidently lunacy is very much on the increase.

11220. Is there anything in the circumstances of your particular district which would account for its being worse than the rest of Ireland. Has it been more affected by emigration for instance?—It is very much affected by emigration. Then the district is rather a poor one—not the poorest district in Ireland, but well on the poor side rather than on the wealthyside—and hence the feeding and housing of the people are on the low scale rather than on the high scale.

11221. (*Colonel Fox.*) Is not alcoholism very much on the increase in Ireland?—Yes, I will come to that afterwards.

11222. (*Chairman.*) Are you prepared to touch upon the causes yet?—From those facts I conclude that there is physical deterioration amongst the people.

11223. Shall we go through the causes *seriatim* now?—Yes.

11224. The first point you notice is the change for the worse in the dietary?—Yes.

11225. Is that due to a diminution in the financial resources of the people, or to their preferring easier methods in the preparation of the food rather than ones that give them greater trouble?—Both causes are at work, but the latter perhaps more than the former.

11226. The disinclination to labour has something to do with it?—The disinclination to labour and also false ideas about the value of foods.

11227. Why have their ideas become more false of late. One would have thought that a people would cling to its traditional dietary unless some good reason was presented for changing it?—There was, of course, a very great reason. The traditional dietary of the country was interrupted by what I may describe as a social cataclysm.

11228. You mean the potato famine?—Yes.

11229. That is going back sixty years?—Yes. I think in order to get a proper idea of the question we should start from that point.

11230. You think the change in the dietary of the Irish people has been steadily in progress since that time?—Yes, quite steadily. Previous to the potato famine the potato was the staple food of the country, amongst of course the classes I am dealing with now, and, as I said, these classes are considerably more than half the population of Ireland. Previous to the famine the proportion was still higher. I might remark here, perhaps, that in England three-fourths of your population are urban and rather less than one-fourth rural.

11231. Seventy-seven per cent. are urban?—In Ireland we have the reverse figures; very nearly three-fourths are rural, and very little more than a quarter is urban. Previous to the famine the proportion of the rural population to the urban in Ireland was still higher. Still a higher number would belong to the rural population. Then the famine came caused by the failure of the potato, and during the famine years the food of the people became largely porridge or, as it is called in Ireland, stir-about, made with Indian meal.

Bishop of
Ross.

11232. Indian meal superseded oatmeal?—In the famine years.

11233. The introduction of the Indian meal dates from the famine?—Yes. So that the food of the people became very largely Indian meal during the famine years, and after the famine years it was a large element in their food.

11234. And has remained so ever since?—No, it has not.

11235. Have they gone back?—When I was a boy, looking back to the period of the late fifties and early sixties the food of the peasantry consisted of potatoes for one meal, Indian meal and oatmeal for two other meals, as a rule, and there was very little bread used. Now in some sense the food has been improved, and hence I am going to propound the paradox that while the food used is a better class of food, yet the people are worse fed. Wheaten bread has become of very common use in Ireland, and has almost entirely superseded the use of both Indian meal and oatmeal, and to a very large extent the use of the potato. No doubt wheaten bread in itself is better food than potatoes or porridge.

11236. Opinions differ upon that point?—Where the defect comes in, in my view, is this: Milk was used in great quantities, with potatoes and porridge, and I think that potatoes and porridge and milk were a more sustaining food than the present food, which is exclusively bread and a very bad form of tea.

11237. Very strong tea, I suppose?—Yes, a considerable number of families in Ireland practically all the year round have no other food at present than bread and tea for all the meals of the day.

11238. (*Dr. Tatham.*) Tea taken in the place of milk?—Yes.

11239. (*Chairman.*) Do they have tea without milk?—It is often without milk—not commonly, but often.

11240. Is it because their taste for milk has been lost, or that they cannot get the milk?—It is largely because the taste has been lost, and to some extent because they cannot get it.

11241. The first is the principal cause?—A false sentiment will work. The peasantry and the labouring classes have got to regard bread and tea as a higher and better class of food than potatoes and milk, or porridge and milk. That sentiment grew up, and still exists, and is getting more obdurate every day.

11242. Do the priesthood share that sentiment?—They have great influence with their flocks. Could they not do something to counteract that?—The priesthood do not share that view, and I may say that a number of priests try to counteract it. At confirmation time, when confirming the children, all the people of the parish attend, and I have spoken over and over again in connection with the education and the management of the children very strongly, and appealed to the mothers, and insisted that the children should get milk.

11243. Without much success?—It has had some success.

11244. Are your efforts seconded by any of the local authorities?—Do they ever distribute leaflets to the poor, explaining the best forms of diet for the nurture of children, and so on?—The local authorities have not done much up to this time, but the new Department of Agriculture and Technical Instruction is making a considerable effort in that direction. I may say that we have an Agricultural Board in Ireland, consisting of twelve persons for the whole country, eight of whom are elected by the County Councils of Ireland, and four are appointed by the Government. I am one of the eight elected by the County Councils of Ireland to represent them on the Agricultural Board, and hence I am somewhat familiar with this class of work. The Department of Agriculture and Technical Instruction has been doing a considerable amount to spread knowledge in this direction, and we have domestic economy teachers opening classes in the various places.

11245. Is not that having some effect?—It is having some effect, but the effect really has not made itself felt yet, and will not make itself felt for a considerable time.

11246. You hope it will?—Yes, but in the meantime the causes are vigorously at work. I regard it in this way, that the causes are like a torrent sweeping away the popu-

lation, and the remedies are only like a drop, and it will take a very considerable time before we have the current on the other side. I may say in this connection that I have been making an effort myself to train the teachers of the girl schools in this matter. In the towns and cities in Ireland, the education of the Roman Catholic female population is very largely conducted by nuns. In the three principal centres of population which I have the female schools are conducted by nuns. A lady came over from Scotland, who had studied in the Scotch Domestic Economy schools, hygiene, and all those subjects, and I gathered a number of the nuns from each convent and established a training school, and that training is going on at present the moment. It began on the 1st July last, and will end on the 1st July next. They are getting a twelve months' course of training, with a view of teaching in the schools. I also expect that from those schools the information will spread out to the female teachers around the country. I am afraid that I am going away from the causes to the remedies. We have disposed of the point of the children in Ireland being largely fed upon tea. I have known of my own knowledge young children only a few months old being fed on bread and tea.

11247. The mothers in Ireland suckle their children to a large extent, do they not?—The practice is dying out very quickly.

11248. Is that because they are unable to from physical weakness, or because they are negligent of their duty?—I think both causes are at work. The number of women who suckle their children has fallen very much. I could not give an estimate, but I doubt if half of them suckle their children at present.

11249. And perhaps they do not suckle them long enough even when they do suckle them for a time?—I sometimes speak to them about not suckling their children, and they tell me that they are recommended by the doctor not to do so, and they are sometimes prevented by their husbands from doing so. Sometimes I quite approve of that, because where you have consumption or insanity, it is, in my opinion, safer for them not to suckle their children. Very often doctors forbid the mothers to suckle them for these reasons. Then you asked if the difficulty of getting milk had something to do with the change. It has something to do with it, and perhaps a good deal.

11250. You referred to the establishment of creameries?—Yes, that has drawn the milk to the creameries. When milk was used it was principally skim milk.

11251. Does not the separated milk come back from the creameries?—Separated milk comes back from the creamery, but there is a very great difference between separated milk and skim milk.

11252. The separated milk has some value, I suppose?—The skim milk was a very agreeable, palatable drink, pleasant to the taste, and also nourishing, because it contained not only all the milk solids, but a considerable proportion of fats; the skimming did not remove all the fats. Now the separated milk is very unpleasant to the taste; it is almost undrinkable.

11253. (*Mr. Struthers.*) It is very thin, is it not?—It has a disagreeable taste.

11254. (*Chairman.*) Which it acquires in the process?—Yes, partly, I suppose, from machinery and also it would seem to me as if there had been a sort of molecular disintegration of the milk itself. It comes out quite frothy. Then it takes a considerable time to get back into the liquid state, and it would seem as if the molecules had been almost disintegrated. Then it contains very little fat, and on the whole it is practically undrinkable.

11255. Cannot it be used for cooking?—No, I do not think so.

11256. With porridge, and so on?—Do you mean in cooking porridge?

11257. (*Mr. Struthers.*) Instead of water?—The porridge was always made with meal and water, and not with meal and milk.

11258. It might be a useful substitute for water?—The use of porridge has died out. Then when you have the porridge cooked you require milk to use with the porridge in the eating of it.

11259. (*Chairman.*) Still you say that the Irish peasantry can get the milk if they like. The principal

cause of their not having it is their distaste for it?—The great majority of the Irish peasants have milk, but they cannot afford to take the whole milk. They require either to convert the whole milk into butter at home or send it to the creamery and convert it into money. They never used new milk, or whole milk, except for babies. They used to have the skim milk, but now they only have the separated milk which is undrinkable; they are practically excluded from the use of milk to a very considerable extent. It is a very great difficulty. If the Irish peasantry were somewhat better off, if they could afford to use a portion of the whole milk for their own food, it would settle the question, but in the present state of the wealth of the country I am afraid that is hardly possible.

11260. Tea is not a cheap drink, is it?—It is cheaper than the milk, it is a very much cheaper drink. A quart of tea is much cheaper than a quart of whole milk.

11261. (*Dr. Tatham.*) Have you any idea of what the price charged for whole milk is?—The creamery price is only 4d. a gallon or 1d. a quart. That is the cost to the peasant who sells his milk. He can of course have his milk for food at a penny a quart.

11262. (*Mr. Struthers.*) His tea will cost him more than a penny a quart—that is high priced tea?—I do not think so. The cost to the labourers who buy milk is 1½d. or 2d. a quart. Those who have milch cows would not sell it at the same price, principally because there is a difficulty about payment.

11263. (*Chairman.*) Peasants in this country would be very glad if they could get milk at 1d. a quart?—Certainly, but I shall have to come later on to the wage question as between Irishmen and Englishmen—the question of means—which makes a very serious difference.

11264. (*Dr. Tatham.*) But the poor are charged a higher price because of the difficulty of getting payment?—Yes.

11265. (*Chairman.*) You attach very great importance to the effects of emigration?—Yes, very great importance.

11266. Do you think that is a well ascertained cause or do you think it is of the nature of a speculative cause?—I think it is a cause about which there is no philosophic doubt whatever.

11267. You divide the population into the strong who emigrate and the weaklings who stay behind—is that an absolutely accurate division?—It would not be absolutely correct to divide the population into two bodies and say that all the strong emigrate and all the weaklings remain behind: that would be quite incorrect; but it is quite correct to say that the total of those who emigrate are strong and vigorous.

11268. The average of vitality is much higher among those who emigrate than among those who stay behind; you would not put it higher than that?—I divide the population of Ireland into two parts—the strong and vigorous on the one side and the weaklings on the other. Then out of the strong and vigorous division I take the large number who emigrate.

11269. Would you say half of them, or a third?—I could not give you a reasonable estimate as to the number of weaklings in Ireland as against the number of the strong.

11270. What is the proportion of strong people who go?—All those who go are strong.

11271. What proportion of the strong of Ireland go—surely there are strong types left behind?—Certainly.

11272. A very considerable proportion?—Yes, a very considerable proportion.

11273. It is not only the weaklings who are left to propagate the Irish race?—I do not say so; we have some strong men and women to breed from, but I say that we have an undue proportion of weaklings to breed from. There are some features of the emigration that I wish to emphasize. Emigration began a very strong flow out of Ireland in the famine times and immediately after the famine, but at that period it was the emigration of whole families. I know in various parts of Ireland there were whole families which went to a foreign country during the famine or immediately after the famine. That had no effect on the physique of those who remained behind—it

left things *in statu quo*. Then for several years afterwards a considerable number of families did go. When the younger and more vigorous members went to America or Australia, after some years they were not satisfied until they finally took out the old father and mother and the young members of the family. So that although the numbers emigrating were larger it did not affect the physique of those remaining behind. But for a considerable number of years it has been only the strong and vigorous that go—the old people and the weaklings remain behind in Ireland. That has arisen from several causes. One of the causes is that the authorities in the United States have become particularly strict about the physical condition of the immigrants into the States; they have a stricter medical examination when the immigrants land, and if they are not found physically fit they are sent back again.

11274. That has had a tendency to check Irish emigration?—It has a tendency to check the weaklings from emigrating, but it has not a tendency to check the vigorous and strong. Then the shipping companies, finding that they had to carry back *gratis* those emigrants, have become very particular, so that before a shipping company in Ireland will take an emigrant, the emigrant has to make a solemn declaration that he is not suffering from tuberculosis or scrofulous glands or insanity or diseases of the eyes. The emigrants very largely have to get themselves medically examined before they leave home at all. So that the present flow of emigration, though smaller in volume, has a much more serious and deleterious effect on the physical condition of the population of the country. Now as to the number of emigrants: from 1851 to 1901, 3,846,393 people emigrated in those fifty years, an average of 77,000 in the year. For the last twenty years the average would hardly reach 50,000. I could give you the particular figures, but they will not interest you. The taking away of 50,000 strong, vigorous men and women every year from the country has a very serious effect. According to the Registrar-General, of those 50,000 on an average who emigrate, 81·5 per cent, of the total emigrants are between fifteen and thirty-five years of age. Therefore of the 50,000, over 40,000 were between the ages of fifteen and thirty-five.

11275. The flower of the race?—Yes.

11276. (*Colonel For.*) Do you find many come back again?—Not many; of course some do, but the numbers coming back are only counted by tens as compared with the thousands who emigrate. On my way over to London I picked up this statement in a newspaper. There has been in Ireland recently an anti-emigration society—they published their annual report on the 21st of March.

11277. (*Chairman.*) Under what auspices has that society been established?—It is a voluntary society.

11278. Has it been supported by prominent persons in Ireland?—Yes. The chairman of the society is Cardinal Logue, and amongst the committee is the Lord Mayor of Dublin, Dr. Douglas Hyde, who is president of the Gaelic League; and Dr. Cox, a prominent doctor in Dublin; and John Sweetman, the chairman of the Meath County Council; and several chairmen of county councils. In this report they say, "In the space of the last twenty years, according to the report of the Commissioner-General of Immigration, Washington, no fewer than 910,000 men and women emigrated from Ireland to the United States alone. Of those 755,000, or 83 per cent., were in the prime of life, between the ages of fifteen and thirty-five." In Ireland at the last census, in 1901, the whole number of persons between the ages of fifteen and thirty-five was only 1,500,000. So that the loss of our young population to our country alone in the last twenty years was fully one-half of the present adult population of the country. That figure of 83 per cent. fits in pretty well with the Registrar-General's figure of 81 per cent. out of the total emigration out of Ireland. You see you might have a somewhat higher proportion of the young people going to the United States than coming here to England, for instance, or going to other countries.

11279. (*Dr. Tatham.*) Is there any compensating immigration into Ireland?—There is immigration of Jews.

11280. Only Jews?—Yes.

11281. Where do they come from?—I think they arrive in Ireland from England. How they have traversed Europe I do not know.

Bishop of
Ross.

11282. Are they mainly Polish Jews ?—I do not know.

11283. (*Chairman.*) They do not come into the rural parts of your diocese ?—Yes, a few of them go round and do very great harm—they go round peddling.

11284. (*Mr. Struthers.*) Gombeen men ?—Yes; they sell tea of the vilest character; they go to the doors of the peasantry and sell them the tea and other articles. It is nearly impossible to keep the people from dealing with them. That is one of the causes of physical deterioration, because they are getting the vilest stuff from the Jews.

11285. (*Colonel Fox.*) Are they foreigners ?—Yes, there are no Irish-born Jews.

11286. I mean those who immigrate ?—Yes, they have simply learned a little English.

11287. There are a vast number of English Jews, but what I wanted to know was whether those particular Jews you are speaking of now were foreigners ?—I think they are principally foreigners.

11288. They are Poles, Roumanians, and Russians ?—Yes, they have generally stayed a little in England first and learned a little English.

11289. I mean they have originally come over to this country as foreigners ?—Yes.

11290. (*Chairman.*) Another of the causes which you attribute is the raising of the marriage age. Of course, to some extent that is a good thing. That has been quoted here as one of the counteracting influences against physical deterioration, that whereas the age at which people contract marriage used to be much too young, now a great many postpone it to a more suitable period of their life ?—I only directed attention to that matter; I have not formed any opinion on the subject myself.

11291. You appear to think that at present the Irish marry almost at the outset of senile decay, or pretty nearly so, when they are really getting past the powers of reproduction. —Yes, a large number of them do.

11292. Why is that ?—It is the want of means—

“Before you marry,

Be sure of a house wherein to tarry.”

11293. That is a sign of the providence of the Irish race ?—It is a sign of increasing providence.

11294. Would moral improvement of that sort be likely to be the outcome of a physically degenerate people; would you not expect some correspondence between moral and physical characters ?—I am not quite sure that it is a very high state of improvement.

11295. We understand that the Irish people are extremely virtuous and chaste, and if they postpone marriage to the age at which you affirm they do it surely argues most extraordinary powers of continence and self-restraint on the part of the Irish race ?—Yes.

11296. Which are very valuable moral qualities ?—Yes; those qualities have been in the Irish race back for generations.

11297. I desire to speak of them with the most profound respect, but can you say that moral qualities developed to that high point are in correspondence with decaying and degenerate physical characters ?—These moral qualities were equally pronounced and equally powerful when the Irish people were marrying at a younger age than they are now.

11298. If marriage is postponed to the late period which you describe, this continence must be of a higher character than it was in the past ?—The continence is more severely tried, but it does not follow that it is of a higher character.

11299. Surely the continence which stands a higher strain is evidence, so far as it goes, of a higher type ?—I quite admit the evidence, but I do hold that if the continence fifty years ago had been submitted to the same strain it would have stood the same test.

11300. That may be so ?—The married age has gone up, and the result is, that the birthrate has fallen very much in Ireland; we have the lowest birthrate in Europe at present.

11301. (*Dr. Tatham.*) And it is still falling ?—It is really keeping pretty evenly at this low rate—it is keeping rather steady. Our marriage rate is low also, but the

marriage rate and birth-rate are keeping rather steadily at this low scale.

11302. (*Chairman.*) The postponement of marriage and the existence of small families are unusual circumstances in a country where the influence of the Roman Catholic Church is strong, are they not ?—They are unusual.

11303. Brittany, where the influence of the Roman Catholic Church is stronger than in any part of France, is the only part where the population is showing an increase ?—That is so. I did not explain with regard to the moral improvement of the people what I think is the cause of the late marriage. The standard of living in Ireland has been going up. There is more seeking after physical comforts than had been the case. People are not satisfied with the same wretched hovels as they have been in the past. They are not satisfied with as cheap food as they were in the past. Potatoes are a much cheaper food than wheaten bread, but they are not satisfied with potatoes at present, and the result is that when the standard of living, or aiming at a higher standard of living, has gone up, and when the revenue of the country, the income of the country, has not increased, but diminished, it is a necessary consequence that the population must go down, and a necessary consequence that fewer people can marry, and that they must marry at a later age.

11304. In this country, we have been told that the aspiration towards a higher standard of living has come with improved pecuniary resources, but, according to your theory, it has come with diminished pecuniary resources in Ireland ?—The resources have diminished.

11305. Is it not strange that *pari passu* with diminished pecuniary resources the aspiration towards a higher standard of living should set in: is that consistent with general experience ?—Whether it be inconsistent or not, it is an indisputable fact in Ireland.

11306. It is one of the paradoxes of the Irish people, we may presume ?—I do not regard that as a paradox, because you had the Irish people living on a dietary and under conditions that were not only uncomfortable, but were, I venture to say, inhuman, and as people advance a little in education they are not satisfied to submit to inhuman conditions.

11307. And yet, at the same time, you testify to the increase of drunkenness in Ireland, which is hardly a sign of a higher civilisation ?—I think it is pretty evident that potatoes as a staple food, without bread or flesh meat, or any other substance, is not a condition which people will submit to. I do not wish to talk politics, but yet, if we want to form an exact opinion of the state of the country, we must not forget the history through which it has passed. I believe it would be just as wise for a physician to try to treat his patient by excluding all reference to the life history of the patient. In Ireland the struggle of the people for nearly two centuries was a struggle *pro aris et focis*, and while making that struggle they really were perfectly oblivious of food or drink. That struggle went on, and afterwards when we began to achieve a reasonable amount of religious liberty and afterwards of civil liberty and political liberty, the people then naturally began thinking about other things of a more physical and bodily character. That was particularly accentuated by the large emigration to America and to England. Ireland is situated between two countries that have, perhaps, reached the highest standard of living of any countries in the world.

11308. That is hardly the case in this country as far as the poorer classes are concerned ?—There is scarcely a family in Ireland which has not relatives in England or America, constantly writing home to them about the American working man having flesh meat four times a day; the brother at home is not contented with seeing flesh meat only at Christmas. Then a number of the American emigrants come back to visit their friends, and while they are at home on the visit they insist on being treated pretty much in the same style as they live in America.

11309. It must be a severe tax upon the resources of their relations ?—They generally make gifts to the friends, and that teaches Irish people a higher standard of living. The standard is creeping up while the resources of the people are going down. This puts us in a particularly awkward position.

11310. I suppose the diminution of their resources is partly due to the amount spent in intoxicating liquors?—I will come to that afterwards. Our marriage rate in Ireland for the last twenty years varied between $4\frac{1}{2}$ and 5 in the 1,000.

11311. Do females in Ireland more largely outnumber the males than they do in England?—I do not think so. I have gone back over the figures for perhaps thirty years, and the male children in Ireland considerably outnumber the female children.

11312. (*Dr. Tatham.*) It is generally the case with births, but they die more rapidly?—I do not know why.

11313. (*Mr. Struthers.*) Is not the balance of emigration largely male?—We have a very large female emigration from Ireland. I think it is quite as large as the male.

11314. (*Chairman.*) Perhaps you will state what you wish to say upon this marriage rate question?—The birth rate has fallen in the last twenty years from $24\frac{1}{2}$ to 23 per thousand; in England the birth rate is about 30, and Germany about 40. The marriages being fewer and being contracted when the people are more advanced in years has a very serious effect upon the birth rate. There are more parents childless, and the number of children in each family is much smaller. Whether those children born when the people are advanced in age are less vigorous I cannot say; I have not observed that they are less vigorous.

11315. They are better than the children of the very young I should think?—I think when I was a boy at school I read in Bacon's *Novum Organum* that the children of the very young are defective. Bacon was one of the earliest in investigating things of that sort. I merely call attention to the fact, I do not wish to draw any conclusion.

11316. Would you say that the increase of drunkenness among the women may have much more to say about the debility of the offspring than the late marriages?—Yes. There is an increase in drunkenness in Ireland, particularly in the towns.

11317. You use a very strong expression in your précis; you say, "The drink demon has seized on many women of the poorer classes, especially in the cities and towns, and is working sad havoc in the health of their progeny"?—Yes. That is especially the case with the wives of the artisans—carpenters, masons and smiths.

11318. Due to the fact that they have better wages and have more to spend upon stimulants?—Yes. The wages of the artisan classes in Ireland are very good—carpenters, masons and plasterers—these men have quite sufficient wages.

11319. And it is amongst the wives of that class that there has been a great increase in drunkenness?—Yes, and I am afraid amongst the women of the towns and cities generally in all classes.

11320. But you do not think there is more drinking among the rural poor?—I do not think so.

11321. (*Colonel Fox.*) May I draw attention to this point in your précis; you say, "In proportion as the creature comforts of the home are unsatisfying so the attraction of the public house becomes the greater." I take it that means when they have less wages. That is exactly the opposite to what you say now?—Your reasoning would be that because the artisans have sufficient wages they ought to be able to give greater comforts in their own homes and therefore that the drink ought to lessen.

11322. Quite so. If the wages are increased their homes ought to be more comfortable, but yet you say in your précis what I have just quoted?—The wages of the artisan classes are quite sufficient to keep comfortable homes, but the women are not sufficiently educated; they do not know how to keep comfortable homes. The artisan classes are only a small number amongst the total population and it is not easy for a small number of people to strike out on a new line and a new system, so that the wives of the artisans are generally satisfied with the same class of home as the wife of the farm labourer or town labourer. One man earns 30s. per week and the other man only 9s. or 10s. The result is that the artisan's wife, who has no higher ideal of housekeeping than the labourer's wife, finds herself with surplus cash of 20s. in hand and it is largely spent in the public house. Of

course the creature comforts could be kept if she had sufficient knowledge or sufficient taste, but as I say, it is not easy to get a particular set of people to rise above their surroundings.

11323. (*Chairman.*) That is the first thing you suggest—the want of knowledge of this sort and the means by which it can be disseminated?—Yes.

11324. Do you think that must be done in the school or after school age?—I think that problem should be attacked in both places.

11325. You think the foundation should be laid in the school?—Yes. And the problem worked out after school.

11326. By what sort of organisation—the county councils?—The foundation should be laid in the elementary schools, and then afterwards the work should be completed through the department of Technical Instruction which works hand in hand in Ireland with the county councils.

11327. It is doing a very valuable work, is it not?—Yes, in the schools themselves the female teachers of the little children could do a great deal not by way of formal classes or formal instruction, but by way of infusing sound ideas into the children. Then afterwards my view is that the children should be allowed to leave school as they do about fourteen years of age and work in the homes for two, three and four years, and then bring them back to classes in cookery and hygiene, and laundry and other classes of that sort.

11328. Could not they attend those classes between the ages of fourteen and eighteen usefully?—I do not think so.

11329. Could not they be collected from their homes twice a week for the purpose?—I do not think they could usefully attend. As I look at the problem, first, before you can make a really good house-wife you require the mind of the person to be developed almost into the mind of a woman, and you require also that she shall have a certain amount of experience of home life. If you try to teach a girl of fifteen or sixteen I think your teaching will be to some extent wasted on her. Her mind is not sufficiently developed to take teaching in beyond mere theory: she has very little practical knowledge of home life and when she tries to apply her theory afterwards she fails and gives the theory up.

11330. You could not bring any compulsion to bear upon her later, could you?—I do not want compulsion.

11331. You merely want to give them an opportunity in the hope that they would avail themselves of it?—I am entirely opposed to compulsion in school matters. In Ireland, where we tried compulsion, we gave it up very quickly because of the moral influences that lead our people—an Irishman will be led but he will not be driven.

11332. There is no compulsory attendance in Ireland?—There is machinery for compulsory attendance.

11333. But it is not used?—It is not much used. It is found to be somewhat useful in the large cities, but in the small towns and the rural districts it has had the very opposite effect; it has set up the backs of the people against education altogether.

11334. (*Mr. Struthers.*) The point is that the compulsory law in Ireland is optional so to speak, that is to say, it depends whether the local authority chooses to apply it to a particular district?—Yes.

11335. It is not a law common to the whole country as it is here?—That is so. The adoption of the law is optional, but once it is adopted the law is compulsory. It was adopted in the town in which I live myself, Skibbereen: the local authority, the Urban Council, adopted this law. They worked it for five or six years and found that it was having a very bad effect and they dropped it, and fell back upon the old method which was the visit of the priest to the home and to the schools.

11336. (*Chairman.*) This question of course touches the further suggestion you make that much might be done to develop the industrial resources of Ireland?—Yes. I might remark perhaps with regard to those nuns whom I have under training in domestic economy and hygiene at present, I intend those ladies when they return to their various schools shall adopt two sets of classes, one set for the ordinary school children in order to give them the first elements of knowledge, the knowledge of

Bishop of
Ross.

*Bishop of
Ross.*

the uses of fresh air, the advantage of cleanliness, some knowledge of the value of foods, and general knowledge of that kind; then afterwards when the children have gone away from school for a few years they will be brought back two or three days in the week to attend classes for a session, say, six months or possibly twelve months, in the higher knowledge. It is in that way that I intend to work it.

11337. You think they would be willing to come?—I know they will. We have had some experience already, and we find they will be willing to come. Then I make a suggestion that to carry out this improvement we would require to train the female teachers of the national schools. At present they go through a course of training of two years in the training colleges; the training is purely literary, with a little of what I might describe as mechanical work of sewing, but they have no knowledge of the ordinary work of a housewife. In fact the female teachers of Ireland have much less knowledge of housewifery than the ordinary woman. Their history is this: a little girl of fourteen or fifteen is appointed monitress in the school. After her appointment it becomes a sort of unwritten law of the family that she is not expected to wet her hands afterwards; her mother and sisters do all the housewifery, and in fact they do the personal work for this child; she is supposed to devote herself exclusively to books. She serves five years as a monitress, and when eighteen, nineteen or twenty years of age she is sent to a training college in Dublin, and spends two years there exclusively at literary work with the exception of needlework, which is part of the course. Therefore she comes out with no knowledge whatever that a woman ought to have with regard to housekeeping—with far less knowledge than her mother or her sisters—and she is set then to teach the girls of the parish. There is no fountain of knowledge from which knowledge will emanate. If she herself appreciated this information and had the information in her mind even without any formal teaching of the children, in my view there would be a sort of magnetic current passing from her to the children which would greatly improve them in these matters.

11338. The Agricultural and Technical Department in Ireland might take this up?—I think the National Board of Education should take it up.

11339. Do you not regard the principles of hygiene and the management of children as a branch of technical instruction for women?—We suffer in Ireland a great deal from what we call red tape. This is just one of the points where red tape comes in. In Ireland the enormous bulk of the population are educated in the national schools and have no other opportunity of education whatsoever. Then if you want to get at the population through the Technical Board of Education you will have to cover the country over with a second set of schools, which would of course be an enormous waste of money and be quite an impossibility. The work of the National Board of Education costs something like £1,250,000 a year, and the Technical Board of Education for the whole country has got the noble sum of £62,000 a year; so that it is quite absurd to rely on the Board of Technical Education to do this work.

11340. Not in the case of the older girls—the young women?—How will you get the young children—how will you enable the young girls of ten, eleven, twelve, thirteen and fourteen years of age to get any knowledge whatever of those subjects?

11341. (*Mr. Struthers.*) Do you think you are quite fair to the National Board in this matter. Have you enquired into what they have been doing lately in the matter of instruction in domestic economy and cookery?—Yes.

11342. You know that about three or four years ago they brought out a revised programme as the result of the investigation of a Commission on practical training?—I am quite aware of that.

11343. And that Commission recommended—and I understood at all events that the National Board had carried out the recommendations—to have an arrangement for having domestic subjects taught throughout the country?—Yes.

11344. And also that training in domestic subjects should be made part of the training college course?—I was not aware of the latter part.

11345. That was the recommendation and I understood it was carried out?—It may have been, but I am not aware of it. That is the very thing I recommend should be carried out.

11346. Also you know the training college under the direction of Archbishop Walsh?—Yes.

11347. And even at the time that this Commission of which I was a member was making inquiries there was instruction, if I remember rightly, in domestic economy, and domestic subjects being given in that training college because of Archbishop Walsh's influence: his own particular views were being carried out there, so that I should think there is a considerable amount of direct preparation of teachers for giving this kind of instruction, and more than that, there would be the actual instruction given in the schools in a good many districts in the country?—What you say is quite correct that there is a change of programme, and as the result of a change of programme, a change in the system, and there was some effort in the national schools, some attempt to give the girls more information on the subject; but quite recently the National Board has abolished that programme and they have gone back to their old lines, so that any attempt at cookery and domestic work in the national schools is now given up.

11348. When was this change made?—Within the last six months.

11349. That is news to me?—It was quite recently. One of the reasons for the change, so far as I know, was that the teachers were incapable of doing any good from want of some knowledge themselves. They were incapable of doing any good in domestic work. Therefore, I think, if we are to approach the question with any hope of success, we should commence with the teachers, and in their training classes give that instruction, and then gradually the thing would spread over the country.

11350. As I say, I understood that was carried out?—It may have been. I am not aware of it. I never heard that it had.

11351. (*Chairman.*) I do not understand you to say that that part has been abandoned at any rate?—If that was ever adopted, I have no knowledge that it had been abandoned.

11352. (*Mr. Struthers.*) Do you know anything whatever of what has happened with regard to another recommendation of the Commission which, I understand, has actually been carried out, namely, that there should be a certain number of instructresses in Domestic Economy, highly qualified women, such as the lady you have got over from Scotland to instruct your own nuns, who will be stationed at certain centres in different parts of the country to instruct the teachers of a given district at the centre with a view that these teachers, in their turn, might teach the children in the schools. That was the recommendation made by the Commission, and I understood that it was to be carried out by the National Board: Was it carried out?—It was carried out. The instructresses came for a few weeks to the various centres, and the female school teachers of the district had to assemble one or two days in the week for a few hours, and the instructress gave them certain information with a view to get them to start this work in the schools. That was actually done, but you will very well understand that if a woman of thirty, forty, or fifty years of age has not had much domestic knowledge up to that time, a few lessons will not get her into what I may describe as the house-keeping groove.

11353. First of all most of the women are younger?—I have known women of sixty years of age under that course of instruction, and I have known them in their schools actually trying to carry out the instructions. I quite approve of the effort, and I regret that it has been given up, but you see very well that effort cannot have very much efficiency. If we really want to get at the thing in an efficient way, I see nothing for it but to give young women in the training college a twelve months course in domestic economy, laundry, hygiene, and other work of that sort, so that you really form their minds.

11354. We certainly recommended that this was to be part of the training college course, and I thought it was

carried out?—I do not personally believe in mere dabbling at a subject of this sort. If in the training colleges you take one hour in a week for domestic economy subjects, I do not believe that will ever influence the mind of the teacher in any very serious way.

11355. (*Chairman.*) You want it to be continuous and practicable?—I would be satisfied with a six months course, provided they could devote their whole time to this and nothing else, and that they had no literary work whatever to do, in the hope of getting their minds into a particular groove.

11356. (*Colonel Fox.*) Do you not think it is better to have it once a week spread over two years, so as to keep it perpetually in their minds?—No, I prefer the other system. If you take it only once a week the main object of those girls will be the literary work. The old tradition is that they should do literary work and nothing else, and if you take them over a two years course the main object before their minds will be the literary work, and this lesson once a week will simply be regarded as a sort of extra, just as they would regard a lesson in physical drill or something of that sort. It will never leave that impress upon the mind that you want.

11557. (*Chairman.*) It will not give it sufficient prominence, in fact?—That is so. If you devote a certain portion of the course to it, suppose it was thought too expensive to add a year to the course, I would take six months off the two years, and give them one and a half years at literary work, and six months exclusively on this work.

11358. (*Mr. Struthers.*) Have you tried to impress these views on the National Board?—No, it is the first time I have brought this point out publicly.

11359. I think it would be well worth while bringing it before them?—A great many of my other views have come out publicly on various occasions, but with regard to this one this is the first time I have mentioned it publicly.

11360. (*Chairman.*) Are the National Board of Education obdurate to influences from outside?—Rather.

11361. More so than the Education Departments of England and Scotland?—I cannot institute a comparison. You must know both terms before you can compare.

11362. Is not a great deal being done for the development of the educational resources of Ireland by the Technical Board?—As a member of the Board of Agriculture, I am bound to say in self-defence that we are doing a great deal.

11363. It is doing a great deal more than the National Board of Education is doing in its sphere?—I say we are working very hard, but we have have not made much impression on the country so far, and it will take a very long time before we have made very much impress. Then with regard to the resources at our disposal, we have to develop a nation with thirty-two counties, and we have for the purposes of developing the agricultural resources of that population £100,000 a year, and for the whole industrial work, the technical education of the female population which we have discussed, and the technical education of the male population, the establishment of industries and factories, etc., £62,000 a year. That does not carry one very far.

11364. You think you are proceeding on the right lines, and what you want is development?—Yes. Up to this our money was quite sufficient for us, because we were only making a beginning and simply directing the mind of the country into this particular groove. I think we have been making very considerable progress in getting it into this groove.

11365. Will not your resources be increased commensurate with the amount of work you have to do in future?—I hope so, otherwise our work will be hopeless.

11366. (*Mr. Struthers.*) Could not the National Board of Education spare you some of the £1,250,000?—I do not think so; the salaries of the teachers in Ireland are paid by the National Board, and that absorbs the greater portion of the money. The schools in Ireland are maintained on the grant outside the school buildings. Most of them were erected in Ireland by the voluntary contributions of the people. In later years they have been erected by a two-thirds grant from the National Board; but in former times they were erected

exclusively by the voluntary contributions of the people. At present the schools have to be kept in repair by the voluntary contributions of the people. Then whatever fuel there is in the schools has to be procured either by voluntary contribution or the children take it themselves. It is not an uncommon thing for the poor little children to have to take a sod or two of turf on a winter's morning to school. I might set it down as one of the causes of the poor physical development in Ireland that the school children are unfairly, in fact I might say cruelly, treated in the schools themselves. I see now many of these little children going to school all the winter barefooted, and in some instances they go to a school where there is no fire. The country children have to travel a couple of miles to school; a great many of them have no cloak or shawl, or anything to cover them. Ireland is rather a rainy country, and they go wet into the school and sit down there shivering all day.

11368. (*Chairman.*) Does not the National Board insist upon the schools being properly warmed?—No; there is no means of warming them except when the manager of the Catholic schools, who is the parish priest, or the manager of the Protestant schools, who is the rector of the parish, make parochial collections amongst the people.

11369. (*Mr. Struthers.*) You speak of this money which is given by the National Board being required for the proper warming and lighting of the schools, because otherwise they have to depend on voluntary contributions; that is because you do not levy a rate for the support of the school in any part of Ireland?—Yes.

11370. In England, besides the Government grant, there is a rate levied in the locality which gives as much money?—Yes, I am aware of that. I will discuss that on the next point, the over-taxation of Ireland, and I will show that so far from being well-treated in that matter it works out exactly the other way.

11371. (*Chairman.*) I am afraid we cannot go into the question of the over-taxation of Ireland—I do not know that it touches the points we are concerned with except so far as it affects the individual Irishman. Can you show that taxation renders it impossible for the Irish peasant to reach even the lowest standard of human comfort?—Yes, it is from that point of view that I look at it.

11372. In what respect is he so heavily taxed?—Taxation in Ireland is almost entirely indirect taxation—I think 75 per cent.

11373. Tea, whisky, and tobacco?—Yes.

11374. As you note whiskey and tea as being two of the most deleterious things, if he leaves them off he is taxed very little?—Tea and tobacco are the most serious taxes upon the great bulk of the people of Ireland.

11375. (*Mr. Struthers.*) Those are not necessary things?—Metaphysically they are not, but if you take the habits of the people they are necessary.

11376. You wish to change those habits?—I am not a smoker myself, but I regard tobacco as a necessary of life at present, taking the habits of the people into account—tobacco and tea.

11377. (*Chairman.*) I should have thought you wanted them to be made prohibitive?—I would be quite satisfied if the duty on tea were perhaps a little prohibitive. If you were to tax tea at 10s. a lb. I would be delighted.

11378. You would not advocate its being lowered at any rate?—Certainly, I advocate its being lower.

11379. That would lead to the people drinking more tea?—No, I hold that is quite illogical. The tax on tea is sufficient to drain the unfortunate labourer's wages away, but it is not sufficient to prevent him from drinking tea, and it is not sufficient to make him go to other foods which are cheaper and better than tea, so that the tax is high enough to injure him and is not high enough to protect him. The same with tobacco. Tobacco is taxed at present at something like 3s. a lb.; if you put it at 20s. a lb. I am quite satisfied; but the Chancellor of the Exchequer is not likely to do that; there is a point beyond which the tax is not productive.

11380. (*Dr. Tatham.*) Before you leave the question of schools I want to ask you whether you have not noticed that children come to school either imperfectly fed or practically half-starved, and have to learn their literary

*Bishop of
Ross.*

task, although they have been very insufficiently fed—is not that commonly the case in Ireland?—Yes.

11381. Should you think that that is one of the causes of physical deterioration?—Of course the mental strain, added to insufficient feeding, has a very bad effect, I suppose.

11382. I suppose there are no provisions of any kind by means of which the children may receive any food at all?—No, there are no State provisions. Really from charitable sources there are provisions, but I confess, although it may seem strange, that I am strongly opposed to such provisions.

11383. You do not want to pauperise the people?—No. I think that if the children come to school and if they get food at the school, instead of relying on their parents to feed them, it has a very demoralising effect.

11384. I am quite sure you will agree with me that if a child is brought to school compulsorily—is dragged there if you like, it is almost inhuman to keep that child there and to expect intellectual work from him during the day unless you feed him?—It seems so.

11385. (*Mr. Struthers.*) I have been told that the schools are voluntary?—Yes; the attendance in Ireland is voluntary—but even in the case you make, Dr. Tatham, I would hesitate a long time before I would agree with you.

11386. Would you accept the alternative?—I quite admit the physical hardship and the cruelty to the child, but I attach so much importance to the moral feature—the character of the child—the sense of self-respect, the sense of self-reliance, and all those other virtues, that I really think I would prefer physical hardship and cruelty on the one hand by leaving them hungry, rather than demoralising them on the other.

11387. (*Dr. Tatham.*) It does not mean mere hunger—it means starving and dying in fact, from my point of view as a medical man?—It would be very hard to see them die.

11388. It is killing them by inches?—Even physical death might be preferable to moral degeneracy—at least, looking at it from a high race point of view. Of course I know that is rather a hard doctrine to lay down, especially for a Christian clergyman.

11389. (*Chairman.*) Have you anything further to say upon the question of taxation?—The way it works out in my mind is this. This is not the first time I have given expression to these views in public. In Ireland we cannot have a strong, healthy, and vigorous population except we have them fairly well fed, and fairly well housed and clothed. The means are not there for the sufficient feeding, housing, and clothing of the people, and in order to supply the means there must be two things done; we must try and increase the production of the country on the one side, and on the other side we must try to lessen the drain on the country. We must then try and widen the margin of living. Now the margin of living is narrowing instead of widening. The price of agricultural produce of all kinds has gone down and is still going down.

11393. Meat?—Yes, certainly.

11394. Has it gone down within the last twenty years?—I myself remember distinctly paying 11d. and 1s. for beef and mutton in Ireland.

11395. (*Dr. Tatham.*) When was that?—In the '70's I paid it myself. Now I can purchase the same beef and mutton for 7d. and 8d.—that is a serious fall.

11396. To the consumer?—I purchased butter in the '70's for 16d. a pound. I can purchase exactly the same class of butter at the present time for 8d. a pound. The average price got for creamery butter last year by the creameries was about 10½d. as against 14d., 15d., and 16d. a pound in the '70's.

11397. (*Chairman.*) Is that for consumption in Ireland, or for export?—10½d. is the export price for which it is sent to England, but it is that price which rules the prices in our markets in Ireland, so that there has been a very serious drop. Taking all the agricultural produce, altogether in thirty years there has been a decrease of 25 per cent. on the income of the agricultural classes, so that their margin of living is narrowing while taxation is increasing. The late Mr. James McCann, M.P. of the Stephen's Green Division, a great authority on statistics, holds that the total income in Ireland at present is not more than about £45,000,000 for 4,000,000 of population, which would give

£11 a head. To my own knowledge, with regard to the labourers of Ireland, who are a considerable class, and the smaller peasantry, the total amount of means in the year on which they have to support their families is not greater than £20 for a family of five, that is £4 a head.

11398. Prices according to you have fallen, but in different proportion; you instance the great fall in the price of food: that ought to be of assistance to the people?—That labourer and that peasant are not interested in the price of beef or mutton or butter, because from year's end to year's end they do not taste those commodities. There are plenty of labourers and peasants in Ireland who never in their whole lifetime saw a morsel of beef or mutton in their houses.

11399. Is bacon dearer or cheaper than it was?—Bacon has kept a more average price than the other articles. With regard to bacon, formerly the classes with whom I am dealing had not meat except about Christmas time; now in the poorer parts of the country most of them would have a little bit of pig's head or some cheaper class of bacon for their Sunday dinner, and in other parts of the country, where the peasantry are a little more substantial, they have bacon almost daily for dinner. But you see the margin of living in Ireland is exceedingly small. The wages of farm labourers are only about 9s. a week. That is a matter I have gone into. In England the wages are from 15s. to 17s. a week for farm labourers. Five is the average family of the labourer. The 9s. a week will be reduced by wet, and when the labourer is sick, and so on, so that I am rather above the mark when I say £20 a year.

11400. What rent does he pay?—One shilling a week for his cottage.

11401. (*Chairman.*) That is very much less than the English agricultural labourer.

11402. (*Colonel Onslow.*) Is that rate of wages general all over Ireland?—Yes.

11403. In certain parts of England the labourers' wages are only about that amount?—The question was investigated quite lately in connection with the Irish Labourers' Bill which is now before Parliament.

11404. In some parts of England the labourers' wages are only 9s. a week?—I saw in some return that the average wage of England was set down at between 15s. and 17s.

11405. (*Chairman.*) The fourth point is the reduction in the number of public-houses?—Yes.

11406. To that extent, of course, you think that all agencies, religious and other, ought to work together?—Yes.

11407. And bring such pressure upon the people as to restrain their consumption of alcoholic liquors?—I think the first pressure should be brought on the Government. I fight these questions very hard myself; I make speeches, I attend meetings, and I preach sermons. I use all the influences I can.

11408. Is it the rural districts or the towns where there are this large number of public-houses?—Both.

11409. I do not suppose the reduction of public-houses in the town would have much effect. More people would go to those that are left?—It would have the greatest effect in Ireland. I am as convinced of that as I am of my own existence.

11410. It is rather a speculative point?—It is a question I have well considered and examined.

11411. It has not had that effect in England, where it has been done?—I am quite prepared to admit that, if you wish, but I am perfectly certain it would have the effect in Ireland.

11412. Why?—The reason is this. In the town in which I live myself the population of the township, part of which is in the country, is 3,208. In that town we have sixty-two public-houses; there is one for every fifty. The population of the town itself is hardly 3,000. Then those publicans are selected by the brewers from the families that will have a number of relations, and they are by preference young girls. They are selected specially with a view to draw the relatives and friends to bring custom to the public-house. You probably know that in Ireland we are a very clannish race, and the relatives will stick

up for one another; the result is that they will all gather round the new publican for the purpose of maintaining him to their own destruction. In the course of three or four years a publican very often becomes a bankrupt, and the brewer squeezes him out and brings in somebody else of a similar class. In the meantime the relatives and friends of the outgoing publican have become fond of drink, and when their friend goes out they continue the practice, and with a new publican a new set of people is corrupted. If I could reduce the sixty-two houses to twenty it would have a great effect on the drink.

11413. If it is a matter of the personal relations of a publican with his *clientèle*, that puts a different complexion upon the subject?—Yes. Lately I discussed that matter in the newspapers; I fought it in the licensing courts at my own expense. There were two licenses given against my opposition by the canvassing of magistrates, bringing them in, and I intend to take one of the licences to the King's Bench. It is rather an expensive process, and I am not a very wealthy man, but I intend to fight the matter. Skibbereen is a market-town, and there are six contiguous rural parishes whose people frequent the fairs and markets. It has been said that the sixty-two publicans are largely supported by the country population coming into the fairs and markets. I have gone over the six parishes, these purely rural parishes, and in the six purely rural contiguous parishes there are sixty public-houses scattered over the country. Roughly, the population of the parishes would be about 18,000—3,000 a parish. They have sixty rural public-houses for their population without giving any assistance to the publicans in Skibbereen.

11414. Is there no restriction placed on the granting of licenses in Ireland?—Yes, two years ago there was a restriction placed that no new licence should be granted.

11415. Nothing has been done to diminish the number that are at present held?—No, I regret to say that the present Government want to restrict the magistrates in England from reducing them, and that will do us enormous harm in Ireland.

11416. By its moral effect?—Yes, I am quite satisfied that the efforts of the temperance reformers in Ireland are helpless so long as we have that number of public houses. Over the whole of Ireland we have one public-house, taking the whole country together, to about every 220 persons.

11417. (*Dr. Tatham.*) Is potheen the illicit still liquor used?—No, it is practically dead.

11418. Why is that?—For several reasons, the vigilance of the police had a good deal to do with it, also the clergy made a great effort against it, because it was found that not only was there the injustice of defrauding the revenue, but the moral effects on the family and on the neighbours were very bad; they all became drunkards from drinking the illicit whiskey. Therefore all the saner agencies in Ireland set their mind against the practice. Personally I have never come across illicit distilling.

11419. We have heard here that it is because the risks attendant on illicit distillation are so great that the price of the commodity is raised, and it is cheaper to buy the exciseable article?—That is the chief cause. There is one remark I wish to add which was suggested to me by a doctor in connection with decayed teeth. This gentleman suggested that it would be most useful if dentistry in Ireland were made a part of the medical charitable relief that was given, and that a dentist should be paid fees just as the medical officer is paid fees for attending to physical illness. Amongst the poor people in Ireland the dentist's charge of 5s. for dressing each tooth becomes an impossibility. A labourer in receipt of £20 a year for the maintenance of his whole family could not possibly spend £1 or 25s. on a child for improving his teeth. If the teeth were improved, it might be the means of preserving the health and even the life of the child. Just as the medical authorities will give relief in physical disease, so the dentistry should be made part of it.

11420. You spoke just now of the notable decrease of typhus within your memory; is that exclusively in the town or city, or is it in the rural districts also?—It is more marked in the rural districts than even in the towns. I have heard myself old priests say—men who were priests

in the 'thirties and 'forties—that there was never any period of the year that some part of their parishes had not typhus fever; now there is very rarely a case of typhus in the country districts. When it does break out, it spreads very rapidly.

11421. It used to be said that Ireland was the home of typhus?—Yes, it has died out very largely.

11422. I suppose when it does occur in a crowded dwelling the tendency is for it to spread now just as much?—Yes, there has been some slight improvement in the dwellings but the improvement is not much.

11423. Do you know whether the district of Donegal is a typhus district?—I am not familiar with Donegal, and I have not come across any statistics with regard to it.

11424. With regard to enteric fever, is that within your knowledge a very prevalent disease in the poorer districts of Ireland—typhoid as it is commonly called?—It is not very prevalent. Some years we have a good deal of it. After a particularly dry and warm summer, I know we have a great deal of it. What strikes me is that water courses and wells get dried up during the summer and cattle and other animals go in, and there are droppings, and then when the rains come in November it breaks out.

11425. It goes into the shallow wells?—Yes, about November and Christmas and that time of the year. A few years ago we had a wet autumn in the country—I think 1895 or 1896—after a particularly hot summer. It comes periodically like that.

11426. It is mainly water-borne?—I think so. It generally comes from November to Christmas—at the fall of the season.

11427. I suppose the water supply of the country is mainly from shallow wells?—Yes, practically exclusively so—by streams and wells.

11428. You spoke of a large number of persons dying at just over 100 years; do you know at what period the registration of births became compulsory?—In 1863, I think.

11429. So that practically you would have to depend pretty much upon guess work in determining the ages?—To some extent, but, curiously enough, the Irish people are very accurate about ages and dates; they are exceedingly fond of genealogical information and discussion in Ireland and they are very accurate about dates. I notice the Registrar General remarks that he investigated several cases of those high ages and satisfied himself that they were correct. It is my opinion that the people are very correct about them.

11430. And you think it is pretty safe to conclude that there is not very much error?—I am quite satisfied that you have a number of those people at very great ages.

11431. (*Mr. Struthers.*) Is emigration still keeping up to its former figure, or is it falling off?—It has shown a tendency to fall off.

11432. Not more than a tendency?—It goes up and down generally according as there is agricultural prosperity or agricultural depression in Ireland. The 'seventies were a particularly prosperous period in Ireland and emigration in the 'seventies fell very low. Then we had a diminutive famine—not so great as the famine of 1846—in 1879; it was the cause of that very fierce political agitation which grew out of it, which you all remember in 1879-1881. The emigration then, in consequence of that famine, went up enormously for three or four years again. Then when there was a little more agricultural prosperity it began to fall again. It has been going up and down in that way. But of course the total numbers for the last twenty years have been considerably less than they had been at earlier times. In fact the sources are becoming largely exhausted. Then, as I pointed out earlier, the fact of the strictness of the United States authorities with regard to emigrants has checked emigration considerably.

11433. (*Chairman.*) Has it sent them largely to England instead of the United States?—Not very much. There is a kind of political antipathy which keeps our people largely out of England.

11434. There are a great many in Glasgow?—Yes, Glasgow, Liverpool and Manchester—in the large seaports and in the large industrial centres you have a very large

Bishop of
Ross.

Bishop of Ross. Irish population. It is the same in South Wales, Cardiff, and Swansea.

11435. (*Mr. Struthers.*) Would you say that emigration in Ireland is distributed over the country as a whole, or is it confined to special districts?—At present it is rather confined to districts. A great part of Leinster and a considerable part of Munster have become exhausted. The population has been drained out and the emigration has practically ceased in those districts. The same process of exhaustion is going on in the more populated districts. The district I live in at present is very much more populous than a great part of Ireland. If you take the number of people elsewhere the population of my district is much higher. Emigration from there is very active, and will continue very active until that district and other districts like it exhaust themselves down to the level of the rest of the country.

Mr. DAVID CRICHTON LAMB, called; and Examined.

Mr. Lamb. 11439. (*Chairman.*) You have been an officer in the Salvation Army for some years?—Yes.

11440. That position has given you peculiar facilities for observing the habits of certain classes of the population?—Yes.

11441. Is it practically the lowest stratum of the population which you come into touch with more than any other?—Undoubtedly.

11442. And from the ramifications of the society your information of that class is pretty extensive?—Yes.

11443. What opinion has it led you to form as to the existence of physical deterioration?—I have not made it a special study.

11444. I merely wish you to state your impression?—My impression is that the conditions under which many of the poor are forced to live is very much against their physical and moral development.

11445. Are those conditions worse now than they were when you began your work in connection with the Salvation Army?—The conditions of the other classes have improved so much more.

11446. You mean relatively they are worse?—Yes, relatively they are worse.

11447. But are they absolutely worse?—No. On the whole, I believe, they are better.

11448. And you say that absolutely there is a larger class in this lowest stratum than there was?—I would not like to express an opinion upon that.

11449. I suppose you would confirm the opinion of most of the witnesses that we have heard, that ignorance as to the selection and preparation of food and overcrowding were the principal causes of that deterioration?—Yes.

11450. Of course that presses with special severity upon the child population?—Yes.

11451. You have some experience of the efforts which have been made to feed school children?—Yes.

11452. Has that been done in a way which has in any sense demoralised the parents?—No.

11453. By sapping their sense of responsibility?—No. We have recognised that danger, but our view has been this: that the children are there and they are hungry. Forced to go to school, yet incapable of learning while starving. We realise that we must not do anything to remove parental responsibility, nevertheless as practical humane people we say this state of affairs cannot exist. With one hand we are doing this work of amelioration—with the other we are fighting to alter the circumstances which bring about the necessity.

11454. Have you conducted the feeding operations in connection with the school managers?—Yes, and frequently distributed the tickets in conjunction with the teachers, but largely through our own people who know the poor people. It is not always those who make the loudest cry about their poverty who are the most needy.

11455. You think, as a rule, relief has been given to the most deserving people?—Yes. Then we have created what you might call a mild fiction by giving them 1½d. worth for ½d. or ¼d. as the case may be.

11436. You are using exhaustion in rather a figurative way, are you not?—You mean bringing it down to a reasonable number of people per square mile?—I do not hold it is a reasonable number of people per square mile, because we have got gradually beyond that point in Ireland.

11437. Take your own district of Skibbereen and its neighbourhood, there is still emigration going on in the district?—Yes, actively.

11438. But is not the population in that district slightly beyond the natural resources of the country?—I do not think so. It is beyond the actual resources of the people to live, but it is not at all beyond the resources of the district.

11456. They have contributed something in all cases?—Yes.

11457. Do you do anything to inculcate amongst the very poor some knowledge of the best way of feeding young children when you get the opportunity?—Yes.

11458. You look upon that as part of your *modus operandi*?—Yes, particularly in our slum work and rescue work.

11459. Which is directed generally to elevating this class as far as it can be elevated?—Yes; for instance, our slum officers in visiting often find the greatest waste going on very often amongst the poor. They would start and direct the youngsters, or the woman herself, in the house to make broth from the scraps which may be about; then she goes and cleans the baby or pays a visit next door, returning to see what is going on.

11460. You think some good has resulted?—Yes.

11461. And in regard to the housing conditions, bad as they are, I suppose they are better than they were. A great deal has been done within your experience to remove some of the worst plague spots from the map of London?—Yes, but the conditions in many quarters are still very bad.

11462. Are the new borough councils doing something towards the amelioration of those conditions?—I do not think they have done much so far. You see the model dwellings are, in many instances, even worse than the old areas.

11463. In point of density of occupation and squalor?—Yes.

11464. Are those model dwellings under the regulations of the county council?—Yes; they are bound to be under the general regulations.

11465. But they are not run by them?—No.

11466. Only built in accordance with plans which they have approved?—Yes.

11467. And you find the conditions as gross and pitiable as in some of the worst rookeries they have displaced?—Worse.

11468. Why?—That is a very difficult question to answer, but you have at once the congestion in a small area; the children are thrown more together in the courtyards and on the stair landings instead of being out in the street.

11469. They are on the balconies and passages and stairways?—Yes; which are badly lit very often. And then you have dust bins and other things getting out of order, and you have the whole population thrown more closely together.

11470. That has added to the density of the people?—Yes. There are many model dwellings which are a great improvement on the old slum areas, but nevertheless, there are dangers in many of the model dwellings.

11471. But they are dangers which with intelligent supervision might be guarded against to a great extent?—Yes.

11472. Many of them have not that intelligent supervision?—That is so.

11473. Is not there a porter, or someone who has some sort of general control?—Practically there is, but after all

he is a mere hireling, and wants to get done with as little work as possible.

11474. And he is not armed with sufficient authority?—He is a type of man who would not care, and who would not have the ability to do the work.

11475. Do you think, strictly speaking, insanitary conditions are reproduced in those buildings of a worse character?—I could not say from my own knowledge.

11476. Surely they are built on a plan which should secure fresh air in perhaps greater quantities than are to be found in some of the low slum dwellings?—Yes; that might be admitted.

11477. You think the standard of morals in some of them is very bad?—I know it is.

11478. From the mere fact that so many families being herded together with easy access to each other?—Yes; and the moral contagion. If you have more people in a given area the risks are greater.

11479. It tends to depress them down to the lowest level rather than raise the worst to the upper level?—That is the tendency. Then if you have one bad woman or bad man in the neighbourhood your risks are greater than if it were in a street where there would be less likelihood of contact.

11480. I should have thought it might often happen that her own evil tendencies or habits might be to some extent controlled by a better opinion round her?—It would if the right people were round her.

11481. But they are very susceptible to evil influences to begin with?—Yes; it is like the old story of the bad apple and the four good ones round it.

11482. In regard to these conditions of overcrowding which you describe here, you say one of your nurses recently attended a confinement, and that the father and mother and six children were in one room; that was not in a model dwelling?—I could not say; it was reported to me.

11483. There is some kind of minimum standard of health which the county council apply to the occupants of rooms; they aim at insisting on a minimum cubic space?—Yes, but it is not applied.

11484. But it is applied in certain cases. You think it might be much more stringently applied than it is?—Yes. Of course you would have a serious displacement of the population.

11485. Would it not be better to face that?—I think so definitely.

11486. I suppose a large number of them would by the ordinary operation of supply and demand find some place to go to?—Undoubtedly.

11487. And the worst would have to be dealt with by some exceptional means?—Yes. I have an idea which I have talked over with several people. Some of them think it is impossible; others think it should be tried—the taking over of one of these worst areas and uniting all the social reformatory agencies there are about and putting in a resident magistrate who would enforce the law. Take the case where this woman was. The doctor, or the nurse, or the sanitary inspector would report that, and the magistrate would go down if necessary and satisfy himself, or take a report. In another case if there were sickness he would inform the nurses who were in the district, and he would also go or send to some employer of labour and invite his cooperation and say, "This person will have to be shifted, whatever the consequences are," because of the existence of an evil which could not be tolerated. My idea was that if it were reported to me that a woman was drinking and neglected her children, the Society for the Prevention of Cruelty to Children should report that and the woman should be warned. If the conditions were bad or doubtful, the magistrate should put on his hat and go and look into the matter for himself.

11488. You do not think there is information enough of what is going on?—There is information enough, but the machinery is cumbersome and there is a difficulty about getting the right information to the right man.

11489. At the same time the law provides for bringing home responsibility of that sort?—Yes, but it is too cumbersome.

11490. It is not direct enough in operation?—No

Then there is a certain helplessness about it, that is to say, unless this resident magistrate was specially dealing with this whole question, the woman would come up and say, "I cannot get a house," which is perfectly true; then the other agency would have to come in and find room. At present the magistrate takes that into consideration and gives time. The landlord may want to get a family out, but the thing drifts, and what can the officials do?

11492. Nothing is done and they remain there?—Yes.

11493. Do you think the owners of this class of property would wish to get rid of these people very often if they could?—I think the first tendency would be to lower the rents, but I do not think that should stand in the way.

11494. I suppose the rent question is the great difficulty?—Yes. Then when you come to certain classes of the people it is not only that, but there is the fact that the woman cannot go and look after a house, and the man cannot, and they must drift on, and deterioration sets in.

11495. Would you charge it upon the local authority to find a place to which these people should be transplanted?—No; I would not ask for new powers, because I do not think you would get them, but I would ask for the enforcement of the existing health bye-laws. I think there is enough legislation to deal with it, especially if the work of the voluntary agencies could be directed.

11496. How would you secure that enforcement?—The only new thing that I would go for would be the resident magistrate; that is the only new idea. He should be an expert, and should lay himself out to do this class of business entirely.

11497. You would issue a closing order upon these premises?—Not exactly a closing order; I might repair the premises, but I would take the whole area and proscribe it—the initial difficulty is the only difficulty—and then let all the officials in that neighbourhood know that they are expected to do their duty, and that they will not be absolved from doing it.

11498. A certain standard would be enforced in that area?—Yes, and the magistrate would do whatever was necessary to enforce it.

11499. Of course you have to take into account the habits of the people, which would make the enforcement of any particular standard of decency difficult, at any rate, for a time?—You would find a great variety of character, of course, and what might succeed in one case would fail in another.

11500. There would be in any area a residuum which would be quite inaccessible to efforts for their improvement?—No, I do not agree with that.

11501. You think that something might be done everywhere with proper care?—Every man, woman, and child living will respond to some effort. If one effort fails, try another; but I would keep on trying until I got the right method.

11502. You want a considerable machinery for doing that, do you not?—I do not think so.

11503. Has the local authority sufficient resources?—It must be left to charitable or religious agencies in a large measure, must it not?—If a woman neglects her children habitually, although her husband brings her in fair money, and if she drinks and lies in bed simply through laziness and drunkenness, I would put the machinery of the society for the Prevention of Cruelty to Children in motion to watch that woman. She would be given fair warning, and if she were a Roman Catholic, or Church of England, I would call upon a minister of whatever religious persuasion she belonged to and give him the facts, and send him to visit her, or perhaps some district visitor. Perhaps the district visitor would stay the first day and get the woman through her difficulties—perhaps go in at half-past seven and help her with her children and with the fire. If that did not answer, I would take her, so to speak, by the scruff of the neck and give her three days' imprisonment.

11504. You recommend drastic methods?—Yes, I would not stop at letting things drift.

11505. The drunken condition of a great many of them renders them insensible to moral suasion, or even to threats of severer measures?—Yes.

11506. I suppose you would argue that in dealing with the residuum, machinery would have to be employed of

Mr. Lamb.

Mr. Lamb. the same kind as the experiment at the Hadleigh colony, in the last resort?—That would be a comparatively small fraction, I feel sure.

11507. You feel that by methods such as you indicate the numbers that would have to be treated on these lines would be inappreciable?—Yes.

11508. I mean that they would not involve a heavy charge on a community of that kind?—I do not think so at all; the existence of it would have a very salutary effect. Following the same figure again, if the woman next door were inclined to neglect her children, and she saw what was happening to her neighbour, that knowledge would hold her up to her duty.

11509. It would have a salutary effect upon her neighbours who were inclined to fall short in their duty?—Yes, I found it so when the Guardians of St. George's (Hanover Square) Union prosecuted a man for failing to maintain himself. They decided to send down to Hadleigh twelve men, and this is what happened. The master of the house came to see me first. He said, "We are sending down twelve men; there are six decent fellows and six who are as fair a type of the rascal as you could see." I said, "Give me twenty-four hours between and send me the decent six first." The second six were a "bright" lot. The first six were put to work without any interference from me, but the second six simply would not start. One fellow said that the master had promised him clothes. He said, "Look at my boots;" he was the spokesman of the whole six. I said, "My dear fellow I have seen better men than you work in worse boots; however, what did they cost you?" "Eighteen pence." "Very well—and the trousers?" "Ninepence." "And the vest?" "Sixpence, and the coat 2s." I said, "We do not work with our coats on here and we will not include that. If you destroy any of those clothes working here I will see that you have as good a rig-out when you leave the place. Now go on with your work." Then I turned to the others and said, "That is fair enough is it not," and they said, "Yes, that is fair." Then he produced a medical certificate and said, "I am not able-bodied."

11510. This all happened in your colony?—Yes. I tell you this to illustrate the facts. He pulled out this medical certificate. I said, "That is curious; did not the doctor see you yesterday;" and he said, "Yes." I said "What is the date of the certificate?" He said "It is March." I said, "Here is one dated yesterday which I have received by post. You can put the other one in your pocket for somebody else; it is no good here." My foreman then took him in hand. We tried him at digging and then put him on bird-scaring, and he could not even do that. He had the stupidity to fall back on the rates and was prosecuted. He spoke of our place in a certain way; in the *Times* it was referred to as a "verminous place," and the *Morning Post* had it a "sermonous place." Mr. Shiel heard what he had to say and then said, "Three weeks' hard labour, and if you come back it will be three months." That had a very great moral effect on the fellows at the colony. When this fellow came back again at the end of the three weeks he asked if we would give him another chance, and I said, "Certainly," and we gave him one. He thought we would give him "beans," but we were glad to see him; in fact I was very glad to see him, because it was a very good object-lesson. Soon after this at one of our religious meetings he got converted. The result in his case was entirely satisfactory; he is now in a position in London and has been for the last six months, giving every satisfaction.

11511. That is what you think is wanted, making those who live in these bad conditions have an object-lesson presented to their minds of what the law can do if it is enforced?—Yes.

11512. (*Dr. Tatham.*) You say drink is at once the cause and the effect of many of the evils mentioned?—Drink covers nearly all the difficulties. As I say, it is at once the cause and the effect. The conditions of life cause the people to drink, and the effect of the drinking is to still further demoralise them. When you see the conditions you cannot blame them, looking at it from the man-to-man standpoint. People do not do what they ought to do, and when a man is in difficulty, or perhaps out of work, he ought not to drink, but it is very easy for people to get drink when they cannot get anything else.

11513. We shall be glad to hear anything you have to say on this point—we have had evidence to the same effect from other people?—It would be simply to emphasise the point generally.

11514. We shall be glad to hear your opinion, because we know the considerable opportunities you have of seeing people of this class?—You can view it from many standpoints, but when you go down to the very poor classes you find that the conditions are such that you cannot expect anything else.

11515. Is it rather that they drink because they are reduced to a state of hopeless misery, and that they take it in order to get some temporary respite from their misery?—It is easily got, and it gives a certain amount of satisfaction at the time. Then their habits of feeding themselves create the desire for drink. It is an artificial and forced life all through, which creates the desire for stimulants.

11516. I suppose the people you speak of really have very little in the way of home life—the cooking is very bad?—It does not exist.

11517. And consequently, I suppose, the man scarcely ever gets a meal, what you and I understand by a meal?—That is so.

11518. He sees a comfortable looking pot-house and into that he goes?—Yes.

11519. I suppose it is a kind of last resource?—That is my experience. The women are at home all the time, and there is a great deal of drinking going on amongst the women, morning, noon and night.

11520. Is prostitution at the bottom of a great deal of it?—Not amongst the very poor. The morals are lax, but the immorality is not what you would expect it to be. If I may put it so, there is a rough-and-ready standard of morality which is very good so far as it goes.

11521. You would not state that as amongst the many causes of drunkenness?—No.

11522. Not amongst the very poor?—No.

11523. I suppose it is amongst those a little bit above them?—When you come to the class from which the prostitutes are drawn, yes, but we do not find that prostitutes are drawn from this poor class. They rather marry early and then you have another evil. I do not know whether your attention has been called to the difference between the English and the Scotch law in this respect, that if the parents marry at any time after the birth of the child in Scotland the child is legitimate. What happens in Scotland if there is an "accident," as it is called, in a family, is this—the mother will probably safeguard the daughter for a year or two and refuse to sanction the marriage and hold the man up to it. There may have been true love enough so far as it goes, and the match in many respects desirable. It is very often found that one child will be four or five years older than the next. In England that is not the case—marriages in England are forced on in order that the first-born child may be legitimatised. You have the same "accident," but there is an incentive to force the marriage on in order to get the child legitimate—which does not exist in Scotland, because, no matter when the child is born, if the parents marry afterwards the child is legitimate.

11524. With reference to General Booth's suggestion as to the treatment of vagrants, have you anything to add to what he says? He quotes your suggestion and approves of it, I think?—Yes, I had a unique experience when I was at Hadleigh for five years, and I made certain representations to General Booth, and that proposal is the outcome.

11525. Have you anything to add to what you state in this report as the consequence of your subsequent experience?—No, that is quite recent—it was in February this year, and it is very full. What I had in my mind when I was preparing my notes for the guidance of other people was that they should be as full and ample as possible, so that anybody who cared to adopt the idea should have the full benefit of the experiences we had there.

11526. In your opinion, with regard to the section of the population who by some means or other contrive to subsist at the expense of the community without work, if this system which you have proposed were adopted on a sufficient scale you think you could get rid of that class altogether?—I am sure of it—it would take a few years.

11527. And you think that the existing amount of charity would probably be more than sufficient to cope with the amount of real distress which cannot be avoided?—Yes.

11528. (*Chairman.*) In reference to this memorandum of yours—there has been a very considerable increase in the vagrant class of late years?—The figures show it.

11529. Are there any accurate figures? Is there any system of enumeration that can be relied upon?—There are the Local Government Board statistics.

11530. (*Dr. Tatham.*) Of pauperism?—Yes.

11531. (*Chairman.*) Mr. Loch said in Scotland there is a census at two periods of the year, in the summer and winter, which gives the maximum and minimum of those who live by the road, but in England he said there was not. So that surely your statement that the number of vagrants has increased is only a surmise. It may be perfectly well grounded, but is it more than a surmise?—Will you turn to the notes at the end of the pamphlet. I do not understand Mr. Loch's statement. He ought to know, certainly, but the counties have their return. On page 35 I say: "The County Reports of 1903, without exception, so far as has been noted, now being submitted to the authorities"—they are police reports, and therefore may not find their way to the Local Government Board—"all show a steady and, in some instances, an alarming increase of hundreds and thousands of vagrants in excess of the previous year. Gloucestershire, said by the Vagrancy Committee of that county to be the Mecca of tramps, shows 58,019 dealt with, an increase of 15,556; while Hertfordshire, a county not likely to have the same tramps passing through, shows a total of over 34,500, an increase of nearly 25 per cent. on the previous year's figures."

11532. (*Mr. Struthers.*) What are those figures—the number of vagrants who have been dealt with by the police in the course of a year?—Yes.

11533. That is different from a census?—Yes.

11534. (*Chairman.*) It may merely mean that the tramps are much more on the move than they were some years ago. The same tramp may figure two or three times in the reports, whereas some years ago they only figured once or twice. What you want is an enumeration of all these people at given periods twice a year?—I agree.

11535. In order to establish the fact—of course you would have to have it repeated—as to whether vagrancy is or is not on the increase, you would have to do that. Certainly, Mr. Loch's opinion was that there was a very great deal of exaggeration on the point. These county statistics, which are not based on any reliable system of exclusive enumeration, create a very considerable and, in his opinion, unnecessary alarm, and he thought that the first step towards a proper consideration of the problem was an actual enumeration on the basis suggested?—Yes.

11536. (*Mr. Linzell.*) You have not the county report, in order that we may see what the character of that is?—No. Of course I would suggest that the same tramps are not likely to have the desire to make 15,000 additional visits in one county in the year. It is not their nature.

11537. (*Chairman.*) No doubt there may be some increase, but it would seem that the material for estimating what that increase is exactly is insufficient. You think that the system is largely responsible for this increase?—Yes.

11538. For three reasons?—Yes, undoubtedly.

11539. Among which you class the lack of the reformatory element, and the lack of uniformity in administration?—Yes, you have the Guardians divided amongst themselves as to whether you are going to give them greater kindness or greater severity.

11540. Would you have the Local Government Board impose some uniform system upon them?—If that were possible, yes.

11541. Will you explain what you mean by this statement: "The casual-ward system as it exists at present is costly and out of date"?—It is costly, as instanced by the case given there, where the Stepney people have had to spend £8,000 to provide for fifty-eight people. We would regard that as very costly.

11542. How would you have provided for them. They have had to be provided for in some way?—Yes.

11543. Would you have sent them to a Labour Colony in the country or something of that sort?—Yes. I would have done something different to perpetuating the present system.

11544. Do you think it would be a good thing that every local authority, or at any rate a combination of local authorities, should establish Labour Colonies in order to deal with this class upon the lines which you follow?—Yes, and, I believe, even if the people did not go to the colonies in any large number it would stop the wandering about.

11545. Then you would have them herded together in the slums of the big towns. It might be worse?—You could deal with them then.

11546. Could you more easily deal with them then?—Yes.

11547. Do you think it would tend to the elimination of what you call the "won't-works" in the long run?—Yes. I have talked to so many. I have approached the subject from various standpoints—from the purely religious point, from the social standpoint, and from the tramp-ward officials' standpoint, and that is my deliberate conclusion.

11548. You divide this class into two sub-divisions—those who object to work, and those who are incapable of sustained labour?—Yes.

11549. You deal with those two upon different lines?—Yes.

11550. First by something in the shape of penal methods?—If I suspected a man shuffling. I would make his food have some relation to the amount of work done. On the other hand I would not do so if he were really incapable.

11551. If he were incapable you would raise his physique to the point at which he became capable?—Yes. I would treat them with the greatest kindness, and give them plenty of good food and exercise for a few weeks.

11552. Which class do you think is most largely represented among the "won't-works"?—Those incapable of sustained effort. The "won't-works" are a fraction.

11553. The class that is susceptible to improvement is the more numerous of the two?—Yes.

11554. From your experience of that class which, I presume, figures largely in this Hadleigh colony, do the results obtained justify what, I presume, is your idea that treatment of this sort enables such establishments to restore them in the course of a few months to the community as useful members of it?—Yes.

11555. But have you got any carefully recorded statistics which would enable you to prove that? Do you trace the lives of the people who leave you?—Probably for a year or two years.

11556. You have well-attested records of what becomes of them for a year or two years after they leave you?—Of a certain percentage.

11557. Of a certain percentage only?—Yes.

11558. What percentage?—I could not say off-hand.

11559. Half of them, do you think?—More if we eliminated 9 per cent. roughly of the people who are unsatisfactory.

11560. That you can do nothing with?—Yes, whom we regard as failures.

11561. You get rid of them?—Yes, they drift. We have to send them away.

11562. They must sink?—At present, yes. I was preparing the figures the other day for another purpose. I could furnish the figures.

11563. I think it would be desirable if you would do so?—I will.

11564. I take it, generally, you are satisfied with the ameliorative effects of the system as applied to the class as a whole?—Yes, for the effect of three or six months steady work under healthy conditions on those whom we cannot trace, which are a considerable proportion, is well worth to the nation all the cost and trouble. The women we can much more easily trace, but when you come to a man he may be a *bona fide* casual, moving about from place to place, and he cannot write. He says he can read and write, but he would sooner shift a few tons of earth or sand than write a letter; and that increases the difficulty.

Mr. Lamb.

11565. I suppose those of them whom you do improve adopt some settled habits of life ?—Frequently.

11566. And therefore it would be possible to trace the success of your system. I can quite understand it is impossible to trace failures ?—It is otherwise. The latter is much more easy, because we hear of them continually ; they hang around so ; the successes we do not hear of.

11567. Would it not be possible to establish some kind of communication with them ?—No. On principle we do not.

11568. You think it diminishes their self-respect that they should be traced back to an establishment of the sort ?—If a man becomes a Salvationist it is easy. But we have Roman Catholics, Presbyterians, and members of the Church of England, and they would not care for it.

11569. They would not like their friends to know that they had been associated with your Home ?—They would not care for us to make inquiries about them, or to be associated with us.

11570. That is your difficulty ?—That is one of our difficulties.

11571. You say, speaking generally, that 65 per cent. of those you treat are successfully treated ?—We do not put a man as a colonist in the records until he has been there a month ; they are casuals, pure and simple. Of those that stay for more than a month roughly 10 per cent. of them are unsatisfactory, either physically, or from other causes. Then quite a third of those that remain we can trace for years afterwards. They probably identify themselves with the Army continually. Another third we can easily trace—when I say “easily” I mean by indirect methods as, for instance, when we emigrate a party. I have a photograph here of a party which we are sending out next month. And here also is a photograph of a party which we sent out to Canada three years ago ; I could trace the majority of them still. (*Handing photographs to the Chairman.*) All those fellows were perfect wrecks when they came down to us. I can invariably tell how long a man has been on the place by his general appearance. For the first months I can tell the number of weeks he has been with us by his trousers, or boots, or tie.

11572. What time do they stay with you ?—Those who stay over the first month stay from six to nine months—it varies according to the season.

11573. What proportion of those who enter go away before the first month has elapsed ?—We do not count those who go out in the first month as being entered at all as colonists.

11574. You have no record of them ?—Yes. I will furnish the figures. (*A photograph was handed to the Chairman.*)

11575. By what process are they admitted—by self application, or by draft from other establishments ?—By both. We get them sent in from the police station, our London shelters, and from the workhouse by the friends of the men.

11576. (*Colonel Fox.*) These are photographs of men who have been reclaimed ?—Yes.

11577. What have these people been doing which gives them such a bright look ?—They have been at work. These were all perfect wrecks when they came to the place.

11578. Have these men stayed three months or six months ?—Various periods.

11579. (*Dr. Tatham.*) Something from one month upwards ?—Yes. This is the party which went out to Canada last year. (*Handing photograph to the Chairman.*)

11580. (*Chairman.*) Would you like to see this plan tried as an adjunct of the local administration ?—Yes.

11581. You believe it might afford the means of dealing satisfactorily with a large portion of this vagrant class ?—I am sure it would.

11582. And you think it affords opportunities for dealing with the submerged tenth, as it has been called, to some extent, which is not vagrant in its habits, but which is to be found herded in the slum quarters in big towns ?—Yes. The married couples we have had there have encouraged us also.

11583. You make arrangements for husbands and wives and their families living together there ?—Yes ; after a certain period of probation.

11584. In the cases where the parents have been grossly neglectful of their children, and where it would be a good thing to remove the children from their care, what do you do ? Have you any nurseries attached to the colony in which the children are cared for ?—We have in London, and we work in conjunction ; it is one organisation. For instance, we will take a man and his wife and children and deal with them according to the circumstances. For a man and woman who are living together, perhaps with no children, we would make an arrangement like this : that if a woman will go into one of our homes for women, and the man will go into the colony and work for a period of six months, then for the further period of six months we will give them a home of two rooms in the colony. By that time their friends will find a situation for them, or we will find work for them. I have a couple going abroad this week after such an experience. Another man came down under like circumstances, has gone back to New York, where he has a situation.

11585. In these cases, where the Society for the Prevention of Cruelty to Children have stopped short of prosecuting the parents, do they ever attempt to remove the children from the parents' care, or do you do that ? We take some of the worst cases from the society, working in conjunction with them, and also with Dr. Barnardo's Home.

11586. Is any attempt made to obtain from the parent any proportion of the cost of keeping the child ?—That I could not say.

11587. You do not attempt that—your work is purely charitable ?—Oh, yes, in our rescue work we have a regular Affiliation Department which does good work in that way.

11588. It is in the interests of the children rather than the parents that, where the conditions are such that no decent standard of comfort or health can be maintained, they should be dealt with ?—Undoubtedly.

11589. (*Colonel Fox.*) These are photographs of men who have gone to the devil, and whom you have sent down to the colonies ?—Yes ; they were absolute wrecks. You would not believe their condition—shaken nerves, and quite broken, down-at-heel, and clothes gone and everything. They are not quite hopeless, but when they come to us you would think they were.

11590. (*Mr. Lindsell.*) Do you provide them with these clothes ?—They buy their clothes. We fix a minimum of food to begin with, but if they care to save out of the minimum—it is 1s. a day, and on that the Kitchen Department has a profit—they can do so. A good many men save out of that enough to buy clothes and boots, and we encourage that.

11591. These are very good clothes which they have got on. Are they provided by the Colony ?—Yes, or by their friends ; or perhaps we have taken them out of pawn for them.

11592. Does the work that they do repay you for the charges they are at ?—No.

11593. Could it not be made to do so ?—Only by diverting the whole enterprise from the object for which it was created. If the 500 people who are there now were going to remain, in a couple of years it would be paying its way.

11594. As they only stay a certain time they are inefficient workmen ?—Yes, and when they are efficient they pass off.

11595. (*Mr. Struthers.*) And you want them to pass off then ?—Yes.

11596. (*Colonel Fox.*) Are all those men in the photograph “won't-works” ?—No.

11597. (*Chairman.*) They are those who were physically incapable until they came under your treatment ?—Yes, and nobody would give them work.

11598. (*Colonel Onslow.*) Criminals ?—There are criminals among them.

11599. (*Mr. Lindsell.*) Very few of these men begin life as members of the absolutely labourers' class. Are they not a superior class, a clerk or artisan class ?—About a third are labourers.

11600. They look like men who, however low they may have fallen in the meantime, must have come down

from educated positions?—That is quite correct, and you will find a good many of those, who through distress want us to take them, are people who have known better things.

11601. (*Colonel Fox.*) What do you attribute their going down hill to?—The average man would probably say “drink;” but I say drink, with this reservation, that it is the primary secondary cause, if I may so express it. What I mean is that if a man makes a bad marriage or if his wife dies, as is the case very often, and he has a housekeeper, and his children are neglected and so forth, he goes to drink. We know he ought not to drink, but that is very often what a man does do. Moral deterioration sets in, and finally the man’s home goes and everything. Drink is the cause of his downfall, but it is not the primary cause. I would say: “Remove that man from his surroundings and find a wife for him, if necessary.” We have done that in one or two instances with excellent results. There is nothing we have not done which we thought was the right thing to do in individual cases.

11602. (*Mr. Struthers.*) You have looked out a suitable woman for him to marry?—Yes.

11603. And told him he ought to do so?—Mrs. Lamb has made it easy for him to fall in love with the right woman! Then again we have put a man in prison or taken him out of prison, and done the best we could in the man’s interest. If we thought a man should have a month’s hard labour for neglecting his wife and children, we have seen that he got it; if we thought that he has had a month when he ought not to have had it, we have appealed to the Home Secretary and got the man out before his time. As I say, we have married them, and divorced them, too, for that matter.

11604. (*Colonel Fox.*) Did you fit them out with wives down at the Colony?—Yes, we have done so; we do not make a practice of that.

11605. (*Chairman.*) I take it you think it would repay the community if it did establish some general system of this kind for dealing with cases such as you have described?—If properly managed, yes. I think everything turns on the management.

11606. The remuneration would come in the shape of men who were a dead loss to the community being restored as active, able-bodied and industrious persons?—Yes, if we could only get people to look at it from that standpoint. That is the fact, undoubtedly.

11607. That is your view?—Yes.

11608. (*Dr. Tatham.*) And you have proved it?—Yes.

11609. (*Chairman.*) You think you have proved it is a practicable scheme?—Yes. We are turning them out continually. We have our failures, but we want now to deal specially with failures. That is the whole idea of General Booth’s Proposal, as set forth in “The Vagrant and the Unemployable.” We do not want to have failures, but we want to deal with them. If you throw a failure out of the back door it does not dispose of the problem; it is still there.

11610. Touching the question of finance—have you formed any estimate as to what the cost of treating each case is, taking the average of detention?—No; I would not like to commit myself to figures at this juncture.

11611. Do you keep accounts?—Yes; there is an elaborate system of accounts, and they are all published.

11612. They are all accessible?—Yes.

11613. So that the figures could be obtained?—Yes. But, with all respect, I do not think you would understand them unless they were explained.

11614. You are not in a position to explain them now?—Not in a way which would give you any reliable data. Why I say you would not understand them is this: They are properly kept and duly audited—the books are under the direct supervision of the Midland Railway Company auditors, Messrs. Knox, Burbidge, Cropper & Co.—but they are so involved that it would be impossible for you to find out the figures for the Hadleigh Colony, which is only one part of our operations. The capital account is dealt with in one sum, and it would be impossible without internal analysis to understand the accounts;

but we should be quite ready to prepare a special statement. *Mr. Lamb.*

11615. Do you see any difficulty in exercising supervision over those colonies if they became general?—No. One of the features of our management is the fact that we raise so many people from the class amongst whom we work, and, having them at hand, in time they inspire the men who come down hopeless. I have seen it over and over again that, when a man’s back is breaking after the first two or three days hoeing in the market garden, and he feels like giving it up, and he is lying in bed, and is perhaps too tired even to sleep, in the next bed is a man who has been there three or four months and is just beginning to enjoy life, and he will say to the fellow who is inclined to give up: “You stick to it; I remember when I had a back like yours, and my hands were blistered, too;” and so hope is instilled into that man. We would draw a great many of the officers for such colonies from those very people, for this reason, that they would appreciate, and they would be better able to understand the habits and the thoughts of the people they are seeking to raise. You do not want to get a class too far removed from them. It is very nice, but a good many of the poor are very touchy on the question of patronage, and when someone who is very much above them comes they begin to wonder if there is some ulterior motive; they regard us a good deal in that way when they come first, until they see the way we live, and that we are not too far removed from them. We do not go down to the same level, but we are not too far removed to be above understanding them and being understood by them.

11616. They must be established on a footing of mutual sympathy?—Yes.

11617. Do you take the people on their own application?—Yes, so long as we have room, and the man is a suitable case.

11618. You investigate it?—Yes.

11619. You do not accept him on his own statement?—Yes, we do; but there are no risks in that if you set him to work at once. There is no inducement for him to tell a lie. If he is on the begging ticket there is all the inducement to spin a yarn, but with us there is no such inducement.

11620. The labour test is the efficient one there?—Yes, we throw them all together, and begin the sorting out afterwards; but we can give the men immediate relief.

11621. (*Mr. Lindsell.*) What acreage is this Hadleigh Colony?—We have 2,000 acres of land, and 1,000 of water, foreshore.

11622. Is that 2,000 acres all farmed?—We have about 800 acres marsh land used for grazing. Then we have about 350 acres in market gardens and fruit; then we have another 600 acres arable, and the other is utilised for the buildings and roads and brickfields, and smaller industries.

11623. You make bricks to a considerable extent?—Yes.

11624. Are there any other industries besides agriculture?—There are the bricks, the poultry, the stock-rearing, pigs, and so on; then we have our laundry and bakehouse, and tailoring.

11625. You do all your own work, I suppose?—Yes.

11626. All the repairs on the estate are done by the workshops?—Yes. We have our carpenters and blacksmiths.

11627. Have you a dairy farm?—Yes.

11628. How many cows do you keep?—There are thirty-five milking.

11629. Is that all done by the men who come to the colony?—Yes, mostly.

11630. They have to learn that?—Yes; of course, we have our skilled superintendents and employés.

11631. How do they live—in barracks?—A glance at this drawing will give you the facts. This is the great dormitory. (*A book—Hadleigh; the Story of a Great Endeavour—was handed to Mr. Lindsell.*) From that they start grading. Then he passes into a place where there are ten beds in a cubicle, and from that to a place where there are three, and from that to one of the farmhouses, which is another step. On page 14

Mr. Lamb. you will find the Old Castle farmhouse, which is the first step up from the dormitories. Then on page 12 you see the cottages. We made the bricks and built the houses right up from the beginning, and the married colonists can start at the lowest grade and work up to a cottage.

11632. When they get up they can get their wives and families?—Yes. We pay them 2s. 6d. or 3s. a day, or at piece-work they may be earning 30s. or 35s. a week.

11633. (*Colonel Fox.*) How long do they remain at that?—According to varying conditions.

11634. Do you keep them in permanent employment?—Yes, until they get something better; or until we have to move them to make room for others.

11635. (*Chairman.*) What is your permanent staff? How many do you want for permanent work apart from what is done by inefficient labour?—We have employees of two classes—permanent employees, and then we have the superior colonist who is passed on from being a colonist to being an employee. The number varies according to the season and the work we are doing. Park House, on page 24, is another farmhouse, which is the highest grade which a single colonist can get to.

11636. (*Mr. Lindsell.*) Does he have a bedroom to himself when he gets to Park House?—There are one or two rooms where there are single beds.

11637. Or dormitories?—It is an ordinary farmhouse with three beds in one room, four beds in another, and six in another. There is room for about a dozen men.

11638. Do they have a sitting room?—Yes, a dining-room. On Sundays they have their food there at certain seasons of the year. We have no fixed rule. They have their tea there always—they may have a good wash and their tea there, which is a distinct lift up. On Sundays they may have their food there in the winter time, because the roads are bad. In the summer, when there are usually a lot of visitors, the visitors have their food there, and then the men go to the dining-room. There are general advantages in his going to the dining-room. They all go in at one door. In *this* corner there would be so many tables with table cloths on, so that a man sees that there is something else for him to aspire to. Then there is another door, and another man passes through there, and the natural inquiry is “Where is he going?” He is going into a select room where he is waited on—the same food, but rather superior attention. Beyond that again there is what they call the Lord Mayor’s parlour. A *choice* of food from the first—after the probationary period, of course—is a practical appeal to his independence, which the man understands.

11639. (*Colonel Fox.*) Do you find many of these men go back to their old haunts?—A few.

11640. (*Dr. Tatham.*) Ten per cent. I think you said?—10 per cent. we regard as failures; but, speaking of failures, one man that I was in despair about, and had really to send away from the Colony for the sake of the discipline of the place, I can tell you something about. After I sent him away I put some machinery in motion to look after him elsewhere. He came to see me not a month ago to ask if I remembered him. I said “Oh, yes.” He said “I remember you, too, of course.” He was a married man, and his wife was toiling to keep the house going, and he had been continually drinking on the sly and neglecting his work, and I had given him such a talking too as I never gave to anyone. He said: “You will be glad to know that I have kept a situation in the city for eighteen months, and I have just got 5s. added to my wages; the wife is going to stop working at Easter; we have taken a little flat in Holloway, and the children are coming up from the country.” That case was marked as a failure on our books, and I suppose it will continue to be so.

11641. (*Mr. Lindsell.*) I understand you to say that it is not paying as a commercial concern?—No. Nevertheless, we know what our loss is, where it is, and why it is; that is to say the superintendent who is responsible for the brick-field and for the farm has the duty after the probationary period, as we call it, to pay a man the value of the work he does. He is paid to do that and nothing else. We tried at one time to get a man who would take a wide view and deal with the case on its merits. That did not do; we had either a man who was too hard or too soft. Then we said—“We will have superintendents,

whose sole duty will be to pay them on the actual work done.”

11642. Do you pay them in kind or in absolute money?—In tokens which are current and in money.

11643. They get so much food?—Yes, and they can save out of it and use it for clothes.

11644. Not lodging?—Yes, they pay for everything that is of value. Then we give them the current coin of the realm, and if they use it well, that is if they do not spend it in the public-houses in the village, we increase it.

11645. To what do you attribute the failure to make some profit. Do you attribute it to the character of the workmen that you are dealing with, because you have to get relays of helpless persons who have to be educated up to doing good work?—Yes, and whenever a man has a market value he moves from us.

11646. Therefore you have to do the work which ought to be done by active men, with men who have to be educated up to that point?—Yes.

11647. And that is where the loss comes in?—I reckon for the first three months a man whatever he earns is more of a loss than even the full cost of his food. The next three months he contributes probably the full cost of his keep without contributing anything towards the management. Then he begins to contribute something towards the management, and at the end of nine months he is fit to take his place in the world. When he starts to earn something for us he is off.

11648. I see you mention here that you have lost £10 on the poultry account. You say, “The poultry and bee section last September reported sales amounting to £712, which fell short of the expenses by about £10”?—Yes.

11649. What do you reckon as against the receipts?—All the legitimate charges in that particular section. We charge the interest on capital and depreciation, management, proportion of rates, and all legitimate charges.

11650. Everything?—Yes. Of course the Poultry Department does not employ very many men, but we have laid ourselves out in that department, as in all departments, to breed the best. That was the feature of the colony in our early days. We had to decide whether we would go on working with cheap horses on the Farm Department, or whether we would lay down a foundation for the best in order that the moral effect on the men would be good. The result in the Poultry Department is that we have good birds. We have got as much as £10 for one, and even £25 for one which went to South Africa, a cockerel.

11651. The better your class of bird the more likely you are to make a profit on it?—Yes.

11652. I am rather surprised that you did not have a profit there?—That is why we have made a profit last year, because of the fancy price stuff. I do not think poultry farming would pay in this country in the ordinary way.

11653. Is there a loss on brickmaking?—In one of our fields, and there because of the fall in the prices. We have three qualities of bricks. Five years ago we sold our stock bricks for 36s. a thousand in London; last year we sold them for 26s., the nett result being the loss of 10s. a thousand. If you take that over a few million bricks it makes a difference.

11654. You feel bound to go on with it in order to give the men work?—Yes.

11655. And the same with everything—you keep things going?—Yes, to the extent of our financial ability.

11656. I should have thought that on market gardening you would have made a profit?—We made a profit last year, but the year before we did not, because of either the drought or the floods, whichever it was.

11657. What steps does a man take to get into your colony?—We get them either on their own application or the application of their friends, or they come from the Police Courts, or from our London shelters, or from the Boards of Guardians.

11658. The missionary recommends them to apply to you?—Yes.

11659. Or you get them from the London shelters?—Yes.

11660. Do you get many tramps pure and simple?—We are really off the beaten track. The road to South-end leads to nowhere else, and therefore we are not on their road.

11661. You do not get the local tramp, but do you get many from the unions about the country?—We get more than we want. They are more trouble than anybody. A man who comes from the union is about four or five times the trouble that an ordinary tramp is, and we do not care to have too many; we have always more than we want. One of the features of the colony is its size, and where you have got 500 or 600 people all the time apart from the people in the neighbourhood you have not the loneliness which you would have if you had only twenty or thirty people. You do not want too many of a set. You can take twenty or thirty at a time and be breaking them in, but if you had fifty or sixty probably you would have trouble.

11662. Supposing your colony were certified by the Home Secretary as a place to which a magistrate might compel a man to go, you would then have, of course, to take whoever might be sent, if you were a penal settlement more or less. I do not mean that yours should be made so really, but suppose it were, would it not enhance the difficulty of dealing with men to begin with?—No, not if it were on a sufficiently large scale.

11663. They would have to be kept there somehow. You could not have them walking off the next morning. I suppose your men can go away?—Yes.

11664. But if a man was committed under a magistrate's order there would have to be some means to see that he stopped there?—I would not pay too much attention to that. In our Inebriates' Home, which is licensed (it does not form any part of the colony), we experienced practically no difficulty.

11665. Under the Inebriates Act?—Yes, it is certified—the gates are as open as the Colony gates. We run it exactly in the same way as we do all our other institutions, appealing to the moral and the spiritual part of their nature. We have only had to produce the bye-laws twice. We do not have them up there aggravating people all the time. The first trouble was two or three months after we opened. We had some trouble and I telephoned through to the officer in charge and told him to lock the gate and put the key in his pocket. They wanted me to go along, but I waited for twenty-four hours; I thought I would let them alone to do the best they could. At the end of the twenty-four hours I went along and assembled them. There were about twenty gentlemen in the dining room. I said I was very sorry that they had had some trouble. I said, "You were pitching into the officer because he locked the gate, and I am pitching into him because he did not do it soon enough." Then I said, "There is some idea that because the bye-laws are not up therefore they do not exist. I tell you that the object of the Salvation Army was to appeal to men morally and spiritually, but if you want the bye-laws you shall have the choice." It is not usual on Salvation Army principles to discuss things like this. But I said: "We will have a new departure: You can elect to-night whether you are going to have the bye-laws or the Salvation Army administration. Here are the bye-laws." I took them out of my pocket. I said: "Here is Mr. Ritchie's certificate. Would you like me to pass it round?" They said, "No," they were satisfied. Then I said: "The first clause says: 'No inmate of any authorised retreat shall retain money, watches, or other valuables without the consent of the superintendent.' Will you be good enough to hand over your watches and valuables; we will start there." Of course they were sensible enough to know that I had the grip of them. I kept my face as straight as I could, and I said, "It is no good going on with the second bye-law till we have enforced the first." One of them laughed and said, "Put them in your pocket, guv'nor." I said, "If that is the will of the people, all right." We have never had them out again except when we searched a man for morphia. We have never had a call for a bye-law since. We had superior intelligence in that Home to what I expect to get if we were taking the tramps as you suggest, but you would alter your tactics accordingly. I would have a place where I could lock the door and put the key in my pocket, and let them feel that I was master, but that would be at the very last resort.

11666. (*Colonel Onslow.*) With regard to the vagrants and the unemployable, it is suggested that colonies might be established and conducted by county councils and board of guardians, etc.? I see you lay stress on the fact that you would strongly favour the Colony being managed by a religious society, it would make it very much harder if it were not managed by a religious society—it would become a refined sort of prison?—Yes, I agree.

11667. You really want the religious element?—Yes.

11668. A sentimental element of some sort?—Yes. I put in the other suggestion because I find, especially outside of London, amongst the younger members of county councils and boards of guardians, and others, a desire to have a tilt at this problem. They feel they have had enough of the old methods, and they want to try something else. I agree entirely.

11669. I understood you to say that you want a magistrate appointed to deal entirely with certain cases; for instance, cruelty to children, insanitary dwellings, overcrowding, and so on; is that so?—That would be in the slum area in any great city. I would like to see that tried.

11670. At present that goes simply to the magistrate of the area, whoever it is?—Yes.

11671. Sometimes to one and sometimes to another?—Yes.

11672. You want a magistrate appointed entirely for this particular work?—Yes; I would make him the rallying point for all the social forces in that neighbourhood.

11673. He would sit entirely for this work and nothing else?—Yes.

11674. He would not deal with the ordinary cases of drunkenness?—That was my idea.

11675. I think you have said the vagrants and the "won't-works" are no particular class—they are not born so—they do not come from any particular strata of society; they are simply people who have drifted down from something better?—Yes, in many instances, but there is a class that wants work, the unemployable, but whom nobody will employ.

11676. There is that class, I know?—That is a large class.

11677. Because he is more or less of a criminal nature, I suppose?—No, because of his physical unfitness, because his dress would be against him. He says he is willing to work, but nobody will give him a job.

11678. From the look of him?—Yes.

11679. There is no such thing as a vagrant who is a vagrant by heredity, is there?—Oh yes.

11680. I know there are what are called gypsies who are no more gypsies than I am, and hawkers and beggars, but they are not the regular slum vagrant who lives in a town when convenient and then wanders off into another town?—There is the town problem and the country problem. I do not think that point has been sufficiently emphasized. I have been at Poor Law conferences, and the people from the town and the country talk about the same thing in an altogether opposite way. The town tramp does not tramp; he loafs. The country tramp must tramp.

11681. It is his second nature, you mean?—No, it is because of circumstances. In a town he will get his breakfast here and his dinner round the corner.

11682. I understood you meant it was the nature of the man, that he can never remain still in one place; there is a good deal of that?—Yes. I do not think you will eliminate that. You have only got to look at the moving which is going on among a class which are not called vagrants.

11683. You think it is the same spirit?—Yes; it exists to some extent. I do not think it is any good trying to eliminate it. But I would try and regulate it or guide it. I would keep them on the move. If suitable, I would move them to Canada or elsewhere. If they have the north-west fever let them go there, or let them go to Ontario. But if you have a man paying rates and rent nobody objects; it is when he wants to go on at other people's expense that the objection comes in. I do not mind the man having a house every three months; that is no business of mine.

Mr. Lamb. 11684. (*Colonel Fox.*) Is not the tramp a professional tramp as a rule ; you cannot reclaim him, can you ?—Yes.

11685. What is commonly called a tramp that you meet perpetually walking along the road ?—Do you mean the tramp in the country ?

11686. Yes ?—If he marries he will settle down in a parish ; then he becomes an “in and out” of the workhouse.

11687. Does he become a respectable being ?—No ; he still tramps about in the same neighbourhood. I venture to say that you cannot go to a single country workhouse in England but you will find one or two families there for generations. They are known ; that is the extent of their vagrancy, that they settle down there.

11688. You cannot break it out of them ?—I would like to have a try.

11689. (*Colonel Cnslow.*) There was a case reported somewhere in Devonshire the other day of a man who boasted before the magistrate that he had never done any work for fifty years, and that he never intended to work. There is that class ?—Yes, we have had numbers of them.

11690. Is there any possibility of getting that class to work ?—Oh, yes ; it is surprising ; they are like children.

11691. I suppose only by pure persuasion ?—Yes.

11692. And appealing to what better nature they may have ?—Yes. They are like children when you really get them past their first difficulty and give them their first shilling. You know how a boy is when he gets the first half-crown he has earned. They are just like that. I have seen it over and over again, with the criminals as well as the casuals.

11693. (*Mr. Struthers.*) What is the longest period you allow a man to stay with you if he wishes to stay ?—We have no fixed period.

11694. Have you any men who have been with you for three years ?—Yes.

11695. How long has the Colony been open ?—About twelve years.

11696. Have you any men who have been six or seven years with you ?—No, not down there. We have them in other parts.

11697. I mean men who have been to this Colony, and who stayed on there from the time they come in ?—No.

11698. You have known them to stay there for three years ?—Yes.

11699. I mean actually in the Colony ?—Yes.

11700. Five years ?—No ; I should think about three years.

11701. I understand you would aim at having them cleared out after they became fairly efficient to earn their own living ?—Yes.

11702. You do not want to have a permanent class there ?—No.

11703. You have no desire to deprive a man of any initiative, you want him to look after himself as soon as he has the capacity of doing it ?—Yes. Three years we regard as a long time. If you have a man who is married it will probably take you a year or eighteen months before you get him in a satisfactory state ; then in the instance I have in my mind now, the man was there a little over three years. He was a married man with six children, who were all in the workhouse. He was a capital worker, out he had a quarrel with his wife, and had gone off ; he had a roving spirit in him. Finally we got hold of him thoroughly and took the children and the wife out of the workhouse. Then we made a collection amongst the colonists for the furniture. We furnished the house and paid some trifling expenses, altogether £17. £9 of that was raised by the colonists themselves ; £3 we paid from the general fund of the Army, and another £5 we lent from the general fund, with this idea—that when his wife came there was to be 2s. a week paid for the furniture for a year. That gave us a lien on the furniture in case of a breakdown, and it gave the man and his wife an inducement to pay. At the end of the year, if they behaved themselves, the furniture was to be theirs. That is what happened. Now he is away from the Colony and in a situation outside and doing well.

11704. Of course I am accepting that there are probably occasional cases where you get an exceptionally good man to be a kind of superintendent ?—Yes.

11705. To look after some department of the work ?—Yes, we do that, and many of our important positions are held by men and women drawn from these classes.

11706. You have a considerable amount of arable land ?—I gather ?—Yes.

11707. Are any of those men who come to you able to plough ?—No.

11708. Not one ?—I would not like to say not one solitary case.

11709. Practically to all intents and purposes your recruits come from the towns and very seldom from the country originally ?—Seldom from the country, that is so.

11710. Out of that lot you would have expected to get some who knew something of ploughing if there is a large country contingent like that ?—There are a very few.

11711. How do you do your ploughing ?—We employ the Essex labourer.

11712. Have you a large number of permanent labourers in the place who are not patients in your establishment, so to speak ?—Not a large number. The farms were mostly out of cultivation when we took them over, but the labourers were still in the neighbourhood, perhaps going further afield for work, and taking what work they could.

11713. Perhaps fifty ?—Not so many as that, nothing approaching to that, not thirty.

11714. Do they come into contact with the inmates in any way ?—Yes ; we have aimed at natural conditions as far as possible, and no matter where a man comes from, from the prison or the workhouse, or the road, that is nobody's business. The wives of the men who are there have met together at what we call our social meeting on a Saturday night, and they have joined in the games, and the women in the colony have darned the socks. We have looked after the social and the home life, and guarded that as sacredly as we could, and made it a large family as far as possible.

11715. The principal superintendents of the department, for instance, the people who look after the brickfield, are members of your own body, are they not ?—No, not all of them.

11716. You do not insist upon that ?—No. All we insist upon is, that he must be a member of a church, and he must be a teetotaler. We permit them to smoke when not on duty, but none of our officers of any rank smoke.

11717. I am speaking of your superintendents who look after certain departments of the work ?—Yes ; we naturally tried to get Salvationists at first because of the influence, but we could not get the right people. I remember one fellow we had in charge of the farm—a good man he was, and capable in many respects, but if he had a sick pig, or a sick calf, he would sit up the whole night nursing it. He ought to have cut its throat and gone to bed.

11718. You have a certain proportion of Salvation Army officers ?—Yes ; when it comes to the social and religious aspect that is all done by them.

11719. Then, I understand you to say that the inmates get paid for the work they do by token money ?—Yes.

11720. Out of that they pay for their food and their clothes ?—Yes.

11721. But suppose a man does not earn enough to pay for his food, you give it to him just the same ?—Yes, in this way. The superintendent is paid to value the work and pay them accordingly. A man I saw the other day came in a great hurry about a year ago, and said, “Is that enough for a Christian man to live on.” I looked at it, it was 3d. which he had had for his day's work. I said, “I do not know.” He said, “Well Barker is no Christian.” I said, “Whom did you say.” He said, “Mr. Barker.” I said, “Now I understand.” He was talking of his superintendent. I said, “Mr. Barker is paid to value your work. He has paid you its market value, and, as a matter of fact, he is paid more than I am myself, and, therefore, I have great respect for his opinion.” That is what I said to the fellow. I said, “If he values your work at 3d. I should think it is

pretty nearly correct. However, if there is nothing against you for your behaviour and so forth, apart from this; we think that a man ought to be encouraged for his good behaviour, and that work is not everything, and I agree that a man cannot live on 3d., and I will supplement that for the next three or four days until you see what you can do." That man was recently joined by his wife, and they have started life afresh.

11722. Do you count up that against him to be deducted afterwards?—That varies. We do keep a record—not a strict record, because the Home Superintendent has a free hand. I give him probably 10s. a week which he accounts for roughly. Very often the quickest way to get rid of a man is to give him 1d. or 2d. for a bit of tobacco. On the other hand, if it is a case we are working at steadily it will be recorded against him. But very often they magnify their difficulties—it is a real trouble to them—and the quickest way is to say, "Say no more about it." It has to be done carefully, of course.

11723. You do not confine them to the place in any way?—No.

11724. They can go out when they like?—Yes.

11725. And they get a certain amount of pocket money?—After a certain period.

11726. And they are perfectly free to spend that in any way they like?—Except in drink. If they spend it in drink we stop it.

11727. But you do not refuse to take a man back if he has been drinking?—No, we take them back over and over again, according to the circumstances.

11728. You allow them to have tobacco on the place?—Yes, we sell tobacco. I am in the difficult position that I denounce the use of tobacco on Sunday, and yet I am licensed to sell it. Yet I can get over it.

11729. I gather your idea is that the slum area should be looked after, and that there should be some social organisation?—That is the idea.

11730. It seems to me that your proposals of the labour colony, or rather, General Booth's proposals, that people should be looked after to a greater extent than they are at present by the police, are not confined to the men who commit a theft, or who break somebody's head, but to those whose whole course of life is likely to make them a nuisance?—Yes, I would treat them as a physician would treat a patient who was ill.

11731. You would keep them under observation?—Yes. You do not give a man the medicine that he likes. I would rather take the doctor's figure than the police figure.

11732. There has to be a combination of free will on the part of each individual with efficient supervision on the part of somebody else?—Yes.

11733. Developing the free will as far as you can, but interfering whenever it is necessary and having the necessary power to enable you to interfere with effect when it is necessary?—Yes. I would receive no man at a voluntary colony unless he was willing. I find a great many people are anxious to dump down their friends upon us on any terms. I always insist upon knowing what the man himself says.

11734. According to the proposals in this pamphlet certain people would be committed by a magistrate to a labour colony under restraint?—Yes.

11735. They would be subject to work for a certain period?—Yes, but I would like to get them committed voluntarily; that is to say, when a man was brought up, the police court missionary would say:—"Please let this case stand over for twenty-four hours," and the man is sent down, and then he is given the option either of having a month's hard labour or, perhaps, three or six months, according to the case, or of entering the labour colony voluntarily. I do not know that the magistrate has any business to do it, but it is done in inebriate cases with very good results, because you catch the man before he is given the last push down.

11736. You think that absolute restraint is only necessary in a comparatively small section of cases?—Yes.

11737. It is necessary for you to have that power in reserve?—Yes.

11738. To compel a man if necessary?—That is our experience with inebriates. We have had one warrant,

and we have only had the bye-laws out twice. We have had one or two break-downs. But of the vagrant and unemployable classes, during this winter and last, we have been feeding 2,000 people at Stanhope Street between two and four in the morning, in numbers varying from 1,600 to 1,800. I am sure I could persuade 80 or 90 per cent. of those people to enter voluntarily. If they did not, then the police would have them up for wandering about without any means of support. I would take them aside and get them to do it voluntarily.

11739. There is no legislation now with regard to their want of accommodation?—There is no legislation at present.

11740. But of these people that you are feeding at present in the night hours, I thought you said you could get 80 or 90 per cent. of them to go to a labour colony voluntarily?—I assume that the new legislation for vagrants is in existence.

11741. And that you had that in the background?—Yes.

11742. I notice with interest that you are not a tremendously democratic community; you introduce something in the nature of class distinctions?—I hope that is not inconsistent with true democracy—with good democracy at any rate.

11743. I note the fact that you have what one might call class distinctions, and that you think they are absolutely necessary instruments in your organisation?—They exist right amongst the poorest. In our Blackfriars Shelter, before we altered it, one of the first things that struck me ten years ago when I took up this branch of the work was this:—We had what we called a 1d. shelter and a 2d. shelter; the 2d. men would not associate with the 1d. men. We had a prayer-meeting in the 1d. shelter room from half-past seven to half-past eight, and I have known the 2d. men stay outside and refuse to come in, not because they objected to the prayer-meeting, but because they would not associate with the 1d. men.

11744. (*Colonel Fox.*) When first the men come to your colony they have no chance of getting drink outside at outside public-houses, because they have only tokens?—That is true in theory, but it is not true in practice.

11745. Later, when they get money paid to them, do you ever find them break out and take drink?—Yes.

11746. They go back—they cannot help going back to their old bad habits?—That is so.

11747. You often find that?—Yes, frequently.

11748. You admit that the cause of most of these people coming to grief, and coming downhill, is drink?—Yes.

11749. And the only place they can get any form of refreshment in the neighbourhood where they are is the beer-house?—Yes.

11750. If we had some means of converting these beer-houses into eating-houses, where beer was kept more or less in the background, do you not think that would have the effect of reducing drunkenness throughout the country?—It might, but it would not apply at Hadleigh.

11751. Would you go in for absolute teetotalism?—I am an advocate for absolute teetotalism, but I advised our people to buy all three public-houses which were in the old village of Hadleigh, and shut up two of them and run one.

11752. Instead of being purely a beer-house you would make it an eating-house or restaurant, where they could if they chose get their beer and their tea, coffee, or cocoa, or anything they liked?—I would, but I am not voicing the official view of the Salvation Army in this respect.

11753. That has been done very much in the British Army—encouraging the restaurants in barracks, and keeping beer in the background. It has been attended with very good results. Do not you think that that might be done in this country with the same results, on the same principle that those cabmen's shelters have rather drawn away the cabmen from the public-houses?—Personally speaking, I am sure it would: I have no doubt about it at all.

11754. I suppose as you are against tobacco smoking in any form, you are against small boys being allowed

Mr. Lamb.

Mr. Lamb. to smoke?—Yes, I would like to stop that. I box their ears every time I see them, and take the risks. I suppose it is not quite legal, but I do it.

11755. What steps would you take besides boxing their ears to prevent boys from smoking?—If there were a simple Act of Parliament passed that would soon do it, because everybody recognises the real evil, but they are afraid to do what I do.

11756. Is there anything you can suggest by which one could reduce the amount of smoking amongst boys? They sell cigarettes in the sweet shops, and all these places?—Yes. I would restrict the Sunday trade to some extent, because the boys have more money on Saturdays and Sundays, but there are a good many missionary pennies which get lost on Sundays. We have little trouble with our own people in this respect, because none of our adults smoke. My youngsters have no temptation to it. They do ape some people a little, but they have no temptation to ape me in that respect. And the same thing runs through all our officers. With regard to drink, I was anxious to follow you, and I should like to make this remark: I do not regard a break-down as in any way against a man, for I have invariably good results after a break-down. The immediate effect when the man was getting well and getting into condition again was the feeling that he could manage himself. I knew, of course, that without the change of heart, that we emphasise, if he had the opportunity he would go drinking again. "Oh, no," he said, that was the last thing he would do. Well, we gave him 6d., deliberately, with the view of seeing how strong he was. Then when he came back, I asked him where the 6d. was. Of course it had gone in drink. After that we had knocked another prop from him, and we could approach him from another standpoint, and I have very good results from the men after they have had a good fall.

11757. That is in the Colony?—Yes.

11758. In your Inebriates' Retreat you have to put restraint upon them: you have to keep them away from alcohol, do you not?—No.

11759. Do you give them drugs of any kind?—No.

11760. How do you reclaim a bad case of an inebriate?—To begin with, we knock off the drink the very first day he comes in.

11761. But you keep them away from drink: you will not allow it?—Yes; for the first three or four days a man is not allowed outside the gates.

11762. You keep them away?—For three or four days.

11763. For how long?—That varies. If a man comes in who has been eating nothing for a week or a month, and has been drinking all that time, then you want to watch him constantly day and night for three or four days.

11764. But many of the cases of inebriates, I suppose, are confirmed drunkards?—Then it is no use locking them up. The only plan is to build up the moral and spiritual nature, and teach them to resist the temptation. There is no place in England where he can locate himself and be many miles from a public-house.

¶ 11765. The only restraint you have at present is that he has no pocket-money?—No, he has pocket-money.

11766. (*Mr. Struthers.*) You have had occasion to consider what is the best sort of diet to keep a man in good form for doing work?—Yes.

¶ 11767. What is your minimum diet for people in the colony?—We have a varied diet, and the man has a

choice; he can go to the bar and make his choice. For breakfast there is always porridge and milk, but he may have cheese, German sausage, and bloaters, or eggs.

11768. Is the dinner done in the same way: does each man choose?—Yes; he may go in for a light dinner if he likes.

11769. It is not that all men of the same class get the same dinner?—No.

11770. He can have what he likes?—After the probationary period. When the man comes in first, he has food irrespective of the work he does, he has a fixed diet for two or three weeks, as the case may be.

11771. What sort of diet?—Porridge, soups of various kinds, a little meat, and plum pudding.

11772. You do not consider that careful feeding is a very important point in the reclamation both of these people and of the inebriates?—We give a fair amount of attention to it. We think that food, to begin with, should be properly cooked, and that it should be of a proper kind. We go in for the best we can afford. We never buy job lines of food, because of the risk. We fix the quality and buy it at practically whatever price it is.

11773. But a sufficient supply of nutritious food is an important element in the reclaiming of these people of both classes, both of the tramp and the inebriate character?—Yes, undoubtedly.

11774. (*Dr. Tatham.*) In the event of your getting a man who has been addicted to the use of alcohol for a long time, and who comes under your care, you prevent him from taking any more alcohol of any kind. Do you find that he becomes ill after that?—Very seldom.

11775. My object in asking is this: Have you any arrangement by which medical attendance may be given in cases of necessity?—Yes, we have a doctor right opposite the house, and usually two or three medical men in the house, I am sorry to say.

11776. You find it necessary sometimes?—On rare occasions.

11777. Those men generally break down pretty much if they have given way to alcohol for a time?—Yes, but when you get accustomed to it you know what to do in extreme cases.

11778. I think you told us just now that in many cases, at any rate, you were able to trace your reclaimed men?—Yes.

11779. Into various walks of life afterwards. Do you find that any considerable number of them go into the Army or Navy?—No.

11780. They do not?—A few, not many.

11781. (*Chairman.*) Most of them are too old, I suppose, are they not?—No, a good many are rejected as physically unfit.

11782. (*Mr. Lindsell.*) Do you take the ages of the people who come in?—Yes.

11783. Do you know what the average age is?—I have not it at the moment. The last average I took was thirty-two, I think.

11784. (*Chairman.*) Most of your entrants would be much too old for the Army?—Yes. A good many of the men I have advised, and sent them to Shoenbury.

11785. (*Dr. Tatham.*) And they are rejected?—Yes.

11786. Because of physical disability?—Yes.

TWENTY-FIRST DAY.

Monday, 25th April, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

The Rt. Hon. Sir JOHN GORST, M.A., LL.D., F.R.S., K.C., M.P., called; and Examined.

11787. (*Chairman.*) Your evidence is principally directed to the causes prejudicial to health in the development of the young?—Yes, entirely.

11788. Do I understand your experience here as Vice-President has anything to say to the fact of your attention being called to these matters?—Yes, constantly. I really can hardly describe the sources of my information, because they have been soaked in during the eight years that I was Vice-President, conversations with inspectors, visits to schools, talks to teachers—I mean I was living in the whole atmosphere.

11789. That is what I presumed was the case?—I could, perhaps, in cross-examination, give my reasons for some of my statements or the ground upon which I make them, but generally I can only say it was my life during that time.

11790. As to the causes of degeneracy which you enumerate, you place first the physique of the mothers?—I should rather say physique of parents. I am impressed with the idea which again you cannot reduce to statistics, that the race is propagated in the greatest proportion by the least fit part of it.

11791. You mean the superior stocks do not reproduce themselves?—I mean the restraints on marriage diminish as you go down in the social scale, and when you get to the most unfit part of the population there is no restraint on marriage. People marry who are perfectly unfit to marry, who are certain to propagate weakness and disease.

11792. Their children die very fast?—Yes. But they marry very young, and all the resources of civilisation are now directed to keeping their offspring alive.

11793. They defeat those resources very much?—They may to some extent. That is a question upon which further information and further research is necessary.

11794. We had evidence from a factory inspector in Dundee, and he said in conversation with factory operatives there, he found women had ten, eleven, and twelve children and but one or two had survived?—Yes. As I said, a great many propagate the species who are not fit to propagate it at all, and those who propagate the most of the species are now weakest.

11795. There is no means of sterilising those?—No. The only remedy I can suggest, which I think the present condition of public opinion would allow, would be to put a stop to the very young marriages. The law is that no people under age may marry without the consent of their parents. In the case of the more responsible classes of society, it is a real restraint, but with the very poor it is no restraint at all.—They do not ask their parent's consent. They do not get it, and they marry just as they are disposed to marry. If you prohibited marriage below a certain age (I am not prepared to say what the age should be, whether it should be twenty-one for both sexes, or twenty-one for men and eighteen for women, or something of that kind), but if you prohibited marriage below a certain age you would stop a good deal of physical deterioration.

11796. Would not such a prohibition be extremely difficult to enforce?—I do not think so.

11797. Would not you get an immense amount of evasion?—I doubt it.

11798. By certificates of birth, you mean?—Production of the birth certificate is not very difficult. Of course there would be frauds. There are always frauds.

11799. Dr. Tatham, who represents the Registrar General's Department, will tell you that early marriages are not so common as they were.—I am very glad to hear that. Sir J. Gorst.

11800. (*Dr. Tatham.*) That is so.—Then another thing. There is, of course, a great objection always raised on the score of morality. Now, I am almost certain that that argument is entirely wrong. That in the most cases immorality is what I have heard called "*pregustatio matrimonii*." It takes place between two people, one at least of whom intends to be married, and if marriage was impossible a woman would not give up her person to the man when she knew he could not marry her. She will when she persuades herself he is going to marry her. So far from the limitation of marriages being a cause of increased immorality and increased illegitimate children, my belief is it would be a cause of less illegitimacy, and no doubt the illegitimate children in the schools—if you see the children in the schools—are very much worse than the rest.

11801. (*Chairman.*) Physically?—Yes; they are less cared for, and, therefore, to put a stop to illegitimacy would be to raise and improve the condition of the race.

11802. Another point is this. Illegitimacy is diminishing?—Is that so?

11803. (*Dr. Tatham.*) Yes, that is so.—That, again, I am very glad to hear.

11804. Not rapidly, but it is.—Then another thing I want to call attention to in the case of mothers of the poorest people, is that they are now so largely incapable of suckling their children.

11805. (*Chairman.*) That we have had a good deal of evidence upon.—And they are totally ignorant of the way of bringing them up by hand. There is an enormous amount, not only of death, but of illness. A great many children do not die, but they are spoiled for life by their ignorant bringing up. The only remedies I suggest for that are, in the first place, what has been proposed—I daresay you have had evidence of it—the establishment of milk dispensaries.

11806. Such as they have in Paris on a large scale, and which in certain municipalities have been started here?—Have they been started? I did not know that. That is one matter. And then another thing is the teaching of the laws of hygiene among the population.

11807. By house to house visitation?—I do not mean what the Board of Education means by "teaching," viz., cramming information into people so that they can answer an examination paper on hygiene. You find plenty of pert young people who do that. It is only the really practical teaching of hygiene by people who are district visitors, and others.

11808. Like the Manchester Ladies' Health Society?—I once went round with Dr. Barnardo's inspector, Miss Jane Taylor. She was a doctor. What I was most struck with were the lessons in hygiene which this woman gave in every cottage she came to. Practical lessons—what the people ought to do for chilblains and little slight ailments, so that her tour of inspection was also a tour of instruction, and most valuable instruction, in the laws of health, and in the ways in which the children fell short of the attention which they ought to receive.

Sir J. Gorst. 11809. There is one question upon that point. One of the witnesses here, Miss Eves, who works in Hoxton, recommended the municipalities establishing crèches, which should not only be philanthropic, but educational places, where mothers could come and obtain instruction at the hands of the municipality as she suggested, under the Technical Instruction Act?—Yes, I think that is an admirable idea, all that kind of practical instruction. I am not a believer in instruction for the purpose of examination, I think it goes in at one ear and out at the other, but instruction of that kind, I think, is admirable and will very likely produce considerable effects in time on the population. Now I come to what we do to children when we get them to school. I think we fail in providing a great many of the necessities of life. First of all, fresh air—I suppose the Committee will agree that fresh air is the first necessity of a child?

11810. Yes?—In some schools the ventilation is good, but in many it is defective.

11811. Their position in towns often makes it difficult?—Yes, that is so. In the country schools ventilation scarcely exists in practice. With regard to the generality of country schools, I have been in heaps myself and I do not recollect going into a country school where the ventilation, was proper. The nose is a very good test, and the smell of a school is always so bad in the country—not in a town—that you can tell at once it is not properly ventilated. The reason is that although admirable precautions are taken by the Board of Education to see that the schools are properly constructed, the teachers stop up the ventilation, the teachers, the children and even the managers, and, I believe, even the inspectors will have the ventilation stopped up because the school is too cold.

11812. It is draughty?—Because it is draughty or cold. You cannot have good ventilation of a school unless you have adequate warmth. Of course in the country schools they have quite insufficient fires and insufficient methods of heating, and when the school is cold anybody—you or I—would probably shut up all the windows and ventilation because it is much pleasanter to perish from bad air in warmth than from cold in the most admirably ventilated building. Another thing is that although the schools are generally well ventilated, the class-rooms are often extremely badly ventilated. It is very much like the House of Commons.

11813. Do you mean faults in construction?—Either from want of proper provision in the construction of the school, or want of proper management of the ventilating apparatus of the class-rooms. The class-rooms are constantly foul when the main body of the school is ventilated.

11814. Do you believe in the ordinary means of ventilation, or do you believe they ought to be mechanically ventilated?—I am rather a window ventilator, but I am quite ignorant upon that subject. I should yield any opinion I have on that to scientific people.

11815. With regard to the children at school a doctor from the country said that it would be a very good thing not to ask children in the rural districts to attend school so early; his opinion was that the children in the country up to six years old, or certainly up to five years old, would be doing better for themselves by running about in the open air and improving their physique with the result of really strengthening their minds for the work which they would be asked to do when they did attend school?—I should like the country children excluded from school up to seven years of age.

11816. He said six years, but you would go further and say seven years of age?—Yes. I would not let a child in the country—it is different in the towns—go to school till he was seven years old. That is the practice in Switzerland, which is perhaps almost the best educated country in the world. They do not let their children come to school till they are seven. They run about in the villages and mountain sides, and they are often employed in looking after cattle, goats, and so on. They do not go into school at all till they are seven years old, and therefore when they do go to school they are sturdy and strong, and their observation is awakened.

11817. (*Mr. Struthers.*) In Scotland it is not usual for the country children to come to school much before six?—I am very glad to hear it.

11818. You would not propose to enforce what is the letter of the law on the subject?—Certainly, I would not.

The letter of the law in England is five years old. I have always thought that it was too young. I should never make a child go into school till it is seven at the very youngest.

11819. (*Chairman.*) Did you ever suggest an alteration of the law while Vice-President?—I think I have done so; I certainly made speeches in Parliament, and I think I wrote memoranda in the office. I think so, but I am not quite sure. Another thing I want to say in connection with this is, that I think the practice of open air lessons should be enormously extended in our schools. In America every lesson they can give in the open air they do. They constantly turn the children out of the schools. Even such things as history lessons. In New York, they will take a class out of the school, take it into the park in New York, draw it up before a statue of Washington and give a lecture on history there. Of course it is really the open air, it is not the statue of Washington, which is the great advantage.

11820. If you had all the children in Parliament Square it might interfere with the approaches to Parliament?—I do not know how far the practice may be possible in towns and in parks—that is a detail—but in most country schools, take a day like to-day, if the children were all turned out of the class rooms into the open air and did lessons there how much better it would be.

11821. Geography lessons might very well be done?—I do not know that the lessons would be better, but I am sure the children's health would. I tried to encourage such a practice when I was Vice-President. I saw a number of the leaders of the Country Schoolmasters' Association; they came and saw me and I preached this open-air doctrine to them. They accepted the notion, but they wrote to me afterwards to say that their managers would not agree to it. They had the schools, they liked to use them; they did not like the idea of the children being put out of doors. In the case of all physical instruction—

11822. That should be out of doors?—I am quite of opinion that you had better not give the physical instruction at all unless you can give it in the open air or in some perfectly ventilated room such as a town school board alone can provide.

11823. To give it in a room where children have been at work for a long time is bad?—Yes; it is worse than not giving it at all if you give it in a closed up room. You ought to have an open playground or a covered shed in which the children can be exercised.

11824. Which is practically open air?—Yes. Then I come to the next great necessity of children, and that is food. Children are ill-fed, not only in town but in the country. Most of the evidence and most of the speeches which have been made have been with regard to town children, but if you investigate the country children they are nearly, if not quite, as badly fed as the town children.

11825. They get as little milk, I believe?—Yes; children's food generally has two defects. It is insufficient in quantity and it is unsuitable in quality. I can give you a very curious confirmation of that. There are a large number of children, the better sort, sent down every year into the country by the Children's Country Holiday Fund. They are not the worst, they are the best of the children, because in most cases the parents contribute something towards their support. A friend of mine who is a vicar in a parish not very far from London, and who has a very large number of these country children in his parish, tells me when they first come down they will not eat the country food; they are accustomed to pickles, bloaters, and strong, tasty food of that kind, and when they get the bread and milk and porridge put before them in the country they begin by declining to eat it. They very soon get over that. In a few days the fresh air makes them hungry and they eat it, and they invariably end by having to have their buttons let out before they go back, showing how quickly the human body responds to fresh air and wholesome diet.

11826. That hardly bears out what you have already told us, that the children of the country are as badly fed. Those are selected, perhaps?—Yes, they live in the better households, 4s. and 5s. a week is paid and people look after them; they are not the ill-fed

country children; they are the improperly-fed children who are sent down from town into the country. I do not know that I need say a word to this Committee about the enormous mischief of teaching children when they are underfed. It is like working an underfed horse; it produces exhaustion of the brain and of the muscles, which the child may never be able to get over. At all events, if you do not feed the children you should not attempt to lay any stress upon either their bodies or their minds. I do not know whether the Committee would like me to mention a definite plan for feeding children, but I have talked to a great many people about it. Would you like me to give you a plan?

11827. I should like you to elaborate any plan that you have for the information of the Committee?—Of course any plan must be subject to modification according to the conditions of the place. You cannot have the same plan everywhere. There are schools where there is no underfeeding at all.

11828. A large number, I should think, in the country?—I should say a large number both in the country and town, where you need not interfere at all. I think the Scottish Commission showed that. I should be disposed to say, having visited Aberdeen, that very little interference was required with Aberdeen children.

11829. In the great bulk of the country districts the mother is never withdrawn from the house early in the day; she is always there to give their children food; it is one of the prevailing causes in the town that the mother goes out to work?—Yes. There are many cases where the mothers have not got food to give their children in the country. In every country district there are an immense number of widows with seven or eight children, and it is almost impossible for a woman to provide necessary food for her children; they sometimes get a little poor-law relief, but very insufficient; and there are a large number of such families in every country place. I know I used to go and see them in Essex when I lived there. The same kind of families live in Wiltshire and in Cambridgeshire; widows, who are living under conditions in which it is impossible for them to adequately feed their children. Those are the people from whom the country underfed children chiefly come. In all schools where a class of underfed children exist the school authorities should organise a provision of school meals, a breakfast and a dinner. Those school meals should be open to every child attending the school who paid what would be the cost price. I believe the thing can be done for something like $\frac{1}{2}$ d., or at the outside 1d., for a breakfast, and something like 2d. or so for a dinner.

11830. Three half-pence we have heard it stated?—Of course it varies in different places and varies in different classes, but the ticket for the school meal should be the cost price of the meal. I would not let the paying child have it for less than the cost price. I think that if a meal of that kind were provided a great many parents would gladly avail themselves of it, because they would get their children really well fed at a price at which they could not feed them at home.

11831. And as a measure of convenience it might be done?—They would get rid of a great deal of trouble and work at home, and the result to the children would be very much more satisfactory. I am of opinion that a great many people would use the public table, as they do in Paris, where public school meals are established. A certain percentage of children use the school canteen as they call it there, for the purpose of getting their regular breakfasts and dinners, and I see no pauperising in that and nothing whatever objectionable.

11832. You do not think it is open to the objection of tending to break up family life?—No.

11833. You are speaking generally?—I do not think it would, I doubt it very much. The father generally takes his food with him to his work. The mother and the children often live upon scraps. Certainly I should not be afraid of doing an injury to family life. Then I think that the teachers of the class should be charged with the duty of giving a ticket for breakfast or dinner as the case might be, or both, to every child that they knew was underfed.

11834. Do you think the teacher's information would be sufficient?—I think if you will examine Dr. Maenamara, who I understand is going to give evidence here—he is

much more fit to speak upon this subject than I—but I think he will tell you that the teacher always knows and can perfectly well know which children are, and which are not, underfed. They see the children; they are with them all the morning and see how they do their work; they know something about the character of the child's home and they are the fittest people in the world, much more than the district visitor, much more than the secretary of a benevolent society, the most fit people in the world to pick out those children who are underfed, and I would charge them with the duty of picking out children who are underfed and giving them a meal, breakfast before school and dinner in the interval. But the teacher should be subject in the performance of this duty to proper supervision and checks. He or she should be required to make a return every day of every child to whom a meal was given to the head teacher, and through the head teacher it should be sent to the school authority. If they saw a child very frequently receiving this ticket they should speak to the teacher and make independent inquiries through the attendance officer or otherwise.

11835. That is the first thing that should be done—the conditions of the child's home should be found out?—Yes. In the case of every child to whom this ticket had been so given application should be made to the parents for the money, and the attendance officer, or a policeman would be better, should go to the house and say: "Your child was fed at school this morning and please to pay 2d. or 1d.," or whatever it was. In cases where the parent, being able to pay, refuses, the amount should be made recoverable by summary process. Under the present law, if a child went on having food at the school for a fortnight and the parent upon being applied to for the money would not pay it and did not feed the child, that would be conclusive evidence of neglect of the family, and the man might be prosecuted and sent to prison.

11836. Under the existing law?—Yes, under the existing law. At present neglect of family goes unpunished, because it is so very difficult of proof. But this system would enable you to get that proof.

11837. It would bring home the negligence of the parent at once?—Yes. Then in the case of those who cannot pay that is a case either for a benevolent society to take them in charge, or for the Poor Law to be referred to. If such a widow as I have been describing sends her children to school, and says that she cannot give them a proper breakfast, and the children are provided with breakfast, I would make it recoverable from the Poor Law authorities, unless some charitable organisation stepped in. What I want to impress is this, that the present system does not bring home parental responsibility. The children go on coming day after day half fed. Nobody interferes, and the parents have not got their responsibility for feeding their children brought home to them. Another thing is that the charitable societies which now give food indiscriminately distinctly tend to pauperise the parents. Dinners are often given to children who do not require them.

11838. Mr. Loch, who was a witness here, animadverted upon that?—A gentleman from Scotland recently wrote to me on the matter, and said that the pauperisation of parents by the wholesale providing of these meals by unauthorised people was doing a very great deal of harm, and I am quite of that opinion myself. If it were done under regulated authority, if the parent whose child was fed in that way was put down on a list and brought to the local authority, the local authority could take such steps as would bring home parental responsibility to the parents, and could prevent their pauperisation.

11839. You would leave it to the local authority to prosecute in such cases?—Yes, I would leave it to the local authority. I should very much like to see the law so amended as to make the sum recoverable from the parents by a very summary process. But, apart from that, I think you might, under the present law, without any change of the law, if you could get the funds establish this kind of canteen. As to the funds, of course, I suppose at the present moment the school rate could not be applied.

11840. It is not applicable?—No. I think in most places it could be done by voluntary contributions. They would provide a sufficient plant and material to begin, and funds to keep it going, at all events as an experiment.

Sir J. Gorst. 11841. Have you formed any opinion as to the proportion of children who go to school underfed at the present moment?—No, I have not. It is one of those things which has become almost a political question now. But I believe that if I were to make a guess I should say that of the child population of our public elementary schools nearly a third were insufficiently or improperly fed.

11842. All over the country?—Yes, taking the whole country through; that was the result of the Scottish Commission. I do not mean actually starving, but improperly nourished.

11843. A distinguished educational authority of Salford, who was in that chair, said that he did not think there were more than 2 per cent. of children there who went to school hungry?—I cannot speak for Salford.

11844. In London we have had the figures put nearly as high as you said—33 per cent.?—I would strongly urge the taking of samples. You can do this by taking samples. If you do that all over the country, as you did in Scotland, you would get a reasonable figure. In Scotland it was very nearly 30 per cent.—Aberdeen and Edinburgh combined. In Edinburgh it was certainly 30 per cent.

11845. In the samples which were taken?—Yes; in Edinburgh alone I think it was 30 per cent; in the North Canongate School, which was the poorest Edinburgh school, I think it was 38 per cent. of children who were, what Dr. MacKenzie, who examined them, called insufficiently nourished.

11846. The teachers are very good judges of a starving child, but do you think they are good judges of what we may call children insufficiently fed: Do you not think the teachers' opinion would be required to be reinforced?—Yes; I am coming to that later. I do not exclude medical advice at all, but I say I would make the teacher *primâ facie* responsible. If a hungry child had not been fed in school it should be the teacher's fault.

11847. The actual figures of London are estimated at 33 per cent. in the worst districts and 16 per cent. in the others. Do you think the meals should be given in the schools?—Yes; either at the school itself or at a building provided by the school authority.

11848. Would not you find that a good deal of structural change would have to be made in a good many schools?—I should think in most places they could get accommodation. I remember going to a country school some years ago, Tendring in Essex, where the meal was given in the school.

11849. Do you propose it should be prepared in the school as well as given there?—Prepared under the direction of the school authorities. In that case I think the dinner was provided by the Rector's wife, who did it in her own kitchen and managed the whole thing herself; and she told me—I remember very well—"This is not charity; this is far-sighted self-interest; because our children get better grants if they are fed than if they are underfed, and we feed them for the purpose of getting more money out of the Government." The next thing I want to mention—I suppose I need only mention it—is fresh water. I think in most of the new schools which are provided care is taken to provide the children with abundant water to drink, but in some of the old schools it is lamentably deficient. There ought to be close to every school in the schoolyard a tap from which the child can drink as much water as it likes. You know how thirsty children are, and if they do not get fresh water they drink foul water. There was evidence given in the Poor-law Schools inquiry that in a certain workhouse school the children habitually drank from puddles because there was no proper water supply—the children drank from puddles in the schoolyard. I need not enlarge to you upon the mischief that might do to the children.

11850. (*Chairman.*) Does the Board of Education make it a necessity?

11851. (*Mr. Lindsell.*) I think now water is very strictly looked after and the county councils are putting on very strong pressure about the supply of water. Of course, it cannot be always laid on to every school.

11852. (*Witness.*) I think we do a considerable amount of mischief to the very young children when we get them into what are called "infant schools." There are kindergarten schools under the great school boards than which no happier or better atmosphere for a little child can be conceived, but in many of the old-fashioned

schools, and in many country schools where there is no infant school but an infant class, I think great injury is done to these little children. In the first place, there is too much of the school about it; they are not fit to go to school at baby age. They are made, for instance, to stand for hours in their classes, a thing which a little child cannot do without great injury to itself, and they are moreover made to stand—I have seen it myself—upon little chalk circles drawn in the ground, and there they stand for an hour. If there is one thing that a child wants it is to move about; and to merely keep it in one place, and keep it by discipline, is often very cruel. I have seen in punishment books records of children being caned for moving about and looking about them. My idea is that if a little baby is put to stand in a class at all—which I think is an abominable thing in itself—it ought to be for a very short time and with very rapid changes. Then there is a thing which may have been brought to your notice by some of the witnesses, which is to be seen constantly in infant schools. The children sleep in the afternoon. Every little child will go to sleep, particularly if it has had a dinner. There is no place for the child to sleep, and they are in the habit of sleeping by putting their arm upon the desk, leaning forward and laying their head on their arms, sleeping in that way for an hour or more than an hour. These children are sleeping with a curved spine, and they do that day after day. It is one of the most pernicious things possible. If you have little babies in your school you ought to provide a place where they can sleep lying straight. It is easy to have hammocks, if necessary, one over the other; but no children ought to be allowed to sleep on desks, and to sleep in the position which I have described. Then the teachers who have charge of these children are seldom certificated or trained; they are Article 68 teachers, little girls of twelve or thirteen, employed as monitresses. They do not know how to manage children. I do not mean to say that some of these Article 68 teachers might not be made into admirable infant teachers, because what you want in an infant school is not a teacher, but a nurse, and you might teach them to be kind to little children and give them practical lessons in hygiene. Many of them do make admirable teachers of little children.

11853. I suppose infants want the care of experienced persons more than any other class?—Yes. I am told that these girls of twelve or thirteen often fail to attend to these infants' natural wants, and that the infants pass their time in a condition of wet from want of some women to look after them. I am now going to say something which, perhaps, Mr. Lindsell will not agree with, but I think that one of the reasons for the defects of infant schools is that these babies are visited entirely by men inspectors. We had in my time a few women inspectors in the Board of Education, but I am told that they no longer inspect the schools. I got a letter the other day, which I will just read to the Committee, as it states the whole story as well as I can do it. This is from an infant school mistress of twenty-five years' standing. She says—"Since I became infant teacher, more than twenty-five years ago, I have had visits from about twenty different inspectors, and I can truly say that only two have had an idea of what a little child is like. I suppose it is the law of nature; if a man could really understand an infant he would be a mother and not a father." If you are going to continue the practice of having these infant schools at all, I think you ought to have a women's department—not merely an odd woman inspector here and there—of the Board of Education, organised for the purpose of managing these schools, which are really nurseries. If the Board of Education will have a number of nurseries under its charge, it must have women to manage them. Now we come to the question of physical drill—physical training. I think the Scottish Report shows that we do a great deal of unintentional mischief in our physical training by not having children properly examined before they are subjected to it.

11854. They are put to too great a strain?—Yes, and children who ought not to be drilled at all are drilled. No child who is insufficiently nourished should have physical drill.

11855. (*Dr. Tatham.*) Rickety children also?—Yes; those children ought not to have the sort of physical drill which is recommended by the Department, and which is practised in the school. Then I think that the child should be tested to show that it is free from heart disease,

or anything of that kind. There was a case in the Edinburgh schools, I remember, where Dr. Mackenzie said that a child might have dropped down dead it was in such a condition of heart disease; it was unfit to have the strain put upon it which was put upon it. I have already said that physical training should not take place in the school, but in the open air or under a shed. Then I think that this physical drill should be of a scientific rather than of a military character. I do not think the sort of training which is very good for country yokels who come from the plough, and are going to be turned into soldiers, is at all fit for delicate little boys, and particularly for delicate little girls. The drill sergeant who comes does not even know how the little girls are dressed; they are very often very inadequately dressed for the sort of training they have to go through. Very likely you have taken evidence about this, but there are scientific methods of drill which are now put forward, and have been carried to very great perfection in Sweden and other countries, which we ought to aim at having—a scientific system of drill in our schools rather than a military one.

11856. (*Chairman.*) A Special Committee has been sitting upon that subject, as I daresay you know?—Yes.

11857. It has reported?—Yes. It was established about a year ago, because Dr. Macnamara and I made such a fuss in the House of Commons.

11858. (*Mr. Struthers.*) The Report is now presented to Parliament?—I have not seen it yet; but as it has been presented I need say no more about that.

11859. As I understand it, what you advocate is something not in the nature of military, but some approach to a scientific system of physical exercise?—Yes. Another thing which is of very great importance is the clothing. I am certain that the clothing of the children should be inspected every day. If nothing more can be done than that, that alone would be a step in the right direction.

11860. (*Chairman.*) Just to see that the child is suitably and sufficiently clothed?—Yes.

11861. With our changing thermometer it might require different clothing every day—yesterday and to-day, for instance?—I do not think that the country child would have felt very much difference. I have no desire to see the clothing of children undertaken by a public authority, but there are several things in connection with clothing which a public authority may do. It might take the children's wet boots off when they come to school and put them into slippers, and even take off their wet stockings and put them into dry school stockings, which would not be a great expense but would be a great benefit. If people who look after these children could only induce parents to do what the fashionable parents do, namely, put their children into sandals instead of shoes, it would be an enormous saving of expense and would, no doubt, be greatly to the children's advantage, because the number that come in with wet clothes and sit all day in wet clothes in a country school is very considerable. Of course no record is kept of that, but that is one of the things of which a record ought to be kept. Then I think the last general thing I need call attention to is cleanliness. I have an idea that if you force all the children of a neighbourhood to come to school the parents have a right to expect and to require that the children shall be fit for their own to associate with, and that certainly is not the case now. In the place where I live, Yateley, which you know very well, every now and then an effort is made to make the gipsy children, the van children, go to school. They come to school swarming with vermin and the respectable people of the village object very loudly. They say, "Our children are sent clean to school, and are we to let them sit on the same bench with these verminous children from the common, who will inevitably infect them with lice."

11862. (*Mr. Lindsell.*) You know that the fact of children being infected with vermin is a sufficient reason for excluding them, by the Code. That has been upheld by the Board?—Then if they are excluded they do not go to school at all.

11863. Where are they to go?—It seems to me that one of the things to be provided by the school should be the means of washing, that no child should be allowed to come into school with a dirty face or hands, but that it should be made to wash its hands outside.

11864. (*Chairman.*) Do you not think that the proper way is to enforce such sanitary conditions as will discourage them living in vans at all?—You know the impossibility of dealing with a population on the common.

11865. It may, I believe, be dealt with now in one or two different ways. I believe the sanitary authority should intervene. Those vans are surely most insanitary?—Yes. I should go a little further than the Board of Education goes—I should take the children and wash them. It is done in Sweden.

11866. (*Mr. Lindsell.*) You must burn its clothes, washing the child is not enough?—You might disinfect, I suppose, by a proper temperature without destroying the clothes.

11867. (*Chairman.*) The clothes are so filthy and rotten that if you took them off the child they would probably fall to pieces.

11868. (*Mr. Struthers.*) Who is to do this washing and baking?—There was an Act passed some years ago, which created great excitement in the House of Commons called the "Verminous Persons' Act, but I believe it has never been put in force in any one instance. I should think an Act could be passed which could be adopted by the Local Authority as part of its sanitary proceedings.

11869. There is this Act already, which enables a sanitary authority to do it, and which is not put into force; it is no use having another Act?—I hope that now that the public authority has become the school manager their eyes will be opened to the necessity of some of these things, and that they may take action of themselves. I suppose dirt is unwholesome, and if that is so you ought to see that the children are not unhealthy.

11870. (*Chairman.*) We should prevent them from living under conditions which create this state of filth?—Yes. Then we come to the actual physical defects in children, which ought to be found out in the schools and dealt with.

11871. This can only be done by medical inspection?—Yes. First of all there are the diseases of the nose and mouth, adenoids, which, if properly diagnosed and proper advice given, could, I think, to a great extent, without any expense upon the ratepayers, be ameliorated. Then there comes the extremely important question of eyesight. I think we want a great deal more scientific inquiry into the conditions under which school children's eyes deteriorate. This is not confined, of course, to the elementary schools; children in all kinds of seminaries of learning get worse eyes.

11872. The young children are employed on too small work to begin with?—Yes, there are some things in our curriculum which are very bad for the children. For instance, one of the common employments of these little babies who come to school is to thread needles. I suppose it is a very bad thing for the eyes of a young child to thread needles. Then in many of the schools there is not proper attention paid to the light. I have constantly been in the country schools and found the children sitting in the full glare of the window, looking at it. Then there are other schools where the light is very deficient, and I suppose that is equally injurious to the eyesight. Then they use blue chalk constantly on the blackboard, which I suppose strains the eyesight. I do not think sufficient attention is ever paid in the schools to the place where the child sits. You will see the teacher lecturing upon a blackboard, and a child sitting right off at the side. He cannot possibly see, or can only see very imperfectly, the writing upon the blackboard. The straining of the eyes must be very bad, but the whole of this question, I think, further scientific inquiry is necessary. Myopia is greatly on the increase, and it is one of the very great disadvantages of all school life. Then with regard to the children's ears. I think it was in the Scottish Report they found 40 per cent. of the children have defective hearing, largely, I suppose, due to mouth and nose diseases. The children certainly should be examined to see who can and who cannot hear, because boys and girls are perpetually caned in school for not hearing something which they cannot hear. The condition of every child as to hearing should be found out, and recorded in the school.

11873. There are some special tests which should be applied for the condition of eyes and ears?—Yes, I think so.

Sir J. Gorst.

Sir J. Gorst. Then there is the question of teeth. I suppose it is now established that the condition of the teeth is a test of general health and physique, and certainly in the schools there has been very little examination into that. What has taken place tends to show an enormous amount of teeth disability.

11874. Experts upon that subject who have been here have refused to admit that there is any correlation between general degeneracy and the condition of the teeth?—It has been adopted by the military authorities as a test, and I daresay you have heard more about it. I was reading the other day what Dr. Hall, of Leeds, says; he makes out that the Jew is so much more healthy than the Christian, and attributes it partly to the condition of the teeth.

11875. He says Jewish children are much better developed, does he not?—Yes.

11876. And he attributes that to dietary rather. Everybody would admit that the condition of the teeth is largely due to dietary, but defects of dietary touch all classes, not only the degenerate ones, it would appear?—Now I come to the question of medical examination which I have referred to once or twice. The measurements proposed by the Anthropometrical Committee, which are of a scientific character, I have nothing to say about; I am not qualified to express any opinion. I have no doubt they are the very best measurements that can be taken, and I rather incline myself, from my general experience of life, to having special operators instead of attempting to have the teachers of the school conduct those operations themselves, particularly as it will be a very intermittent thing, affecting each school once in ten years, if that scheme is carried out. For my purposes, what I want to say is that this anthropometrical examination will not do much for the children. It will not do what I want to see done.

11877. It will not be a substitute for medical inspection?—No. As far as it goes I am entirely in favour of it. I think it would be an interesting addition to our statistics, and would be well worth the very small sum of money which it would cost if the Chancellor of the Exchequer could be induced to see it in that light. But for the purpose of the medical inspection of the children, I should begin by a daily inspection by the teacher. The teacher of the class, which is often only between thirty and forty—I do not mean the head teacher but the teacher of the class—should draw up his class in line, and walk round them as a military or naval officer walks round his men when they are drawn up on parade to look after them and see the condition they are in. I think there should be a general record kept by the teacher of the physical condition of every child, which should first of all contain the particulars of the child's home, what sort of home he lives in, whether it is in a one-roomed house with a large family, or in a two-roomed house, whether in short the child is properly and decently lodged. That would give a great deal of information, because it would show what Dr. Mackenzie of Edinburgh seemed to think he almost established there, a correlation between the kind of house the child lived in and its general condition in the school. Then, I think, a daily record should be kept of the condition of the child as to nutrition. Of course if the child comes to school without its breakfast, absolutely hungry, he should note that; I would also keep noted the general condition of the child as to nutrition and as to health. Then a daily record should be kept of its clothing, whether it was clean or dirty, and also whether its person was clear or dirty, all of which a teacher with a note-book in his hand could take notes of by walking round his class. It would not take long to go through thirty or forty children, and it would be an extremely valuable record of the condition in which the children were growing up, and would greatly promote increased care on the part of parents.

11878. You would have this done in all schools or only those of the poorer classes?—I would have it in all schools as a desirable record of the general condition and health of the school children. I think the teachers would take a great interest in it when it was once begun, and it would give you a continuous record of the health of the school population; it would give you more information as to the sort of race that was growing up than any other course you could take. Then besides that there ought

to be a periodical inspection by trained observers. I should say nurses—trained nurses.

11879. As well as doctors?—The doctor comes last. I would have more frequent inspection by trained nurses than by doctors. I should say it might be as much as half-yearly or even quarterly. That, of course, is a question for the local authority. There is an inspection of this kind in many of the schools in London and in many of the schools in Liverpool and possibly in other places. The nurses would examine the children more at length and more in detail than the teachers; they would, for instance, look at their throats, their noses, and their general condition; they would pay special attention to their eyes, both to defects of vision and diseases of the eye and eye-lid, which are not very uncommon in some of the poorest schools. They are highly infectious, and children suffering from them should be at once taken out of school. The teachers would in time become experts, and detect eye disease long before the advent of the nurse. But there ought to be a professional examination of the children. Then the same inspectors would examine for defects of hearing. The defects of hearing would be recorded in the general history of the child, and the condition of the teeth. They seem to me the people who, in the first place, might determine the fitness of the child for physical training.

11880. Would it not be expecting too much for the most highly-trained nurses to have the qualifications of an oculist, aurist, and dentist?—It is not that. The trained nurse would only have to recognise that there was something abnormal and refer to higher medical authority.

11881. Indications of specific diseases are not so easy to determine?—Many people who are not doctors at all, who have had no professional training at all, can tell an ophthalmic child in a moment. My friend Mrs. Barnett, who is neither a doctor nor a nurse, can do so. I was never more astonished than once when I went into the baby-room in a workhouse; there were thirty or forty children grovelling together on the ground, and she darted like a man into a flock of sheep and seized one child and said: "That child has got ophthalmia." A medical man was sent for and it was found that this child had ophthalmia and it was taken away at once. All bad cases would have to be referred to a medical officer, and I suppose every school authority now will have an official medical officer. I do not know to what extent he need visit the schools. I should think in large places like London, Manchester and Liverpool, it would be most desirable that the children should all be visited by the medical officer. It might be more difficult in the rural districts. At all events, where there was any case of serious disease or defect amongst the children the medical officer should be referred to. How far these serious illnesses and defects should be treated at the public expense is a question which I do not know I need argue here. I am strongly in favour of treating them at the public expense.

11882. I suppose in the first place you would have the matter referred to the parents?—Yes, if the parents liked to pay, well and good, but if there is a serious illness or defect I do not consider that it is pauperising the parents to have it treated at the public cost. It is now treated at the workhouse infirmaries and hospitals at the public cost. Taking the strongest selfish view of the matter it is in the interest of the State to cure and alleviate, as far as possible, the diseases of the members of the community. The child whose eyes or ears are treated at public cost will grow up a stronger man or woman and do better work for the commonwealth, because of the attention bestowed upon it in its earlier years. I think it is the worst economy in the world when you become aware of any curable weakness in a person who is growing up a member of the community to refuse to treat it; it is the most wasteful extravagance not to deal with it early and cure it.

11883. Unfortunately people look at the cost rather than the benefit?—I am afraid they do.

11884. I suppose a scheme of general medical inspection, supplemented by the inspection of trained nurses, would be an expensive one?—You may make it as expensive as you like.

11885. Could it be done economically?—I think so. What I should begin with would be nurses. I should make a general inspection with power to refer to the public medical officer of the district—there is one in every district—such cases as they thought were serious.

11886. Could you get such a staff of nurses if you wanted it?—I think so.

11887. Is there not a great demand already on the existing supply of nurses? It would mean an enormous addition to the number of nurses who are now employed if all the big educational authorities had a staff?—Yes; if the educational authorities had a separate staff I have no doubt it would. But in country districts village hospitals are not unknown: and the nurse from a village hospital could easily visit the neighbouring village schools.

11888. They could be given a small fee perhaps?—Yes. In a village you could get it done by a nurse resident in the place at a comparatively small charge. In a place like London, or other great towns, the more you do for the people the more expense you would incur and the more officials you would want. It would give a very great increase to the number of nurses and medical officers required in London if anything of the kind were done.

11889. (*Mr. Lindsell.*) The London School Board have medical officers already?—Yes. The nurses now employed in schools are all paid by voluntary contributions.

11890. (*Mr. Lindsell.*) But there are medical inspectors as well as other kinds of inspectors appointed by the London School Board. We had one here.

11891. (*Dr. Tatham.*) I understand that you do not want to put children under six years of age into the schools at all?—That is so.

11892. And you think it is especially necessary in those cases for the young children to have nurses rather than teachers?—Yes.

11893. I presume your idea is a preventive one mainly?—Yes.

11894. You think that it would be economical to act on preventive principles and prevent the spread of, say, granular lids, which you speak of, among children?—I have always thought that. I have always advocated that all this sort of thing is economical.

11895. I may supplement what you said just now with regard to the spread of ophthalmia amongst young children in schools. I myself have seen a workhouse in Lancashire where practically every child in the infant school was down with granular lids at once. That was a case in which prevention would certainly have saved the ratepayers a very great deal of money?—Yes.

11896. It became a matter of Government inspection for a time. So that really preventive measures taken early enough would probably have saved hundreds of pounds to that one Board of Guardians?—I am quite prepared to advocate that on purely economic grounds, without any philanthropy in it at all.

11897. And you would have your trained nurses examine a school at short intervals, and where they found cases requiring a reference of those cases to a medical man?—Yes.

11898. Do you happen to know anything of the work of the Ladies' Manchester Health Society?—No, I not do.

11899. It is proceeding very much on the lines which you spoke of just now, of the lady doctor acting under Dr. Barnardo; in Manchester a large number of ladies, the wives of some of the manufacturers and important people in the place, have joined together and formed a society. They themselves employ a very considerable number of women of the working class to visit under their direction the people in their own homes, and their work is very largely educational—I mean educational from the sanitary point of view. They teach mothers how to feed their children, how to clothe them, and how to look after them in sickness, and that kind of thing. The work of that society seems to me to be worthy of imitation, and I should be very glad indeed if that could be extended. It is not so well-known as it should be?—I had not heard of it, but I think the plan excellent.

11900. (*Mr. Lindsell.*) I understand that your views with regard to the ventilation of schools are not that it

is the fault of the arrangement of the schools, but the teachers will not make use of the means at their disposal?—I believe it is very largely the people who will not use the ventilation which is there. I have not a word to say against the requirements of the Board of Education in the building of any new school; I believe their requirements are good. But I know from my own experience that they are often not put into practice.

11901. How could one remedy that?—By inspectors. The inspectors often do not look into these things.

11902. Of course this new system of having the sanitary authority and the educational authority under one and the same head will probably lead to an enormous extension of those things which you suggest?—Yes, I think so.

11903. The medical officer of health will now be in a more authoritative position?—Yes, I think that was the design of the authors of the recent Act.

11904. Certainly. The question about excluding children until they are seven years of age is open to argument on both sides?—Yes.

11905. A little child may not be very much better in its home surroundings or even in the open air. It may be exposed to other risks, perhaps not the same risks, but other risks?—I am afraid the interest of the child in many places is sacrificed to the desirability of the mother going to work. The object is that the mother should go to work.

11906. The object is to get rid of the child?—Yes, family life and everything goes to the wall as compared with the necessity of getting the mothers to work.

11907. (*Chairman.*) Not in the rural districts, surely?—Yes, even in rural districts. But my observation applies more to the manufacturing districts, and especially to the textile districts. With regard to a woman who is a good weaver, they will hardly let her get over the birth of the child; the overseer who wants her back urges her to come back. An Act was passed for their protection forbidding them to go back within one month.

11908. The last Factory Act?—Yes.

11909. (*Mr. Lindsell.*) Now, with regard to this important question of the feeding in the schools: you said that the teacher would hold a sort of daily inspection of his class?—Yes.

11910. And would know, among other things, cleanliness, and so on. Whether the child showed symptoms of deficient feeding?—Yes.

11911. That would give a sort of foundation to go upon, to start with?—Yes.

11912. Then the next step would be to provide meals for such children as were reported by the teacher to be insufficiently fed. Those meals, in your opinion, should be given by the school authority?—Not necessarily by the school authority.

11913. I mean provided?—Yes, provided under the responsibility of the school authority. I see no objection whatever to a benevolent society undertaking the duty of doing it, but it must do it as the agent of the school authority.

11914. In the East Lambeth Association it is done undoubtedly under the auspices of the School Board: that is a purely voluntary association which co-ordinates all the benevolent child-feeding schemes. For instance, Mr. Sims, of the *Referee*, gives a large sum of money, and that is done under the ægis of the London School Board, and with the appliances at its disposal?—Yes.

11915. If that were done once by the school authority as a legal duty voluntary aid would come to an end, would it not?—I do not know why it should. There are a great many public obligations in this country fulfilled by private benevolence, *e.g.*, the provision of life-boats. The British public is very fond of doing some part of the work of the Government for them, and I do not see any objection to its being done by benevolent persons, so long as it is efficiently done, but the school authority should be responsible for its being done efficiently. Take the lifeboat service. The lifeboat service is extremely efficiently done, I am told, but if it were not efficiently done the Government would have to step in and take it out of the hands of the benevolent society which undertakes it.

11916. You would rather leave it, if possible, to a benevolent society, acting under the direction of the school

Sir J. Gorst.

Sir J. Gorst. authority ?—I think that would be a very good plan. I should like to try that, at all events, as an experiment.

11917. Then a ticket would be provided by the head teacher at the school ?—Yes, the child would get the ticket at the school.

11918. And the parents would be called upon to pay ?—I should like to see that done, yes. I would give a meal to every child whose parent did pay beforehand.

11919. But if the parent failed to pay, the meal would have to be given at the public expense before the public could demand the fee back ?—Yes: it would require legislation to recover back the price of the meal from the parent. I should like to make the price of the meal summarily recoverable from the parent, just as you summon them for non-payment of rates.

11920. (*Mr. Legge.*) By this summary process you mean recoverable as an order in bastardy ?—I should call it recoverable summarily.

11921-2. The way of putting it in the Act of Parliament is that it shall be recoverable as an order in bastardy ?—That is legislation by reference. It is not a nice reference in this case.

11923. (*Mr. Lindsell.*) You said there was already an existing law by which the parents could be punished for not feeding their children ?—Yes, neglect of family.

11924. The danger is that if the parent went to prison the family would be worse off ?—That is the difficulty of the whole position. It is not peculiar to the case of feeding in school; it is a law occasionally put in force. A man is sometimes sent to prison for not providing for his family, and the family goes to the workhouse.

11925. Where would you have this food prepared ? In the country, for instance, it would be very difficult, would it not, unless there was a Rector's wife who was willing to give her kitchen for the purpose ?—Of course, such a thing as porridge is very easily prepared.

11926. (*Chairman.*) It is not prepared quickly ?—No, but you can boil it all night; that is a detail.

11927. (*Mr. Lindsell.*) Broth, soup, and things of that kind ?—Yes.

11928. It would be much more difficult in the country than in the town ?—Possibly.

11929. (*Chairman.*) It will not be wanted in the country to any large extent ?—I do not think it will be wanted so much in the country as in the town.

11930. (*Mr. Lindsell.*) You said something about the class of teachers they have for infants in the country. You would agree that the Article 68 teacher is often, if a woman of mature age, as good a teacher for small classes of infants as you could have ?—I think so.

11931. Far better than an immature pupil teacher ?—Yes; and some of them very easily learn. A movement took place in Oxford a couple of years ago; they brought a great many of the Article 68 teachers into Oxford and sent them for only a fortnight to a very good infant schoolmistress in Oxford, and they said that the effect in the country districts, the improvement that was made, was extraordinary. Many of them only want teaching, and I do not think it is a very difficult thing to give that sort of instruction to a young woman even if she does not know the multiplication table or the rule of three. She might be an admirable person to take charge of a little child.

11932. (*Mr. Legge.*) You referred to children of six years of age in Switzerland tending cattle and goats; do you approve of that ?—Yes. I do not think there is any harm in that under the circumstances that they do it there.

11933. You do not object to light occupation for children ?—Not in the least. The children want to do something and they like it—they love it. Of course it is all in degree and kind.

11934. You have perhaps seen reports of the Mosely Commission ?—I have only seen the outside of it. I have not read it.

11935. They referred to some experiments being carried on in America with regard to giving children some sort of occupation as well as schooling; and similar experiments have been carried on both in Sweden and in this

country. Have you seen, for instance, any of the working of the day industrial schools, such as Drury Lane ?—No.

11936. Where the children have their meals and have three hours' book work and then a couple of hours, or two-and-a-half hours, the girls domestic work, laundry work and cooking, and the boys trades; have you any objection to an extension of that system to the poorer districts ?—Not in the least. It is an admirable system. I understand it to be a system of teaching the children to do something and then giving them such literary or intellectual instruction as is necessary to enable them to do it.

11937. Not only with that limit which I should term rather narrow—I mean to stimulate their intellectual faculties as well as merely to enable them to perform certain manual operations ?—There is an institution established in Cairo which is very much what you mean I think—at any rate it is what I mean. They have an institution there—they do not call it a school—but they take boys from the streets of Cairo and apprentice them as tinsmiths or carpenters. They take them into the institution as apprentices. They know nothing; they do not know how to read. In the course of learning to be tinsmiths or carpenters, they give them all sorts of instruction; they teach them arithmetic, and how to read and write, but it is all in connection with what they are learning to be.

11938. You would be in favour of variation of types of schools to suit particular districts ?—Yes. I am very strongly in favour of that. I think the old plan of merely teaching reading, writing, and arithmetic in a formal way is a very bad one.

11939. As the age for compulsory attendance is extended would you allow children, say a girl of thirteen years of age who otherwise might have to stay at school until fourteen, to be licensed out of school for half-time employment at home, providing the school authorities were satisfied that the home was a good one ?—I think a system of that kind would require to be very carefully watched for fear of its degenerating into child labour.

11940. An extension of the principle of Mr. Robson's Act ?—I know that Act very well.

11941. Have you studied at all the question of special courts for dealing with children ?—I have often discussed that.

11942. Are you in favour of that ?—I am very strongly in favour of that.

11943. Because obviously the more the children come under the observation of the court the more intimately would the history of the case be studied ?—I would never let a child go into an ordinary police court under any circumstances. There ought to be special tribunals for everything connected with the child.

11944. Now as regards your preference in favour of special operators for the anthropometrical census, I am glad to see you attribute a great deal of intelligence to the average teacher ?—I do not think the average teacher is at all an unintelligent member of the population.

11945. You go so far as to say that an average teacher can detect an underfed child by looking at it ?—No, I do not say that. If you will cross-examine Dr. Macnamara upon that point I think you will find that the teachers have a great many more methods. They observe the conduct of the child. He said the other day in the House of Commons, for instance, that he knew a group of children when he was master of a poor school who were always to be seen crouching in a corner of the playground, and not going home when the other children went home to dinner, and by questioning these children he found that they had no dinner to go home to. It is more than mere looking at the child.

11946. Surely the average teacher is intelligent enough to take a child's height and weight ?—I suppose they could. I do not doubt the teachers would be able to do it if you put the work upon them.

11947. Or, at any rate, one teacher in any particular school ?—Yes.

11948. Or if we had this army of nurses invading the schools, perhaps the trained nurses might have intelligence enough to take the child's height ?—Yes. Of course

it would give them more to do. They would be employed or a longer time.

11949. Are you aware what is done by the certifying surgeons under the Factory Acts?—Yes.

11950. They see the children and young persons at very critical periods, fourteen and sixteen; they have to medically examine them. Surely the average certifying surgeon would, in your opinion, be capable of taking the height of a child and so on?—Yes.

11951. It is not on scientific principles that you insist upon the special operator?—No. I always like a thing done by people specially qualified to do it, if I can get it done, rather than by amateurs.

11952. (*Colonel Onslow.*) I do not quite understand about the system of tickets at schools for feeding; where it would be convenient to the parents, either through their having to go out to work or any other causes, to have their children fed at the school, you would allow them to do so?—Yes.

11953. It would not be a sort of punishment for the parents not feeding their children?—No.

11954. They could do it if they wished?—Yes.

11955. And is not there an old law in existence by which the school fees could be recovered from parents who could pay, and in some cases where it was shown that the parents were too poor to pay then it was thrown on the rates?—Yes, I remember; it was thrown on the Poor Law Guardians.

11956. (*Mr. Lindsell.*) The parents could be sued for the fee?—But could they summon summarily?

11957. No. It would be sued for as a debt?—Yes.

11958. (*Colonel Onslow.*) It struck me that would be useful machinery for obtaining the fees.

11959. (*Mr. Legge.*) This is a terrible business, this civil process for the recovery of debt.

11960. (*Colonel Onslow.*) You spoke of the insufficiency of food in the country schools amongst certain children. Is that owing to ignorance or neglect or poverty of the mothers mainly?—I should say owing to all three.

11961. A combination of all three?—Each one in different cases. There are cases of ignorance, but I should say they are not so numerous. There are many cases of neglect, almost entirely from drunkenness, and there are a very great number due to poverty.

11962. We had a lady who had investigated many parts of England, and she was very strongly of opinion that it was owing to the general ignorance of the women of the lower classes; they did not know how to feed themselves even?—I have no doubt that the lady was quite right. Nothing is more deplorable than the impotence of the general English labourer or labourer's wife in the presence of food. Where a Frenchwoman would make an excellent dinner an Englishwoman would almost starve.

11963. That is what this lady said.—That is my experience. I have been in a great many poor people's houses both in England and France, and I should say that, although an Englishwoman spends a great deal more on feeding her family than the Frenchwoman, the Frenchwoman gives them a great deal more food.

11964. Then with regard to the daily inspection of teachers which you mentioned, surely something of that sort is done now, is it not?—Some of the teachers no doubt do; they look round their class.

11965. As the children are going in?—Yes, but it is done in an informal way, and no record kept.

11966. That is so: There is no record kept. I should like to mention one thing about the services, both the Army and the Navy: I think one reason why the authorities are so very particular about the men having perfectly good teeth when they enter is more because when a man is on service, and very often at sea when he is in the Navy, in the old days, if he has not sufficiently good teeth to masticate his food, his health must suffer, because he does not get sufficient food, and consequently he breaks down. That I think is the main thing. And the second point is that when a man has defective teeth or any other physical defect, although he may have been in the service some years, and have cost the country a good deal of money, if he wishes to get out of the service it is the easiest thing for him to complain to a doctor,

and he is brought before a medical board and he gets out. I think that is the point?—I understand. *Sir J. Gorst.*

11967. (*Mr. Struthers.*) You suggested that one of the causes of defective ventilation of the country schools was insufficient heating; the teachers stop up the means of ventilation in order to make the place reasonably warm?—Yes.

11968. Very often a country school is a long room warmed with one open fire, and it is very difficult indeed by means of an open fire to heat the whole school properly. Can you suggest any means of dealing with a case like that?—I suppose a school to be efficiently warmed ought to be warmed by hot water pipes.

11969. That means a pretty elaborate machinery for a small country school?—It means a capital outlay to begin with. But surely it is very much more economical in the long run to get a room warmed with hot water than with an open fireplace.

11970. It might be so, yes. But apparently there has been nothing said by the Board of Education as to the advisability of warming the schools with hot water instead of an open fireplace?—In the old times when it would be done at the expense of the Managers, possibly it was too costly for the Board of Education to suggest, but now you have the local authority which has to manage for all time, they might make a great many improvements of that kind.

11971. You think it would be reasonable to ask them to consider this question whether these small country schools might absolutely be warmed on a different plan?—Yes.

11972. You would not think there is anything in the point that an open fire is an aid to ventilation itself?—I suppose it is a very good means of ventilation.

11973. What you said as to the number of children who are insufficiently fed in the country districts is in evidence before the Committee, I think. Have you any definite statistics on the point?—No. There are no statistics to be got.

11974. It is a personal impression?—It is a personal impression from conversations with a great many people, school managers and others, and what I have seen when I visited country schools.

11975. From inquiries made at the school?—The part of the country I knew most about was Essex, near Manningtree. When I lived there I went a great deal into the labourers' cottages, and I knew a number of very hard cases of widows with large families who had the greatest difficulty to make both ends meet. It was before I was Vice-President.

11976. You think that is not confined to Essex but is widely spread?—I should think so.

11977. You do not speak from positive knowledge of any other place or from information given to you of any other district in the country?—Yes, I have asked that sort of question when I have been going about in other places. My general impression is that it prevails over all the country districts.

11978. Both south and north?—I think in the northern counties the country people are much better off. The country people in Lancashire, Yorkshire, Cumberland and Westmoreland are better off. I was born in Lancashire, and I know the country people there certainly are much better off, or were much better off, than the people in the south. They get better wages.

11979. You know that information on insufficient feeding is extremely vague. The Report of the Scottish Commission, which you referred to, says: "We were informed by some of the School Board representatives, notably from Edinburgh, Glasgow, and Aberdeen, that in these towns the Boards co-operated in this matter with philanthropic agencies, and caused inquiry to be made, so that practically most of the necessitous cases were relieved." Then they had a witness, Mr. Bridgeman, who said: "There are now practically no cases of underfed children attending the London Board Schools"?—I should think he was taking a very sanguine view of it.

11980. I do not say he is right, but there is a divergence of opinion even as to what is underfeeding?—Yes, it is even a matter of opinion what is under-feeding.

11981. That rather brings us to the point that you referred to in this Report, the proportion of underfed children which they quoted from the investigation made

Sir J. Gorst. by Drs. Hay and Mackenzie. It brings out that Aberdeen shows 9 per cent. of the children badly nourished, and Edinburgh shows 29·83 per cent. That is what you were referring to?—Yes.

11982. We had Dr. Mackenzie here, and he explained what is very material indeed, that the 29·83 per cent. means children who are thin; but in his own report he says that thinness is of two kinds—namely, that due to underfeeding and that due to hard training. He says—“For example, there was the thinness due to underfeeding, which was the predominant form at North Canongate, and the thinness due to high training, both muscular and nervous, which was the common feature of the other schools.” So that there again we are dealing with a very vague figure?—Very. I think all attempts to get at the actual percentage of children is altogether vain.

11983. It is almost more than that. There seems to be a distinct want of understanding as to what are the signs of children being underfed?—Yes. Have you had the master of the North Canongate school here?

11984. (*Chairman.*) No. When I was in Edinburgh last year I had a conversation with him; he is a very remarkable man.

11985. (*Mr. Struthers.*) You mean Mr. Young?—Yes. He impressed upon me this fact—he said:—“I did not try to make out a case for the North Canongate School. If I had I should have made a much worse picture than Dr. Mackenzie drew.”

11986. I believe it is quite possible, but that school is an exception, is it not?—I believe it is an exceptionally poor neighbourhood.

11987. There are several other statements in this Report and one must be careful of the inferences to be drawn. For example, Dr. Mackenzie was questioned upon this point as to the contrast between statistics of children of very poor health in the different towns—Aberdeen, 0·5 per cent. of children in poor health; Edinburgh, 19·17. That is a contrast which is frequently referred to, but he was clearly of opinion that the greater part of this was to be accounted for by the personal equation. The characteristics they were dealing with, complexion, and so on, were the sort of things on which very different opinions might be expressed about the same state of facts?—I was in Aberdeen last year and went round the schools, and I was struck with the exceptionally healthy appearance of children at Aberdeen, so much so that the people taking me about said: “We must in justice take you to the worst school in the town.” I went to the poorest school in Aberdeen—I cannot remember the name—and certainly from the sort of general view that I took the children looked very well nourished and very well set up—bright, active children.

11988. In reference to this uncertainty as to what the facts are, might it not be a good thing, not merely for the returns but for the means of drawing the attention of the school authorities generally all over the country to the subject, for the educational authorities to ask for a return from the school authorities of the facts as to underfeeding?—They could only give you opinions: they have no accurate facts. What I should like to see done would be to have samples drawn from all over England and subjected to the same sort of careful medical examination as was made in Edinburgh and Aberdeen. I think that would be a most useful piece of information. You could take a sample of Manchester children, Liverpool children, Leeds children, London children, and so on.

11989. It is so difficult to make a sample, because the population is in spots; it is not uniform?—I know that is a difficulty.

11990. It is rather a question of getting actual facts as regards each particular school, is it not?—Take a certain number of typical schools.

11991. To make sure that there was no omission of schools by arbitrary selection, why not have a return of the whole of them? It might be simply blank as regards the great majority, but that would ensure that no school was being overlooked?—The objection that I should make to the return is that this return is rather a matter of opinion. There is no definite test of an underfed child. It is only the opinion of the headmaster, or the

class teachers, or the local authority, as to what is an underfed child.

11992. Of course, a good many of the present school authorities have a medical officer, and I should think a great many of the new authorities will appoint a medical officer, and such an inquiry would be conducted under his direction?—I should have confidence in an inquiry conducted by a professional man.

11993. Of course, the statistics which we have been getting hitherto have not been those of professional men as a rule, with the exception of Dr. Mackenzie and Dr. Hay. With regard to your plan for dealing with underfed children, there is one point that I am not clear about: Do you contemplate the scheme being helped from the rates at all?—Yes, the rates must be responsible for it.

11994. For the feeding of the children?—The rates must be ultimately responsible. I think that with the payment by the parents and contributions by benevolent people the drain on the rates would be very small, but they must be fallen back upon.

11995. (*Chairman.*) The poor rate or the school rate?—It is really the same thing, is it not?

11996. With regard to its incidence it is not?—Then I should say the school rate. It must be part of the cost of education.

11997. (*Mr. Struthers.*) There is no power in the school authorities under the last Act to draw upon the rates for this purpose?—I do not think there is. That is a legal question.

11998. Certainly there is no power in the Scottish Acts?—I do not think there is. Mr. Lindsell's opinion would be very valuable on that point, but I do not think there is power in the Acts to draw upon the rates for feeding children.

11999. (*Mr. Lindsell.*) No, there is not.

12000. (*Mr. Struthers.*) But in the meantime it could be carried out by benevolent societies under the direction of the School Board?—I think so. I think in many places the thing could be started experimentally and the local authority might confidently anticipate subscriptions. I am quite sure they would in Manchester.

12001. (*Mr. Lindsell.*) The moment people begin to think that they can go on the rates they will not subscribe; that is the danger?—They can enable the local authority to do a bit of experimental work.

12002. (*Mr. Struthers.*) The plan is by no means a new one with regard to voluntary agency; it has been in operation in many parts of the country for varying numbers of years. In Edinburgh they have an Association which does exactly what you propose, which has been in operation for twenty-five years?—I know it has been done. I do not suppose the plan to be at all a new one. It is what is done in Paris, only in Paris it is done at the public expense.

12003. (*Mr. Lindsell.*) Your organisation might be done at the public expense; if the school authorities found all the machinery that would relieve it a great deal?—Yes.

12004. (*Mr. Struthers.*) They could lend the machinery at present—at least they have been doing it?—I suppose they could.

12005. Because in Edinburgh they get the teachers' School Board authorities to make investigations into the case at the homes of the children?—Yes.

12006. Then how do you get over this difficulty? The teacher says, “This child is underfed,” and the child is supplied with breakfast or dinner, but when the parent is called upon to pay he says, “No, I fed the child at home?”—That is a question of evidence. The teacher may have made a mistake. It is possible to make a mistake in one case, but not very often. He would not make a mistake for many days running.

12007. That precludes all dealing with the parent in a summary way, because the parent is entitled to say, “I did feed the child at home?”—If a parent were summoned before a magistrate for refusing to pay for his child, he could say, “The child did not want a breakfast,” and give evidence upon it.

12008. It must be more elaborate than sending a policeman to collect the 2d.?—You could let the policeman go

and ask for the 2d., and if he did not get it he could report that he did not, further inquiry could be made, and after that a summons could be issued. Then if the man summoned, said, "I did not neglect to feed my child; it had a good breakfast," and if he convinced the Justice of that, he would dismiss the case. There would be few such cases; there might be mistakes made now and then.

12009. With regard to teaching of hygiene, I rather gather that you advocate its being taught to the mother?—Yes, by missionaries.

12010. You have not very great faith in the teaching of hygiene in any form in the schools?—I have not. I think the learners pass an examination, and there is the end of it. It is like teaching ventilation. Most people know how much oxygen there is in the air, but they shut all the windows up, and breathe carbonic acid gas.

12011. What do you say with regard to cooking and laundry work?—I have the same kind of feeling with regard to teaching of cooking and laundry work.

12012. Would you rather have it taken out of the school altogether?—No. I would not go so far as that, but I am not a great believer in the efficacy of the teaching of cooking as now practised. I should look upon it as in an experimental stage at present.

12013. Your view is rather objecting to the present method of teaching it as a school subject?—I think if we could only teach the older children it would be an advantage. It has been taught to little girls who are incapable of learning. If it were taught as in polytechnic, to girls of sixteen or seventeen I should not feel so much objection. What I do feel is that the time is occupied in teaching little girls to make rock cakes and things of that kind. Of course it is very amusing. We used to like very much as children to make messes—what we called cooking.

12014. Do you think there is any possibility of having a good system of teaching cookery to girls of from twelve to thirteen?—I am not sanguine. I should begin at fifteen or sixteen, I think.

12015. That is after they have left school?—It is, unfortunately.

12016. (*Chairman.*) Would you advocate the compulsory attendance at continuation schools of girls from fourteen to sixteen for the purpose of learning cookery and hygiene, domestic management, attending to children, and all such subjects?—Yes. As soon as public opinion is ripe for it, I would have compulsory continuation schools.

12017. For those girls who will become mothers?—Yes; they are all possible mothers.

12018. You think a recommendation on that point would be a very useful one?—Yes. Very useful. So soon as public opinion will stand it I would have compulsory continuation schools for both sexes, and for the girls particularly, for that purpose.

12019. You would make the continuation schools for boys rather of a physical character would you not?—Yes.

12020. (*Mr. Struthers.*) If those subjects were provided for in compulsory continuation classes then there would be a great deal of time set free, which is at present occupied in the ordinary day school; I suppose you think that would still be made good use of up to the age of fourteen?—Yes. I think they have too many things to teach now in the day schools, and if anything can be taken out of the curriculum so much the better.

12021. The argument of many people is that these are so very much more valuable than the other things?—That is quite true, but unless you keep your girls longer you cannot teach them. There are all sorts of things that it is eminently desirable should be taught, but they cannot be taught unless the children stay longer at school.

12022. In the meantime while we have no compulsory continuation schools, what do you think of the plan of the Glasgow Board of having a class for girls over twelve and a half, say, who leave school at fourteen? They are obliged to stay till they are fourteen. Having reached a certain stage of general education before they enter upon that special course, they have a year or a year and a half teaching of about twenty-five hours a week, out of which ten is given to housekeeping, taught practically—the various forms of it?—I think that is perhaps better than nothing. I would very much prefer to have them generally at a later

stage, but I think it would be an experiment well worth trying. *Sir J. Gorst.*

12023. It is being tried?—Yes.

12024. (*Chairman.*) There are one or two points I wish to ask you further upon. In regard to a great deal that has passed in your examination by Mr. Struthers, have you still the same opinion that school teachers are to be trusted to pronounce whether a child is underfed or not generally?—Yes. I think they are the best people. It is the best authority to which you can refer the matter, *prima facie*. I would have the teacher's action in the matter carefully watched both by the head teacher and the local authority. I do not say that every teacher would succeed, but I believe they are the best people to employ at the commencement.

12025. Do you not think that but for the teacher pronounces whether a child is underfed or not he should place himself, through the school authority, in communication with the school attendance officer and ascertain something about the condition of the child's home? Otherwise he might make a mistake?—I think he should, but you should not do it as a preliminary to feeding the child. If the child is there without its breakfast it must have it.

12026. If it has been without its breakfast for years, there is no reason why it should not be without it for a day or two longer?—I should certainly make the teacher make inquiries.

12027. Mr. Loch, of the Charity Organisation Society, gave evidence upon that point. He said that no child should be fed without thorough investigation into the circumstances of his family?—That is the general method of the Charity Organisation Society. They make a long, elaborate inquiry, and in the meantime the patient dies.

12028. There is no reason, with the machinery which the school authority has at its disposal, why the investigation should be a long one?—No, but I should not delay the feeding of a hungry child until after the investigation. But the moment a child begins to have tickets given it I would have an investigation made.

12029. You would recommend the distribution of those tickets by the teacher?—Yes.

12030. You are familiar with the Paris scheme?—Yes.

12031. One of the particular points in the circular of the Prefect of the Seine is the desirability of getting the distribution of the tickets out of the teacher's hands?—I respectfully differ from the Prefect of the Seine on that point. I do not know what it may be in Paris, but I am sure that in England the teacher is the best person. I do not say that he is unexceptionable; he might make mistakes, but of all the people I say the teacher is the best to give this power to. Somebody must do it, and I think the teacher is the proper man or woman.

12032. In respect to the other recommendation of the Prefect, you agree with them; that is the system you would like to see more or less established in London?—Yes.

12033. In regard to what you were saying about the breakfast meal, we had Dr. Robert Hutchinson, a well-known authority on nutrition here—he was asked to give evidence on behalf of the Royal College of Physicians, and he is connected with two or three children's hospitals. He said that a child, no doubt, ought to have a certain amount of nourishment during the twenty-four hours, but it does not matter how you divide it up, except that it is more important to have a meal before physical exercise than before mental exercise, and therefore the mid-day dinner is more important than breakfast?—That is a point upon which I should yield to the faculty, but I have a vivid remembrance of my own agonies as a boy when I went to before-breakfast school; I never was good for anything until I had had my breakfast. Perhaps it is the personal equation which enters into this.

12034. (*Mr. Lindsell.*) They always made us have an hour before breakfast?—Yes.

12035. The more fortunate elementary school child does not undergo that?—No. But you know there is a sect of people nowadays who do not eat any breakfast at all—a non-breakfasting heresy has sprung up. I am no authority on it.

12036. (*Chairman.*) You do not think the feeding of

Sir J. Gorst. school children can be worked in with teaching cookery to any extent, that the children themselves should be interested in the preparation of the meals that are distributed?—The worst of it is the time. I think that the preparing the food in the school itself might be done by the older girls and older boys. I do not see why they should not teach the boys cookery.

Dr. RALPH VINCENT, M.D., called; and Examined.

Dr. Vincent. 12039. (*Chairman.*) You are physician to the Infants' Hospital at Hampstead?—Yes.

12040. It has not been in existence long, I think?—No; since March, 1903, but it represents the results of work carried out in private practice. I organised it on the basis of a hospital to demonstrate the method of grappling with the problem of the infant.

12042. It was established with a special view to infantile diseases arising from malnutrition?—Yes. I found that to be the factor.

12043. That you thought to be one of the principal factors in the degeneration which exists?—Yes.

12044. You are familiar with the serious conditions often attending infant life?—Yes. I do not think you want those statistics; they are in my book, "The Nutrition of the Infant."

12045. You will leave the book with us?—Yes. I should like to refer to the pages which I have marked, especially page 268. The cases referred to on that page come from Liverpool. I have gone into the statistics especially of Liverpool and Sheffield and the various towns, and the great factor in the causes of disease—

12046. Of this extreme mortality among infants?—Yes—is invariably improper feeding. Diarrhoea, cholera, infantum, atrophy, gastro-enteritis, diseases of stomach, etc., are the chief headings. Inflammation of bowels, inflammation of stomach, dentition, bronchitis, pneumonia, and convulsions are generally the secondary results of bad infant feeding. I would also point out that Dr. William Hill, of Birmingham, has shown that sanitation has nothing to do with it. He prepared a number of tables to show that the sanitary conditions of affairs do not make any real difference at all.

12047. It is food and food alone?—It is food and food alone.

12048. And food at the early period of life?—Yes, about the first year, and especially the first six or nine months.

12049. You think that is the most important period of all?—Yes. Because after that it is easier for the mother to deal with the matter. After that the child can be fed on whole milk and the problem is simpler, but before that it is necessary to imitate human milk. The first thing is the difficulty with regard to maternal nursing. We ought to advocate this; but it is getting more and more difficult. There are a variety of reasons for that. I would like to point out—it is referred to on page 29 of my book—what Dr. Holt of New York has said in relation to this. He says, "In New York at least three children out of every four born into the homes of the well-to-do classes must be fed at some other font than the maternal breast." Later on he says, "It is not, as has been so often asserted, that the modern mother will not nurse; nearly all in my experience would be glad to do so if they could, but they simply cannot." That is my experience with the well-to-do classes here.

12050. We are not touching upon them. It is more so with the other class I suppose?—Yes, I find the same thing.

12051. What do you attribute that to?—The mother is called upon to undertake work, she is called upon during the whole of pregnancy to carry on her ordinary duties. Very often she has to go to some factory, and to manage her house.

12052. The number of mothers employed in factory work is not great?—No, but there are her duties at home in looking after the rest of the children. It is very doubtful as to how far mothers can maintain successful nursing when they have that to do. They fail to do it continually. It is quite rare to find hard-working women supplying good milk.

12037. They do in the Navy?—Yes.

12038. (*Mr. Lindeell.*) We have cookery classes in seaport towns?—The rule of the Code restricting the teaching of cookery to girls was one against which I always fought. It was the Treasury that refused to relax it.

12053. It is the effect of exhaustion?—Yes, she wants to be treated as a woman, providing milk, and she cannot work the house and do all the things she has to do as well. In consequence a substitute food for the infant becomes necessary. The great reason for the present conditions is that the methods in general use for providing this substitute altogether fail to meet the essential requirements. That is the crux of the situation. On page 88 of my book I refer to those ordinary methods, which I have absolutely given up for the reason that they do not meet the requirements. Again, a serious thing is the use of artificial foods, by which I mean patent proprietary foods.

12054. They are very unfit for the purpose?—They are absolutely fraudulent.

12055. And deleterious?—And altogether deleterious. Many of them do not provide a food at all in the proper sense of the word.

12056. They have not got the chemical elements which they profess to have?—Several manufacturers publish analyses representing fairly accurately the chemical composition. These analyses are often sufficient to demonstrate their complete inadequacy. If they put flour and sugar together and advertise it as a perfect food for infants there is nobody to say nay to them; they can advertise it as a perfect substitute for human milk.

12057. Cannot they be dealt with under the Food and Drugs Act?—Apparently they cannot. I may quote one instance of many in my book, on page 108. Here is a food, for instance, which is advertised in the journals. Take Nestlé's Milk Food; it contains 5.5 per cent. of water, 11 per cent. of proteid, 4.8 per cent. of fat, 77.4 per cent. of carbo-hydrates, and 1.30 per cent. of mineral matter. More than one-third of the carbo-hydrates is in the form of starch. It is one of the worst forms. That is advertised as a perfect food for infants and a perfect substitute for human milk, and it is consistently advertised as that.

12058. Cannot your profession expose the pretensions of these things?—Many of us have endeavoured to do it, but so far we have not had much success. Here is Allenbury's Food as another example.

12059. Allenbury is Messrs. Allen and Hanbury?—Yes. I have gone through Nestlé's Food, Allenbury's Food, Horlick's Malted Milk, Mellin's Food, Condensed Milk, and so on. I think everybody competent to express an opinion is agreed that all those foods are absolutely unfit for infants. That is with regard to artificial feeding, but it is almost as bad with regard to the ordinary methods of substitute feeding, as I prefer to call it. For instance, take the action of certain municipal authorities—they have taken some milk and water, added some sugar, sterilised the mixture, and sent this out as food for infants.

12060. Was that humanised milk?—Yes, it is not a food for infants. Here I cite Dr. Ashby's case of scurvy, arising from taking municipal humanised sterilised milk. It is what one would expect. Sterilised milk causes scurvy. When it does not even produce such definite symptoms it injures the infant generally. You cannot by any of these ordinary methods produce a proper food for infants.

12061. You condemn sterilised milk?—Yes. I should like to refer you to pages 131 to 138 of my book. The first thing about milk for infants is that it should be a vital living fluid. It should never be heated above 160° F. None of the food I order is ever heated above 150°. The processes I advocate are entirely different.

12062. Processes for its preservation?—Yes. Heating over 150° kills it practically, or, at any rate, little over 150°.

12063. It destroys its nutritive value?—Yes; and

produces one definite disease, scorbutus. May I give you a list of a few technical things: "The chief physical and chemical changes occurring in milk as the result of sterilisation, according to various authorities, have been tabulated by Judson and Gittings. Lecithin and nuclein are decomposed, organic phosphorus is diminished, while the inorganic phosphorous is increased. The phosphates become insoluble, and precipitation of the calcium and magnesium salt occurs. Normal lactic acid fermentation is inhibited. The fat emulsion is injured or destroyed. The lactalbumin is coagulated, and caseinogen is only partially or not at all coagulated by rennin, this latter change being related to the precipitation of the calcium salts. Digestion of the caseinogen is delayed. After prolonged sterilisation albuminoid toxins may be produced."

12064. That is due to sterilisation?—Yes. If it had not been too technical I should like to have shown you this. If you were to send me raw milk and a sample of the same milk heated to 180°, I should be able to tell you by the test whether that milk was raw or a sterilised milk. As a matter of fact, if you add the reagent, orthomethylaminophenol sulphate, to raw milk, with hydrogen peroxide you get a brick-red precipitate, but if you add it to sterilised milk it remains the same. There is no change whatever; in other words, you have killed those properties. An important point, which I much emphasise here, is that while I condemn the artificial foods, the people have largely gone to them, for the reason that the methods of using cow's milk have been so utterly inadequate.

12065. You mean, they cannot obtain it to begin with?—Pure cow's milk cannot be obtained, and it must be modified for the use of the infant. The modifications which are in vogue, and which are recommended, are quite hopeless. Nobody knowing anything about the composition of human milk and cow's milk could imagine that those modifications could meet the requirements.

12066. What is your alternative suggestion?—That being the case, I rejected all these methods, and I started to get a pure cow's milk, to break it up into its various constituents, and to re-combine it so as to meet the need. I should like to draw attention to pages 118 to 130, dealing with the milk supply. Those are the facts that I have found. There is no such thing as pure milk generally supplied. I draw attention to page 120, where you will find the case mentioned of a bowl of milk standing on the counter of a shop in a wide thoroughfare—in Knightsbridge, in fact—within a few yards of a continuous and dense traffic.

12067. It is imbibing every kind of bacteriological poison?—Yes. It should be pitched down the drain.

12068. (*Mr. Struthers.*) They do not actually sell that, do they?—Yes; they make a great point of having it in wide bowls, because the difficulty, unless the bowl is wide, is that the cream rises and the lower part is deficient in cream. That is why they have it in those wide bowls.

12069. (*Chairman.*) It presents a large surface for contamination?—Yes. Milk ought always to be protected from exposure. Practically speaking, you cannot get a pure milk; it is not available. Then I refer to its being broken up into its various constituents and re-combined so as to meet the need of each individual infant. The first thing was to design a farm, with a milk laboratory attached, and that is the first thing I should like to discuss. I have rather anticipated the food question, but Appendix 4 is very important: *Diet in regard to structure*. I have already raised the question about the first year being of such extreme importance, and I draw your attention to the increase of weight and length, the growth of the head, and the growth of the thorax, in the year. We have to find a food for the infant which will meet this normal development, and we have only one means, and that is by modifying the milk. An infant is made inevitably rickety about fifteen months of age as a result of neglect during this early period of life, and nothing that can be done later will ever remedy it. There is no other period of life where structural development is proceeding at such a rate. I compared that in the infant and the child and the adult. A child is still growing rapidly, but the scope of diet for the child at about eighteen months of age is much wider; although it should still have milk, it may have minced mutton or fish, and so forth, and therefore the limitations are much less severe. Now I will go on to the production of pure milk. Here I have

a series of photographs. (*The Witness produced some photographs.*) I will begin by saying that milk is the most dangerous product to handle. Dr. Vincent.

12070. Because of its liability to contamination?—It is intended naturally, of course, for milk to be the food of the offspring, to proceed directly from the mother to the offspring, whether human or otherwise. It is a most perfect medium in every way for the development of bacteria. It is all the more so because it comes from the cow at about 100° Fahrenheit, which is the best temperature for the development of bacteria. Every factor has been neglected in the production of pure milk. Another point is that once the milk is bacterially contaminated to any serious degree it is absolutely injured for infants; no amount of sterilisation or heating will do it the slightest good. The reasons are these: There may be a few bacteria in the milk coming from the udder, but that is a matter of very little moment. What we have to stop is the *development* of bacteria in milk, which is quite a different thing, and which never occurs under natural conditions. By the development of these bacteria the chemical composition of the milk is altered; that is to say, the proteids and the fats are lived upon by the bacteria, and are split up; toxins are formed, and those toxins are always present when sterilisation is carried out, however effectually. Once the milk is contaminated it is contaminated for all time; nothing can ever do it any good as regards the infant. I will give you a little sketch of the farm I designed. *This* is the cowshed; *these* are the modifying rooms; *those* are the refrigerating rooms. The cowshed has a solid concrete floor; there are no drains underneath it. Everything runs outside; the walls are lined with enamelled iron; there is a false roof providing ventilation. You will notice there is a south light right down the main corridor between the cows, and it is light practically everywhere; it is quite light—that is a very rare thing to find in a cow-house. Then there are three hydrants in it which are used to flush the whole shed out at least once a day. The cows are groomed and washed; the udders are washed in particular before milking. The men wear sterilised coats, and the milk is taken through sterilised cotton-wool into special milking pails, so that it is only at the moment of the passage from the cow to the pail that it is open to any contamination. The cotton-wool covers it, so that directly it is in the pail it is free from contamination. That is the first essential. The next essential is that the milk has to be separated if it has to be used for infant feeding. That is a momentary thing. Each batch of milk as it comes is taken to the cooling-house. That is a most important point. We cannot allow this milk to stand for even an hour, because the development of bacteria at 100° is so great that it would spoil it.

12071. In any atmosphere, however pure?—There are always germs, you will never get away from bacteria. They are in the udder, for instance. It is not those bacteria—those comparatively few bacteria—which cause injury; in fact, I have done a good deal to show that lactic acid bacteria help the infant; without them it is probable that no infant would live. There are always lactic acid bacteria in the stomach. It is not those which injure; it is the development of those bacteria, which is quite a different thing. They have never lived in this milk. This milk is immediately transported to the cooling-house.

12072. (*Dr. Tatham.*) Have you this system in operation?—Yes. I have had it in operation for more than a year now.

12073. (*Chairman.*) It is a costly system, is it not?—It is costly on a small scale. Here is the gas engine to drive the machinery, and here is the refrigerator. (*Handing a photograph to the Chairman.*) This milk is immediately taken and placed over a cooler. The milk comes over here, and is taken into the churn. It is put into refrigerating tanks, and gets to forty degrees within a few minutes of milking, and it is kept at that temperature for the rest of the time. At that temperature bacteria do not develop; they are in a quiescent state and do not develop at all.

12074. At what temperature?—Forty degrees Fahrenheit, or rather lower sometimes. It is quite a common experience to find a small quantity of milk frozen on the cooler, but that is not a particularly good thing. This is only a method of getting pure milk, either whole or

Dr. Vincent. separated. In regard to infants, we have made a most important step there, but we have made a very little step as regards providing the infant with food. The next thing is to modify the milk. That is a photograph of the set of modifying rooms. They are opposite the cow-sheds, some distance away.

12075. Where milk undergoes changes to prepare it for the use of infants?—Yes. The first of this set of rooms which I show you is simply the washing-room. All the bottles are roughly washed, but they are not sterilised there; all the traces of *debris* of milk are removed, and the bottles are thoroughly cleaned, and you will see that they are placed downwards to drain into these trolleys. Having cleaned the vessels, they are taken to the sterilisers. Here are the trolleys, and here are the churns. This room is for the men's clothes. Everything is sterilised in those three chambers.

12076. (*Dr. Tatham.*) Where is this establishment?—It is at Sudbury—the Sudbury Park Farm, Middlesex.

12077. They are managing it?—I have a novel arrangement with them. There is a lot of money involved here, and the question was how to do it. Medical inspection is no use whatever when the medical inspectors are in the employ of a dairy company. That is obvious, because they are not sufficiently independent. The Walter-Gordon Laboratories have done everything I have told them, practically, and I am constantly visiting the farm. My relation to them is absolutely voluntary. I condemn anything I do not approve and insist on everything being as near perfection as possible. I watch the diet of the cows, and see that the infants under my care are provided for, and I have a complete check upon them in consequence of the number of infants in the hospital and elsewhere. Their business is to deal with the commercial aspect, and my business is to deal with the medical and scientific aspects. Here is the modifying room, to which I have paid a great deal of attention. This is the first view of it. (*Photograph handed to Chairman.*) There are three illustrations here. Here are the various solutions which they use. This tap means that there is ice at the back in a separate compartment, so as to keep the solutions absolutely cold. You will notice a pipe running on both sides of the wall from which water passes down. By this means the room is kept cool and free from dust. This room is practically a sealed room. There is a water-cooled motor. The air passes through there, through many sprays of water, and thus it is perfectly pure, and also cool. There the modifiers are actually making up the modified milk. There is one other photograph. You will see on this side the door by which they enter, and there is the truck on wheels. That contains iced water, and this is a very important provision, because it prevents the rise of temperature in those small tubes, which would otherwise occur when the mixtures are in such small bulk. Now I will give you a description of the method. In the first place, I would like to put before you certain private cases. There is much technical detail, but I should like to call the attention of the Committee to certain points. They are all private cases, and I have only taken a few for that reason. The first is the case of a mother who lost her baby at the age of seven months. They were quite well-to-do people, and, although every skill was available, at the age of seven months the baby died. She could not provide it with proper food, and the doctor could not. When she was going to have another baby she was anxious and she came to me to see what could be done. That baby was fed by laboratory methods from birth to twelve months of age, and its development is comparable with that of the finest type of breast-fed infant. The character of the diet is shown from November 18th, 1902, to December 2nd, 1903, when it was placed on plain whole milk.

12078. (*Chairman.*) Are these the constituents of this food from day to day?—Yes. I should like to roughly point out one or two factors, showing how unreasonable it is to try and make this process of modifying milk so simple that anybody can do it. I began on November 18th with a very delicate food. The food was gradually adjusted and enriched, so that on February 9th it was thriving on a food containing fat 3·75, lactose 6·50, whey proteids 0·90, caseinogen 0·50. I thought the time had come when a whole "proteid" might be tried, and on February 14th its food was fat 4·00, lactose 7·00, proteids 1·25. This upset the infant and the proteid was reduced to 1 per cent. Still it upset the baby, and I had to go back to ·85 of whey proteids and ·15 of caseinogen. If you

follow the chart you will see that I built the caseinogen up again till on April 21st the baby was established at 1·25 (whole proteid). You will see that the food was gradually enriched till it contained 3·50. I should like to point out the weight of the baby gradually increasing from 7 lbs. 13 oz. on November 17, 1902 to 28 lbs. on October 8th, 1903. The teething took place at the normal age; it walked at the normal age; and it is about as fine a type of baby as you could find. Then take the next case. I have selected this as a case where I had to operate on the mother. It is the Case II., L.M. It is generally speaking a serious thing to take a baby two months old from its mother and put it on substituted food suddenly, but this was done. The milk was used, and the baby did just as well. It went on from March 18th to March 22nd, when it was discontinued. It did very well, but it was discontinued because the mother was able to nurse it. On September 30th that baby came again under my care, because the mother's milk was failing. The infant was then fed by graduated mixtures till December 18th, when it went on to milk and cream. I will not weary you with these other cases. The case which you have there is a very interesting case. The father is a very wealthy man indeed. With every nursing attention they absolutely failed to provide the baby with food by the ordinary methods and the chart shows the adaptations of the food to meet the requirements. These cases are, admittedly, selected cases. I have put them before the Committee to show that what I am advocating is not a matter of merely theoretical speculations, but of the most practical application.

12079. You would hardly contend that these methods are of general application?—Yes, they are; we shall not succeed until they are applied.

12080. Are not the practical difficulties insuperable—the economic difficulties?—I think not. Now I come to the hospital. I wish to put before the Committee the fact that we have done nothing more elaborate here than is absolutely necessitated by the facts in modifying cows' milk. Here are the papers of the Infants' Hospital and the Infants' Health Society. (*Documents were handed to the Chairman.*) Each baby in the hospital has its food ordered for it, and there are various charts in which its food and progress are detailed. Its weight is taken and notes of its condition. Here are the whole of the charts. (*The documents were handed to the Chairman.*) I put this before you because you could not possibly apply a severer test to any method than this. In the first place, we practically use no medicines except a little castor oil occasionally. I have given some particulars in Appendix 7, on page 5; the weights of the babies in the hospital have been added up to April 22nd. I draw your attention to the condition of the infants when they come in:—Two months old, weight on admission 7 lbs. 11 oz.; age four months, 6 lbs.; age nine months, 7 lbs. 4 oz.; age three months, 6 lbs. 9 oz.; age six and a half months, 12 lbs. 6 oz. Taking them all through, they are all extreme cases of malnutrition.

12081. This Appendix does not show how long the children remained in the hospital?—No; you have those in the charts. This is a summary. Each case has a number which is referred to in the charts.

12082. (*Colonel Onslow.*) How long do you keep them? From six weeks to two months—there is an asterisk against some of the cases. We have to take in cases such as tuberculous meningitis, which we take for a day or two and send to other hospitals. There is practically not a case of malnutrition which has not succeeded well. I may point out that, as a matter of fact, we have lost one case since the beginning of this year. Here is a baby which comes in on November 3rd at 7 lbs. 11 oz., Dorothy Fox. She was discharged on January 26th, weighing 10 lbs. 12 ozs. You will see by the chart how the food was adapted. From the time of admission to discharge there were ten variations in the diet.

12083. (*Chairman.*) You are always varying the proportion?—Yes. These babies are ill and want delicate foods, and I gradually constructed a food of relatively high proteid-content.

12084. With the normal child have you arrived at a conclusion of what is required?—The principle is the same. That first case I submitted is typical of the management of a baby from birth. The mother's milk is always changing, it is getting richer in certain parts and poorer in others.

In order to meet the digestive requirements it is necessary to alter the milk. Each feed is put up separately in these tubes. (*The tubes were exhibited.*) I prescribe so much fat, so much proteids, and so on. The single feed is warmed to blood-heat, the cotton wool plug is removed, the mouthpiece is applied and the food is ready for the infant.

12085. The milk being made from your prescription ?—Yes.

1208. You can hardly expect every child throughout the United Kingdom to be fed by prescription ?—They are now. The only difference is that it is a general prescription instead of being an individual one as it must be in order to succeed.

12087. Do you mean a medical examination of every infant in the country ?—I think it is quite easily arrived at. In the hospital I can do it, and so can any medical man after a certain familiarity with the subject, with a nurse in residence. Take any district, have a dépôt, find out the babies which are born, and so on.

12088. Do you think the hospitals in London have sufficient machinery to do that ?—I do not think that it should be done by hospitals. I think it much better that in each district the doctors should attend twice a week. There should be a nurse in residence. It should be organised either by philanthropy or by the municipality. The nurse should make it her business to know all about the babies which are born in the district, and a doctor should observe weight and the general particulars in regard to the infant. I can manage twenty in an afternoon quite easily, and even forty in an afternoon at the Infants' Hospital, although I have to go some way to Hampstead.

12089. Do you think this could be done by municipal organisation ?—Partly. Personally, I think it would be well for the municipality to give a grant rather than take it over as an official matter. I think it would be much better to do that.

12090. Do you not think that hospitals are proper organisations to co-operate with ?—I do not see how it can be worked with hospitals. Hospitals are for the treatment of disease. Here, our primary object should be to prevent disease.

12091. Would any doctor be able to do that ?—I should have thought you wanted an expert ?—At present, in difficult cases, yes ; but I find that in private I go to see cases in consultation and the doctors gradually get into it ; with a little study I do not see why any intelligent doctor could not master the principles in a month easily. Once he is in the position of seeing infants, and doing it systematically, there would be no difficulty. You might have difficult cases which call for an expert. It is not impossible to have that with an organisation like the Infants' Hospital and the Infants' Health Society, and to ensure that expert assistance should be forthcoming when desired.

12092. Has this Infants' Health Society any extended operation at present ?—We started the Infants' Hospital, and we have only just started the Infants' Health Society.

12093. The hospital is in connection with the Society ?—Yes. We started an Infants' Hospital with all its scope before it, and we decided that in order to carry out our methods in the best way as regards these dépôts, there was a good deal that might be better done by a Society in the way of organising dépôts all over London.

12094. Have you done anything towards that ?—No. As a matter of fact the letters have only been published to-day in the "*Times*" and other papers, signed by the Duke of Portland and others.

12095. (*Mr. Struthers.*) Which was first, the Hospital or the Health Society ?—The Infants' Hospital was founded in March, 1903, but the primary organisation now is the Infants' Health Society, because the Infants' Hospital has merged itself as part of the work of the Society.

12096. But the Society is a later development ?—Yes.

12097. (*Chairman.*) It is to be much more general in its operations ?—Yes. I would like to call attention to Appendix 8. I have here a photograph of one of the wards of the Infants' Hospital. (*The photograph was handed to the Chairman.*)

12098. You require of course, in the first instance, some general security that the milk supply comes from a pure source ?—Yes.

12099. Having regard to the extremely foul way in which milk is to a very large extent now put upon the market, through having an immense distance to travel and so on, there are many intermediate steps which might be taken to give it comparative purity, are there not ?—Yes, but if you study the production of pure milk, and are going to take legitimate precautions to obtain pure milk, you will find you are landed in all the expense. You cannot get pure milk unless it is refrigerated and kept at forty degrees Fahrenheit.

12100. You have no guarantee of its purity unless you do that ?—No ; the only other way is to injure the food by sterilising it.

12101. Surely steps can be taken to see that a dairy is clean instead of dirty ?—Yes ; but the man who will do that will be the man who will want to refrigerate his milk.

12102. (*Mr. Lindsell.*) Refrigerating milk is very common in Paris ?—Not what I should call refrigerating. They put it over a milk cooler and reduce it to sixty degrees Fahrenheit. That does something.

12103. (*Chairman.*) But it is not enough ?—No.

12104. (*Mr. Lindsell.*) You want to bring it to forty degrees Fahrenheit ?—Yes. I point out the rate of bacterial development at about 60° in milk in my book (p. 145).

12105. (*Chairman.*) What do you estimate the cost of this apparatus to be ?—I have gone into the cost as far as I can, and I say that is governed by the cost of pure milk plus the cost of modification and delivery. I put it that trebling the actual cost of the cream would allow for the expense of modification and delivery. Cream is the costly thing in milk because it is wanted in such a comparatively large amount for infants, and is present in milk in such a comparatively small amount, about 4 per cent. Then any adequate method depends upon the number of cases. If you have an organisation for thirty cases, a large part of it is applicable to 300, the average cost can never be much below 5s. a week for each infant, and it is not likely to be more than 10s.

12106. It would cost that to feed infants upon these methods ?—Yes, or, leaving out these particular methods, any method which provides an adequate food for an infant. Taking the actual cost of milk, and its modification and delivery, it must cost about 5s. a week ; it cannot be much below. If you take the amount which is consumed by an infant, say, three months old, it will be two pints a day at the least. That is 3s. 6d. a week, the cost of absolute material.

12107. (*Dr. Tatham.*) That is the cost of the milk at two pints a day ?—Yes, 3s. 6d.; that is without allowing for modification.

12108. (*Chairman.*) Surely it would be better for the working-class mother to conduct herself so that she could suckle her own children ?—That is the great factor, but, unfortunately, they cannot do it.

12109. But I suppose if they took proper precautions they might do it, and in face of the very great expense of this alternative, they might be induced to do it ?—I should certainly encourage maternal nursing, but a large number of these women cannot nurse, and cannot provide a good food, and it is equally important that we should stop, if possible, a mother providing her infant with a food which is no food at all. We are constantly seeing a mother come up to the hospital who is providing a watery mixture which is not milk at all.

12110. If your alternative is to supply milk which is outside the limit of her pecuniary resources, I do not see where you could have any improvement ?—My contention in the whole matter is that, either we must leave this alone, and say we cannot do anything, or, if we are going to do anything, then we must see that we are providing a food for the infant. The only way of providing a food for the infant is upon the general principles which are carried out at the Infants' Hospital—I will not insist upon unessential details. That is going to cost money.

12111. As it appears, milk cannot be provided at a price which is within the means of the parents ?—That is absolutely the case.

12112. Then do you propose as a corollary to establish eleemosynary system for the poorer classes ?—Certainly.

Dr. Vincent.

Dr. Vincent.

It is absolutely essential if we are to bring up the poorer classes properly. We have only to realise the number of infants that are dying, and the amount of disease, crime, and insanity which are directly due to improper methods of infant feeding. We are filling our asylums from that cause. That is not my opinion alone; I should like to point out the opinion of men like Coutts and Gowers. On page 267 of my book you will see this: "Mr. William Hall, M.R.C.S." (of Leeds), "in the summer of 1903, weighed, measured, and examined the limbs and teeth of 2,335 board school children in the city of Leeds and neighbourhood. He found that more than half of these children were rachitic, and that considerably more than half had decaying or badly-developing teeth." Now, if you will compare that with the note "on the ultimate effects of rachitis," you will see the following: "Out of fifty cases of laryngismus stridulus forty-eight were rachitic, and of these, nineteen had convulsions. Of 102 cases of general convulsions, forty-six were rachitic. Even in later life the effects of rachitis seem unquestionable. Gowers found that 10 per cent. of epileptics had suffered from rachitis. Coutts found the rachitic history more frequent, and assessed it at 17 per cent."

12113. (*Mr. Struthers.*) What book are you quoting?—My book on "The Nutrition of the Infant." I admit that my proposal is radical and extensive, but it is the facts which justify me. Then take page 244: "Holt refers to an important fact which has received little attention. The growth of the long bones is arrested. This is one of the most characteristic features, so much so that a rachitic child of three years often measures, in height, six or eight inches less than a healthy child of the same age, the difference being almost entirely in the lower extremities." Wherever you find defects of the nervous system or deformities, you will come back to rachitis or similar lesions, and these lesions are due to improper feeding.

12114. (*Chairman.*) We have been told that in some of the larger centres of population, for instance in Glasgow, rickets has almost disappeared. How do you account for that? I do not understand that there is an improvement in their milk supply?—I do not believe it. I am certain that if I went to Glasgow I could produce very many cases of rickets.

12115. (*Colonel Fox.*) How long does this treatment last?—Six months on the average. We find a number of mothers who nurse their infants for a certain period, say a month.

12116. What is the period for those children who are not suckled?—I think six months, or rather above it. After eight or nine months you can get them on to mixtures of milk and water and so on. It is the first six or nine months that you have the trouble. Then I point out the amount of injury which is done by feeding. One of the most striking is the result of measles, scarlet fever and so forth, in the production of *sequelæ* like middle ear disease and tuberculosis and so on. I am convinced that if you take the same infection you will see one child gets measles and goes through it and the mother says it is rather better for it; the other gets middle ear disease, general tuberculosis or something of the kind, and is injured for life. Middle ear disease and these chronic defects practically arise from the *sequelæ* of these specific infective diseases, and their incidence is determined by the want of resistance due to the malnutrition of the infant.

12117. Is this system the same as that in vogue in Paris at the present time?—No. It is chiefly Budin's system there; they sterilise the milk.

12118. (*Chairman.*) That is open to objections?—Yes. What they do there is this: They "satisfy" the infant. They satisfy the stomach of the infant and have practically no regard to the final nutrition. That is a factor which has been neglected all along.

12119. You are passing rather a sweeping condemnation on the medical faculty as a whole, are you not? There are many prominent members of the medical faculty who have identified themselves with this treatment which you condemn?—Yes; but I am afraid it is no good. I think many of them have approved because it is better than something worse, rather than because they have regarded it as really sound.

12120. You mean there are many ignorant people in your profession as well as in others?—I prefer to go by the facts which I have put in my book. They are the results of my observation. It is perfectly true that the whole

question of infant feeding has been very greatly neglected. Generally speaking, at most centres of medical education in this country the subject is barely touched upon, and the medical student has but little opportunity of making himself familiar with the facts.

12121. Your proposal is that the municipality should charge itself with the provision of properly prepared milk for all the children in the country?—Yes, under proper supervision.

12122. Up to six months?—Up to the first twelve months you would want to provide pure milk, and for two years you ought to supervise the feeding of the infant. After one year it becomes much less difficult; you do not want the same degree of medical supervision. If you find a pure milk you can leave it to the mother, as a rule, and the child can take food in the way of fish and so on at about eighteen months of age. I think the most dangerous thing is the attempts which are being made to deal with the question, which are inadequate; I think they are more dangerous than anything else. With every respect to them, I think the attempts at Battersea and Liverpool, for instance, are most dangerous. I think it is a most serious thing for a corporation to give its endorsement to a disease-producing milk. It may stop gastro-enteritis, but Dr. Ashby's case, which I have referred to, shows scurvy produced by a municipal humanised sterilised milk made at Liverpool. This was in the *British Medical Journal* of 27th February. (A copy was handed to Dr. Tatham.)

12123. (*Dr. Tatham.*) It is only one case?—Yes.

12124. *Post hoc* or *propter hoc*?—You will see what he says there. I describe the scurbutoid condition in my book.

12125. (*Colonel Fox.*) In Paris they are very well pleased with their system; they weigh the babies and watch the growth most carefully?—I can only speak generally, because I have not had actual experience in regard to Paris, but I am satisfied that the sterilised milk supplied to infants here will not succeed. It has been tried over and over again. It will not succeed even in private, with the best nursing.

12126. (*Chairman.*) We have heard something of what they do at Battersea, for which success is claimed?—I am afraid they are all claiming successes, but that is so easy.

12127. We have been told that the death-rate of infants has been diminished?—At the present time it is very difficult to argue about death rates, because, as we know, last year was a wet summer, and so forth. Then in regard to Liverpool I saw some statistics. Those statistics are absolutely worthless. In the first place it came to this, that if an infant had been fed from the dépôt for a week, and the milk had upset it, and then it had been fed on another food, that baby was counted as a success to the dépôt, because it had had its name down in the dépôt books.

12128. (*Dr. Tatham.*) Will you think me troublesome if I ask you to go categorically over what you have said to us?—Not at all.

12129. You began by condemning ordinary milk as a food for infants?—Yes.

12130. Such milk as you say you have seen in London?—What we know as the ordinary milk supply.

12131. That is bad?—Yes.

12132. And if it has been kept any considerable time it gets progressively worse, until it becomes poisonous?—Yes.

12133. Do you think it is bad for adults as well as children?—Yes, but nothing like so bad. It is the delicate state of the children which makes it so bad for them.

12134. It is decomposed because of the toxins?—Yes.

12135. As regards the sterilisation of milk, you know it has been the practice for some years to feed infants on sterilised milk?—Quite so.

12136. And, speaking generally, I suppose the practice has been considered successful, has it not?—The criterion of success is so inadequate. Practically, when you ask a doctor what he means by success in a baby you will find that the nurse tells him that the baby is no longer sick, and the intestinal dejections are fairly normal. Whether that food is providing it with the requisite elements of

nutrition hardly comes into the question. I can produce a sterilised milk that will satisfy an infant in the sense of meeting its digestive troubles without any difficulty. It is a twofold problem to provide an infant with what satisfies its digestion, and is also a nutritive food.

12137. Then you condemn sterilised milk as a food for infants?—Absolutely.

12138. Even modified in any way?—Yes. I should like to point out that I am using the word “sterilised” to mean that the milk becomes more or less sterile. I do not altogether oppose Pasteurisation if it is not carried above 155 degrees Fahr.

12139. Anything beyond that you say destroys the nutritive properties of the milk?—Yes.

12140. It kills the bacteria, at any rate?—Some of them.

12141. But it also destroys the nutritive value?—Yes.

12142. In what respect does it destroy the nutritive value?—There is a great deal we are doubtful about. It destroys the anti-scorbutic property, whatever that is.

12143. You would not give that a name?—I should prefer not. We do not know what it is. It has got a great deal to do, I think, with the nitrogenous extractives. The lecithin and nuclein are killed by the heat, and when they are present it appears that this anti-scorbutic property is present also. Sterilisation gives rise to radical changes in the character and composition of milk, upsets all the salts, precipitates the calcium salts, interferes with the coagulation of rennin, which is a most important thing, and there are numerous other changes. But apart from the chemical evidence I would rely upon accurate clinical facts. I will defy anybody to produce a healthy infant that has been fed entirely for three months on sterilised milk.

12144. In what respect does sterilised milk, in the sense of which we are speaking of it, differ from your modified milk?—In the first place, no modified milk prescribed by me is heated to a temperature at which any of its vital principles are destroyed. We have tests for raw milk. The milk supplied to babies under my care answers the tests of raw milk. In the second place, no infant is ordered for, because it is an infant; every baby has the amount of fat, lactose, whey proteids, caseinogen, and alkalinity which is necessary, according to the individual. Every case goes up labelled with a name, and every baby has its own individual food. If that food upsets the baby we go into the questions—is it sick, is it this or is it that? And we adjust the food to meet the conditions. There are many cases here in these charts, which you can study at your leisure. Here is a case of 2·50 fat, reduced to 1·50, and then reduced to 1 per cent., then rising to 1·75, 2·25, 2·50 and 2·75.

12145. That is fat?—Yes. Then the proteid started at ·95, ·25. I was engaged in altering the amount of fat in that case. The proteids finally finished at ·75 and ·50. Here is a very good case, where the composition of the food originally was 2·7 per cent. of fat, ·7 whey-proteids, ·25 caseinogen; and we finished at 3·50 fat, ·75 of whey proteids, and ·50 caseinogen.

12146. With regard to the establishment at Hampstead, at which the milk is preserved—?—Are you speaking of the farm?

12147. Yes?—The farm is at Sudbury. That is the photograph of the hospital which you have there. This is the farm. (*Witness handed the photograph to Dr. Tatham.*)

12148. At the establishment where this milk had been treated is the milk sent out in a bottle unmodified?—No, everything is done at that laboratory. To-night the modifiers will start work about five o'clock, and will be going on till twelve o'clock at night. At seven o'clock they will start modifying. At three o'clock the van comes up, and it is distributed all round London. They modify at night because the physician wants to make prescriptions during the day. In fact, as demand increases they will probably be working all night.

12149. (*Chairman.*) You already distribute all over London?—Yes.

12150. (*Dr. Tatham.*) Am I asking a question which I ought not to do if I ask you of what your modification consists?—By no means, everything is published. What we do is this. We pass the milk through a separator driven

by a gas engine; we get the fat about 80 per cent.; on the otherside we get what is practically a fat-free milk. Now, that fat-free milk contains caseinogen and everything else in the milk except fat. Caseinogen is the great difficulty of infant feeding. We have to get rid of that, because the casein in cows' milk is three times as much as in human milk. We have this fat-free milk, and in addition to that we have the rennin ferment. The caseinogen is precipitated by means of the rennin ferment, and this fluid is heated to 150 degrees to kill the ferment. Thus we have the whey containing the whey proteids the nitrogenous extractives, and all the constituents except casein. It is a most serious thing to dilute milk with water, because the salts and the nitrogenous extractives are already low compared with the high amount in human milk. With all our delicate infants we use the whey proteids. We have now a cream that is standardised to 32 per cent. Then we have a lactose solution of 20 per cent; lime water, and distilled water. The modifiers have tables in which every possible prescription is provided for, showing the exact amounts of each constituent up to forty ounces, and so forth. Perhaps I might give an illustration of that in prescribed mixtures. You will see about twenty prescriptions of mine on page 95. You will see, on the one hand, the prescription, and on the other hand its actual composition. It can be made to forty ounces or 100 ounces. In the photograph you will see those nurses working.

12151. (*Chairman.*) They are making up those prescriptions?—Yes.

12152. (*Dr. Tatham.*) Nothing else is added?—No. If the physician wishes he can order oat jelly or other materials to be added. You can have anything added.

12153. Is it proposed to extend this practice?—We do so much at the hospital. We take these cases where every method has failed. Now the question comes when they come out of the hospital what is to be done, because it is not good to keep them in a ward. We have a carriage which takes six for a drive, but we cannot keep them in hospital for more than two months, because they suffer from want of fresh air. Now we are going to try and feed those babies outside the hospital. The hospital is to be moved to a central district, the Marylebone Road probably.

12154. (*Chairman.*) Is that so good as Hampstead?—The London air is very good if they have good food.

12155. (*Dr. Tatham.*) How long has the hospital been established?—Since March, 1903.

12156. It has not been long enough to show any statistics showing the value?—These are the statistics.

12157. But they are too few, are they not?—They are too few in a way, but they are such severe cases. It is a very good test, if you consider the weights of these babies and their general development. If we can succeed here I think that is a very good test. I have already tested them in private, and have not had a failure. Those cases have been invariably successful. Take this case of Queenie Osborne, No. 62, she began at six months old with a weight of six pounds, fourteen ounces, on January 8th; six pounds, twelve ounces, on January 12th; and from that the baby went right up to eight pounds, nine ounces. That was a case of severe marasmus.

12158. You have statistics with respect to a good many cases?—There are about forty, I should think.

12159. (*Chairman.*) Would it not have made these figures more valuable if the amount of time spent in the hospital had been given?—You would have to examine the charts in order to find that out. It is in the chart. I did not want to make my summary too full. The charts show the time they entered and the time they were discharged.

12160. (*Dr. Tatham.*) You will agree that the value of your statistics will be very much in proportion to their number?—Yes. As a matter of fact we have only twenty beds at the hospital. When I took this house I practically took it entirely on my own responsibility. The Committee came afterwards. We want to get fifty beds. I am confident that we shall soon be able to produce statistics of 250 cases. It is simply a question of the limitation of beds. We have refused fifty cases in the last fortnight.

12161. Is it not within the first twelve months that the feeding difficulty is most acute?—Yes.

Dr. Vincent.

Dr. Vincent. 12162. After the first twelve months what do you propose to do?—Pure milk is still needed, but, as a rule its modification is not necessary.

12163. I think you spoke just now of a process by which you filled ordinary bottles?—Yes.. In addition to preparing modified milk they put whole milk over the cooler and take it into these churns, put it into the bottles and put a seal on them.

12164. And reduce it to 40° Fahr.?—Yes, before it is bottled and then pass it into bottles and put it in the tanks which you see in the further room.

12165. Will the milk keep in that condition?—Yes. I have it in my own house. They only deliver once a day, about 9 o'clock in the morning, and it is perfectly fresh without any refrigerator at eleven o'clock next morning, simply because it has been kept free from bacterial development and growth. If any member of the Committee would like to see the farm I am sure you would realise the work there much better than from my description.

12166. There is one point which I should like to put to you and I am perfectly certain it is an important matter. There is no provision in your method of modifying milk for the destruction of disease germs of any kind, for instance enteric fever germs?—All the provision there is to prevent them getting in.

12167. You prevent them getting in?—Yes. We have our cowshed and the milk is passed through the cotton wool, so that no germs which do not exist in the udder of the cow or in the hands of the milker—and he has to wash his hands—could get in.

12168. In the establishment you speak of the cows are milked on the spot?—Yes. I do not allow them to buy an ounce of milk. All milk must be produced there.

12169. That is an important point?—Most important. And all the diet is regulated.

12170. The diet of the cows?—Yes. It costs half as much again to feed those cows as is ordinarily the case. In order to get pure milk you must not use oil cake. Every farmer does use it because it gives him a good quantity of milk. He also uses brewers' grains and distillery grains.

12171. (*Mr. Struthers.*) What is the objection to the use of oil cake?—It produces an oil in the milk which is quite different from the fatty emulsion which is normal to milk. It upsets infants at once.

12172. It gives a different quality altogether?—Yes.

12173. And the brewers' grains?—The brewers' grains produce a thin milk with an odour and gives rise to products the precise nature of which I do not know, but I know that brewers' grains upset the milk and it took a little time before I could get the cows in order. I used to find these things and I looked into the diet and found it arose from oil cake or brewers' grains.

12174. You say that 5s. a week is the very lowest figure?—It is a difficult thing for a doctor to give a commercial estimate, but I name that because I want to put before the Committee that it is perfectly certain it is not going to be done for nothing, or for very little.

12175. Of course between 5s. and 10s. a week is a price which a very large proportion of the population, who are probably most in need of it, simply could not pay?—Quite so. My experience is that it does not matter whether you reduce it to 3s. 6d. even, because unless the State or somebody steps in nothing is going to be done. You need not take only the poor, but the people you would not call the miserably poor class. Only a few days ago I saw a case from Wood Green; I saw the wife of a clerk earning about £120 a year. She could not find food for her baby and she came to see me. I got her infant into the hospital for a little time, simply because the cost of the food and its delivery at the house was beyond her resources. If that is the case with them surely it is impossible for the poorest class, who are only earning perhaps 18s. a week, to pay for food for the infant or make any serious contribution to its cost.

12176. Of course these people have children and feed them at present?—Yes.

12177. And a considerable number survive; they do not all develop rickets?—It is quite a rare thing in a poor family to find a woman rearing all her children. You find that there have been several who have died or who have

had disease. It is quite unique to find a poor mother who has been feeding her children artificially bringing up four children according to the standard of health. Those women generally say that they have lost three or four children of the same complaint and the fifth is going the same way. That is the fact which is most extraordinary.

12178. Your experience at the hospital would not enable you to say yet that your death-rate among a certain number of children would be distinctly lower than the ordinary death-rate?—Since this year we had only one death, but they have much of careful nursing. Last year we had twenty-five deaths in the whole year. Many of the infants die in the first two or three days after admission. As a matter of fact, every case in this hospital, practically speaking, would have died but for this hospital. Every case was a failure and going downhill, and in fact had got there. That is the reason I put even this small number of cases forward, because they are a very severe test in that direction.

12179. There is a considerable diversity of opinion as to what constitutes rickets. Some doctors say the child has got no serious affection, when another doctor would say that it had?—I do not think there is any serious difference of opinion amongst experts now.

12180. But that is a very small number of the whole medical profession?—Yes. What I meant by that answer was that there is not very much difference of opinion. Everybody who knows rickets can see it. The signs of rickets are described, and they are fairly obvious. You must remember that the apathy of some of the medical profession is not unnatural. Do what he can, the doctor in the country cannot order a real food because the materials are not available in very many cases.

12181. We had the statement made that rickets had practically disappeared from Glasgow, but you tell us that if you went there you could produce a number of cases?—Yes.

12182. Dr. Scott, who made that statement to us, is a man of some standing in the profession, and has had a good deal of experience?—It is an astonishing statement for me to hear. Take another town such as Manchester. Only a short time ago I heard from Dr. Ashby that the number of deaths was nothing to the number of children whom he could produce who could not walk at two years of age. Manchester and Glasgow seem to be fairly comparable.

12183. I understand in addition to producing this pure milk, with the whey separated from the fat, the essential part of your procedure is a proper mixture for each individual child, according to its age and circumstances?—Yes.

12184. Do you determine that mixture *à priori* with a certain proportion of fat, of lactose, and so forth?—To a certain extent, yes. Clinical experience comes in there, always in the case of a sick infant, and generally in the case of a healthy infant. The mixture is in the nature of an experiment somewhat, but it is an experiment based on a considerable amount of observation. I know that a baby of a certain weight and character will usually take 3 per cent. of fat and so forth. As I see an infant correspond to the standard, so I adjust the food. I am careful to begin low, because I know that a high fat would upset them at once.

12185. There is such a thing as a normal healthy infant?—Yes.

12186. Would not you expect to have a normal satisfactory milk for that child?—I will point out to you the Table on human milk. I have summarised all these observations in the book. There is a correspondence between mother and child. On page 21 there are fourteen analyses of human breast milk, the mothers all healthy, and the infants all digesting well and gaining in weight. The milks are of different compositions, and they are Dr. Rotch's figures. All my work is based on that of Dr. Rotch, of Harvard University, Boston. I have done a great deal in the final development in this country, but my book is dedicated to him, and he is responsible for the milk prescription and the milk laboratory.

12187. Has this plan of milk prescription and milk laboratory been carried out in America?—Yes, extensively.

12188. For some years?—Yes, since 1891, when it was originally started. At the present moment a Milk

Fund is in existence at Boston, and a great number of the babies are fed in this way in New York.

12189. This system which you propose, which the Infants' Health Society is to introduce, has been in operation in America for some time?—Yes.

12190. In certain towns?—Yes, Boston, New York, Philadelphia, and other towns.

12191. Are there any statistics as to the result of the general operation of this new method in these towns?—Statistics in regard to results are difficult to obtain, but I may tell you this, that the Professor of Diseases of Children in the Harvard University and the Professor at the Columbia University at New York have both endorsed it, and, practically speaking, all the representative men in America now are working with it. I am, however, not acquainted with any definite statistics.

12192. What I mean is this: Of course they have their system of death rates for children of certain ages, just as we have here?—Yes.

12193. And if this system has been widely spread in certain towns, such as Boston and New York, one would have expected some clear result on the death rate at the ages of infancy?—Yes.

12194. Has that been noted as a well-established fact?—Even in America I should say the application to the poor is a recent development. The Milk Fund at Boston is of quite recent creation.

12195. (*Chairman.*) How is the cost met there?—By philanthropy.

12196. Not by municipal action?—No. They have a milk fund, and people subscribe to it, and physicians send in their orders on a sort of coupon.

12197. You think the creation of such a fund in English towns would be of the greatest possible service?—Personally, I would much rather welcome the creation of a fund on philanthropic lines, with the municipality supporting it—perhaps giving it a grant—rather than making itself actively responsible. I think it is very questionable whether a municipal authority should take up infant feeding to that extent.

12198. I will refer you to the questions about rickets in Glasgow. Dr. Scott, who is a doctor of very good standing in Glasgow—in fact he is a certifying factory surgeon, and chairman of the School Board in the vicinity, and has done his whole life work among the poor, said: "Apart from that"—that is with regard to the quantity of lime in the water—"rickets are disappearing." I was somewhat struck by that, and I said: "You go so far as to say that?" and his reply was, "Yes?"—If it has anything to do with the lime in the water, I think that can go, because lime in the water has nothing to do with rickets.

12199. He said, "Apart from that?"—"Disappearing is rather a difficult term to deal with.

12200. It means there is a great diminution. Again, he was asked: "You explained to us just now that there is a great diminution in the number of children suffering from rickets, and you attribute that to better nourishment. Am I right in that," and he said, "Yes?"—I would not like to say that there is not an enormous number of children suffering from rickets. That is a statement which I challenge most emphatically.

12201. (*Dr. Tatham.*) It will be your wish as time goes on to keep very accurate statistics with regard to the treatment of cases?—At the present moment we have the weight when they come in, and the actual food. They are weighed twice a week, and the precise food is given and anything such as brandy or a dose of castor oil is all registered. Also there are notes taken and every case is gone into on those lines, so that I hope to have a valuable collection in course of time. When I first started this I could not put all those charts in order, and it was only in October that I did so. But I think that at the end of this year we shall have enough statistics, because 100 good statistics show a great deal more than 1,000 inferior ones.

12202. But 1,000 good ones are superior?—Yes.

12203. With regard to the causes of mortality, you are aware I daresay that they are pretty much now what they were twenty years ago?—Yes. I think that is so generally speaking.

12204. Of course there are exceptions?—Yes.

12205. With regard to syphilis, do you think that plays a very great part in the mortality?—It is difficult to say. From my experience as to the mortality in the Infants' Hospital I should say yes. Nearly all those cases with asterisks are syphilitic. Excluding the commonest cause—defective diet—I think congenital syphilis is an important factor in regard to malnutrition, but I have not had sufficient experience in regard to syphilis to offer a definite opinion.

12206. When a case turns out to be syphilitic or tuberculous you discharge it?—Yes, if we can.

12207. Because your hospital is not intended for such cases?—Yes.

12208. Then with regard to tuberculosis?—We should remove it. Our business here is to find the diet. The case which was referred to was sent to Hampstead Hospital, and Dr. Cook operated on it. I omitted to mention two cases showing very strikingly the effects of sterilised food. Here are the two cases. They are numbers 115 and 116 on the charts. These babies were fed on the diet and did not improve; I thought they had been fed on sterilised food, and were not provided with the anti-scorbutic bodies in sufficient amount. I added orange juice, the remainder of the babies' diet being the same. On the 11th when I gave it the first case weighed six pounds three ounces, and the weight increased seven ounces in four days; the second one gained five ounces in four days. They were twins, so that this was a very fair test. They were cases showing a scorbutic condition, and I was astonished that they were not doing better. I simply added the orange juice, and that condition disappeared.

12209. (*Colonel Onslow.*) An immense amount of milk comes to London from dairies in Dorsetshire and Wiltshire?—Yes.

12210. They could not run their dairies on the Sudbury principle?—I think they could.

12211. A great deal comes from the small farmers?—That I would absolutely stop.

12212. That is rather hard on the small farmers?—As a matter of fact he does not do much now; he must join in.

12213. (*Chairman.*) He must join in a co-operative system?—Yes. I would stop the middleman system in regard to the milk traffic absolutely. It cannot be properly controlled.

12214. (*Colonel Onslow.*) I understand you to say that the cows are actually washed every day?—Yes.

12215. Does not that affect the animals?—No. They are groomed and they are in very good condition. Of course they want to be taken care of.

12216. I should have thought that the washing was an entirely unnatural process to a cow?—The conditions are so artificial; keeping them in a shed in winter, and keeping them together.

12217. (*Mr. Struthers.*) Do you test them for tuberculosis?—Yes. They are all tested for that before they are admitted.

12218. Are they fed on grass in summer?—Yes, they are provided with a very fine meadow. But the system adopted is that they are fed before being turned out, so that they do not depend on the grass for their nourishment.

12219. (*Colonel Onslow.*) What do you feed them on?—Hay, pea-meal, bran, and in the winter a few mangolds to make the food succulent. Pea-meal is an important thing. It is expensive, and is always left out unless this is looked to.

12220. (*Dr. Tatham.*) You know that in the medical profession it is certainly a very common practice to recommend that the ordinary milk supply shall be boiled before it is taken, for the purpose of preventing the spread of enteric fever?—Yes.

12221. Do you think that is a wise precaution?—No.

12222. What would you do?—I prevent the contamination. In the chapter on the "Heating of Milk and the resulting changes" I endeavour to show that we should prevent the development of bacteria.

12223. You contemplate the eventual treatment of all milk supplies on this principle?—Yes. My view is summarised in the paragraph: "Whatever be the excuse of

Dr. Vincent.

Dr. Vincenz. expediency, the whole argument would appear to be unsound and inconsistent with the principles of scientific procedure. To supply an infant with contaminated milk is certainly far from advisable, but milk containing pathogenic bacteria is contaminated whether heated or unheated. The *prevention* of contamination is the prime necessity." It is only a temporary expedient to boil milk.

Dr. ARTHUR SHADWELL, M.A., M.D., M.R.C.P., called; and Examined.

Dr. Shadwell. 12225. (*Chairman.*) You have given a great deal of attention to the subjects connected with our inquiry?—Yes.

12226. With regard to national vitality, you divide the subject into two parts, vigour and reproduction: what you have to say in this *précis* is mostly concerned with the first head?—Yes.

12227. I rather wanted to ask you some questions about the other. I understand it was your view that there was a decided tendency of the superior stocks in all classes towards a diminished rate of production, and that that was an element in deterioration?—Yes, there is a general decline of reproductivity in all Western nations.

12228. I suppose on account of the standard of comfort, and so on?—That is general; but with regard to the point to which you refer, I had a little evidence on that, but all the positive evidence has disappeared, I understand, and therefore I cannot refer to the figures. I can tell you the point that I had to illustrate, which is the point you have just asked about, the class of people in whom this failure of reproductivity is most marked. I have some figures for a number of industrial towns. The decline in the birth-rate is most marked in the textile towns; in the metal towns the birth-rate remains much higher. That holds good both for this country and for Germany. The difference is very marked; I took a series of each. I had some correspondence on this point with Dr. Neech, the Medical Officer of Health for Halifax. He said he could not trace any connection between birth-rate and occupation because, of course, in these textile towns the women go into the mills. He thought it had to do with the class of people. Really the two things are the same. The fact that the women go into the mills, and therefore do not want to have children, amounts in the end to the same thing as that the population in those towns is of a superior kind because several members of the family earn money and bring it in. The wives earn as well as the husbands, and the standard of comfort is exceptionally high; it is higher than in those iron and steel towns in which the birth-rate remains highest—where the same decline has not taken place. There they are a rougher class and live simpler and more primitive lives; they take life as it comes, and they have children.

12229. Do you think the children are of a physically inferior type?—No; I do not say so. The others are more comfortable and better off. But these are what you call a lower class. I do not pretend to attach a definite meaning to the word "lower." As to whether they are physically inferior I cannot say. You would have to get the data accurately with measurements, and so on, in order to arrive at that. We have no data.

12230. Do you think there is any ground for the impression that the reproductivity of the more capable classes, both physically and mentally, is diminishing?—The general reproductivity is diminishing in all classes, but you mean more among the higher classes, the better educated, those who live a more comfortable life. Better in that sense, yes; but as to saying they are physically better, that I cannot say. It seems to me that vigour implies reproduction. The two words are identical. Vigour only means a proper fulfilment of the natural functions of which reproduction is one.

12231. It has been suggested that the more capable among the working classes are not reproducing themselves as rapidly as they were, and not in the same proportion as the rate of reproduction among the less capable, but I do not know that there is any evidence of that?—It depends what meaning you attach to the words "less capable."

12232. Less capable of putting into existence persons who are physically fit?—No, there is no evidence of that. I should not say that people in those towns—for instance,

12224. But it is better to boil milk as circumstances are at present?—If I were given the ordinary cow's milk of commerce I am very doubtful what I should say about it. If milk is dangerous unless it is boiled then, to my mind, that milk is unfit for consumption. But if such a product has to be used it would be better to boil it.

Bolton, and Oldham, Bradford, Halifax, Huddersfield, and Blackburn—those towns in which the birth-rate is less, that the people there are physically inferior to those in Sheffield, Newcastle, Wolverhampton, or Birmingham. No, I cannot say that; there is no evidence of that at all.

12233. Are you familiar with the conditions of life there?—Yes, in all of them.

12234. Is your experience in the urban or rural districts?—In the urban districts. I have made a study of those industrial towns.

12235. Have you formed any opinion of how far the population of those towns is being recruited by the best of the country stocks?—No; I have not been able to form an opinion.

12236. Do you think that the process is having the effect of depleting the rural districts of their best stock or not?—The rural districts are not being depleted. I suppose you have evidence of that.

12237. Not so much as we should desire, perhaps.—It is the general impression, and I see it constantly repeated, that the rural districts are being depopulated, but that is not the case. The population increases generally in the rural districts, though not at anything like the same rate. The population is becoming relatively much more urban.

12238. There is 77 per cent. in the urban district now?—Yes; I thought you would have had evidence on that.

12239. We know about the distribution?—I mean about the depletion. I did get out the figures, but I took it for granted you would have those with regard to urbanisation.

12240. We know all about that, but the question is whether that is accompanied by the depletion of the better stocks in the country so that the poorer stocks are left to reproduce themselves in the country, whereas the better stocks go into the towns and suffer degeneration there; that is the point, so that the evil may be—I do not say it is—caused in both ways?—Yes.

12241. You have not any opinion to express upon that point?—No, there is no evidence upon that. We cannot get at it.

12242. Evidence on that point could only be got by something in the nature of an anthropometrical survey established for a number of years?—Yes; it would have to be very systematic even then to get at that.

12243. I think you have formed some personal impressions as to the existence of what you describe, and what you no doubt correctly describe, as deterioration, as to whether it exists or not?—If you ask my own opinion, though there is no proof and the evidence is very inadequate, it is that the evidence for deterioration rather weighs down the balance. I believe the evolutionists are right, and that there is a general process of deterioration going on.

12244. Because of the check which has been given to what is called the elimination of the unfit?—That is the theoretical explanation.

12245. Do you think it is well based?—Yes, I think it is well based.

12246. Do you know Dr. Allbutt, the Cambridge Professor of Hygiene?—Yes.

12247. "He maintained very strongly indeed that of all the discriminating agencies to produce the survival of the fittest, disease was the worst, and he argues that the injury to those who survive is so great that all measures which combat disease tend to improve the race." Do you agree with that?—I am quite aware of those objections, but in spite of that I think the evolution theory does hold good, and all the evidence confirms it. The

evidence is very unsatisfactory and inadequate, but such as it is, it confirms it.

12248. You think it does ?—I do.

12249. Have you anything to say in support of that belief ?—No. I have not much to say. I am unwilling to give it, because it is merely an opinion, and I think we have far too many opinions without anything to back them, and therefore I do not put forward an opinion myself ; there is such a mass of assumption, opinions and impressions, I am tired of it myself.

12250. When you go on to talk about the change which is involved in what is called urbanisation of the people, you admit that urban death rates are lower than rural death rates were twenty or thirty years ago ?—Yes, but then I cannot interpret death rates. I do not know whether death rates mean an improvement or not.

12251. Surely an improved death rate means a greater power of resistance ?—I do not know that it does at all ; on the contrary, I daresay you have had these figures here from the Manchester Unity of Oddfellows, their last report. Longevity has increased, but there is a remarkable increase in sick claims. The people live longer, but they are not so well. Those are the figures (*handing same to Chairman*). The sick claims have increased at all ages. That is one of the reasons why I cannot interpret the death rates to mean necessarily improvement in physical vigour. If they do, then there is an end of the question ; death rates are falling everywhere ; we must all be improving, and there is no good inquiring any further.

12252. No doubt they are not conclusive, but as a matter of fact they show something ?—Both processes are going on in my opinion, and what we want in order to determine on what side the balance lies is the data which we have not got.

12253. Which you would wish to see collected by close investigation into the conditions of the people ?—Yes ; it is the only way to get them.

12254. You do not think the apparent increase in insanity, for instance, is proved ?—No ; it is not proved.

12255. In Ireland, I take it, it is ?—It may be in Ireland.

12256. I think there is no doubt about that, so far as statistics can prove anything ?—My own belief is—and here again it is only a belief—that both insanity and cancer are really increasing, and that the increase is not merely apparent : it seems to me too steady and too large to be accounted for by any errors of registration.

12257. It is certainly so in cancer, and if cancer is a disease of deteriorated tissue, which comes late in life, prolongation of life would be expected to be accompanied by cancer ?—Yes. Sir James Paget pointed that out years ago, but Dr. Newsholme has shown that the increase in longevity can only account for a very small part of the increase of cancer ; it does not account for the whole, supposing the increase to be real. I think those two things, both dependent on what they call instability of tissues, are evidence that the evolution theory is correct.

12258. And your general conclusion is that adequate data is indispensable to any real knowledge of the question. What is your opinion as to the way that data should be collected ?—I would not presume to lay down the method.

12259. Do you mean an investigation into the physical characters of the people ?—Yes, certainly, such as has been proposed. The only thing which I thought might be of use to you which you have not got (and it is positive evidence as far as it goes) is the statistical evidence from Germany. There the same process of urbanisation has been going on, and those are the figures which I put in, and which are lost.

12260. Have you the figures at home ?—Yes.

12261. Could you furnish them ?—Yes. This process has been going on for a number of years ; it has not gone on so far anything like as it has here, but it has attracted attention ; I mean the probable effect of the urbanisation upon the physique of the people, and it has been much discussed. With them it is a vital question because of its bearing on military strength.

12262. I take it their towns are much healthier than ours ?—They are in many respects. The excess of births over deaths is very much greater there than it is here.

12263. Their towns are laid out with greater regard

to the conditions of health, open spaces, and so on ?—*I Dr. Shadwell.*
do not know whether you can say that on the whole ; they are better in some respects, but not in others. The evidence has been gone into, it has been discussed, of course. They discuss everything which arises in Germany very thoroughly, and they have proved that rural districts are more healthy, and they have the recruiting returns. Of course their recruiting returns are of the greatest value, because they cover the whole population ; the whole male population is medically examined on reaching the age of twenty, year by year, and there is no doubt that from the recruiting returns the physique of the rural population is greatly superior to that of the urban. That is both in general and in detail. Then there is a certain amount of evidence of deterioration since the urbanisation began. It does not amount to much. But the proportion of the unfit has risen, and the proportion of the fit has fallen slightly. It does not amount to much, but it is positive evidence as far as it goes.

12264. If you would let us have these figures I shall be much obliged ?—I will do so.

12265. (*Dr. Tatham.*) Are you in practice as a physician ?—No, I no longer practice.

12266. From your investigations does it occur to you that emigration is a factor in whatever physical deterioration exists, assuming that it does exist ?—You mean the removal of so many persons in the prime of life ?

12267. Yes ?—Yes ; I should think that it probably has something to do with it. But there are two classes of emigrants, are there not ? Some of the emigrants are persons of unusual enterprise and vigour, but you have the other kind of emigrants that leave their native country because they fail there.

12268. But are not they returned to us ? I understand that in large numbers they are returned to us from America and other places ; they will not have undesirables ?—Now they will not.

12269. That is so now, is it not ?—Yes.

12270. So that really it comes to this, that emigration consists very largely of the best blood of our country, and if that is the case, surely what remains behind must be less desirable for purposes of reproduction ?—Yes.

12271. Do you think that is a tenable position ?—Yes.

12272. Do you think that alcoholism, speaking generally, is at the bottom of a good deal of deterioration ?—Not of deterioration ; of degeneration, of course it is. There is so much less alcoholism than there was ; it cannot be the cause of deterioration.

12273. Is it true that there is so much less alcoholism ?—Oh, dear yes.

12274. Are you judging from the published statements of mortality ?—Certainly not. The statistics of mortality are valueless.

12275. *Qua* alcoholism ? What are your grounds ?—The mortality statistics do not represent facts ; they only represent opinions, and it has become the fashion to put that down as a cause of death when it used not to be so.

12276. I quite agree with you, but you were saying there is evidence of reduction of alcoholism ?—Yes.

12277. What is the nature of that evidence ?—The police returns and the descriptions of what used to take place. Are you acquainted with them ?

12278. I am, unfortunately ?—You do not agree with that ?

12279. I would rather hear what you have to say, because I know you are interested in the matter ?—I have said a good deal in this book on the subject (*book handed to Dr. Tatham*). The first two chapters deal with that.

12280-1. I knew you had written on this subject and that is why I asked you the question ?—I think if I read you a few extracts from that you would see what I mean when I speak of that. You know the high water mark of drunkenness in this country was in the middle of the 18th century, when they passed the Gin Act of 1736. There was no very marked improvement down to the time when the very famous inquiry was held by the House of Commons Committee in 1834. Have you read descriptions of what took place then ?

12282. No ?—I have here a lot of evidence of different kinds. There is the consumption of drink, the number of

Dr. Shadwell. licensed houses, the police returns of public drunkenness, and the description of what used to take place. I think that that is generally admitted.

12283. (*Dr. Tatham.*) I am glad to hear you say so.

12284. (*Chairman.*) Is there not more drunkenness among women?—No; certainly not. I have gone into that. If you look at this diagram (*book handed to the Chairman*) I think you will see.

12285. (*Dr. Tatham.*) What are these?—These are judicial statistics. If you read earlier in the century than that you find they held censuses of the public-houses, and the women were in quite as large a proportion as in any recent one. I think it was in 1829 they brought the subject up before the Middlesex magistrates, and the Chairman remarked that on the previous Monday seventy-two cases had been brought up at Bow Street for absolute and beastly drunkenness, and the worst of it was that most of them were women. The notion that it is a new thing among women is a complete delusion. There is abundant evidence that the same thing has been going on for centuries. I may say the evidence I have put together in that book has been confirmed in the inquiry I have been recently carrying out into the conditions of industrial life by employers and others, old men in the industrial towns who described to me what used to go on. They said there is no comparison at all nowadays. It is "simply ridiculous"—that was the expression used—works were never opened on Monday, seldom on Tuesday, and on Wednesday there were not many men there. They were only in full work on Thursday, and then they used to work Thursday, Friday, and all through Friday night and Saturday, and you could not get them to go to get their wages till midnight on Saturday because they wanted to earn money. They used to be lying about the streets on Sunday morning, as described to that House of Commons Committee, and the employers used to drink with the men. This was the usual practice. Whatever there is now fades into insignificance beside it.

12286. (*Mr. Lindsell.*) Do not you think that is in any way counterbalanced now by private drinking?—So far as statistics go the average consumption per head remains very constant. It rises and falls with trade, but the average is much the same as it was seventy years ago. It has not increased, it is rather less.

12287. But the fact that public drunkenness is not so marked as it was does not necessarily prove anything?—No; I agree with you.

12288. I see you refer here, as one of the possible causes of deterioration, to compulsory education?—Yes.

12289. In what way do you regard that as tending to deterioration?—The effect of having the children in the schools for a number of hours. I do not think the schools are so unhealthy as their homes—probably not—but they are unhealthy, much more unhealthy than a factory, for instance.

12290. Do you think so?—Yes, most decidedly. The air in the schoolroom is decidedly worse than in the factory.

12291. Is that due, do you consider, to the inseparable accompaniments to a large number of children gathered together, or defects in the present system of school buildings?—It is both. I think it might be improved. I do not think you could have a large number of children together without some fouling of the atmosphere.

12292. Do you think the regularity of life and the better habits inculcated, and the attention that is paid to children now, does not counterbalance any harm that may be done?—Yes.

12293. I mean a child before he went to school, his home conditions were bad, and the surroundings were bad, and the exposure?—I think you rather misunderstood what I said here.

12294. You say in your *precis*: "Other causes must be sought in new conditions—e.g. compulsory education, enormous growth of amusements, theatres, and music-halls, juvenile cigarette-smoking," and so on. You put compulsory education in the same category?—As a new condition in recent years. I do not say it is a cause of deterioration; it may be a cause of improvement. My point there was that you cannot seek deterioration in things which have been much worse than they are now; you must seek it in something new.

12295. That is a possible cause?—You must seek in it that; I do not say it is in that at all.

12296. (*Chairman.*) It may be in the conditions attaching to it?—Yes.

12297. (*Mr. Lindsell.*) Is juvenile cigarette-smoking very deleterious? In some countries they are supplied with cigars in the schools?—Yes; there are some countries where there is a great deal more juvenile smoking than there is here. I do not think it is good for them.

12298. (*Mr. Struthers.*) There is no positive evidence to show it is bad?—No; there is no positive evidence about any of these things.

12299. (*Colonel Ouslow.*) Not even if it affects the heart?—If you show me a boy whose heart is affected by that, I should say "Yes, it has done harm."

12300. The question is whether it is caused by cigarette smoking?—There is no evidence of that.

12301. (*Mr. Lindsell.*) You say you noticed an immense increased consumption of Indian tea?—Yes. I am sure that is a cause of ill-health. I do not put in any figures with regard to the increased consumption. But you know China tea has almost gone out and the Indian tea has increased enormously. I have always found that women coming to the hospital—out-patients, of course—complain of indigestion and constipation. You begin to ask them about their habits, and then they will own, of course, to drinking tea, but in great moderation. If you cross-examine them a bit you find it comes to something like twelve cups of tea a day, and they drink it exceedingly black and strong, which is what they call good; by good they mean bitter. Then the effect of this is counteracted by corresponding quantities of pills and other patent medicines to put it right. They suffer habitually from indigestion and constipation, and I am sure that excessive tea-drinking has a good deal to do with it.

12302. (*Mr. Struthers.*) You mentioned, specifically, Indian tea?—Yes. There is all the difference between Indian tea and China tea.

12303. (*Mr. Lindsell.*) Is there more tannin in it?—Yes; its effect is entirely different. I suppose it would be called tannin.

12304. (*Mr. Legge.*) You mention among the alleged causes of deterioration which are less operative now than they were—ignorance of mothers; have you any evidence on that point?—No. The reason I say that is that now some attempt is made to teach them; formerly there was none.

12305. We have had a good deal of evidence, particularly from ladies, stating that the ignorance is growing, and that it is growing because there is less home teaching than there was. It is true there is a certain amount of artificial teaching in schools, but they state that the family life in overcrowded urban centres, and also in neglected country districts, is practically a thing of the past, and so a girl of to-day does not get that domestic education which she was favoured with in the past?—I do not agree with that at all.

12306. Early in your examination you said you thought, on the evolution theory, there was some ground for leaning to the view that there is a certain amount of deterioration, but I have not been able to gather from you since why; what is there in the evolution theory?—Do you mean theoretically?

12307. Yes, to lead one to any supposition of the sort. We are not declining from an ideal state of the past?—No.

12308. Is there anything in the evolution theory to lead one to imagine that deterioration is more probable than otherwise?—I suppose if the evolution theory holds good, softening of the environment is necessarily followed by deterioration.

12309. That is what I wanted to get at?—The theory of natural selection is that the weakly perish in the struggle for life, and so you maintain a certain standard of vigour. If you soften the environment, and lessen that struggle, you do preserve the unfit. There is not a question about it, we do preserve the unfit. When I say unfit I mean the least fit, those who would have perished. We preserve them of all kinds. We restore them to ordinary life, and enable them to propagate their kind.

It is not possible to dispute that; in fact, most of our social agencies, legislation, and that sort of thing, are directed to that end.

12310. (*Mr. Legge.*) I must have misunderstood you, because I thought when the Chairman raised that question that we had interfered with the struggle for existence, you did not agree with him.

12311. (*Chairman.*) No, I do not think so. He expresses dissent from Dr. Clifford Allbutt's opinion.

12312. (*Witness.*) It has been worked out most thoroughly by Mr. Headley. I do not know whether you have been referred to the book; it is "Problems of Evolution."

12313. (*Mr. Legge.*) You have made a thorough study of certain conditions of certain industrial centres?—Yes.

12314. You are familiar with municipal enterprise?—Yes.

12315. You think it is a valuable power, the placing as much power as possible in the hands of the local authority? You would rather have certain powers exercised by the local authority than by the central administration?—You mean local government—decentralisation?

12316. Yes?—I can hardly answer that question.

12317. Do you think that a municipal authority, if it wishes to improve the conditions of life in its sphere, can do so?—Yes.

12318. Is there any particular direction in which you think their hands might be strengthened by legislation or otherwise?—No; I think that they have sufficient powers. I do not know that they always use those powers wisely or with discretion, I do not think they do.

12319. Are there any points on which you could criticise their action. Have you studied the smoke question, for instance, at all?—Yes. I have paid attention to the smoke question.

12320. Have you considered what powers they have for keeping the atmosphere pure and to what extent they exercise them?—Of course there is the greatest variety of local administration, but smoke, as regards manufactories, is considerably checked in this country, I think more so here than anywhere else: it is incomparably worse in America, for instance.

12321. (*Chairman.*) Not in Germany.

12322. (*Colonel Fox.*) They enforce the law in Germany?—Of course in Germany they enforce all laws better. I agree with you that the law is very unevenly enforced here. But there is no means of dealing with domestic smoke.

12323. (*Chairman.*) Not by compelling every householder to burn anthracite?—No. If he were fined for having visible smoke coming out of his chimney he would burn anthracite, or use a charcoal stove, or gas, but you can never get such a measure passed.

12324. There is no objection to the use of anthracite; it is claimed that is the most economical there is?—Your housemaid would give warning.

12325. Why?—Because it is a bother to light; she would have to get up much earlier. That is a very practical objection.

12326. (*Mr. Legge.*) Supposing the result of an anthropometrical survey showed that the physique of the population in one district was very much worse than in another, you would be, I suppose, in favour of the central government as representing the country at large bringing pressure to bear on that local authority to conduct at any rate an investigation into the causes of the inferior physique of the district?—Certainly. I think the local authority ought always to be supervised and kept up to the mark.

12327. (*Mr. Struthers.*) I understood you to say that while the population in the towns has increased at a greater rate than the population in the country, there has not been an actual decrease in what you would call the rural population?—No.

12328. That also has had its own increase?—Yes.

Dr. Shadwell.

12329. Though not so great as the other?—Yes.

12330. That applies to the country as a whole?—Yes.

12331. Because there have been many districts where there is an actual decrease of population?—Yes.

12332. Do you know what are the main causes of the depopulation in those districts?—No; I am not prepared to say.

12333. The difference in the farms?—It may be.

12334. Do you think the physique really of the rural population is better than the town population in this country, or is there any evidence on the point whatever?—I do not know of any evidence in this country, that is why I attach importance to Germany—they have got evidence.

12335. What evidence is that?—The evidence of the army. The military medical returns are conclusive on the superiority of the rural population—the proportion taken broadly.

12336. Having got that fact, have they proceeded to found any theory upon it as to the causes of the superiority of the rural stock?—No, beyond general conditions of life in the town and in the country respectively.

12337. More open air life?—Yes, I suppose so.

12338. And not better feeding and not better sanitation?—No. In many respects what we call the sanitary conditions are greatly superior in the town than in the country.

12339. (*Chairman.*) There is better water, too, very often?—Better water and better drainage; in fact, those conditions are generally as bad as they can possibly be in the country districts.

12340. (*Mr. Struthers.*) On this point of the natural consequences of the law of evolution, that the softening of the environment tends to the survival of a larger proportion of the unfit and therefore towards something like progressive deterioration—on that theory the State and municipalities and the body politic, so to speak, has interfered in the direction of softening the environment?—Certainly.

12341. That is an interference which people in their present disposition will insist on making?—Certainly.

12342. There is no question of going back on that?—It is an inevitable process.

12343. We will take steps to preserve the unfit?—Certainly we shall go on doing so without doubt.

12344. But the State having interfered in that direction, is it almost a natural consequence that they should interfere in another direction also, and that while softening the environment they ought, so to speak, to segregate the unfit from that softened environment and put them in a special environment?—I should think very likely they will do that.

12345. You mean as a result of the logic of facts?—I should think eventually they will do that; there are lots of people asking for that now, and all kinds of things, to regulate marriage and births of children and bringing up of children and, in fact, take over the whole thing.

12346. For instance, to take over the feeding of children. We have had that proposal just now; that, of course is rather on the side of softening the environment?—Yes.

12347. That is not a case of segregating the unfit?—No. You mean not letting them propagate themselves?

12348. Putting difficulties in the way, at any rate?—Because they would not do any harm otherwise, would they?

12349. I suppose you ought to distinguish between two kinds of unfit: there are the temporary unfit and the permanently unfit, and it is hard to distinguish at first sight between these two classes. Of the whole total

Dr. Shaduell. who are regarded as unfit, we ought at least to make trial of whether an improvement cannot be made in a considerable percentage—such things, say, as a labour colony?—Ycs.

12350. And means might be taken to preclude or prevent from marriage people who had been confined in lunatic asylums, for example, repeatedly, and showed symptoms of disease which were likely to be introduced into the offspring?—Yes.

12351. You think that would be the natural counterpart to the State's action—something of that kind I mean—in softening the environment?—Yes, I should think somebody would probably advocate it.

12352. I would rather get your own opinion on the subject?—As to whether the State ought to do that?

12353. Yes?—I do not know what the State ought to do. It is quite likely the State will do that at some time.

12354. When we speak of whether the State ought to do it or not, what is the standard by which you are judging?—Now you are asking me what is better and what is worse and I cannot say.

12355. In the matter of softening of environment you might raise some question as to whether we ought to soften the environment or not?—Yes; quite so.

12356. Your answer is whether they ought to or not, it will be done?—Yes.

12357. And you think similarly with regard to the interference with the unfit. Very likely the State will do something irrespective of whether it ought to be done or not—"ought" in that sense?—Yes.

12358. Then you say that we are badly in want of fresh data of various things. You say, in your *precis*, that a collection of adequate data is indispensable to any real knowledge of the question. In what directions? Have you any specific suggestions to make?—No, I have not.

12359. You express the general opinion that we want more information, but you are not prepared to make any definite suggestion as to what might be done in the way of collecting that information?—I am quite in accordance with the suggestions which have been made with regard to the systematic and periodical measurements.

TWENTY-SECOND DAY.

Wednesday, 27th April, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*.)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Dr. MACNAMARA, M.P., called; and Examined.

Dr. Macnamara. 12360. (*Chairman.*) You are Member of Parliament for Camberwell?—Yes.

12361. Your experience as a member of the London School Board, and prior to that, in direct connection with elementary education as a teacher qualifies you to speak upon this subject?—Yes.

12362. In considering the conditions of the parents of the children who you think are in need of assistance you draw a very sharp distinction between the better class and the poorer class?—Yes. I say you can draw a sharp line dividing the working class children into those who were never better cared for, never better physically trained, never better looked after generally, than they are to-day, and those on the other hand who, in the matter of nutrition, clothing, housing, and so on, were never worse off than they are to-day.

12363. You think that recent years have accentuated the differences between those classes?—Yes. I suggest that 80 per cent. of the working class children were never so well off as they are to-day. I think that is the result of the influence of thirty-three years of compulsory public education, the habits of discipline formed in the schools, the physical training given in the schools, and in the organised games of the playgrounds and playing fields, and the elevating effect of the school system upon the home—I lay great stress upon that.

12364. You think that has had an influence?—Yes. It induces a greater pride on the part of working class parents in respect of their children, particularly with regard to cleanliness, clothing, feeding, and so on. All these things have left me perfectly convinced that four-fifths of the working class children are better off than ever they were.

12365. But there are some whom these influences have

not touched, and who are relatively worse off than they were?—They are probably not worse off, absolutely.

12366. But relatively?—They are absolutely worse off in regard to housing, but in other matters it is more by way of contrast with the improvement of the others.

12367. Relatively?—Yes.

12368. Of course this estimate is a rough one?—Yes.

12369. I suppose it would vary considerably in different places?—Certainly. There would be districts where the proportions would be entirely reversed; that is to say, you would only have 20 per cent. well looked after in some extremely poor districts.

12370. With regard to London, as a whole, you do not think that there are 20 per cent. of the school children who come to school habitually hungry?—I should not put it so high as that. There are 20 per cent. who come to school habitually improperly fed.

12371. That is owing to parental ignorance?—Parental ignorance, lack of means, and in a minority of cases thriftlessness and self-indulgence.

12372. To general causes rather than to special poverty?—Yes. I should not put it as high as 20 per cent., who come to school habitually hungry. Of course the proportion would vary with the time of year. The proportion would run up in a hard winter when the building trade and allied trades are out of employment.

12373. Coming to the consideration which the London School Board has given to the subject, you lay great stress upon the recommendations of a Committee which sat in the year 1898?—Ycs.

12374. Have you the reference to that Committee?—Yes. It is the third Committee which sat in ten years. The reference is “That it be referred to the General Purposes Committee to consider and report whether and what inquiry can be made, before next winter, as to the number of children attending public elementary schools in London, who are probably underfed, and how far the present voluntary provision for school meals is, or is not, effectual.” There were three Committees. In the first place, there was the Committee of 1889; they went into the matter and they came to the conclusion that 43,888 children, or 12·8 per cent. of the whole of the London children, came to school habitually hungry, and that volunteer agencies could only meet the needs of half those children. The second Committee in 1894 simply perfected the system of securing statistics. Then there was the Committee of 1898.

12375. It was the Committee of 1898 which actually dealt with the question and came to close quarters with it as it were?—Yes. The majority of the Committee came to a very definite conclusion.

12376. Was it a fairly representative Committee?—Yes. But I ought to say that its main finding was not accepted by the Board.

12377. That I understand. Then I think it would be very useful if you would give us what the conclusions were?—The fundamental conclusion we came to was that voluntary effort alone was not sufficient to meet the needs of the problem of feeding the hungry children. Then we set out the following proposals. In the first place, “It should be deemed to be part of the duty of any authority by law responsible for the compulsory attendance of children at school to ascertain what children, if any, come to school in a state unfit to get normal profit by the school work, whether by reason of underfeeding, physical disability, or otherwise, and that there should be the necessary inspection for that purpose.”

12378. What do you mean by necessary inspection? Do you mean medical inspection?—Certainly; I mean inspection both on the part of the Board’s officials, and I imagine, in regard to physical disability, a medical inspection. But with regard to underfeeding, the Board itself has, or could have had, machinery other than medical machinery for testing that question. I do not think that you require a medical examination. There are attendance officers and teachers and so on who could do that.

12379. There should be an examination of the condition of the child’s home?—Yes. Then secondly, “Where it is ascertained that children are sent to school ‘underfed’ it should be part of the duty of the authority to see that they are provided, under proper conditions contained in Clause 6.”

12380. You make it a preliminary that it should be ascertained whether children are actually sent to school hungry: you would not act on vague surmise or speculation?—No. Then it should be the duty of the authorities to see that they are provided with food. Then we came to the conclusion, “That existing or future voluntary efforts to that end should be supervised by the authority.”

12381. Supervised and supplemented?—Yes; that is the next point, “In so far as such voluntary efforts fail to cover the ground, the authority should have the power and the duty to supplement them.”

12382. Do you believe that the assumption of that duty by the school authorities could be carried on consistently with the maintenance of voluntary effort: would it not sap it at its source?—It has been carried on for a considerable number of years in a number of Continental cities. It is only fair to say that, as a result, voluntary effort has not increased.

12383. It has been arrested?—Yes.

12384. Do you not think it would dwindle in London?—I cannot say. But certainly it is the fact with regard to one or two municipalities on the Continent that voluntary effort has not only been arrested, but has dwindled as a result.

12385. Do you not think it would have the same result here?—I do not know; I daresay.

12386. You are quite prepared to face that?—Yes, I am not concerned with it.

12387. Except that you admit it would involve a growing charge upon the community?—I think so, yes; a charge which, of course, would be met in part, as you will see, not only by voluntary effort but by payments on the part of parents.

Dr.
Macnamara.

12388. I will come to that presently?—Then we say, That where dinners are provided it is desirable that they should be open to all children, and should be paid for by tickets previously obtained, which parents should pay for, unless they are reported by the Board’s officers to be unable by misfortune to find the money; but in no case should any visible distinction be made between paying and non-paying children. Finally, we say, “Where the Board’s officers report that the underfed condition of any child is due to the culpable neglect of a parent (whether by reason of drunkenness or other gross misconduct), the Board should have the power and the duty to prosecute the parent for cruelty; and that, in case the offence is persisted in, there should be power to deal with the child under the Industrial Schools Acts.”

12389. That of course would only be exercised in extreme cases?—Yes. Broadly that is the scheme. It is fair to the Board to say that the majority of the Board rejected the assumption of responsibility on the part of the public. That was the main breaking point.

12390. Of course, under this system, you anticipate that a great many parents who are quite able to feed their children, and who do it now, would pay for those meals as a measure of convenience?—Oh yes. I call your attention to the fact that in the municipality of Paris, where a system of this sort is in working, practically 62 per cent. of the meals are free; therefore, roughly, 38 per cent. are by purchased tickets.

12391. I suppose you would contemplate recovering from a great many of those parents?—Yes, certainly.

12392. I mean apart from those you prosecute for neglect?—Yes.

12393. Do you think you would stand any good chance of doing that?—I would like to say, shortly, that the great bulk of the working class parents will make provision; they make very great sacrifices for their children; but if they cannot, through accident or misfortune, or illness, I think they ought to be assisted at the public expense without any suggestion of pauperisation. In the final case, if they can make provision, but as the result of thriftlessness, or drunkenness, or negligence they will not, then I would punish them with the utmost severity of the law, and I am not particular about the methods. I would broadly say that I would punish them most severely in that case, but I would not let the children go hungry in order to maintain parental responsibility exactly where it does not exist at the present time.

12394. I can quite understand your being able to deal rigorously with extreme cases, but there must be cases where a kind of *insouciant* thriftlessness is present, where a man is culpable, but whom it would be rather severe to treat as a criminal?—I should endeavour to recover the cost from them.

12395. How are you to do it with a parent of that type?—You would use the same machinery as for recovering the cost of fines for non-attendance at school. It is a very similar class of parent.

12396. You are aware that under the Industrial Schools Act they recover a very small proportion of the charge?—I am aware of that.

12397. Do you think they would be any more successful here?—Probably not. We do recover a very considerable amount of fines. I am thinking of the class of parents that I believe you are thinking of, parents that you could not very well say were criminals but were really careless people, who will not send their children to school. They are fined and their fines are recovered.

12398. Do you think it could be done by arresting the wages of the parents?—That is a very serious proposal to make.

12399. That has been proposed here?—I should not like to answer that offhand.

12400. Do you think that if a thorough investigation into the circumstances of the family preceded any action of the sort, indirect influence might be brought to bear

Dr. upon the parents which would lead to any large amount of money being subscribed?—I think it is very likely in a great many cases.

12401. I mean the influence of sympathetic visitors?—I think it is very likely.

12402. Moral suasion?—Yes, but in the last resort you would have to use the machinery of the law for punishing them. I am quite convinced of that. That would only be with regard to a very small minority.

12403. I suppose you would agree that one or two signal instances of such punishment as you suggest would have a very salutary effect?—Yes; there is a very good instance of the truth of that proposition in the recent administration of the Education Act. Up to 1900 the maximum fine was 5s. for non-attendance at school including costs. From 1900 it has been £1, with the result that on the one hand the school attendance has enormously improved and the number of fines has appreciably decreased.

12404. The parents will not expose themselves to the risk?—The fine has developed a conscience.

12405-6. Subsequent to the decision of the Board upon the report of that Committee you submitted some views of your own on the subject?—Yes. They are elaborations of the main contentions of the Committee and a practical application of the proposals of the Committee to the cases of the various schools then under my charge. I suggest the grouping of schools with a kitchen and dining-hall connected with three or four schools in each case.

12407. Perhaps you had better give your practical suggestions in full?—I can put it very shortly. I propose that a dining-hall should be furnished at the Johanna Street School for the three North Lambeth schools: Johanna Street, Waterloo Road, and Addington Street.

12408. This is a model for the treatment of the problem in every great urban centre?—Yes. I take those three very poor schools, and propose to provide them with a dining-hall and kitchen.

12409. Would you utilise some existing room as a dining-hall, or would you add a dining-hall to the schools?—In these particular cases it would be necessary to add a dining-hall, but I daresay there are rooms which could be utilised.

12410. Would not the halls in most schools be utilisable?—I should object to that.

12411. Why?—I do not think you could disorganise the school hall.

12412. It is used now during the interval when the school is not utilised for educational purposes?—I know that, but there would be a considerable amount of dislocation. The children would come from various schools. You might have 1,000 children dining off soup in the hall. There would be a great many objections.

12413. I think there would, but do you not think that we should be prepared to meet and overcome these objections from the point of view, if this plan is to be adopted, that it should be done at the least possible cost to the community?—I would rather have them dine in the school hall than not at all.

12414. That is the point I put, that if we advocate a great change of this sort, to which a great many people would object, surely it would be better to do it in a form which was open to the least objection?—Yes, I am much obliged to you for putting that before me. I daresay in many cases such a room could be provided in the existing premises, but if not, then I should say it should be provided. It is also true that a school kitchen and boiler, and so on, is already in existence in a great many cases.

12415. You want a very simple apparatus for the kind of meal you would provide?—Yes. There are all sorts of parochial agencies providing teas, and all that material could probably be utilised. Then I suggest that dinner coupons should be procurable by the parents at a convenient public office, say the local town hall or district council office, or whatever it is, to be paid for, or received gratuitously, by the parents, according to the necessity of the case. I want to lay great stress upon the fact that there should be no difference between the style of the coupon, whether purchased or whether obtained gratuitously.

12416. That is the Paris method?—That is the canteen method in Paris, yes. Then the parents would give the children a dinner ticket, and instead of their going home or hanging about the playground, they would go to the dining-hall and get their dinner, at least one meal a day, by that means. That is the Parisian method.

12417. You say in your *précis* that it has been practised in a great many Continental cities; do you mean that a scheme of this sort is the rule in Continental cities?—No, it is not the rule.

12418. It is locally adopted?—Yes, and a similar scheme to this is in existence in Brussels and Vienna.

12419. The municipal authority has adopted it?—The Paris municipal authority is absolutely responsible for making up any deficiency in the funds arising from any cause. In 1897, under the system I have just explained, the Parisian municipality school canteen system distributed 8,250,000 meals. They were not all dinners; some were breakfasts. The total cost, roughly, was £70,000. Of that amount voluntary contributions and the payments for coupons by parents came to, roughly, about £30,000, and the rate therefore would amount to the extent of about £40,000. To take the case of London—London has a population of about twice that of Paris, but I think the child population is about three times as much, or thereabouts. Therefore, you would want, roughly, to put an outside estimate, three times £40,000, viz., £120,000, which is about three farthings in the pound on the rateable value. That would be the outside estimate for a scheme of this sort working in the whole of London.

12420. Assuming nothing was recovered from the parents?—Assuming that nothing was recovered from the parents, but that the parents paid for tickets voluntarily where they could?—We hope, of course, that a great deal would be recovered, but that is assuming that nothing was recovered.

12421. Now with regard to the important point of determining what children are underfed, how would you propose that should be settled?—The school attendance officers and the education authorities have an intimacy of knowledge with regard to the homes and the circumstances of the children which probably is not realised. Their daily visits, and so on, enable them to obtain that knowledge. When the Royal Commission on Housing sat in 1884, I think I am right in saying the whole of the members were very much struck with the enormous amount of intimate knowledge which these attendance officers had of the condition of the poorer people.

12422. That has not diminished, I suppose, by this time?—No; on the contrary. I can speak personally of this matter, because I was for eight years the headmaster of a board school, perhaps the poorest board school in East Bristol; I knew in a very short time the children who were hungry, by their appearance. I knew in another way: when the school was disbanded at midday, day after day, winter and summer, there would be twenty or thirty boys out of, say, 300, who would hang about the playground. I would ask them why they did so. They were very reluctant, of course, to state their case, but by careful observation I found that they stayed about the playground for the simple reason that there was nothing to go home to. I knew they had nothing to eat at all. Obviously those boys had been at any rate, from eight o'clock in the morning till midday with nothing to eat, and there was nothing to eat then. Then another thing; a practised elementary school teacher can tell by the appearance of the child, particularly in cold weather, as to whether it is hungry or not. The teacher may be misled, of course, because the child may be sickening for some disease, but the pasty, worn and wan look and pinched appearance of a child is eloquent testimony as to its condition. It is a very common experience in the poorer elementary schools, especially when the frost commences, that quite a number of children during the course of the first session in the morning become sick, and vomit. Of course some of them may be sickening for measles or scarlet fever.

12423. Some of them may have eaten too much?—I do not think you would say that if—to deal with a very unsavoury subject—you saw the nature of the vomit. I think that would remove that idea at once. The fact is that severe cold upsets these very hungry stomachs at once, and the poor unfortunate child retches. The teacher and the attendance officer together in consultation could with almost scientific accuracy find out the hungry ones.

12424. I could understand that, with regard, perhaps, to a considerable proportion of cases—all the worst cases, at any rate—but I should think there must be a very large residuum of other cases where a teacher, with the closest knowledge, and the most accurate power of observation, might be deceived?—Yes, I think that is likely.

12425. But you think with the knowledge to be obtained from the attendance officer as a corrective of rash conclusions on the part of the teacher, there would not be any great abuse of the system?—I am perfectly convinced that the attendance officer and the teacher together could bring you very near to the actual state of facts.

12426. Supplemented, I suppose, by taking the opinion of a medical officer in cases of doubt?—Certainly, and any other agency that can be secured for the purpose—the managers, for instance, many of whom are in touch with the parents, particularly in the denominational schools, and who know the conditions of the homes.

12427. I suppose you would consider that a medical inspection of schools is a very valuable addition to the machinery?—Yes. That is done in Brussels.

12428. Have you anything to say on that point here?—Yes, I think I have put the case of Brussels in my *précis*. They have ten medical officers upon their staff, and every child is visited once every ten days.

12429. That is unnecessarily frequent, is it not?—I am stating what goes on in Brussels. I call your attention to the final article in Volume II of the “Special Reports on Educational Subjects,” issued by the Board of Education. It gives the best description of the case of Brussels. From it, it will be seen that every board school child is medically examined once every ten days. Its eyes, teeth, ears, and general physical condition are overhauled. If it looks weak and puny they give it doses of cod liver oil, or some suitable tonic—zootrophic tonics, and so on—partly secured by a system of voluntary contribution, partly payment by the parents, and partly supplemented by public rate aid.

12430. Have you any idea what the cost of that is?—No, but I would refer the Commission to this final article in Volume II. of these “Special Reports.” It is an extremely interesting article, and gives the whole thing very fully.

12431. The cost of applying such a system to London upon that scale would be very considerable, would it not?—No. The Brussels medical system costs between £500 and £700 a year—this examination by a medical man. That is the total cost.

12432. The remuneration of medical men in Brussels must be very small?—It is only part time; they do not give themselves up to it entirely.

12433. But if every child was to be examined once in every ten days, it would cost more here?—*Pro rata* it would cost more.

12434. It would involve the work of a very large medical staff?—Yes. But I think I am right in saying that the cost in Brussels of this medical examination once in every ten days comes to between £500 and £700 a year.

12435. Do you think yourself that such a frequent examination is necessary?—No.

12436. There are a great many schools where that would be wholly superfluous?—I think in every elementary school every child ought to come under medical supervision, but certainly not once every ten days. Take the case of the eyes; the elementary school teacher is only a layman and if a child says it cannot see what is on the blackboard the invariable practice is to bring the child as near to the blackboard as possible. The chances are that its proper place is at the back of the room. The elementary school teacher cannot be expected to know that.

12437. And the same with regard to hearing?—Yes, the same with regard to hearing. Therefore I think it is most desirable that there should be a medical examination, but certainly not on this scale—not once in ten days.

12438. Will you give the Committee your description of the Paris system?—Yes. I put in the following report forwarded in 1898 to the School Board from the Foreign Office:—“PARIS.—The proposal to provide poor children with a free meal in Paris originated in 1879 with M. Mallet, at whose initiative the Conseil Municipal brought forward

a suggestion with this purpose. The matter was warmly taken up, and in February, 1881, the broad lines of a somewhat extended scheme were traced by the Préfet de la Seine, and submitted by him to the Mayors of the Arrondissements. The Préfet's circular letter lays down the following essential principles:—(1) Free meals to children known to be in want whether their parents are paupers (on the books of the Bureaux de Bienfaisance) or not. (2) Establishment of canteens at the various schools under the control of the Mayor and School Fund Committee. (3) No meal to be served except on presentation of a token (‘bon’) which could be bought, or was given gratuitously to the children. (4.) Secrecy as to whether the ‘bon’ was bought or received free. This last point was to be secured by making all the tokens of identically the same pattern. On one other point the Préfet lays some stress, i.e., the desirability of keeping the distribution of the free tokens out of the teacher's hands. It will be seen that this scheme goes somewhat beyond the original proposal, inasmuch as it allows parents in comfortable circumstances to give a wholesome hot meal at a very low cost—usually less than fifteen centimes—to their children at the school they attend, and the results show that the convenience has been appreciated. The working of the canteens is left entirely to the mayor and School Fund Committees, and canteens are now open in all the Arrondissements except the VIIIth, where there is probably no pauper population, and they appear to be working very successfully. The expenses are borne in the main by subventions from the municipality, but the School Funds Committees also contribute something in most Arrondissements, and there is a considerable revenue from the sale of tokens. The financial question has, however, for some years past been a source of anxiety to the framers of the municipal budget, and in 1891 the Budget Committee report draws attention to the constant increase of the burden which the school canteens are laying on the taxpayers of Paris; the situation does not seem to have improved subsequently, as the municipal grants, which amounted to 545,900 francs in 1890, had risen in 1897 to 912,885 francs. The following table shows the receipts from the sources above mentioned, the total revenue and the proportion of the municipal grant to the total, and some other figures, for the next six years, 1892-1897

Year.	Subvention from Municipality.	Subvention from School fund Committees.	Receipts from sale of tokens.	Total Receipts from all sources *
	Frs.	Frs.	Frs.	Frs.
1892	688,600	7,911	318,758	1,095,592
1893	764,900	7,570	305,208	1,165,065
1894	787,660	36,472	329,925	1,233,181
1895	833,625	30,366	331,320	1,237,597
1896	867,501	29,900	338,455	1,277,104
1897	912,885	28,100	351,480	1,347,538

Year.	Proportion of Municipal Subvention to total receipts per cent.	Number of meals distributed.	Proportion of free meals per cent.	School Population
1892	62·80	6,971,340	56·11	Returns Incomplete
1893	65·69	7,257,780	58·98	
1894	63·87	8,167,256	60·75	
1895	67·45	8,256,948	61·77	
1896	67·92	8,440,662	61·36	
1897	67·84	8,229,870	61·96	

* Including balances from previous years.

Dr.
Macnamara.

Dr. Macnamara. The Caisse des E'coles are charitable institutions recognised by law. They derive their funds from the subscriptions, bequests and donations of private individuals, and from grants by the Conseil Municipal and local bodies. The mayor in each Arrondissement and some other functionaries are ex-officio members of the Committee, and the societies do much towards the successful working of the schools." Then I lay very great stress upon the six proposals made by the Special Committee of the School Board in 1898.

12439. The present medical staff of the London School Board would not be sufficient for the purposes of a general medical inspection?—No. But I think that, with a comparatively small addition, security might be taken that every child would be seen from time to time. Of course in the poorer schools it might be necessary to see them oftener, but with regard to the schools in Hampstead, and so on, I say that a child should be seen once during its career, preferably on entry into the school.

12440. Every child should pass under medical review at its entry into the school?—Yes, and in the better class schools that is all that might be necessary.

12441. (*Dr. Tatham.*) How would it be if, in the place of the system you suggest, it were the rule that every child on admission to school was examined by a medical man to see what his physical condition was, and whether he was or was not in such a bodily condition as to profit by instruction. Would that be a good thing?—It would be most desirable.

12442. I mean as a preliminary matter?—Yes. But in the case of the poorer schools you would want to keep in continuous touch if your record is to be of any value.

12443. Supposing you have this as a preliminary, would not that somewhat modify your ideas with regard to subsequent examinations: do you not think that then it would be possible to utilise the school teachers to a much larger extent, given that the children start with a fair bill of health, if I may use the term?—Certainly.

12444. Do you not think that you might then do with a smaller number of medical examinations?—In what I may call a well-placed elementary school, certainly; having got a preliminary statement of a child's condition you might very well then, unless something extraordinary arises, leave it to the teacher. But in the poorer schools, the slum schools, that would not be sufficient. You want to keep in continuous touch with them.

12445. I may tell you frankly that, in putting this question, I have an ulterior object: I think that in the interests of the public health generally, and certainly of children in particular, it is desirable that we should get something approaching a register of sickness?—Yes, I quite agree.

12446. And it is with that object that I am putting the question?—I agree with you entirely.

12447-8. You know at present we have absolutely nothing in England corresponding to that?—I know that.

12449. With regard to our statistics of health, we have to rely absolutely on the statistics of mortality and, as you know, they are very misleading?—Yes.

12450. With regard to children, do you think it is practicable to arrive at anything like an approximate estimate of the number who are underfed?—I do not mean actually starved, but insufficiently fed?—Yes. You may safely say that in all the great towns there are always from 10 to 15 per cent., and in the East End of London a larger proportion, of children who are always underfed, and that the proportion increases in hard weather. I accept your term "underfed"—I do not refer to starving children.

12451. No—insufficiently fed?—Yes. The proportion, of course, increases in severe weather, when certain trades are unemployed and when there is a good deal of distress.

12452. You are aware that the Rev. Mr. Rees, of Salford, has given evidence before this Committee upon that point?—No, I was not aware of that.

12453. (*Chairman.*) I think he said that in Salford he did not think there were more than 2 per cent. of children underfed?—Then you come to a definition of terms.

12454. Yours and his may differ?—Yes. I consider a child to be underfed if he is not properly fed. Taking, again, my own experience of daily supervision of, say, 300 boys, I know that fifty of those boys, at any rate—not always the same fifty, but at least fifty every day—got nothing except a piece of bread and dripping, or a piece of bread and onion or a raw turnip. From my point of view that child is improperly fed. That is what I meant when I said between 10 and 15 per cent.

12455. (*Dr. Tatham.*) Do you think it would be quite cruel to force that child to pursue the usual school course?—Obviously.

12456. (*Mr. Lindsell.*) Is it your plan to feed the children in every school, or to select certain areas and certain schools?—You might very well begin by certain areas in the poorer parts.

12457. You would leave that to the school authority?—The local authority.

12458. They would proclaim an area, so to speak?—Yes. If you had a centre, a dining hall, anywhere near any elementary schools, there is no reason, if the parent cares to utilise the mid-day dinner for his child and pay for it, why the child should not go to it. But I would begin with the poorer parts.

12459. You would establish these food centres in the poorer parts?—Yes.

12460. And then you would make no distinction among the children at all; every child who liked to come could do so, provided he complied with the conditions, and his parent supplied him with the money?—Or the ticket.

12461. He would be entitled to it without any inquiry?—So far as the child is concerned, yes; that is most important. I think nothing would be more objectionable than to let one set of children have tickets which are obviously secured for nothing, and another set to have tickets which were paid for. The children are very acute in making distinctions and differentiations, and discriminating between each other.

12462. Every parent would get a ticket; you would not inquire into the circumstances of the parent till afterwards?—I do not think that. On application for a ticket at the municipal office, I think there should be at once some question as to whether he could pay.

12463. There would be some record or some information at the office where the ticket was applied for?—If I came and said, as a parent, "I want a book of coupons," the question would be, "Are you going to pay?" If I said I could not pay, I think that point ought to be looked into.

12464. Supposing the parent said that he could pay?—Then he pays and gets his ticket.

12465. You would allow that?—Certainly.

12466. His payment should cover the whole of the cost?—Yes.

12467. It would cover the whole cost, and you would supply the dinner if the parent asked for the coupons and paid for them?—Certainly. It is an essential part of the system that those who can pay and want to pay should do so.

12468. (*Chairman.*) Do you not think that it would be fair, if the parents availed themselves for their own convenience of this system, that they should pay a little more than cost price, with a view to the surplus helping to meet the cost of the meals which it is necessary to provide for those who could not pay?—Yes, if used as a matter of convenience, I think that should be so.

12469. It would save them a great deal of trouble, and that ought to be computed in what they pay?—Certainly.

12470. (*Colonel Onslow.*) In the information you have given us with regard to Paris it would appear that the proportion of municipal subventions and the proportion of free meals represents roughly a difference of about 6 per cent.?—That is so.

12471. Excepting in one year where there was a larger amount from the subvention from school funds?—Yes.

12472. It would appear that 6 per cent. really was the working cost?—Probably that is the case.

12473. Above what is received?—Yes.

12474. Therefore, as the Chairman has said, if you were to make the people who could pay pay a little more it would reduce that?—Yes; probably that 6 per cent. is the working cost, and the suggestion made by the Chairman would probably wipe that out altogether. I think so.

12475. (*Mr. Lindsell.*) Then with regard to the effect it would have upon voluntary effort, do you think, if all the machinery which you now suggest were provided by the school authority, that is to say the whole of the means of supplying the food and so on, that the actual cost of the meals for those who could not afford to pay would be covered by voluntary effort?—It might in the first instance, but it would be quite as well frankly to admit that directly you come in with a public subvention to make up the deficiency, the tendency is for voluntary effort to decrease.

12476. The probability would be that voluntary effort would not cover the difference between the cost price as shown by the takings, and the deficit which would represent the cost of the meals to those who could not pay?—No, I do not suppose that for a moment that it would I think there would be a substantial charge upon the municipality. Personally, I am prepared to face that.

12477. Subject, of course, to increased powers of dealing with a parent who could and would not pay?—Certainly. That is a very essential part of the scheme.

12478. You know that in the days of school fees attendance at school without a fee was not held to be an attendance which exempted a parent from prosecution?—I am very doubtful whether that was ever utilised for the purposes of prosecution.

12479. There was a case of the London School Board where a case was tried, and the Court decided in favour of the Board. It was the case of the *London School Board v. Wood*. It was decided that if a child is sent to the school without the school fees, when those are payable, the parent has not caused his child to attend the school within the meaning of the bye-laws. Would it not be possible to provide that a parent who did not cause his child to attend school in accordance with the bye-laws, if he sent him in such a state as not to be fit to receive instruction, should be in the same position?—And then the parent is to be prosecuted for not sending his child to school because he has not fed him? That is fantastic!

12480. I mean that something on those lines might be adopted for getting at the parents?—I think not.

12481. How would you get at the parents?—I should make due inquiry as to what the circumstances of the parent were.

12482. What would the punishment be?—First of all we should endeavour to recover the cost by the ordinary means in the same way as we do now in regard to fines for non-attendance. I suppose there would be a distress warrant if it were necessary, and then, I suppose, failing all that, the parent would go to gaol.

12483. We should have to legislate in some way and make the cost of the food given to the child recoverable?—Yes; we ought to do that. Where the Board's officers report that the underfed condition of any child is due to the culpable neglect of the parents, whether by reason of drunkenness or other gross misconduct, the Board should have the power and the duty of prosecuting the parent for cruelty.

12484. You would bring it in rather under the Prevention of Cruelty to Children Act?—Perhaps an extension of that Act might meet the case.

12485. (*Chairman.*) It is an offence under that Act now, is it not?—Yes; but I should think there would be no prosecution exactly on those lines. You might proceed to recover the cost as you would recover a fine for non-attendance at the present time. I do not know which course would be the better.

12486. (*Mr. Lindsell.*) I know the idea of making it a case of non-attendance, although the child is sent to school, because the child is not fed, may be fantastic, yet something on those lines might be adopted, punishing the parent for neglecting his duties towards his school-going child?—You have two courses open. You can extend the Prevention of Cruelty Act, and punish the parent because the child is not sent to school properly fed, or you can say: "This meal cost so much, you can pay us and you will not, and we will make you," and

then proceed against him in the ordinary course by distress warrant, and ultimately by imprisonment, I suppose. Dr.
Macnamara.

12487. You would have no course of action against a parent without making it an offence?—Both of these proposals of proceeding against the parent would clearly involve additional legislation.

12488. And that might be done either by an extension of the Prevention of Cruelty to Children Act, or possibly under the Education Act?—It would have to be an extension of it to recover the cost of the food in the same way as you now recover a fine for non-attendance at school.

12489. And if the parent habitually and without reasonable cause still continued to refuse to provide the child with food you would bring in the Industrial Schools Act?—Yes. There you do not want any further legislation. In the case of habitual neglect I should think the existing law would be sufficient.

12490. It would involve putting a child in with a rather different class of children?—You mean as regards the nature of the neglect?

12491. I mean that the ordinary child who is sent to an Industrial School probably comes of criminal parents and has himself been brought up in criminal surroundings. Would not it be rather hard to send a child to an Industrial School who does not belong to that class?—Yes. You would only use the Industrial Schools Act, I think, in extreme cases; and indeed the existence of the machinery such as I have suggested to meet the case of parents who do not feed their children, and the penalties which follow, would reduce the number of cases you would have to take under the Industrial Schools Act.

12492. Who would be the judge when the parent applied at the central office? The information in the possession of the officials who gave the coupons would be derived, I suppose, from the teachers and the attendance officers of the schools in the district?—Yes; and of course, so far as England and Wales are concerned, they are now municipal officers.

12493. Exactly?—It is in the hands of the municipality.

12494. And probably would not involve any very large increase of officials?—Oh, no, I think not.

12495. That seems to be the general impression. But, of course, the present medical position is slightly different, and that would involve an increase of staff?—Yes; that would involve an increase in the medical staff, clearly. There are a great many educational authorities—the great bulk I should think—who do not utilise the services of a medical officer at all in their ordinary routine.

12496. A few of the large ones do?—Yes, but outside those the thing is unknown. It is only a few of the large towns like Liverpool, Manchester, and Leeds, who utilise their services.

12497. But now that the authorities are one in many cases—the sanitary and the school authority—simply augmenting the staff of the medical officer of health might do it?—Yes; without prejudice to my view as to the best view of constituting the local authority the authority, that is an advantage.

12498. (*Mr. Legge.*) Reverting to the question of admitting children to industrial schools: you are aware that there are two classes of those schools in which there are not supposed to be any criminals' children—the truant schools, and the day industrial schools?—Yes.

12499. The machinery you suggest would enable children to be dealt with in that way?—They might go to the truant school.

12500. Or the day industrial school?—Yes.

12501. I must revert also to the question of the recovery of money from the parents; that is a point on which the public will worry a great deal?—They will lay great stress upon that, and quite properly.

12502. I think it is a pity that in the six points which were set out in that resolution of the members of the Committee that point was not made a little clearer?—We only deal with it in the sixth.

12503. I suggest that you meant to have put it in the fifth, where you say that tickets could be previously

*Dr.
Macnamara.*

obtained, and the parents should pay for them unless they are reported by the Board's officers to be unable by misfortune to find the money?—Yes.

12504. And I suggest that, as regards that, rather than the procedure by distress warrant, and so on, which I have been fighting to get clear of for years, we should adopt the procedure under the Prevention of Cruelty to Children Act, and under the Youthful Offenders' Act, namely, the Bastardy Procedure, which is very summary?—Yes. I mentioned the procedure by distress warrant, and so on, because that is the procedure now in connection with default in respect of attendance at school. But I have also mentioned as an alternative, and perhaps a better alternative, the Prevention of Cruelty to Children Act's procedure.

12505. I have that now in force as regards the recovery of moneys under the Industrial Schools Act?—Yes.

12506. And it is having a very marked effect?—That experience would be useful if any new scheme of this sort were adopted.

12507. Though I am bound to say the proportion of parents who cheerfully go to prison instead of paying seems to be going up very rapidly. I know you are very well acquainted with the day industrial school system, and I should like to ask you whether you do not think it would be a good extension of your scheme if, besides the introduction into a certain number of schools of the advantages for giving children food, you also secured for a certain class of the population the other advantages of a day industrial school, that is to say, the special attention to manual training, so as to fit them for what is more likely to be their future life than any form of commerce?—Surely, the ordinary public elementary school has a great deal of manual training? Do you mean industrial training?

12508. Yes, industrial training?—Yes; I think that would be desirable. I understand you suggest that the day industrial school system might be very well widened in its operation?

12509. Extended?—Yes. So as to take up a very much larger number of children in the poorer parts, so that they may thereby get the advantage of the industrial training at the industrial schools?

12510. Yes?—I think that is desirable.

12511. I do not mean that such schools need necessarily be certified by the Home Office.—I understand that.

12512. In fact, that the day school curriculum should be extended so as to embrace such a variety of school as that?—Yes. Are you now making a suggestion in respect to the ordinary day school curriculum, or merely proposing that a larger number should come under the ægis of the day industrial school system?

12513. I mean that a certain number of schools should be established in such districts as Lambeth, which you quoted, and the curriculum in those schools should be on the lines of a day industrial school.—That is a rather serious proposition.

12514. (*Chairman.*) Do you mean with a view to dealing with the feeding problem?

12515. (*Mr. Legge.*) No.

12516. (*Chairman.*) It is in connection with that?

12517. (*Mr. Legge.*) We have had a good deal of evidence, particularly from Leeds, as to the inadequacy of our educational elementary school system to fit a large number of children for the part they have to play in life.—I think I follow exactly what you are endeavouring to put to me—that it would be well to extend the principle of the day industrial school curriculum to a considerable number of schools in the poorer parts, so that the instruction in those ordinary day schools might partake more largely than it does now of an industrial character, of a practical character?

12518. Yes.—That is a very serious proposition. Because a child happens to be born in a very poor part I do not think you are entitled to rob him of the foundation—which will not be very deep in any case, because he will have to leave school very early—of a really thorough general education. I think you do him the greatest wrong if you do that. If you are going to introduce largely the system of a day industrial school—making brushes, carpentry, boot-making, and so on—

you are to that extent going to acc detrimentally in regard to the general instruction of the school, because you are going to utilise the time which is now applied to general education: that is obvious. I should hesitate very seriously before I committed any child, because of the fact that it was attending in a very poor school in a poor locality, to such an education as would increase the difficulties in the way of his improvement and of advancing himself, in such a way as he probably would do if he had industry, and so on, upon the foundation of a thoroughly general education, apart from mere industrialism. There is a great deal to be said for the proposition you put to me; the elementary school work is not quite practical enough, and does not lead up sufficiently to the daily life of the people in the poorer parts, but I should shrink from restricting the curriculum in such a way as would increase the difficulties of the upward and onward movement of the poor child simply because he was born in a poor locality.

12519. (*Chairman.*) Still, the interests of a child might be watched and safeguarded if he showed signs of greater intelligence?—You mean by a system of scholarships and exhibitions?

12520. Or by removing him to a school of a better type?—Yes. That does not exist now, however, to the extent that it ought to.

12521. (*Mr. Lindsell.*) Then there is the point that a child given the facilities of a general intellectual education would probably pick up the other things far more readily in later life on account of the development that he had in an earlier stage?—If a child has a foundation of what I may call a more or less philosophic general education on a very small scale, it is very easy then to specialise.

12522. (*Mr. Legge.*) I am going to press you on this point. I am prepared to deny that a child at Drury Lane is under any disability such as you suggest, as compared with a child in the ordinary day school in a poor district. I think if you test a Drury Lane child, and if you test the school as a whole, by any method you please, you will find that their philosophic or literary education of three hours a day is just as high in that poor school as you will find in any of the other schools. Of course you have a much more regular attendance for one thing?—Yes.

12523. You appreciate the value of that?—Yes.

12524. And you have the extremely close touch which is got in such a school between the teacher and the child?—That is so. Of course that is a very special class of school. I dare say that is so. Heaven forbid that I should say anything against Drury Lane, or any similar school. But I must be allowed to insist upon the necessity, if possible, of giving the poorest child the foundation of a general education.

12525. But if it is found that he is not sacrificed, but is rather advanced, by having his other faculties also developed, you would not object to it?—Clearly not. I should encourage it if your premise is correct.

12526. Have you considered the question of Children's Courts, special Courts for dealing with educational cases?—Yes.

12527. Are you in favour of such a system?—We have constantly advocated that. You mean for non-attendance, particularly.

12528. Yes, and for trying Industrial School cases?—Yes. The London School Board and most of the educational authorities in the country have long pointed out the undesirability of associating parents in such cases with the ordinary cases which come up for Police Court hearing.

12529. (*Mr. Lindsell.*) They are dealt with in London now separately from the stipendiary magistrates?—Yes; they are dealt with by the justices, but they are not dealt with in separate Courts. There are no special Courts. All my sympathies go in the direction of special Courts for those cases.

12530. (*Mr. Legge.*) You have given the reason which has moved various educational authorities to advocate such a course, but have you ever thought of this, which has come forcibly before me, that, as a matter of fact, a child going into a Police Court under present conditions—a child in a certain class of society—comes out a hero?—Yes.

12531. And that having a special Court would remove this halo from his forehead?—I daresay as time goes on the same might be true of that special Court in regard to that child: he also might come out with a halo in time. But still I am very warmly in sympathy with the proposal that they should not be associated with the ordinary procedure of the Police Courts for these purposes.

12532. Has the recent dispute in Leeds between the stipendiary magistrate and the Education Committee come to your notice?—No.

12533. That is an illustration of the difficulty which might arise in trying to recover money from parents for food supplied to their children by summary process?—I am not familiar with it.

12534. It is a dispute as to whether the Education Committee in recovering money from the parents for the support of their children in Day Industrial Schools have not been acting cruelly to the parents?—I am not familiar with it.

12535. We have had a suggestion before us of an anthropometrical census, and some witnesses have advocated the use of none but skilled operators; others have thought that as regards school children the teacher in every school could qualify himself for the purpose of taking the simple measurements required, just as in factories the certifying surgeon might: what do you think of that?—If you are going to take an anthropometrical census it should be done very scientifically and very thoroughly, otherwise it is practically useless.

12536. You know the particulars which are required—height, weight, and so on?—I can well imagine what they would be. I daresay the teachers could qualify—in fact, I am sure they could—but I think, on the whole, if I were going in for a scientific set of statistics—and I think it is a great pity that we have not had them all along since 1870, because we should then be able to make some interesting comparisons—I should see to it that that was done in the very best way by persons who are specialists in the making and the taking of such a record.

12537. (*Chairman.*) Do you think that a way of dealing with these underfed children may be based upon the massing of them in special schools?—Would that be a method of differentiation which would work satisfactorily?—The schools would have to be day industrial schools in their character; you would have to gather them over considerable areas.

12538. I suppose those children are more or less congregated in certain parts of London?—Yes, great masses of them are. But, of course, there are cases spread all over the place. I should be very glad to get anything done, but I think on the whole the system I suggest of associating a dining-hall with groups of schools, beginning with the poorer districts, would be the better.

12539. There is nothing inconsistent in a coincidence of the two systems?—No, that is so.

12540. As each might be found to work better in certain districts?—Yes, possibly.

12541. Do you think it matters much when an underfed child gets its meal?—I would like him to get a breakfast. If you are only going to provide him with a meal at mid-day, the morning is one of torture to him if he is absolutely hungry, and I would like him to get a breakfast in extreme cases.

12542. Do you know the name of Dr. Robert Hutchison, at all?—No.

12543. He is a well-known authority on the subject, and he was nominated to give evidence here by the Royal College of Physicians. He gave the Committee to understand that a child ought to have a certain amount of nourishment during the twenty-four hours, and that it does not very much matter how you divide it up, except

that it is more important to have a meal before physical exercise than before mental exercise, and that, therefore, the mid-day dinner is more important than breakfast?—Of course a mid-day dinner is more practicable, but there are lots of children coming to the poor elementary schools with regard to whom I should feel easier in my own mind if they got a breakfast as well as a dinner.

12544. A basin of porridge?—Yes.

12545. That is a most excellent food from the point of view of breakfast?—Yes.

12546. Have you formed any opinion as to what the cost of this meal would be, and what its character should be, in order to get the greatest possible return for that cost?—Judging by the Parisian example, it would cost £120,000 in London to carry that system out.

12547. What would you give for that amount?—Lentil soup, for instance, and jam pudding.

12548. Soup and bread, and cake occasionally?—I do not know about cake. I should invariably give them soup of some sort, and pudding.

12549. Do you contemplate in cases of real destitution that the Poor Law administration should be brought into play at all?—More than it is at present? Well, of course, everybody knows that the Poor Law administration is not very favourably viewed by the people themselves, and my feeding system would break down at once, I am sure, if the Poor Law had much to do with it.

12550. The system you advocate?—Yes. It would be very much to the children's detriment if it were associated in any way with the Poor Law administration.

12551. Would it not be a means of applying pressure to the parents if they disliked the operation of the Poor Law?—Yes, I daresay it would.

12552. You admit that?—Yes, I do.

12553. It is not altogether to be ignored as a means of pressure?—No, but if this were under the auspices of the Poor Law in any way you might as well give it up at once. The children would then suffer because of the parents' dislike of the system.

12554. I mean that the school authority should apply to the Poor Law authority for payment in those extreme cases where it was necessary?—You might deal with it in that way, but I should not prefer that myself.

12555. (*Mr. Legge.*) You know you have the power under the London School Board to do that in the industrial schools now?—Yes.

12556. (*Chairman.*) They do not do it.

12557. (*Mr. Legge.*) It is not done in London.

12558. (*Witness.*) There is good reason for it. It is held to be objectionable procedure, so far as the parents are concerned. We do not do it.

12559. (*Mr. Legge.*) It is done in certain parts of the country. The amounts collected on behalf of the parents have been dwindling.

12560. (*Chairman.*) Do you think it is right and proper that the susceptibilities of a parent who neglects his duty should be dealt with so tenderly by the community?—No. But when we have a variety of courses open to us I suggest that, in the interests of the children whom we have before us, it would be desirable to take the line of least resistance. There are various ways of dealing with a parent, and if he can be dealt with without at the very outset rendering him in a defiant mood, he should. I would avoid the Poor Law system. I think it is desirable that you should do so.

12561. You propose to invoke the criminal law in the last resort?—Yes, in the case of gross neglect of children, and as a last resource.

*Dr.
Macnamara.*

Friday, 29th April 1904.

TWENTY-THIRD DAY.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS
Dr. J. F. W. TATHAM.

Mr. ERNEST POOLEY (*Secretary*).

Sir LAMBERT H. ORMSBY, M.D., called ; and Examined.

Sir
L. Ormsby.

12562. (*Chairman.*) You are President of the Royal College of Surgeons in Ireland, senior surgeon of the Meath Hospital and County Dublin Infirmary, senior surgeon of the National Children's Hospital, Dublin, and Chairman of the Association for the Housing of the Very Poor, Dublin ?—Yes.

12563. You have formed a bad opinion of the condition of the lower strata of society to be found in large towns, have you not ?—I have.

12564. You might enumerate here what you hold to be the conditions of their life which are so depressing ?—In the lower strata of society in large towns I consider their surroundings and domestic home life are in a very depressing condition, there is a total neglect of every hygienic and sanitary rule of life, and those conditions I say are perhaps made up of the insanitary dwellings, the insufficient and improper food, insufficient clothing, and breathing and re-breathing from week's end to week's end the same polluted and contaminated air ; and then they have no means of recreation or athletic exercises to throw off those effects.

12565. You sum up there pretty much the gist of most of the evidence we have had on the subject ; would you say those conditions are worse in Dublin ?—Yes, I would say they are worse.

12566. Is that owing to municipal neglect ?—I think the lower orders of the Irish, as a rule, are much poorer than the lower orders of the ordinary English inhabitants of the slum population in the towns. I have been in Birmingham, and I have gone through the slums at the suggestion of a clergyman there who wrote a little book on "The Tragedies of Life." I was very interested in the subject, because it appeared to me to be very much in the same condition which exists in Dublin. I went round, and I saw a good deal that was nearly as bad as I find exists in Dublin.

12567. Is that lately ?—About six months ago.

12568. I suppose the temperament of the Irish tends to make them very careless and thriftless, does it not ?—Very careless and thriftless, that is their character.

12569. And their standards of comfort and decency are not particularly high ?—No, they do not seem to care. They are very careless about life, they do not seem to realise their position.

12570. They take things very easily ?—They take things as they come.

12571. Except politics ?—Yes ; they are rather inclined to politics and think a great deal about such things.

12572. You think that these conditions that you describe are particularly detrimental to infant life ?—I do.

12573. Will you kindly tell us what you think on that point ?—I am attached to a large Children's Hospital, and in the out-patient department I take my turn of duty three days a week. I see a large number of women and children, and infants ; frequently a poor slattern mother brings her infant and it looks in a dying state, and then probably two or three days afterwards she comes to me and says that the child died and wants a certificate of death. They have a habit in Dublin of insuring the

infants, and before they can get the insurance money they must have a doctor's certificate of death. A very amusing thing, though it has nothing to do with the case, occurred in Dublin—I daresay you saw it in the newspapers—where a woman was supposed to be dead and was waked. Her daughter-in-law went to the doctor, who had seen this old woman some time before, and said the patient was dead. In the medical certificate there is a saving clause for a medical man—"As I am informed, So-and-so died on such and such a date." Her daughter-in-law, having received the death certificate, went off and got the insurance money, and when the old woman did not get her share of it she peached about it. It all came out she was not dead at all.

12574. And the medical certificate had been granted ?—Yes. The poor doctor has been chaffed most frightfully about it since.

12575. Does he not deserve something stronger than chaff ?—He says he only stated in the certificate "As I am informed." Many of these mothers come to me and say that their baby died. How am I to know whether the baby died or not ? I am unable to visit the cases.

12576. Then I should refuse the certificate. Would not that meet the case ?—If you refuse the certificate they will not get any money to bury the child, and they have no money, so the corpse would remain unburied.

12577. Then the authorities must bury it. Do not you think by granting certificates under those circumstances you encourage the abuse of infant insurance ?—Yes, but I think it is very seldom such a case as that occurs. It was the late Sir Dominic Corrigan who got the clause inserted in the medical registration certificate "As I am informed."

12578. It seems to lend itself to abuse ?—But it would be a very great hardship on some people if the doctor refused a medical certificate.

12579. But in your opinion this infant insurance practice is not a good one ?—No, I think it is very improper.

12580. You think it is liable to abuse ?—Yes.

12581. The only security which apparently attaches to this insurance is the medical certificate, and if it is granted in this loose way you do aggravate the abuses of the insurance system ?—Yes, but the child is nearly always dead.

12582. It is the cause of death they want to know ?—I think by insuring these they run a very big risk always.

12583. Which they are prepared to take ?—Yes.

12584. All they want to know is the mere fact that the child is dead ?—Yes.

12585. They do not care whether it has been done to death, or has died of neglect ?—That is the risk they run—the death of the child, no matter by what means, insures the money being granted.

12586. It is part of the sporting instinct which characterises the Irish race. Would you like to see this practice of child insurance checked ?—Yes. I think in all cases the children should be examined medically.

12587. Do you mean before insurance ?—Yes, before

insurance I think they should be medically examined. In these low, cheap insurances they would not pay a medical man to examine them, and they just fill up a form and pay the necessary fee without medical examination.

12588. Do they as a rule insure them for a larger sum than is required for burying?—I think it is generally about £3 or £4.

12589. They can bury a child for less than that?—Yes, but they want a drink, you know, and the expenses of a wake.

12590. Would you be disposed to say that before the death of a child of tender years is registered at all a medical certificate should be necessary?—Yes, and it is always now necessary.

12591. You think that would be a safeguard?—I think it would, and I think it would stop a great many children being insured at all. I know there are very few children that I would insure from what I know of the risks they run and the care they get.

12592. In regard to the condition of Dublin, which, I presume, you have in your mind when you say what you do on the conditions of big towns, has not the municipality done anything towards improving the state of things?—They have done a great deal towards improving the houses. At the present moment there are four large housing schemes, some of which are completed.

12593. Improvement schemes?—Yes. The first in order of establishment was the Dublin Artisans' Dwellings. They have built an enormous number of houses, and very good sanitary houses. These were built particularly for the artisan class. Then the scheme of Lord Ivoagh—the Guinness' Trust—which caters for a higher social scale than the ordinary artisan. Then we have the Municipal Body of the Dublin Corporation, who have cleared large areas in Dublin at an enormous cost. I will give you an example of that. The Bride Street area (which is very close to where I brought His Majesty the King round to see these dwellings) was taken by them—three acres of ground. To merely clear the ground it cost £36,000; that was before they put a stone or a brick upon it. The fourth is the one which I have the honour to be chairman of, The Association for the Housing of the Very Poor. The word "very" was coined by Sir Charles Cameron. (*A document was handed to the Chairman.*)

12594. I think he said something on the subject?—Yes, he said to me that those three schemes, the Guinness' Trust, the Dublin Artisans' Dwellings Company, and the Dublin Corporation's scheme, only tapped a certain class of the lower orders of social strata. The very poor could not get into these rooms because they were all too high rented. Then, The Association for the Housing of the Very Poor started in the year 1897, and our object was to give dwellings at 1s. 6d. a week. We presume that the workers, who are the people who would inhabit those houses, would only be able to earn from 10s. to 12s. a week—people like sandwich men who carry notices about, hawkers, and casual labourers.

12595. Casual labourers?—Yes, casual labourers. We thought that 1s. 6d. a week would be a very small sum. We first started by buying a property containing a number of houses, and we paid £2,000 for it. Then we had to equip it for all sanitary requirements, and it cost us £2,000 more. Then we came to the conclusion that we would not buy already built property, but we would build blocks *de novo*. This was a case in point. We paid £2,000 for the houses, and to put them in proper sanitary order, in order to suit the Public Health requirements, it cost us £2,000 more. But notwithstanding that, we are able to pay on that small property 3 per cent. We have endeavoured in that scheme to mix up philanthropy on strict business principles. But to show you how municipalities are really fleeced as regards acquiring ground in the city, the corporation for the same amount of acreage paid £36,000 for clearing the ground, whereas I, as an individual, was able to get the same amount of acreage for £2,000. Of course I need hardly tell you, we all know that when a Municipal body makes an offer the price goes up, but I purchased it for the amount I have named. I do not know whether the people knew what I wanted it for. They probably thought I was purchasing it as an investment. I quietly acquired it, and then handed it over to the company. Of course in the deed it was put down in the name of

the Chairman of The Housing of the Very Poor. You will see we are introducing ideas in this scheme which, in Dublin at any rate, has never been introduced before. One fact is that we are not going to allow the people to bring their beds into the rooms. We are going to have bed recesses, which we have provided, and we are going to have hooks in the wall, and provide wire-woven beds for them, which will be our property. Our caretaker, as the tenant goes in or goes out, will have them painted and properly attended to. There is another thing which we find, namely, that the lavatories and w.c.s are always going out of order in the three other building undertakings mentioned, when they are common to three or four families. Children will put things into the pan, and so forth. When the caretaker comes round it is impossible to say who did it; they never can find out. Now, in our scheme we are going to have a lavatory and w.c. all self-contained—for one family only, who will be responsible for its safe keeping.

12596. For each tenement?—For each tenement. Of course, naturally, it is a little more expensive, but still it will give them increased facilities. I do not know whether you know the inner life of the Irish people, but they are very peculiar, and even careless. At the women and children's dispensary I find that constipation is the bane of these people.

12597. From tea?—No, from carelessness. They will not go up to the w.c. when they meet anybody on the stairs. That is not peculiar to women. We find that is so, and I had a chat with the architect about it.

12598. Do you take any steps to prevent overcrowding in these tenements when you once let them to a family?—Yes, we do our best. The Dublin Corporation—and I believe it is the case with other municipal bodies also—send inspectors round at night to make midnight inspections, to see how many are in each room. We let a room to a man and his wife, and he probably will let it off again. I believe overcrowding does occur to an enormous extent.

12599. Cannot your caretaker report?—Yes, he reports whenever he finds it out, and the people get notice to leave if they continue to transgress.

12600. From you?—Yes, from us.

12601. I suppose the Dublin Corporation takes some steps to prevent overcrowding?—They do. I know that for a fact. The assistant gardener of Merrion Square told me that he did not understand why the inspector came in the middle of the night. But the inspector wanted to see how many people he had in one room. They do pay surprise visits in the middle of the night at irregular times, in order to ascertain that. That is the only way it can be done.

12602. A great deal is being done to improve the conditions even in Dublin?—Yes, a great deal has been done.

12603. You may expect to reap the advantage in the condition of health of the people in a few years?—Yes. Sir Charles Cameron has closed 3,000 houses in the last ten years as unfit for human habitation.

12604. What has taken their place? Have the areas been cleared?—A good many houses are still standing, although uninhabited, because the corporation have nearly exhausted their borrowing powers. I suppose when they are able to borrow more money further housing schemes will go on. But I am very strong indeed on the subject of housing the poor as a means of improving the general condition.

12605. From your experience in connection with this company you believe it can be done upon lines which are remunerative?—I do believe so if it is properly worked. We have in our Association paid 3 per cent. ever since it was started.

12606. There is no reason why it should be a burden upon the community if the town council undertakes it?—None whatever. But I do believe that private enterprise is more likely to be remunerative than municipal enterprise, and I think that has been proved elsewhere.

12607. It is more vigilant, I suppose?—Yes, it is more vigilant, and it is more individual in the matter. For instance, we meet monthly, and we have our reports. Naturally, everybody who is on the directorate are enthusiasts in this housing scheme, whereas with sub-committees of municipal bodies they attend irregularly, and when they do attend they are very anxious to get away, and they depend on their secretary, or whoever he

Sir
L. Ormsby.

Sir
L. Ormsby.

is, to give them reports. But we are really enthusiastic about the matter, and look into every detail.

12608. You tap the sentiment of philanthropy?—Yes we think we can run it on business lines and make it pay.

12609. Do you think the effect of these movements is at all to raise the standard of effort among the private owners?—The private owners naturally do not look at us with favour, because they think we are taking a means of livelihood away from them—that is, house-jobbers.

12610. Does it not lead to some competition on their part to make the conditions of their houses a little better?—The Public Health Department demand now that they shall supply all sanitary requirements for the houses, but it is hard to carry it out fully, for most of the tenement houses in Dublin now occupied were houses which were occupied by well to do people, and by one family only. The requirements were sufficient for one family, of course, but when you put six or seven families into the house the sanitary requirements naturally would be deplorably deficient. As a mere matter of sanitary arrangements you have them, because they have to keep the law, but they are very indifferent. I have frequently looked at the back yards of the houses, and seen the sanitary conditions. They were not fit for pigs, although they carried out the law. They were there, but of a very indifferent character.

12611. They were of imperfect construction?—Yes. And filthy in condition. Naturally, it would be impossible to pay for inspection sufficient for all these.

12612. Would not occasional prosecutions answer in raising the standard of cleanliness to some extent?—They do prosecute. I am sorry to say, as an Irishman, that I think some of my countrymen are innately dirty.

12613. You find a great many people in England so too?—I do not say that the upper Irish classes are, but the lower orders are. I have noticed very frequently in examining the people that their outer clothing is very good. But when I have examined their under clothing I have been shocked.

12614. It is often the case, is it not, that when they have good clothing they prefer to wear bad?—No, I think the Irish like to wear the best they have.

12615. We understand there is a great deal of pawning of their clothing?—Yes, there is a great deal of that.

12616. They anticipate their wages?—All their clothing is, generally speaking, in the pawnshop from Monday morning till Saturday afternoon. Their weekly money is paid on Saturday, and then the things are taken for the Sunday's amusement; and then on Monday morning in they go, as regularly as clockwork.

12617. Perhaps it tends to the clothes being kept clean and tidy, which may be better than if they were kept in their own houses?—Yes. They only have one day to wear them. That is the usual thing. If anybody happens to watch a pawnshop on Saturday he will see droves going in to get their clothes out, and on Monday they go in again.

12618. The people are always in advance of their resources, in fact?—Yes, they are. That is their thriftlessness. It is a very curious thing. I gave a lecture not long ago to the Trades Council—a kind of club for the people, and I got statistics of what was done with the money of the labourer who only got £1 a week, and the artisan who got 6s. a day, nearly £2 a week. I found that the family of the labourer at £1 a week got more advantages out of that £1 a week than the artisan's wife and children got out of the £2 a week. The labourer and his wife said they had no money for drink, whereas the artisans spent a great deal of money on drink.

12619. And that, of course, depresses all the conditions of their life?—Yes, the labourer at £1 a week and his family live better than an artisan as regards food and clothing.

12620. In Ireland you have not to deal with the same tendency of the aggregation of the population in great towns which we have in this country, I mean the great towns in Ireland are few and far between?—No, not to the same extent, but there is a great deal of migration from the country parts. There is always a great deal of emigration, which I mention later on.

12621. But is there much drifting of peasantry into the towns?—There is, because they come to look for work. They do come into the cities from the country.

12622. Has not the depletion of the rural population by emigration left more work for those who remain behind?—No, I think they are not able to work. They are the

weaklings who are left behind. It struck me very much not long ago when I was in the South of France, to see every inch of the land cultivated, and then to go through miles and miles of Ireland and see not a particle of cultivation present.

12623. Would it repay cultivation?—Indeed, I think it would. Of course Sir Horace Plunket and the Board of Agriculture are doing wonders, and I believe will do more for encouraging the industrial and agricultural resources of the country.

12624. That I understand to be the case?—I believe so. There are certain teachers now in every department, teachers as regards agriculture, dairy work, poultry, bees and so on.

12625. Should you say that the Irish peasantry are responding to the invitation?—They are to some extent, but not nearly to the extent that I assume they will later on.

12626. It will be progressive?—An Irishman is a very curious person. When anything comes from the Government he begins to think what it is for, and he is not sure exactly what this great movement means. Of course the lower orders of the Irish are principally guided by their clerical advisers, and if their clerical advisers encourage them to take advantage of these opportunities they will do so.

12627. But clerical opinion in Ireland is in favour of Sir Horace Plunket's scheme. The Bishop of Ross, who gave evidence here, spoke as enthusiastically as you do about it?—Yes. I think the more they encourage the people to adopt them the more likely it will be to be a success.

12628. You think that some of the degeneration in the rural districts is due to changes of food?—Yes. I was recently standing at Westland Row Station, Dublin, and I saw a policeman who was six feet seven in height. I said "Where did you come from?" He said, "I came from County Clare." I said, "What did they feed you on?" "Well," he said, "I took a bit of anything that was going." I said, "I want you to be particular." He said, "I fed upon potatoes and bacon, and I had a fair amount of milk." He was a splendid man. I asked him if he had any brothers, and he said he had. I asked if they were all as tall as he was, and as finely built. He said they were not quite so tall, but they were very well built. Of course, with regard to the Dublin Metropolitan Police—I do not know if any gentlemen round this table have seen them—but all I can say is, a finer body of men I do not think I have ever come across.

12629. I think that is true of the country constabulary all over Ireland?—No, the Royal Irish Constabulary are smaller men.

12630. But still they are fine men?—Yes. I think that the Royal Irish Constabulary are sprung from the upper farmer class. I think the Metropolitan Police are not of quite so high a standard socially as the Royal Irish Constabulary. But I should say of the two the Dublin Metropolitan Police are the finer body of men. They say that in Dublin there are more public houses and more places of worship than any town of equal size in any part of the world. Of course the publicans are always very anxious to keep in with the police.

12631. Do you think drunkenness is increasing in Dublin?—I do.

12632. And emphatically among women?—Yes, and emphatically among women. Naturally we can easily understand that that must have in the long run a depreciating condition as regards their offspring. Another point—I suppose it occurs in England as well as it does in Ireland—is with regard to women nursing their babies too long. I have seen women frequently nursing their babies for two years, with the object of course of preventing them having another child.

12633. They say they do that in some parts of England, but on the whole, the evidence has been that mothers nurse their babies only for a short time, and very often not at all—that two or three months exhausts the capacity of the mother, even if she is willing to suckle her child?—Yes.

12634. In one part of your *précis* you say when the baby comes the mothers are too weak to suckle it?—Yes; that is so occasionally.

12635. That is the town bred mothers?—Yes.

Sir
L. Ormsby.

12636. Where they do suckle them they suckle them too long?—Occasionally.

12637. Is there much employment of mothers?—I do not think that in Dublin there is as much work for married women as in other towns. For instance, Dublin is not a city of mills and manufactories by any means; it is not like Belfast; in Belfast, of course, the city is full of manufactories and a very large number of women are employed.

12638. And the same in the towns round about?—Yes; more particularly in the North of Ireland where the flax and the linen industries are so largely worked. In Dublin there is a very large biscuit manufactory—Jacobs' Manufactory, something like Huntley & Palmer's; they employ a very large number of women.

12639. You think the effect of the migration into the town is to make the next generation of a weaker type?—Yes.

12640. And to that extent you think that there is some ground for believing that progressive deterioration occurs?—I am perfectly convinced that there is progressive deterioration among that stratum in Dublin. I have not the slightest doubt about the matter. I can see it myself, I have been now practising in Dublin for thirty-five years, and I have always been very observant. I have been attached as surgeon in two hospitals and have done a great deal of the out patient work and also before I acted as dispensary medical officer in one of the City dispensaries. I therefore had ample opportunity of seeing them in their ungarnished state, not only at the dispensaries but also in their own dwellings.

12641. Then you say that the people who come into the towns from the rural districts are of a weak type to start with?—I think they are, because the people that are left behind do not, as a matter of fact, work their land—I do not know why they do not—they think they will get easier employment in the cities.

12642. You admit that there are a good many agencies besides these housing schemes which you have described, which are working in the cause of improvement?—There are. There are a great many gymnasia now started. I sometimes take the Chair in the Dublin gymnasium, and I am charmed to see the young men coming there to take advantage of the opportunities afforded. But I am sorry to say it is only a certain class who attend these gymnasia, that is, clerks and such people—the very lower classes do not take advantage of it. They could if they chose. Then both the Protestant and Catholic Church in Dublin have got up what is called Boys' Brigades.

12643. Does that tap the lower classes?—Yes; that is about the only thing that taps the poorer classes. But those who join the Boys' Brigades, I think probably, are the better class of the poorer class.

12644. The lowest class resist almost any agency?—Yes; these poor little boys who sell papers in the street are of miserable physique, and all the winter evenings they are only half clad, and naturally run a great risk of getting pneumonia. We have a good many cases of pneumonia in the Children's Hospital among those children.

12645. Is anything being done to give them a knowledge of how to utilise their resources by obtaining the best food?—I think attached to each parish there are some committees who endeavour to improve their conditions. I think in England that is carried out more fully than it is in Ireland. That idea of teaching the lower class of people is quite a new idea in Ireland.

12646. Are the Irish people suspicious of any such efforts?—No, I think not, but they are so poor and so careless and so indifferent as to what is really good for them that they do not seem to take very much notice of it or show any anxiety to be better.

12647. I suppose you would agree with what other witnesses have stated, that during the last thirty or forty years, practically since the famine, there has been a considerable change, which is detrimental to health, in the character of the food of the Irish people?—Yes. I have supplied you with a document containing the history of the daily life of a typical child in the slums of the city. You see she had "Tea, bread, and sometimes butter." It is only sometimes they have butter.

12648. When you mention "stew," what does that include: is it a vegetable stew, or is there any substratum

of meat in it?—I suppose they probably get a little meat. The various butchers lay aside a certain amount of very indifferent meat which they sell at a very cheap rate. On Saturday night you see these people going round the butchers' stalls, this indifferent meat is all placed to one side, and they sometimes get a supply at a very small cost.

12649. It is curious that potatoes are not mentioned in this dietary?—In the country, of course, they eat nothing but potatoes.

12650. So long as they last?—Yes.

12651. And then they have recourse to Indian meal, I understand?—Yes.

12652. That is not a very good thing, is it?—No; it is not as good probably as potatoes with a little butter-milk, or butter, or oleaginous material of some kind—I do not care if they get it in fat bacon. You may say that American bacon is bad, but the fat is there, and it is the fat which is wanted.

12653. Do they never eat preparations of oatmeal in any form?—Yes, sometimes.

12654. (*Dr. Tatham.*) You would have the fat there?—Yes.

12655. (*Chairman.*) In going through your list of remedies you mention the number of cubic feet which should be provided. Do I understand that no effort is made to enforce that minimum standard?—Of course the public health authority do enforce it where they can, but it would require a very much larger number of inspectors than they have; probably it would require a regiment. They would be eternally going round.

12656. Would not one or two prosecutions have a salutary effect?—They do prosecute.

12657. When you make that distinction between 200 cubic feet for a child and 400 cubic feet for an adult, do you think that is sound? Does not the child during the earlier years of life want more pure air than the adult, during the period of development?—I take that merely from the Public Health authority's figures.

12658. Do you think it is a sound distinction to draw?—I do not think a baby would want so much air as an adult.

12659. But a child?—I should say a child about twelve or fourteen years of age would probably want as much air to develop it as an adult. Of course that 200 or 400 cubic feet is a very relative kind of thing.

12660. It is the minimum?—Yes; one would like to have more, but very often you get considerably less.

12661. Has anything been done to increase the number of recreation and play-grounds?—Yes. Lord Ardilaun first began by opening Stephen's Green, and you can see the little ragged children from the various lanes and back streets close to Stephen's Green playing there. There is a place allotted to them and they can gambol about and fall over each other and enjoy themselves thoroughly.

12662. Dublin is not badly off for open spaces?—No. With regard to the square in which I live in, Merrion Square, there have been very many suggestions made that we should open that to the public. But what the Commissioners felt is that every class should have a recreation ground for themselves, and as there is a recreation ground exactly opposite Merrion Square, called Leinster Lawn, open to the public, which is very large—I think it contains three or four acres—it is only fair that another class of people should have some place for themselves.

12663. You have some other squares?—Yes; and they can all be entered by the public by paying one or two guineas a year. But Lord Meath, who owns a great deal of the slum property in that part of Dublin called the Coombe, has opened playgrounds, and he has put a man there in uniform who sees the children do not indulge in any dangerous form of recreation from the swings and so on.

12664. There is apparatus there?—Yes, nearly all the city churches have opened pleasure-grounds, with seats, and places for the children of the poor to play about in.

12665. You do not think the Irish child suffers from any abuse of school attendance or anything of that sort, or over-pressure from education?—Parents frequently come to me to sign a certificate to say that the child is not fit to go to school.

Sir
L. Ormsby.

12666. They are not compelled to, are they?—They are compelled. There is compulsory attendance at school now for every child in Dublin.

12667. But it is not very rigorously enforced, is it?—I think it is. The reason I think it is simply that many mothers come to me and say that if they do not get a certificate from me they will probably get prosecuted. They are quite satisfied if I write: "This child is in my opinion unfit to attend school for a week," and sign my name. I frequently have to do that in the out-patient department of the Children's Hospital.

12668. Do you think the children in the rural districts attend school too early? It has been suggested to us that it would be a good thing if in the rural districts where children could live a healthy life out of school, they should not come to school till they were six or seven years of age?—I am rather of that opinion. I do not think it is necessary to raise the standard of education for children who are to devote themselves to agriculture. I think when you educate them too much they begin to look higher and give up work as agricultural labourers.

12669. It is rather from the point of view of whether they would not learn better if they did not attend school too soon—whether their bodies would not develop better with advantage to the mind?—I should be inclined to think that it would be far better. We do not want tadpoles, all head and no body. I would far prefer that their bodies should be seen to before their heads. I have had a strong opinion about that in regard to all classes of society. Although it is a very dangerous question to enter upon, I do not think that ladies entering universities is to the advantage of their physique afterwards. I think the more they develop their brains the less they impress strength and robustness upon their offspring. That is my opinion, for what it is worth. I think they often cease to breed altogether.

12670. You mean that their physical powers are diminished?—Yes, because, whatever others may think, my opinion is that wherever robustness comes it comes from the mother, not from the father.

12671. You think that a close application to sedentary life would be bad for women who would become mothers?—Yes.

12672. In regard to the dairies in Dublin, is sufficient precaution taken to see that the milk supply which is available for the poor is fairly pure?—I have spoken to inspectors on that subject, and I would say that there is no day in Dublin but that there is some prosecution instituted against somebody for deficiency in certain constituents of good wholesome milk.

12673. Do you exact a proper standard of cleanliness?—The inspectors are most careful, so far as they can be. There are 500 dairies, and I find that there are nearly a dozen inspectors eternally going round and getting samples of milk. They do it at irregular hours, so as to try if possible to enforce at any risk or any cost that the poor shall be supplied with good wholesome milk.

12674. All this milk comes into Dublin from the country?—Yes. Some cows are kept in the city in dairy yards, but the Public Health authorities in Dublin are very anxious to get rid of all the city dairies. They cannot very well do it as there are some vested rights in the matter, but later on they hope to have every one of these dairies taken out of the city.

12675. Do they exact as high a standard of cleanliness as they can?—They do, but I do not think much of the city dairies.

12676. Milk is very difficult to protect from contamination?—Yes, very. There are so many ways in which impurities may enter the milk. You know they talk about scalding the pails and all that kind of thing, but you see the dairy boys who milk the cows with dirty hands—the foulest possible. Then there is a great deal of water that gets into it.

12677. Now I will ask you a few questions about the lunacy matter which has been given great prominence by witnesses who have been here from Ireland?—Before you come to that, I do not know whether you have noticed in my *precis* that there are 21,000 families in the City of Dublin occupying one room.

12678. Is it not often the case that those rooms are very large ones—parts of some old houses?—Yes. If it is a dining or drawing-room it is a large room, but

people occupy the smallest possible rooms that you could hardly whip a cat in.

12679. What is the average size of the families in those rooms?—There are four or five who occupy them.

12680. Is not that a point which the municipality have attempted to tackle?—They have attempted to combat that.

12681. Does it not require drastic measures to deal with it?—The magistrates naturally hesitate to impose penalties upon them because the poor people are not able to get better accommodation. Then the difficulty which Sir Charles Cameron has experienced, if you close them, where are the people to go to, unless you have others ready built for them to enter?

12682. Does not a problem of that sort tend to solve itself if you take the necessary steps to create the problem? It is solving itself by the organisations which I have mentioned, but it will take a considerable time. In Dublin, which I know the most about, it will take a considerable time to supply the proper housing accommodation which is required for the very poor.

12683. But the tendency is in that direction?—The tendency is towards improvement.

12684. Then with regard to lunacy. These figures which you have given confirm the impression that other people have given us?—Yes, they do.

12685. That increase of lunacy in Ireland is very serious?—It is taken from the statistics.

12686. We were told that forty or fifty years ago one in 700 of the Irish population were lunatics and now it is one in 170. You are inclined to believe that there are considerations which show that the state of things is not really so bad as those figures might lead us to think?—I explained that by saying that people are put into asylums now who were never put into asylums before. Owing to the low death rate in the asylums the inmates accumulate and the admission rate goes on from year to year, and naturally it helps to swell those numbers. Of course the two ways of diminishing apparently the amount of lunacy in any given year is from death and recovery. The death rate is about 7 per cent. and the recovery rate about 34 per cent.

12687. How many of those who recover lapse, do you suppose?—If they are acute cases I would say perhaps a third of them relapse.

12688. Have you any idea what the comparative figures are for England?—No, I have not. *This is the last report of the Irish Inspectors of Lunacy (handed to the Chairman).* I daresay you have seen that.

12689. Yes.—Then there are a number of old people who get softening of the brain or slightly demented; they are not really mad, but people will not take the trouble of minding them, and they go to a magistrate and two doctors who can certify for them—and they manage to get them in.

12690. They are merely cases of senile decay, I suppose?—Yes.

12691. There is one element in the production of lunacy which you have not to deal with to such a great extent in Ireland, and that is syphilis?—No, there is not so much syphilis. I have this information from the two inspectors, Sir George O'Farrell and Dr. Courtenay, and from Dr. Woods, the medical inspector of perhaps the largest asylum outside Dublin, that is, Cork Asylum. I am told that it is very seldom that they put down syphilis as a cause of insanity. That is not the case I believe in England. Of course general paralysis of the insane is incurable, and it is frequently caused by syphilis.

12692. There is not such a large proportion of cases of that kind?—No. There is one cause which the inspectors lay very great stress upon, and that is heredity.

12693. A lunatic taint which is transmitted?—Yes, they nearly always can trace it back to the father or grandfather—or uncle or aunt—or somebody in connection with them. There is a history in these cases.

12694. Lunatics then are not inclined to be sterile?—No, I should not think they were.

12695. Why do you think the death rate is so low amongst Irish lunatics?—It is due to the cause of insanity and to the great care taken. Of course they get the same care in England. I have visited English asylums as well

as Irish asylums and it appeared to me that the arrangements were very much the same. I do not think the Irish asylums as regards care and equipment are one whit behind the English asylums.

12696. Is it the case that insanity in England is more closely associated with bad physical condition than it is in Ireland?—Perhaps it is so. They say that figures are able to prove anything.

12697. It is to some extent the outcome of degeneracy?—I should think so.

12698. You affirm what others have said as to the increase of lunacy in Ireland being largely due to the flow of emigration?—I do, because, as a matter of fact, it is only the robust members of the family that ever leave the country.

12699. The laws in the United States make it impossible that the others should go there, do they not?—They do; they send them home.

12700. And the shipping companies will not embark them for that reason, because of the risk of having to bring them back?—Yes, and they have to be medically examined. Of course it is natural that when the weaklings are left behind the existence of life is more keen.

12701. And you attribute something of it to the excitable and nervous temperament of the Irish race?—Yes, they are very excitable.

12702. They are easily thrown off their balance?—Yes, very easily. The Irish people in the rural districts do not drink continuously, but fairs occur frequently—they occur every week in different parts, and although the people may not attend them always, yet when they do they generally have a very big bout of drink.

12703. (*Dr. Tatham.*) I think it is your opinion that the question of physical deterioration very much centres round that question which you have illustrated in detail, namely, the question of the housing of the poor?—Yes, that is my strong opinion, and next to that I think that the food comes in.

12704. But you put the housing of the population as the first cause?—Yes, I would.

12705. You have spoken of the attempts which the Corporation of Dublin have made from time to time to improve the condition of the houses, and you have mentioned the enormous cost of so doing, as compared with your own experiment in connection with the erection of dwellings in Somer Street?—Yes, and Werburgh Street. That is the place which we bought, which was already built upon.

12706. Your private improvement scheme?—Yes.

12707. You think that in the direction of private improvement schemes rather than of schemes carried out by the municipal authorities lies the greatest hope of the improvement in the housing of the working classes?—I say it can be carried out on more economical lines. Both have the same object in view, but if I had £50,000, as a private individual I could do more than if I had £50,000 coming from a municipal body. When you want to buy a property the price goes up immediately for a municipal body, whereas in the case of a private individual nobody knows what you are purchasing for; you do not give them any information till the purchase is completed. I gave you an example, which I think is a very striking one, that for the same amount of area the Corporation of Dublin had to pay £36,000, whereas I, as a private individual, bought the same amount of area for £2,020, quite in the same part of Dublin, and quite as necessary. It is in a part of Dublin where the poor do congregate and where the artisans require dwelling houses.

12708. Does the experience of the Dublin Corporation go to show that although houses may be provided for the very poor it does not at all follow that the very poor get into them?—They do not get into them, because the Corporation naturally try to get as much rent as they can to pay the interest on the borrowed money. Most of the money is borrowed from the Board of Works, or on Government loans, and they pay the interest and capital at the same time, and if they get in a certain class of people who are unable to pay, of course they get nothing out of it, and they have to go to the expense of going to the Police Court or the Recorder's Court, as the case may be, to get them evicted. In any case they are generally three weeks without rent. They give notice and before they can bring them to trial three

weeks are lost, and therefore they lose the rent for this period of time.

12709. Have you in Dublin any organisation for domiciliary visits among the poor?—Only charitable ones. There is a Catholic Association called the *Vincent de Paul*. It is a kind of room-keepers' society. The poor people make applications for charity, and before any money is granted some member of the Committee makes visits and sees exactly whether what has been stated is correct or not as regards their poverty. Of course every gentleman round this table knows that there is a great deal of imposition in the disposition of charity—there is a great deal of misrepresentation, and very often people get charity who have no right to it, and a great many people who have a right to it do not get it.

12710. Are you aware of the work which, for a good many years past, the Ladies' Health Society of Manchester has been doing amongst the poor?—Yes, but that has not been adopted to the same extent in Ireland. Ireland, naturally, is a queer place. We have two troublesome questions in Ireland—I would not like to go so far as to say we would be better without both—they are religion and politics. They strongly come in the way. If a Protestant organisation starts the Catholic community probably feel that perhaps their own organisation should assist them, and *vice versa*. I could say a great deal more, but you can easily understand this is a rather burning question to enter upon, and I would prefer not to do so.

12711. In your dispensary practice you spoke of the prevalence of tuberculosis?—Tuberculosis is very common among the shop-girls. They seem to suffer from tuberculosis.

12712. Of the lungs?—Yes, mainly.

12713. Something like three deaths in every thousand of the population?—Yes; I believe that is correct.

12714. It is very high?—Yes.

12715. Very much higher than in England?—Yes, I know that.

12716. With regard to the mesenteric form of tuberculosis amongst children, is that very common in your experience?—No; I got our Resident to give me a few particulars. In the Children's Hospital, out of 258 cases, this is how they run: tubercular meningitis, five cases; tubercular glands in the neck, twelve cases; tubercular disease of the knee, five cases; tubercular disease of the foot, twelve cases; tubercular disease of the hand, four cases; and tuberculosis of the lungs, six cases. All the others were of course the same disease, only in different places. Then there is rickets—twenty cases of genu varum and genu valgum, that is knock-knees and bow-legs, which are common things amongst children. We generally call them rickets.

12717. (*Chairman.*) Owing to soft bones?—Yes.

12718. (*Dr. Tatham.*) Very largely due to improper feeding, I suppose?—Yes. There is a point about that which I know is not accepted by chemists and physiologists, but I believe it thoroughly, although I cannot prove it—that is that where cities are supplied with water which does not contain much lime, deformities of the lower limbs in children are much more prevalent. You know the water supply of Dublin is very good. It comes from a place nearly forty miles from Dublin, and after coming so far there is very little lime in it. Sir Charles Cameron does not agree with that; he says it does not make any difference whatever. I do not know what the Glasgow water is like.

12719. (*Chairman.*) There is very little lime in that water.

12720. (*Dr. Tatham.*) It is distilled water practically? I had it from Sir William MacEwen that the deformities of the lower limbs in Glasgow are very prevalent.

12721. (*Chairman.*) They were, but we had evidence that they had diminished; in fact it was said that rickets had almost disappeared in the last twenty years.

12722. (*Dr. Tatham.*) In spite of the fact that the water contained no lime?—Then, probably, we must look for some other reason.

12723. With regard to typhus. I have no doubt in earlier days you had a good deal of experience of that?—Yes.

Sir
L. Ormsby.

Sir
L. Ormsby.

12724. Is that in your judgment becoming rarer in Dublin?—I think so. We have a good deal of typhoid fever in the autumn in Dublin, but I do not think myself that it is greater than it was: I think it is somewhat less.

12725. I am speaking of typhus?—I think typhus is fast disappearing.

12726. Twenty years ago it was otherwise?—Yes. I do not know when I saw a case of typhus last. I do not remember. It is certainly very seldom in the last ten years. I remember when I was clinical clerk to the late Dr. Stokes typhus was a very common thing—that was thirty-five years ago. I thought you were referring to typhoid.

12727. Unfortunately in certain parts of England we are not quite so successful. There is typhus, at times, in Liverpool, as you know?—Yes.

12728. You spoke just now of pneumonia as existing in certain institutions; do you refer to the epidemic form of pneumonia?—No.

12729. The infective?—No, I do not refer to that.

12730. The ordinary?—The ordinary pneumonia, which comes on from various causes—insufficient clothing in severe weather. What I was thinking of was the little paper boys who go about barefooted.

12731. Bronchial pneumonia?—Yes.

12732. Then you spoke of drunkenness among the women. Do you think that is rather increasing generally amongst the population?—I do. I think among the ordinary Dublin artisan class that is so. It is more in their case than in the case of the labourers, because, as I said before, the labourer and his wife have not much money; they must pay for a certain amount of food, and they must pay their rent. A man goes round every Monday for his rent, and if he does not get it he gives them notice to go, so that they have to put that by first. No matter what they drink on Sunday they must have the Monday's rent ready. I do think that the women drink perhaps more than they did.

12733. That probably is one cause of the increasing neglect of children?—Yes, I think so. I think that is really the bed rock of the whole question, the care of the growing young.

12734. And you spoke of the feeding of children as being, in your judgment, the cause second in importance?—Yes.

12735. Do you think that, as a matter of fact, children get practically no sound milk at all—I mean children of the working classes?—They get very little.

12736. And such as they get is not what we call whole milk?—No, I do not think it is, because, first of all, I think it is stale when they get it—it is not fresh.

12737. It is decomposing?—More or less, and you could not tell how long it has been there notwithstanding the necessary inspections and analysis of it by proper authorities.

12738. Is a good deal of it separated milk?—Yes. I do not know whether you gentlemen are aware that there is a great deal of what they call creameries in Ireland now. They are establishing them all through the country. It is very interesting to hear the different opinions. One set of people say it is the salvation of some of the country districts; others again say it is the ruin of the country districts. Now the salvation of the country districts is this, that they get quick money for their milk—they get it at once when they leave it at the creameries. And where the ruin would arise is that they get back the skim milk devoid of all the important constituents that are so useful for development and nutrition. They get back this skim milk which is really useless to feed children or even young stock—even pigs.

12739. And it is upon this wretched stuff that the poor children have to live, if they live at all?—That is all they get.

12740. There are some valuable chemical constituents left in it are there not.

12741. (Dr. Tatham.) Yes.

12742. (Mr. Lindsell.) It is the separator which has done it?—Yes.

12743. (Mr. Struthers.) If it were taken along with other foods which contain the constituents which are lacking in the milk it would be useful?—Yes.

12744. (Dr. Tatham.) That is practically the only food they get?—Yes, they may have potatoes with it.

12745. But without fat—that is the important thing?—Yes, they want fat.

12746. With regard to cancer, is that increasing in Ireland or not?—I think it is increasing. I have no reason to know it more than the statistics that have been published by the Registrar General. He mentioned Armagh as the county where it is most prevalent. In reading over that report, and the individual testimony of different medical officers, I really could not come to any definite conclusion as to whether Armagh was the county in Ireland which suffered most from cancer, or not. Some people say it is owing to the dampness of the situation in which the houses are built and so forth.

12747. Do you, as a hospital surgeon, notice that cancer is increasing?—No; as a hospital surgeon I can say there is always a run of cancer cases, but I cannot say there are more than there were. I am a member of the Cancer Commission here in London, and I know from statistics collected from the three countries that the view which is now held is that it is increasing and that there are various reasons for it.

12748. Do you know whether it is increasing in England?—Yes; I know it is. It is perhaps due to the mode, the anxieties, and the struggle for life being much greater. I think mental reasons help in the production of cancer. It does not seem to me to refer to one social class; it seems to affect all classes.

12749. (Chairman.) You do not think it is due to a purely parasitical growth?—That is a doubtful question. I do not know what is the cause of it. I could not give any opinion about it, because so many different views have been put forward and have been given up.

12750. (Dr. Tatham.) Is the death rate in Ireland decreasing? It is scarcely fair to ask you that perhaps?—I do not know, but *this* is the list of births and deaths in Ireland for 1903. (Document handed to the Chairman.)

12751. With regard to the attendance of children at school, do you think that to any large extent children attending school do so insufficiently fed or half starved?—Yes; I think they are insufficiently fed.

12752. Is there any organisation by which young children can be fed in the school?—No, I do not think that in our schools there is. I think it would be a very good thing if it were arranged.

12753. There is no voluntary arrangement?—No, there is no voluntary arrangement, as far as I know, in Ireland at the present time. But I have often thought it would be a very useful means if the school rates or school funds could be applied in that direction.

12754. At present, I believe, they cannot?—I believe they cannot.

12755. As a surgeon you think that if you insist on the children being educated they ought to be fed?—Yes; never mind where they get the means. They certainly cannot work in a hungry state—none of us can.

12756. (Mr. Lindsell.) I think you mentioned two or three times the little paper boys?—Yes.

12757. Is street trading very marked in Dublin among the very young?—Yes, it is; but the Dublin Corporation have lately got powers through some bye-law to limit it.

12758. There was an Act of Parliament passed last year dealing specially with that subject?—Yes, and they are now putting it in force. I think it would be a very good thing indeed if it could be so done. Anybody on a winter's evening, say about December or January, could see these wretched little boys, half-clad and hungry-looking, selling their newspapers in the streets; of course they sell other things besides.

12759. Matches, and so on?—Matches principally. Of course the selling of matches is merely a means of evading being taken up by the police for begging. The matches are only humbug; they do not want to sell them. At least they offer matches to ladies who do not generally require them, but that is merely to say that they are trading. They do it for begging purposes.

12760. There was no attempt beforehand to regulate the sale of newspapers, and so on?—No.

12761. But they are going to adopt this Act?—Yes.

12762. (*Colonel Onslow.*) Mr. Legge, who has had to leave, asked me to ask you one or two questions. You are in favour of re-housing of the very poor being left in the hands of private persons? Would you see any advantage in the supervision of such associations by a public authority, such supervision being in co-operation and not as a check?—As a matter of fact, inspectors inspect our dwellings just in the same way as they do the corporation dwellings.

12763. You would welcome assistance from them?—We are only too anxious; as a matter of fact the medical officer of the district only met me the other day, and he said: "By the way, I was very pleased in going through those houses belonging to your association; they compare most favourably with other parts of my district." "Oh, yes," I said, "I am glad you went round." He said: "Of course the corporation officials go round as well, and I always find the more inspectors we have the better." Now, I remember the Dublin hospitals forty years ago, and the appearance of the equipment of all the hospitals in Dublin, with no exception whatever, are all wonderfully improved. I believe it is due to those various inspecting bodies: each body going round suggests some little thing, and that is brought before the managing committee, and then these things are carried out. In the same way, if Sir Charles Cameron, as the chief executive public health officer, would suggest to our association that such and such a thing was necessary, it would be brought before our committee, and we would naturally comply with it, because our anxiety is to have these places as an object lesson to other institutions, and the more perfect we make them the more natural would it be for extension to take place in other directions. And furthermore, as we are a purely charitable body—at least we are a charitable and business body, as anybody who likes can take shares in it for £1—and all who subscribe for our shares we should be glad to welcome. We are only too anxious to increase our list of shareholders.

12764. Would you welcome arrangements whereby a private association such as yours could borrow money from the public authorities on easy terms?—Yes; we are about to borrow money now from the Board of Works.

12765. Mr. Legge has another suggestion, that another method of securing such assistance would be a grant on easy terms from a public authority of sites on which private associations could set to work; what do you think of that?—I think it would be a very admirable system. Clontarf, one of the suburbs of Dublin, has lately been annexed to the city area of Dublin, and the Corporation have some ground there. We stated to the Corporation, "If you will give us that ground rent free, or for one shilling a year, we will, as we progress, place dwellings upon it." We will do that if they give us a practically free site, but we cannot make it pay financially if we are to pay a large sum for the site. In fact in these schemes, which have been carried out in the large towns of England, say, Liverpool, Birmingham, and Manchester, the purchase of the site for a large amount has prevented them making such projects a financial success. If they get the site free, or nearly free, I have not the slightest doubt that they could do an enormous amount of good to the class who require help in this direction, and make them pay the municipality or whatever body took it in hand.

12766. I should like to ask one or two questions on my own behalf. I see that you say in your *precis* that means should be taken to prevent young boys of tender years from smoking and drinking. I should like to have your opinion of the effects of smoking on boys of tender years; we have heard some rather different opinions. Some say that it has not a large effect, but that it would be better that they should not do it?—Everything helps, no matter in what degree. I have no objection to smoking, although I do not happen to be a smoker. Twenty years ago I threw a cigar out of my mouth and said I would not smoke again. Nor have I done so. But I do not object to it. But I do object to a growing child smoking. I do believe that it has some deteriorating effect, but I cannot tell in what direction.

12767. You agree with the general idea which was prevalent some years ago that no young boy should dream of smoking?—Of course smoking is very much more practised now. You see gentlemen smoking in the street, which was never done twenty years ago. Now it is a common thing. You seldom see anybody walking about without smoking either pipe, cigar, or cigarette.

12768. With regard to quite small boys, you hardly ever saw them smoking twenty years ago?—Hardly ever.

12769. You think that smoking, especially this shocking bad tobacco and cigarettes of all kinds, is deleterious?—I think that cigarette smoking has assisted degeneration. It is not pipes which these boys smoke, but it is generally the butt ends of cigars, which other people throw away.

12770-71. Then you say that you consider drink, especially amongst women, is greatly on the increase; I suppose that has only increased in comparatively recent years. It is surely less than it was 100 years ago, is it not?—I do not know. I think drink is cheaper. I think porter is cheaper. The poorer class in Dublin drink an enormous quantity of porter. We have got the largest brewery in the world in Dublin, and the people certainly help to make it larger.

12772. (*Colonel Onslow.*) Would not the general condition of the vast population of a city like Dublin be a great deal better than they were 100 years ago?—I do not think they are much. There is a great deal of migration from the country to the city, and I do think that drinking among the lower classes has increased. I have no means of knowing, because I cannot compare them with what they were 100 years ago.

12773. We have no statistics?—No.

12774. The only thing we can go by is accounts of it, stories really, and pictures?—Yes.

12775. And the general impression which one has received?—Yes. I should say that drinking among the lower orders has increased. That is my opinion. The reason which I base that upon is that I see it very generally adopted in all classes. Where there is poverty I generally find that drink is somewhere about in connection with the family. Then I think the drink is cheaper. Porter is very cheap; you can get a glass of porter for a penny.

12776. (*Mr. Lindsell.*) Do you look upon porter as a great intoxicant. Is not the injury arising from drink rather more from the alcohol contained in it—from spirits?—Quite so. But, as a matter of fact, I would say that country people drink more whisky and the city people drink more porter. I know that the percentage of alcohol in the porter is very much less than the alcohol in the whisky. I mentioned here that it is bad whisky. If they drank good whisky it would be different. It is a matter of very great regret to me that good Irish whisky does not seem to come to England at all. If you drank good Irish whisky you would never drink Scotch whisky. In Ireland the lower order of Irish do not care for whisky unless it has what they call a "bite" on it. It must have something to catch their throat. I suppose it is whisky containing all kinds of impurities. But in towns, particularly in Dublin, porter is the staple drink of the lower orders.

12777. And what they get drunk on?—Yes; it is wonderful what capacity they have. I had a man in hospital with a broken leg—he broke it when he was drunk. He said: "I was having a pint when I broke my leg." I said, "How many pints did you take?" He said, "I drank about ten pints." Porter is a very nutritious thing in reason; in fact, it agrees with invalids. I would sooner order porter than many tonics, and it is very cheap.

12778. Do you include tea in these deleterious drinks?—Of course the tea they drink is stewed tea. All the Irish are very fond of tea.

12779. Some people attribute the increase of lunacy to the increase of rank tea that they drink?—I do not know about that.

12780. (*Mr. Struthers.*) I understood in Ireland that they were particular about their tea, and that they only bought expensive tea?—Yes; the very best. That is a very peculiar thing, that even if they are hard up they will give the best price for it.

12781. What do they do with it; do they brew it?—Yes; they stew it on hobs on the fires.

12782. I see you are of opinion that religion has some thing to do with lunacy?—Yes. The Irish of a certain class are a very religious race, and sometimes they get imbued with religious delusions. I have met with a good many such cases.

12783. You perhaps think that this strong composition of religion, which is one of the great features in Ireland,

Sir
L. Ormsby,

Sir
L. Ormsby.

may have something to do with the increase of feeling and consequently increase of lunacy?—I daresay that might be so. Drink and hereditary causes are the two principal causes. If there is a great increase of lunacy in Ireland it is due to temperament.

12784. What you said about so many of the lunatics having relations who are afflicted suggests that inter-marriage may be a cause, does it not?—Yes, but I am informed by the higher clerics of the Roman Catholic Church that they prohibit it wherever they possibly can, but when people want to get married they have a way of eluding those kind of things; they go to another parish. The Catholic Church clerics have a wonderful power for good over their own people. The people will be guided by their own priest when they will not be guided by anybody else. I will give you an example. There is a large saw-mill and other machinery works with which I am connected—the Dublin, Wicklow, and Wexford Railway Co.,—to which I am consulting surgeon, and very frequently accidents occur there. A man comes into hospital with a leg or arm seriously injured. I say, “I am very sorry, but that leg or arm will have to come off.” He says, “I will not have it off.” Then I say, “Will you sacrifice your life and your limb too?” And the man replies, “I do not care, I won’t have any operation done.” I say to the house surgeon, “Send for the priest.” There is a rule of the Church that you must not perform any serious operation without the ministrations of a clergyman. The priest comes, and I say, “Father So-and-So, this poor fellow has got a mangled limb and it will have to be removed, otherwise he will lose his life.” He goes in and talks to the patient, and presently he comes out and says “All right, go on.” The man does whatever the priest says. It saves time. We always use that precaution. It is a very serious thing for a man to realise who the minute before was all right and then, as the result of an accident, has a mangled limb; it comes so quickly that he does not like to lose a limb. In that way the clergyman always has more influence than the medical man in advising the necessary operation to be performed.

12785. We had from one of the clergy themselves, the Bishop of Ross, the fact that this taint of lunacy is very wide-spread, so many families have it?—Yes. I believe that is due to hereditary causes. I think that heredity has a great deal to do with the production of lunacy.

12786. I see you agree with the common opinion that it is the able-bodied and enterprising who emigrate?—Undoubtedly.

12787. You have never made any inquiry yourself on the subject as to the kind of people who did emigrate?—Oh yes, because I know as a matter of fact that they cannot emigrate unless they are examined by medical officers; I know that shipping companies will not take them.

12788. That secures a certain minimum, no doubt, but my own experience amongst certain rural districts in Scotland is that it is not the most enterprising who emigrate, but those who fail at home?—Yes, but you know emigration either from England or Scotland does not compare at all with Ireland, because there are very much fewer classes in England and Scotland emigrate compared with Ireland. Nearly everybody emigrates from Ireland in a certain class, at least one member of a family. You often say, “Where is your sister?” “She is in America.” “Where is your brother?” “In America.” Nearly all go to America.

12789. It is very common throughout the country?—Yes.

12790. Of course there can be no question as to the propriety of feeding the school children if you are going to give them any education at all. But is it not equally important to feed children who are not at school?—Most certainly.

12791. Might it not be desirable to secure that the children who are not at school should have food as well as those who are?—Certainly.

12792. To provide for the better feeding of infants for example?—Yes. I believe that is the cause of the question which you are now investigating—the want of care in the feeding and the want of care in every possible way of the young. I am a New Zealander by birth and I was there till I was fourteen, and my remembrance of the young colonials is this: There is no poverty there, none whatever. Everybody can get enough and plenty to eat of what is good for them. Living an outdoor life as they do the youth there become as strong as a horse. I am told by medical officers who saw the New Zealanders that went to the South African War that they were the finest body of men which came from any country.

12793. The point I want to get at is this: However important the feeding of school children may be we must not regard that as the whole problem: it is only one aspect of it?—It is only one aspect of it.

12794. Because if you allow those children who are underfed to be away from school they would not be any better off?—No, they would probably be better off at school if there was feeding going on.

12795. If they were at home or playing about the streets they would be exerting themselves physically or mentally probably as much as at the school?—Yes.

12796. Probably they are more at rest at school?—With regard to sitting at a desk, I believe that is a cause of spinal curvature.

12797. That is another question:—Until we have a better system of posture for school children I believe that poring over desks has a contracting influence. I have often examined their chests. I have not gone very particularly into the question of physique, but I look generally at the height, weight, and chest measurement as three very important points in the physique of a child, and I must say that those who are always at a desk are more likely to have contracted chests.

12798. You will be glad to know that a system of physical exercise for schools has now been proposed, in which the attention of the teachers is very strongly drawn to this point, of the position of the children when at school, if they are sitting at desks at all, as well as a recommendation that they should be as little at the desk as possible?—Quite so. I believe that long continued posture in one position is very productive of various spinal distortions.

12799. (Chairman.) There is one question I wish to ask you with regard to the birth rate. Do you think from your experience of Ireland that there is anything in the idea which has been represented to us that there is a tendency among the superior stocks of all classes towards a diminished rate of reproduction?—I do not believe it. I know what you are alluding to, but I do not believe in Ireland it is adopted to any great extent.

12800. Is it not so?—No, not at all to the same extent as adopted in other countries. If suggested the people would generally refuse to use any means, because it would be “against the tenets of their Church.” I believe that the well disposed classes, as a rule, would not adopt any means for the prevention of children.

12801. You do not think the families of the better stocks of all classes are diminishing?—No.

12802. (Dr. Tatham.) Reverting for a moment to a point Mr. Struthers put to you just now, you expressed the opinion, in which we all agree with you, that it is very necessary indeed that young children should be well fed under any circumstances?—Most assuredly.

12803. But the question I want to put to you further is. Do you or do you not think that it is more necessary that a child who is to be subjected to the ordinary process of instruction should be well fed?—I do.

12804. That is the point?—I remember hearing an address from Lord Wolseley when he said that he would far prefer children to be ignoramuses, as regards their brain work, as long as their bodies were improved in the same ratio. I would sooner see them with a good physique than tadpoles—all head and no body.

TWENTY-FOURTH DAY.

Monday, 2nd May, 1904.

PRESENT

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Mr. ARTHUR H. CHEATLE, F.R.C.S., called; and Examined.

12805. (*Chairman.*) You are Assistant Aural Surgeon to King's College Hospital?—Yes.

12806. And Surgeon to the Royal Ear Hospital?—Yes.

12807. Where is that?—In Soho.

12808. Have you given special attention to the subject of ear disease as evidence of degeneration?—I made this examination in 1902 with the express idea of bringing the matter before the public and before the Education Board.

12809. This examination of children at Hanwell?—Yes.

12810. Of course they are *ex hypothesi* of a degenerate type?—Many of them come from the worst districts of London.

12811. They are children who from birth have suffered from such causes as are probably degenerative in their character?—Yes; those in the "Main School" come from Southwark and the City of London, while those in the "Ophthalmic School" are drafted from the Poor Law Schools all over London.

12812. Is that at Hanwell too?—Yes. One is called the Ophthalmic School and the other the Main School. As a matter of fact, there is not much difference in what was found. There was just as much disease in the children coming from all parts of London as those coming from the City of London and Southwark in the Main School.

12813. There is a good deal of connection between eye and ear disease?—A certain amount.

12814. There is one particular type of disease which is called *retinitis pigmentosa* of the eye, which is associated with deafness, is there not?—No, *keratitis*, due to syphilis.

12815. Not *retinitis pigmentosa*?—Not often.

12818. Mr. Tweedy attributed the amount of *retinitis pigmentosa* he found in children from the rural districts to the effect of intermarriage there?—Oh yes, that is so.

12820. What do you say as to its connection with deafness?—It must be very slight, but there is a definite eye trouble which is due to syphilis, interstitial *keratitis*. They get complete deafness from interstitial *keratitis* in the eyes, and a very bad form of deafness indeed.

12821. You appear to discover the principal cause of deafness in adenoids?—It is one of the very greatest causes.

12822. What is its origin?—It is an enlarged tonsil at the back of the nose.

12823. Why is it so prevalent now?—It is extremely difficult to say. I doubt if it is more prevalent now than it was some years ago.

12824. You do not think so?—No. We have evidence from pictures that it was prevalent in the times of the Old Masters.

12826. You know that the contraction of the jaw which you speak of was prevalent in those days?—Yes; and the open mouth, the dropped jaw.

12826. I suppose it is as a rule congenital?—Some children are born with it; that is to say, they are unable to take the breast because they cannot breathe, but with others it seems to come later on, about one year or two years old.

12827. Is that due to environment?—It is difficult to say, because adenoids are very frequent among the upper classes.

12829. You are not in a position to form any opinion as to what the causes are, nor is the profession?—No, not as to why these tonsils should become enlarged. Of course we are hampered by the fact that it is almost as common among the upper classes, in fact quite as common, where children are in healthy surroundings, as among the poor.

12830. So that you are not disposed to say that it is a thing which should be associated with degeneration?—No; my idea is that it was quite as prevalent years ago as it is now.

12831. There is only one way of treating it, and that is by removal?—Yes.

12833. (*Colonel Fox.*) When you refer to the pictures of the "Old Masters" you mean that they painted people whose mouths were open?—Yes; you see evidence of it in the portraits.

12834. The mouths are open or the jaw dropped?—Yes; it is the same thing, the mouths open and the jaw dropped.

12835. (*Chairman.*) You found only a very small proportion of those you examined in the Hanwell School where the trouble was not due to adenoids?—Yes.

12836. What are the effects which you trace to adenoids?—First of all, the mouth-breathing, with all its attendant evils.

12837. That means want of expansion of the lungs?—That is one thing.

12838. Want of proper oxygenisation of the blood?—Yes; contracted chest, stunted growth; they are stunted both intellectually and physically. Of course the nose is meant to filter and warm and moisten the air which is breathed in, and if they breathe through their mouth those various things do not happen.

12839. There is vulnerability to infection also?—Yes.

12840. Therefore it may be a fertile source of zymotic disease?—Yes; and then they get facial deformity.

12841. That reacts upon the teeth?—Yes.

12842. And then they snore during sleep?—No, it is more than that; they have disturbed nights.

12843. It affects them too?—Yes.

12844. (*Colonel Fox.*) It means if they breathe cold air through their mouths it has a bad effect upon them?—Certainly; air which is unwarmed, unmoistened and unfiltered.

12845. (*Chairman.*) Do you notice special mental deficiencies connected with these people?—Yes, that has been brought out by Dr. Thomas Barr, of Glasgow. I quote it in that small book of my own which I have put in. There is a marked difference intellectually between those who are deaf and those who are not. Then also Dr. Permewan, of Liverpool, has worked on the subject. I did not work at it from that point of view in Hanwell. Dr. Thomas Barr, of Glasgow, in his Report found that in 140 there were twice as many with defective hearing among the backward children as among the forward children.

12846. That was due to adenoids?—To deafness, defective hearing. Of course adenoids is a fertile source of deafness.

12847. I suppose that would be naturally the case—a deaf child does not receive and register the same number of impressions?—I think it is more than that. They are dull mentally.

12848. You think they are actually dull mentally?—Yes.

Mr. Cheatle.

Mr. Cheate. 12849. It is not merely that their minds are deficient through want of exercise?—No, they are dull mentally, as well as being unable to receive stimuli.

12850. The only remedy is the removal of the adenoids?—Quite so.

12851. You think that with a view to the discovery of these cases among the young some sort of medical inspection of schools is almost essential?—Yes.

12852. Are the tests of defective hearing and the signs of ear disease such as in the first instance the teacher might discover with a little training? Of course you want medical supervision in the background, but could you trust the teacher in any large number of cases to form a *prima facie* opinion?—Some of these cases are only commencing, and they would not be detected by the teacher.

12853. Would not there be signs which would suggest it to the teacher?—There may be a discharge from the ear, and of course the deafness in class and the dropped mouth could all be recognised by the teacher.

12854. Features of that sort could be recognised?—Yes.

12855. But there are more occult conditions which would require medical examination?—Yes. For instance, a child with malignant disease at the back of his nose presents very much the same appearance as a child with adenoids.

12856. That is so, is it?—Yes. There are other causes of nasal obstruction besides adenoids which they would not recognise. And the same with diseases of the ear; there are some causes of deafness which want very careful examination from many points of view before we can come to a determination as to what is the real cause of the deafness.

12857. Would an ordinary medical practitioner be qualified to form an opinion on any of these cases?—He must have a special training in diseases of the ear.

12858. That does not, I suppose, form part of the ordinary medical practitioner's training, does it?—In the New University of London they put it in the curriculum that every man shall attend a course of aural surgery.

12859. That would so far qualify a man?—It is difficult to say, because they are not examined in it.

12860. They are not examined in it?—No; they get perhaps a question now and then in their examination for their degree, but they are not thoroughly examined in ear disease.

12861. It would complicate the matter very greatly if you had to have a specialist for every form of special ailment?—That would be unnecessary I think. Of course we have it at the hospitals.

12862. But I mean on your educational staff?—I think it would be quite enough if a man had been through a thorough course of aural surgery. He need not necessarily be a specialist, but he must be able to separate one disease from another.

12863. In appointing a medical officer to supervise the schools, the authority which appoints him should have regard to his qualification in that respect?—Yes, and also with regard to the eye.

12864. So that you would want no specialists?—No, but specially trained men. The skin also is an important thing.

12865. How do you propose to educate mothers up to the standard of requirement which may prevent some of these maladies or weaknesses developing themselves in their children?—It has been proposed to do it by popular lectures. I think that is a very difficult thing. I think the principal thing is to educate the child at school.

12866. You cannot compel people to attend lectures?—No, it is very difficult.

12867. And the child is very apt to forget what it learns at school?—Yes, but something sticks.

12868. Do you not think that by domiciliary visits of properly qualified persons like the ladies connected with the Manchester Health Society it might be done?—

12869. That is perhaps the best way of bringing home the knowledge to them, and a system of health visitors

might be organised in connection with the sanitary supervision of the local authority?—Certainly.

12870. And that would probably be a more effective way of bringing home to mothers what are the proper conditions than any other?—Certainly.

12871. I suppose from what you know of the effective teaching of hygiene in elementary schools you are not prepared to attach much importance to it?—I do not know.

12872. Children leave school at fourteen and girls do not become mothers till eighteen or nineteen at the earliest?—They might be taught to keep the windows open and so forth.

12873. The general idea of what are healthy conditions might be instilled into them?—Yes.

12874. (*Dr. Tatham.*) Do you think that if it were a system practically part of the law of the land that every child should be examined at least on entering the school, they would then be able to get hold of the cases which might benefit from treatment?—Certainly.

12875. Even although subsequent medical examinations might be at long intervals; it would be a great thing I take it, from what you say, that they should be at any rate examined on their entrance to school?—Certainly.

12876. In that case you might probably detect some of the cases which are beginning?—Yes, and those cases of adenoids would be detected.

12877. You would very likely save the hearing of the child?—Yes, and the life too, not only from the ear point of view, but from tubercle and various other things.

12878. In fact you would regard that as a very desirable thing to be brought about?—Yes.

12879. Is it your experience that syphilis is increasing?—I am not prepared to say that. I see the effects of syphilis in a very fair number of cases in children, but I have no data to go on to say it is increasing.

12880. Mr. Tweedy was asked this by the Chairman, "Do you include syphilitic diseases of the eye under that?" and he said: "I think there are fewer and certainly less severe forms of syphilitic disease of the eye than there were twenty-five or thirty years ago. I do not mean to say that there is less syphilis. I do not know?"—Quite so.

12881. (*Chairman.*) Should you say that there was less disease of the ear attributable to syphilis than there used to be?—No, there is no difference at all.

12882. But there is not more?—There is certainly not more.

12883. (*Mr. Lindsell.*) I suppose these diseases, such as adenoids and so on, are constitutional to a great extent; they are not necessarily caused by bad surroundings?—No, they are not necessarily caused by bad surroundings, because we see that condition very much in the upper classes and in the middle class as well.

12884. The real point is that when they get to the age when they can be examined, like the school age and so on, they ought to be immediately brought under remedies?—Certainly.

12885. There should be greater facilities for obtaining remedies?—Certainly.

12886. How far would the education of children in the laws of hygiene and good air and so on affect the question?—I imagine these children would become fathers and mothers in their time, and then they will remember something of what they have been taught at school as regards fresh air, etc.

12887. Fresh air would not prevent a child having adenoids?—Not at all; I was answering the question from the general health point of view, because the poorer classes always have their windows and doors shut, both in the country and London, and they cannot be healthy if they do not have fresh air.

12888. If they attended to the laws of health in that way that would produce a better general state of health in their offspring?—Yes.

12889. And would therefore indirectly tend to decrease the tendency to these special nose and ear diseases?—Yes—cleanliness and fresh air.

12890. (*Colonel Onslow.*) With regard to the competence of ordinary medical men to detect diseases of the ear, I presume that medical men, like the officers of unions, must have a great deal to do with children and must be constantly coming across these things; would not they therefore be competent to examine the children in the schools without any special training?—Many of them have had no training in ear disease at all, and perhaps do not know what to do when they see it. Nearly every student who passes through the hospital, either during the time that he is qualifying or after he is qualified, realises the necessity of being able to recognise and treat the ordinary forms of ear disease, and he goes back to his hospital or goes to an ear hospital and has a thorough course, and then he is in a very good position.

12891. It has been rather indicated that medical examination in schools on special points like the ear, the eye and the teeth, which will require special knowledge, would be reserved by an ordinary medical man, a man in general practice, in order to be examined by a specialist afterwards?—Yes. That should be so, if they were not quite able to determine it.

12892. If they had a suspicion. It would not be necessary for a specialist, say in the ear or the eye, to be appointed to examine all the children?—No, it would not be necessary, it would be a needless expense.

12893. It would be sufficient to have what you might call a general practitioner, and when he observed anything beyond him which he had suspicion of then he would refer it to a specialist?—Yes. But I should insist on the medical officer producing good evidence that he had been through a satisfactory course in eye and ear disease.

12894. And, in fact that he is a competent man to judge?—Yes; he would be then.

12895. I see you make a remark here in your *précis* on the public services; you say that they demand practically perfect hearing in both ears. Are you aware of the present recommendation with regard to the examination for the Army and Navy?—Do you mean the method of examination?

12896. Yes. Do you know it?—No, I do not.

12897. I presume an Army or Navy surgeon would be fairly competent to ascertain any defects in those respects, would he not?—From the point of view of defects of hearing they are able to distinguish quite well whether a recruit is able to join the Army or the Navy.

12898. Unless a discharge was present they would not be able to detect any internal defect in the ear?—Some of them would, because in the Medical Staff College they have to pass through a long course before they get their majority, and during that time they have to take up a special subject, and a certain number of men take up the subject of otology, diseases of the ear, and they have a very good course indeed. Some Army men are very well competent.

12899. And also the Naval men?—I do not know about them. The Navy has not quite such an elaborate scheme.

12900. No; they have not the opportunity really. They are always abroad practically?—They bring the medical Army officers home from abroad to go through this course.

12901. It would be a very good thing if they had the same system in the Navy?—Yes.

12902. (*Colonel Fox.*) Do you think that if young children were constantly taught to breathe through their noses instead of through their mouths at school during their physical training, and at other times, that would have a tendency to decrease the number of cases of adenoids? Do you think that if the nose were used in a proper way it would reduce the number?—It is difficult for many of these children to breathe through their noses at all; they are so blocked up by adenoids.

12903. When quite young?—Yes. It would be impossible to make a good many of them breathe through the nose at all. It would be cruelty to insist upon it. They cannot do it.

12904. The glands are always there in all cases?—Yes.

12905. Those glands are affected, I suppose, by breathing through the mouth instead of the nose?—Yes.

12906. Is not the best remedy for that to train up children to breathe through their noses?—It is a very important factor.

12907. And by doing so perhaps preventing that growth of the glands?—It is a very important factor indeed, but if the mass is very great, as it is in a great number of cases, you cannot make them breathe through their noses; it is a physical impossibility for them to do so.

12908. In a bad case?—Yes. It does have a good effect in slighter cases; there is no doubt about that.

12909. I ask that question because we have laid it down in the new code of physical training in schools that great attention should be paid to what we call breathing exercises, and they should insist upon children during the exercise breathing through their noses instead of through their mouths?—It is a very excellent thing.

12910. Do you think that would have a decidedly good effect?—Certainly.

12911. (*Chairman.*) What are these tests of hearing which could be applied by teachers most simply and effectually?—It must be done in a quiet room. The only way of testing children's hearing is not with the watch, because you always get contrary answers with regard to a watch, but with the voice, the whispered voice.

12912. The whispered voice is the best test?—Yes. That is the test that I used in examining the Hanwell children.

12913. That was the test which you applied?—Yes. Every child was placed at a distance of 18 feet away, and simple questions were asked in a quiet whisper, questions which they could easily understand and easily answer, with their eyes shut, first testing one ear and then the other.

12914. That is a plan the teachers might very easily adopt?—Yes.

12915. Do you think there are any forms of deafness which may properly be associated with the presence of degenerative tendencies?—I cannot answer that in the affirmative. I do not know.

12916. With regard to the cases of deafness which you traced in many of these children at Hanwell, you are not prepared to say that any of those were due to depressed environment except so far as they were the reaction from a bad state of general health?—That is so.

12917. It would tend to make some of these forms of malady worse?—Certainly. Of course, one of the things specially dangerous to health and life is the discharge from the ears.

12918. Is that a disease of syphilitic origin?—No; it is due to invasion of the middle ear by a specific organism, that is to say, the poison gets into the middle ear behind the drum.

12919. Where from?—From the back of the nose.

12920. It is traceable from the nose?—Yes, and it is a very common result of scarlet fever, diphtheria, measles and smallpox.

12921. Is it set up apart from the occurrence of disease of that sort?—Oh, yes; an ordinary cold may do it.

12922. And if neglected, what are the ultimate effects?—A certain number of lives will be lost.

12923. Does it permanently unfit a person who suffers from it?—Certainly.

12924. It acts both upon the mind and body?—Yes, certainly. Besides, they are deaf as well with it on the side from which they have the discharge coming. In some instances it is due to tubercle as well.

12925. It is easily treated?—Sometimes it is very easily treated. It only wants careful cleanliness and the removal of the adenoids, because they are an important factor in it too. Other cases want rather a severe operation to put them right.

12926. In point of fact would you be prepared to say that the existence of adenoids is at the root of 80 per cent. of the cases of ear diseases with which you are familiar?—It is a very great factor.

12927. And there is no means of saying what adenoids are due to?—No, except that it is an enlargement of the gland.

12928. Are any investigations being made with a view to tracing adenoids to their source?—We are always working at that, of course.

Mr. Cheate.

Mr. Cheattle. 12929. But your investigations have thrown no light upon it yet ?—Of course you get it in good surroundings and in bad surroundings, and it is difficult to say. Some of them are definitely tuberculous.

12930. But not a large proportion ?—No, say 5 per cent., perhaps, are tuberculous in origin. Adenoids seem to run in some families—all the children will have adenoids in the family. Perhaps it will be seen that the father or mother have suffered in the same way before them.

12931. We were told here that the practice of sucking india-rubber nipples led to the contraction of the children's jaws, the upper one particularly, do you think it has that effect ?—Yes, especially if they have adenoids.

Dr. LEWIS A. HAWKES, M.D., M.C., called ; and Examined.

Dr. Hawkes. 12937. (*Chairman.*) Will you kindly state your qualifications and what has been your medical experience ?—I am a graduate of the University of Edinburgh.

12938. And you have been in general practice in London ?—I had a number of years' hospital work.

12939. In London ?—I was a short time in the Birmingham General Hospital and in the Children's Hospital, and I was for some years at the Ventnor Consumption Hospital. Then I came to Fore Street to the Metropolitan Dispensary, before I really went into general practice in London.

12940. Are you connected with that Dispensary now ?—No.

12941. But you were for some years ?—Yes.

12943. How many years have you been in general practice since you left the Dispensary ?—About seven years.

12944. In Finsbury ?—Yes.

12945. Therefore you have had special opportunities of considering what the conditions of the people are ?—I have been in Finsbury really since 1891, because nearly the whole of my work lies in Finsbury itself.

12946. During the ten years that you have known Finsbury has the condition of things, as far as the whole of the people are concerned, grown worse ?—No, I do not think so. So many houses are being pulled down. Since I first went to the City there has been a great change. I used to look after streets of inhabited houses which have now all been pulled down.

12947. Were they streets of insanitary houses to a large extent ?—Yes, to a large extent.

12948. There has been a good deal of improvement in that way within your experience ?—Yes.

12949. Proceeding now to deal with the different periods of child life that you mention in the *précis*, there is a very large infant mortality in Finsbury still ?—Yes.

12950. You say that in 1903 the death rate of infants between one and five years old was 43·7 per cent. of the whole ?—Yes.

12951. I suppose you associate that to a large extent with the very large number of one and two tenement houses ?—Partly, yes.

12952. We have had some evidence with regard to that before. From some figures sent to me I find that in Finsbury the death rate per 1,000 in those houses was 38·9, and the rate among occupants of four or more rooms was 5·6, and of the whole borough 19·6 ?—That shows a very extraordinary condition. In the latter part of my *précis* I have explained partly what I think is one of the important reasons for the mortality.

12953. You attribute a great deal of the health of the new born child to the conditions of the mother's health ?—Yes.

12955. Has the number of mothers who suckle their children, or the period for which they are able to do it, diminished, so far as you know ?—I am rather afraid the number is diminishing. There is the tendency to give up suckling.

12956. I suppose in some cases that is a good thing, because the mother is not in a condition to suckle ?—Really it is, providing, of course, she is judicious in her feeding afterwards.

12957. But where a mother is capable and healthy, do you think that she is disinclined to do her duty in that respect ?—It partly depends whether she is going to work.

12932. It would aggravate the conditions ?—Yes.

12933. The tendency of the adenoids to become troublesome would be accentuated ?—Yes.

12934. (*Dr. Tatham.*) In the case of the 5 per cent. of cases of adenoids due to tubercle, do you find concomitant tuberculous disease of the lung ?—Sometimes, and tuberculous disease of the glands of the neck.

12935. It is not generally primarily situated in the adenoid ?—The idea is that it is—that that is the point of infection.

12936. (*Chairman.*) That is the original site of the tubercle ?—Yes. The nose is in an unhealthy state and renders infection more likely.

12958. Is there much married women's factory labour in London ?—Not to a great extent, but there is a great deal of work done at home. A woman before her marriage is perhaps employed in some kind of work, and after her marriage she goes and brings the work home.

12959. That should not interfere with her suckling her child ?—It takes her away from home, going backwards and forwards, very often.

12960. Should you say that the conditions which affect the health of the mothers in Finsbury from your experience are worse than they were, or less bad ?—The one great point about it is the drinking tendency.

12961. That you think is growing ?—I am afraid that is growing.

12962. Among women ?—Yes.

12963. That is a point about which there has been a little difference of opinion. Of course the judicial statistics do not bear that out, but that only means that there may be more drunken women who do not come under the cognisance of the police ?—There is more quiet drinking.

12964. I think Dr. Wigglesworth, who is an authority on the subject, says that pregnant women as a result of their condition are apt to take to drink ?—My own view, which I arrived at after working at it for some time, was that it was greatly due to dyspepsia—to a condition of chronic gastric catarrh.

12965. You mean they take it to give them a sensation of warmth and comfort ?—To relieve the pain. That is how it begins I think with many of them.

12966. For that you must go back to badly cooked food ?—Yes ; I have mentioned that.

12967. Both insufficient food, which is due to poverty, and badly cooked food, which is due to want of knowledge of how to deal with the material they have ?—Quite so.

12968. In that respect do you think the condition of things is worse than it was ; do you observe more ignorance in mothers of families now in regard to the preparation of food than was the case formerly ?—I do not think they are a bit better than they were.

12969. I suppose the immense number of tinned meats which are put upon the market rather tends to discourage them from getting a better knowledge—they can do without any considerable knowledge of cooking ?—I think everything depends upon the environment. If the woman lives in a house where there is apparatus to cook with she will cook ; but as in an enormous number of cases she has very inadequate apparatus, she can only boil or fry, and the surroundings and so on are such that it is impossible for her to cook decently. Then very likely she does not know how. That is a very important condition, one which I do not think is taken up properly. I have discussed that at the end of my *précis*.

12970. What do you mean by "auto-starvation" when you speak of the condition of the mothers ?—I refer to that later on, but I can take it now if you wish. I take it rather in connection with the third period, because I look upon the third period as that when the deterioration is most likely to take place.

12971. That is after school age ?—Yes.

12972. Then we will pass on ?—Of course there is the question of feeding a child. The bottle-feeding of infants is admittedly an important factor, and of course in those one-tenement houses the tendency of most of these people is to give their children cheap tinned milk. That is what I used to notice very much. It was not a question of giving

them cow's milk from the dairy, but there was such a great quantity of cheap tinned milk.

12973. And I suppose after the first twenty-four hours that the pot is opened it is liable to contamination?—Yes. It remains open upon the mantelpiece until it is finished, during which time it is likely to be contaminated by the dust and dirt in the room.

12974. Do you think tinned milk in itself is deleterious?—I think it is deficient in nourishing properties.

12975. So I suppose is a great deal of the cow's milk?—Yes, and the mother's own milk, so far as that goes. The cream has been removed very largely from the tinned milk, and it has been worked up with added sugar.

12976. Do they use many of these patent foods, such as Nestlé's Food, and Mellin's Food?—Yes, that is a question of expense. But Robinson's Groats, and foods of the same character, are used, and of course they are grossly abused, because quite young children are fed upon these semi-solid foods, as I call them. No infant's stomach can stand them very long.

12977. What is the remedy for this? How can you bring the proper sort of food within reach of these people?—I am on a committee in Finsbury which has as one of its objects the introduction of a system for providing sterilized milk for infants—not at the expense of the municipal authorities, as was carried on in Battersea.

12978. It would not be done by the municipality?—No.

12979. We were told the other day that sterilized milk is scorbutic in its tendencies?—I am afraid a more skilled man than I must express an opinion upon that.

12980. (*Colonel Fox.*) Dr. Vincent said that there was no nourishment in sterilized milk at all—the sterilization destroyed all nourishment?—I have no doubt you would find someone else who will disagree with him. But anyhow it is better than some of the stuff they give their children. It may not be a perfect way of doing it, but I think it is certainly less dangerous.

12981. (*Chairman.*) At present you say that tinned milk is the staple food?—I should say tinned milk is the staple food. Milk bought in some of the small shops is kept by the addition of preservatives, especially that which remains over at the end of the day. Preserved milks are a great source of danger.

12982. They contain boracic acid?—Yes, and formaldehyde. In Finsbury it has been found that the smaller the shop the greater the amount of preservatives.

12983. What you want is to organise some system by which what the parents want per diem can be delivered to them direct from the distributing agency which supplies properly sterilized milk?—Yes. That is a possible way of doing it. Apart from that you have the very important factor of the amount of common sense the mother has, and that is generally rather at a minimum.

12984. I suppose if steps were taken by domiciliary visits, or some system of that sort, she may acquire sufficient knowledge?—I think so, and if the midwives instructed the mothers more thoroughly.

12985. During the first ten days they are bound under the Act to give the mother all the advice which they should do?—But they have to be capable of giving advice.

12986. It is hoped that that will be so?—Yes, it is hoped so. The Queen's Jubilee nurses, whom I helped to introduce into Finsbury, are an enormous educational factor. They are trained in hygiene as well as nursing. They go to the people with the definite purpose of nursing, and give no relief in money. With the Bible woman and the missionary woman of course there is always a suggestion with the people they visit of what they can get out of it afterwards.

12987. You say they are a very useful agency?—Yes, they are. I had a frightful time to get them in. The women used to abuse me, but I said "You will have me and the nurses, or if you will not have the nurses I shall not come," and after they had realised what a little cleanliness and tidiness really meant there was never any difficulty afterwards.

12988. They are amenable to it?—Yes, when once you get hold of them, but of course the difficulty was to get hold of them.

12989. Did they resent interference, or regard it with suspicion?—They used to call them "them char ladies." But afterwards, when I used to offer to send a nurse to a child the mother would say, "I can do what the nurse did last time." So that it had really made an impression. I consider that the work I did through them was almost greater than any other work I did.

12990. With reference to the use of patent foods, I suppose they do not pause to consider whether they are the sort they require for the purposes for which they are applied, even if they are good in themselves?—I think the patent food they use is often the one recommended by the next door neighbour, or anyone else.

12991. What character of patent foods do you refer to in your *précis*?—They use all the different kinds of foods which are not expensive.

12992. Allenbury's?—Yes, sometimes—those who have got the money.

12993. Nestlé's?—Yes.

12994. Horlick's Malted Milk?—Benger's Food is rather largely used on medical advice. It is not expensive, and I used to get them to use that largely.

12995. That was not for very young children?—No, but even for young children it will be found good. I have tried it. It is the only one. Soaked biscuits and groats are favourite foods.

12996. Moistened in milk?—Yes. These semi-liquid foods are likely to turn acid when taken.

12997. And produce acute inflammation of the intestines, of which a great number of them die?—Yes. With regard to the question of preservatives, I had a case the other day of a child who was brought up on a patent apparatus—Soxhlett's apparatus was used. It suddenly developed a violent attack of enteric trouble. It was traced to the cream, added to the milk—to which a preservative had been added—so that illness can be produced even when every care is taken to prevent germ contamination.

12998. The tendency of the mothers to inebriety makes the difficulty of feeding their children much greater?—They have never been taught to think for themselves. They do not think.

12999. I suppose a drunken mother is rather impervious to advice under any circumstances?—Yes, she is rather a terrible person.

13000. Do many children die of overlaying?—Yes, a good many die in Finsbury from overlaying. I cannot give you the figures.

13001. Is that due to drunken parents as a rule?—Yes, I should say so. Nearly all the children are overlaid between Friday night and Monday morning.

13002. Could not the local sanitary authority insist, where there are young children, on the provision of separate cots for them?—I do not think you realise the conditions under which they live sometimes. I have gone into a room and found a whole family herded together, black as tinkers, all mixed up.

13003. In one bed?—Yes; father and mother and perhaps two or three children in one bed, and other children lying on a shakedown at the bottom of their bed.

13004. Surely conditions of that sort might be dealt with drastically by the local authority if they utilised the powers they possess?—You cannot march into these people's rooms in the middle of the night, and that is the only way you can do it.

13005. Why not? If you are suspicious of the fact that the conditions are fatal to decency and health I should have thought you could have done it?—It is very rare that it is known. In the case I alluded to I remember it was one Sunday morning. The people had two or three rooms and they could easily have occupied those.

13006. They preferred to occupy one room?—Yes, for the sake of the warmth. It was in winter. They were mugged up in one room.

13007. I should have thought with a proper system of inspection by the local authority conditions of that sort might be discovered and dealt with?—I do not think so. I do not see how you are going to do it. Registered tenement houses can be visited at any time.

Dr. Hawkes.

Dr. Hawkes. 13008. For instance, if you come across a case of this sort can you not report it to the local authority?—Certainly; but the case I alluded to is some years ago. I do not come across it now. Had we the same active medical officer in those days as we have now I certainly would have done so.

13009. You think in all those respects there is a great deal of improvement now?—Yes, there is an improvement.

13010. I suppose the substitution of the Metropolitan Borough Councils for the old vestries is an improvement?—Yes, distinctly. Everything must depend on the powers of the medical officer of health.

13011. And the way he is supported?—Yes, and whether he is keen himself. If he is keen and well-supported there is nothing that he cannot do.

13012. Do many children fall into the fire?—I only came across cases where children were left alone, where the mothers had gone out. They go out to public houses on the pretence of shopping, and leave the children alone.

13013. Taking the school period, which you described as from five to fifteen years, there the death rate is very small?—Before I come to that, might I emphasise one point, namely, the question of control—the teaching of self-control and self-restraint. There is a great lack of training children in this direction. A child by the time he comes into school is often a most unruly and intractable person. That is due more or less to injudicious correction.

13014. There is coercion?—Yes, and very injudicious correction. You find that the children of the poor from their earliest years are a great deal more spoiled than children of the better class.

13015. To save themselves trouble, I suppose?—To keep them good and keep them from making a noise.

13016. They get everything they ask for?—Practically. They are given things to play with which they ought not to have. At quite an early age they get halfpence and farthings to buy all sorts of sweets and unwholesome things.

13017. How would you remedy that?—I am afraid it is only by educating the mother. Many of these women never seem to be able to carry more than one idea in their heads at a time. After I had been working about eighteen months in the Metropolitan Dispensary my one idea was to take every child as soon as it was born and put it away in a Government home of some kind.

13018. Withdraw it from its mother?—Yes; take it away from its surroundings. I became thoroughly sick and disgusted at the want of common sense of the mothers, it seemed such uphill work to teach them anything.

13019. Is that general or is it only found among the lowest stratum?—It was found among many of the people I worked among.

13020. Do you find that among the wives of men earning good wages?—Yes; they are often just as bad.

13021. You find as hopeless ignorance?—Yes.

13022. As in the casual labourer's wife?—Yes. It is largely dependent on what the woman had been before marriage. If she had been a domestic servant in a decent house she made a good wife.

13023. That is the best training?—Yes. Those who had been general servants in small houses or shops were often dirty and slatternly. Then the factory girls, some of them made good wives, others were ignorant, and went from bad to worse. You have an awful feeling of the want of thought and the want of common sense among them. It is the acting on the impulse of the moment which is the serious thing.

13024. You have not thought how that can be corrected?—Only by gradually improving the condition of those who are growing up.

13025. Do you think that compulsory attendance at continuation classes of all girls between fourteen and seventeen who are not in domestic service, devoting the time spent in these continuation schools to lessons in household management, tending to children and the preparation of food and so on, would be of service?—I would like to see a kind of female conscription from sixteen to

eighteen. I would not bother about teaching board school children cooking and laundry work, but I would teach them later.

13026. You would make them attend schools devoted to those subjects?—Yes.

13027. That, you think, would produce a very good result?—Yes; that would be a very great improvement.

13028. It would appear that girls in domestic service do not require this teaching?—No; they do not.

13029. Would it be involving those who are in factory employment, or other sorts of work, in an excessive strain to ask them to attend these classes twice a week?—I am afraid there is a good deal in that. My wife, who is a medical woman, lectured on first aid and home nursing at the Evening Continuation Schools, and she has told me of the condition of the girls in some slum districts who have come to the lectures in the evening after a long day's work; she says they are quite incapable and unable to listen to anything; they cannot take it in. It has to be put in the very simplest way.

13030. That would be an obstacle?—That is the obstacle. They are underfed also, and that is a thing which I cannot insist upon too strongly. I cannot get people to take up from my point of view the question of the self-underfeeding of all these people.

13031. Not because they have not got resources?—No; but because they do not understand it.

13032. They prefer to spend their money in other ways?—Yes; and, of course, the circumstances of factory life lead to conditions which take it out of them so much.

13033. It creates a distaste for domestic life altogether, does it not?—Yes; it does. It is extremely difficult to get a girl to take up service unless her mother has been in service before.

13034. But the daughter of a factory-bred woman becomes a factory hand?—Yes.

13035. You regard this period of school life as the most crucial?—It is the healthiest period.

13036. And, I suppose, it is the period where development in a good direction or degeneration in a bad direction steps in?—I think the school period is really the opportunity for giving a child a good physical send-off, and then he will be better able to resist the difficulties which may meet him in his later period.

13037. Do you think that the child at school age gets more regularly fed as compared with the children before that period or after?—I think most distinctly so.

13038. I suppose there is a large amount of neglect?—There is undoubtedly a large amount of neglect.

13039. Do you think the number of children who come to school underfed, or illfed, is considerable?—I am afraid that in certain districts, and in certain parts of our district, it is so.

13040. Is that wilful or necessary neglect?—I am afraid wilful. Of course they have not much food, and what they have is poor in quality, but the mother is probably lying in bed.

13041. She is very lazy?—Yes.

13042. And the child has to go off to school on an empty stomach?—Yes.

13043. So that the system of feeding in the school itself would have to take account of all these home conditions, and if they did, do you think there would be any difficulty in making the parents pecuniarily liable for any expenditure on behalf of the child at school?—I should like to see you get it back afterwards.

13044. You might take it from their wages?—When a man is a costermonger you do not know what his money is. I may say that I used to go into a Mission Hall where penny dinners were provided, and I knew practically the parent of every child there, and I could pick out the children whose mothers could perfectly well have afforded to give them food.

13045. Were there a large proportion?—No; I will say that for them. But there were a certain number of idle, lazy mothers who would sooner give their children a halfpenny or a penny and send it out than prepare a meal for them herself.

13046. If they were asked to do it would they give the child money and allow it to hand it over to the school authority who supplied the meal, in order to save themselves trouble?—Yes.

13047. You think they would be induced to do that?—I think they might.

13048. To a large extent?—I think in all these cases if you are going to give food to the children some investigation should be made.

13049. Into the home conditions?—Yes.

13050. You think that is a condition precedent?—Yes; I would make that imperative. One knows the hypocrisy of these people and the awful way in which they lie about things.

13051. I suppose in a great many cases the necessity of medical examination would come in there. If the child is assumed to be ill-fed perhaps the teacher could not altogether determine that?—I hold very strong views on the question of medical examination of school children.

13052. You think there should be a system of that sort?—Yes.

13053. Every child should be submitted to it on entry?—Yes, and I think every child should be examined properly. I do not mean the sort of superficial examination which is done now, but it should be properly examined. There are certain points which should be taken, and on those points it should be possible to shape the way in which that child's work should be laid out.

13054. You must understand that in most of the schools it is not possible to modify the course to suit the requirements of every child; there are a certain number who ought to be taught in special schools perhaps. That is one point?—I am referring not so much to the mental conditions.

13055. You are referring to the physical conditions?—Yes. I think we have a right to expect the State to provide them with healthy bodies.

13056. By suitable physical exercises, and so on, and proper time given to them?—Yes. We who see something of these lads after they leave school know how utterly worthless half the knowledge they have gained is. They are simply hopelessly ignorant six months after they have left school, unless they are going in for some trade, and then they simply specialise on that.

13057. Would you repeat this examination?—Yes, in all deficient cases.

13058. Periodically?—Periodically.

13059. How often?—I would certainly do it once a year.

13060. That you think would be enough?—Of course there would be certain children you would pick out with temporary deformities who might require to be sent more often.

13061. From the positions they assume in class and so on?—Yes; and sitting down to read. I have written to schoolmasters on the subject, and they have poohpooched it; they do not see that there is anything wrong.

13062. Do you think that teachers, as a rule, are qualified to assist towards the results which you expect to flow from a medical examination; are they able to detect physical defects, as a rule?—No, they do not know; they are ignorant except of external conditions which they notice. Internal ailments can only be found by qualified men.

13063. If they are encouraged?—I do think they do what they can.

13064. You think they would not be indisposed, if they had more knowledge, to assist the objects you have in view?—No, I do not think they would. There is one point with regard to that pointing out what, to my mind, is one of the necessities on the question of physical education. Last autumn I was asked by one of the big Polytechnics to examine a number of young men to see whether they were suitable for gymnastic work. There were fifty-three men. I spent some little time on them; I gave each man about seven or eight minutes' examination, roughly. These were men not only from London but from all parts of England. There were not 10 per cent. of those men who were sound. They were a fine healthy looking lot of men, and one would have said that there was nothing the matter with them. Their average age was 18·3 years.

13065. About the age of recruits?—Yes. Sixteen of these men had bad sight; some of them wore glasses, and some of them did not know that they had bad sight; twenty-seven out of the fifty-three had troubles with their throat and nose.

13066. From adenoids, probably?—Adenoids, tonsils, and teeth. Fifteen of them had, I will not say diseased hearts, but in such a condition that I would not let them do very much heavy work. Sixteen had weak chests.

13067. Phthisis, do you mean?—No, only general weakness. Seven of them had a tendency to spinal curvature; thirty had flat feet and twenty-four had varicocele of the testicles. It was a most extraordinary thing.

13068. Who were these men?—These were young men, young engineers, men starting engineering work. Their ages varied; the youngest was fourteen and the oldest thirty.

13069. You examined them for the Polytechnic?—Yes.

13070. They were men whom you would call the flower of the working classes?—Certainly. Some of them were well educated; some of them had come from Board schools. I was absolutely astonished.

13071. How many of those men would have been rejected if they had been intending recruits?—I should think 80 per cent.

13072. (*Colonel Onslow.*) Under the Government regulations I should think the whole lot would have been rejected?—Pretty well. There was hardly a sound man among them.

13075. (*Mr. Lindsell.*) What was the trade they were going into?—Electrical Engineering.

13076. They were candidates for the appointment?—Yes, in fact they were joining a class.

13078. (*Colonel Onslow.*) They were about the average working class?—Yes, some of them, and some were of a better class.

13079. (*Mr. Lindsell.*) Did they come from all over the country?—Yes, all over the country.

13080. (*Chairman.*) Do you think that fact points to there being a great amount of degeneration?—All I can say is that if you take haphazard fifty-three men, whom nobody imagines have anything the matter with them, and you discover facts like that—well, I should like to take fifty-three men somewhere else, and see if they are the same. With regard to the varicocele, I believe that is from bicycling, from the pressure of the saddle. They will not let a man pass into the Service with that.

13081. You really think it was due to bicycling?—Yes.

13082. That was the largest figure of the lot, was it not?—No, flat feet was the largest figure of the lot—that was thirty out of fifty-three.

13083. What do you attribute that to?—I do not know I cannot understand. They are all healthy looking men and active men; many of them play football.

13084. In the rural districts the heavy soil leads to flat feet?—Yes. If they wore heavy boots it would perhaps account for it. With regard to the other things, I could account for them, but I could not see how flat feet came in except from general slackness.

13085. Then some of them could not hear?—A few had deafness, but comparatively few.

13086. We cannot associate from the evidence we have had, either deafness or defects of the sight with any tendency to degeneration?—No, but they may be factors afterwards.

13087. They may tend to produce it?—Yes. You have, no doubt, had evidence of eye-strain and the effects it produces, and, of course, undoubtedly adenoids and tonsils enormously interfere with the conditions of development.

13088. But they do not seem to be associated with what are called degenerative conditions?—No.

13089. We had a medical authority on that subject, and he said that adenoids were just as common in the upper classes as in the lower?—Yes.

Dr. Hawkes. 13090. (*Colonel Onslow.*) Would not flat feet be partly attributable to a rickety condition in extreme youth—a weakness of the bones in the leg?—It might be that. It shows the ligaments must be weak. I wish to point out that if those young men had been examined in their younger days those flat feet could have been corrected by gymnastics.

13091. (*Chairman.*) Where money is plentiful how do these people spend it? Do they spend it on their children; are they interested in their children?—Not very.

13092. When money is not plentiful I suppose the children are the first to suffer?—Yes.

13093. Do you meet many who are self-sacrificing?—When any excess of money comes in it does not go to the house as a general rule?

13094. It goes in amusements or luxuries?—Yes. There is one case which immediately arises to my mind. I went one day to a house and found a man, whose child had got pneumonia; I found him sitting by the fire in his best clothes. I said to him, "Are you on strike or out of a job?" "Oh no," he said, "I won £10 on the Cesarewitch." His wife never got a penny of that. The man simply drank and betted away the whole of that £10. There was no suggestion of giving it to his wife or even to pay for medical assistance. Eventually when I sent a nurse and gave instructions that the child should be sponged all over he said he would see her blowed first. She was shot out and I was shot out too.

13095. That was a working man?—Yes. I saw that man's wife and attended her when they had hardly a sixpence in the house. It is one of the results of gambling.

13096. Was he in regular work?—Yes, at the time, but he took a holiday until that £10 was gone. I am afraid that is a typical case.

13097. Is there much gambling?—Oh yes, there is gambling among men and women and children.

13098. In the form of betting or of cards?—Betting and playing at cards. It is done with small sums, but a small sum among that class is greater than £5 to anyone else, but the women have taken to betting and that is a worse thing.

13099. It is a love of excitement?—Yes, always excitement, something fresh.

13100. I should have thought the conditions of their life were not so hopelessly stagnant as they were. I should have thought that there were more means of employing their energies in other directions?—Yes, but if you live among them you find that the love of excitement is the one thing that keeps them going. There is so much said about the kindness of the poor to one another. Well, there is a great deal of kindness, but, of course, that kindness does not last. It exists for the time when they are sympathetic; they will do anything. They will all come in and help and do anything, but if the illness extends and you want something done it will not be done. I remember one case where the people had to come to me and report to me at the dispensary about the condition of a patient; I used to find that someone else was sent, but that someone had to be paid 2d. to come down. The kindness is only due to impulse and sympathy which is created on the spur of the moment, but it passes away.

13101. Coming to this period before marriage which is the period between school and adolescence, there you think the degenerative tendencies are most likely to set in?—Yes.

13102. There is no parental control which is of any value?—That is so.

13103. And the children practically shift for themselves?—Within certain limits.

13104. They get occupations which provide them with money?—Which make them semi-independent.

13105. Do the parents annex any part of their earnings?—In a great many cases they do. I am an active member of the Charity Organisation Society in the city, and I see more of it in connection with that work. We see cases where a great proportion of the earnings will be given. The child has a certain amount to spend on itself.

13106. You think in proportion to what it earns the child obtains a good deal of care and consideration from the parent, in the way of food at any rate, although it may be badly cooked and so on?—In the early stage there is a certain amount of control, and, therefore, parents practically take the whole and give the child so much back. But as the child gets older and earns a little more, that little more is not always stated to the parent I think.

13107. And that they spend on themselves?—Yes.

13108. Badly, very often?—I am afraid very often badly.

13109. You think that girls are worse off because they stint themselves in food in order to buy clothes?—Yes. The great thing with regard to girls which seems to drag them down is that they are at an age when they want air and want plenty of food. When I was appointed Resident Medical Officer to the Metropolitan Dispensary the committee decided to open the Institution in the evening, in order to assist the workers who were unable to leave their employment during the day.

No other Charitable Institution in the City does this.

The work developed, until I used to see from sixty to one hundred people in the evenings on which we were open. All those people were working in the City, because I refused to allow anyone to come on unless he or she was actually doing so. They live in every part of outer London, from Enfield right away to Walthamstow.

13110. They were not resident in Finsbury?—Not all of them; they were typical of the residents of outer London. Many of them have a heavy meal just before going to bed—sleep badly—wake tired and heavy with a nasty taste in the mouth. Do not use a tooth brush or cleanse the mouth—swallow a cup of strong tea and rush off to catch an early workman's train. They come up to London and have an hour to wait before they begin to work with nothing but a cup of tea.

13111. Only a cup of tea before they start?—Yes, that is the only thing they touch.

13112. Not bread?—No, just tea—strong tea. They work from eight till twelve on a cup of tea; and then by the time dinner time comes they are really fagged out and tired and do not care for food, and what food they have is either brought from home or it comes from a cook shop. Only too often it is pickles and vinegar and a little bread. I knew the little shops all round me, and I used to see at twelve o'clock every day a string of girls with cups containing a little pickled cabbage or picallili and so on.

13113. There is a great want of a proper type of restaurant for the poor, is there not?—There are many restaurants, but they do not care to go to them.

13114. Of the type which would give them what they want?—They want the food for nothing. They will not spend money if they can help it—certainly the girls will not—on getting proper food. Of course, there are those vegetarian places, which are cheap. Then they go on that very scanty meal till the afternoon, and then they have another cup of strong tea with perhaps a piece of bread. Their work is perhaps from six to eight or nine and they go back by train, getting home about nine-thirty or ten, and then they have a meal, when they are thoroughly fagged out.

13115. They must take a long time getting home?—They have their last meal at nine or ten. They get home any time between these hours, but they do not take their last meal until just before they go to bed.

13116. That is their best meal in the day?—I do not know; it is often bread and cheese and beer.

13117. (*Colonel Onslow.*) Are you speaking of girls, or men and boys?—The girls; the men and boys feed themselves. I could not understand how it was. I got so many people. Medicine does them no good, because they are living this ridiculous sort of life. I used to talk till I was sick and tired of it. I used to begin by getting them to take milk instead of a cup of tea. If I could do that I could do a lot. That was a commencement.

13118. Give them a foundation?—Yes, but they will not understand. The only thing is to teach those people.

13119. (*Chairman.*) These girls are living in their parents' houses?—Yes.

13120. Are they of no use to advise them?—They are as bad as the children. They get dyspepsia naturally, as you can quite understand, after this has gone on for a few months, and they gradually drift into a state of chronic catarrh of the stomach with constipation.

13121. Girls of sixteen or seventeen?—From sixteen onwards, because the younger children do have a little breakfast. It is when they get a little bit beyond control that they do that.

13122. It would be almost impossible to get that class of girl into the continuation school that you were talking about?—That is the difficulty, that is to say, if she has to do it and work at the same time; she is not fit. That girl is not fit when she gets home at night to do any brain work, because she is starved—she has starved herself. It is not that there is not food there, but she is so stupid and she is following the traditions of her mother and relations. They all do so, and it is the cause of half the drinking among the women.

13123. I should have thought that their desire to feel fit would have made them feed themselves sufficiently?—Yes, but they are so hopelessly ignorant in matters of that kind. I was led to make observations, and 80 per cent. of the women who came to me when I was at the dispensary lived in that way.

13124. I should have thought it was the primary human instinct to eat enough food if it could be got?—But to show how little it is understood and how little it is taken up I may tell you that I used to be spoken of as "the doctor who asked people if they had had any breakfast."

13125. As though they thought it was a monomania on your part?—Exactly; as if it were a fad of mine.

13126. What are the conditions in respect of clothing? They do not spend the money on warm things, I suppose?—They spend it on the externals.

13127. On things which attract attention?—Yes.

13128. Fine feathers?—Yes; the scanty clothing underneath is often deplorable; it is sometimes heartrending when I come to examine some of these unfortunate people.

13129. I suppose that often sets up pulmonary disease?—Yes, I am afraid it does very much. Then, of course, there is the question of the condition of women going into public houses in England. There is a man in the detective force in New Zealand whom I know who came over here, and he told me that the one thing that struck him was the number of women to be seen drinking in the public houses in England.

13130. Do they not do that in New Zealand?—It is not considered a right thing.

13131. It is public opinion which prevents them?—Yes. You go on any Saturday you like where any factory girls are coming out of their work and have just been paid and you will see them like flies round public houses, five and six in a little group. They all go in. It is not one drink and then come out, but it is etiquette that each shall stand in turn.

13132. In what occupations are these women?—Every possible kind: collar makers, artificial flower makers, baby linen workers, collar ironers—a most unhealthy trade—feather curlers and box makers and book folders. Box making is largely carried on in and near the City.

13133. Do many of them actually work under unhealthy conditions?—Of course they work under much more healthy conditions than they used to do. But if they are doing work at home, then the conditions are very bad, indeed, very often, because you have piles and piles of boxes and foul smelling glue and size about the house—it is perfectly sickening.

13134. There are certain parts of the Factory Acts which touch home work?—Yes.

13135. They are evaded?—Yes, they are quite evaded.

13136. Taking the period of married life, do people marry prematurely now so much as they used to do?—No, I do not think so.

13137. Dr. Tatham will tell you that from the Registrar General's returns early marriages are not so frequent as they were?—Yes, and from my own observation that is so.

13138. Then the occupations which you have been describing would tend to give them a distaste of home life?—Yes.

13139. And to make them useless as mothers?—Yes.

13140. What do you mean by "Choice of home," in your *précis*?—A great deal depends on what a man is doing. If a man has to live near his work he must take what accommodation he can get. That is really what it means. It is not as if there was any choice.

13141. Having regard to the late hour that these girls have to get back, it seems preferable that they should live in London?—Or within a very much shorter distance of London. If you could manage to do something in that direction it would be of advantage, because, after all, they are often going from one slum to another.

13142. Then we come to the point as to whether the housing of Finsbury is not better than it was. You say that within your knowledge a very large number of insanitary inadequate houses have been pulled down?—Yes, but factories have been built in their places.

13143. There has not been any supply of proper houses in their places?—They are gradually building, I think.

13144. What you refer to is the demolition of houses for factories?—Yes. There has not been much building in my time. The Peabody Trust have built dwellings, and there are some other model dwellings in Finsbury, but since then there has been very little building.

13145. Within Finsbury itself there has been very little building?—Practically none.

13146. Do you think the Borough Council of Finsbury or the County Council will do anything in that area?—The County Council have just taken the site of Reid's brewery in Holborn. That is being developed now.

13147. Are you aware of any tendency on the part of factory owners to live out of London, to transfer their factories to less crowded areas where the rates and rents are lower?—No. I know it has been done.

13148. You have not come across any tendency in that direction?—No. But, of course, it is the character of the houses. That is one of the things which I should like to speak of, that these people have to go into these houses, and parts of the London area are always changing its character, going down, down, down!

13149. But surely there are counter tendencies towards improvement?—No, the people go into houses which were only built for one family; that is to say, there is one kitchen, one water closet, one sink. That is all very well for one family, but when every floor and sometimes every room in the house is let separately, that kitchen belongs to the person who rents that particular room, and the result is that you find a small room with only just a common little grate in it. There is no oven, there is no water laid on; all the cooking has to be done at this little grate with a saucepan and a frying pan, and possibly a gridiron. That is the only way they have for cooking unless they go to the bakehouses.

13150. Could not you get at the owner and make it his duty, if he lets his house to more than one family, to provide proper appliances for family life?—I asked our medical officer of health whether that could be done, and he said, "No, we have no control over them; we cannot step in and say that they must do this, that, and the other." You must remember that this has been going on for many years. This is one of the great reasons of the bad feeding; it is not that the people cannot cook, but that they have not appliances. It is impossible to do anything like that, and when you have to consider the difficulties of badly ventilated rooms, smoky chimneys, and the quality of coal these people buy, you will see they are great. These people only buy the poor coal, you do not get much heat out of it. I think that has been a very important factor, and I think, of course, that is one of the advantages of these industrial dwellings which have been built, that they do have proper cooking apparatus. In the Peabody Trust Buildings some time ago they put

Dr. Hawkes. gas stoves practically in nearly every room, or in every two and three tenement rooms, in the Finsbury blocks, but they put the gas stoves in the open room and there was no arrangement made for ventilation and getting rid of the fumes at all.

13151. Do you mean the fumes escaped into the room ?—Yes.

13152. (*Colonel Fox.*) The same as from a gas burner ?—Yes.

13153. (*Colonel Onslow.*) Who is the responsible person for that ?—I do not know ; I suppose the Trust. People sleep in these rooms and then ventilation is generally not too good. These stoves were on the penny-in-the-slot principle and very expensive. I think a great many of them are given up and not used at all. It always seemed to me a most disgraceful thing to put them into the rooms in the way they did.

13154. (*Chairman.*) How many tenants are there in these one-roomed tenements ?—I should say two adults and not more than two or three children.

13155. That is surely too many for health ?—Yes, it is.

13156. Is any attempt made to enforce a minimum amount of cubic feet of air, because that is within the competence of the borough council ?—There again comes in a difficulty, unless you make a midnight visit.

13157. But you must do it ?—That is all very well if you have a big slum street. But next door to the house where I am living I think there are four families. I have not the faintest idea how many people really live in that place.

13158. Surely the local authority could obtain the information if they chose ?—But they must be registered, I think. This is a point upon which I do not know the law, but I rather think that is so.

13159. They have the power to enact bye-laws to require a certain minimum amount of cubic space for every occupant of a house which is let as a lodging ?—Which is not registered ?

Unregistered tenements are practically private houses. If a man came to me in the middle of the night and wanted to see how many people were sleeping in my house I should not permit him to do so. I know perfectly well in our own district if the medical officer of health had the chance he would jump at it, but his hands are tied, and very grievously tied. I very much wanted him to interfere with the people in the top floor, who were distinctly creating a nuisance.

13161. (*Chairman.*) Lodging or tenement, it is the same. Surely he was not prevented from interfering there, was he ?—Yes, they were not registered.

13162. The local authority are entitled to regard as a nuisance any house which is overcrowded to a degree which is in their opinion prejudicial to health ?—Yes.

13163. Surely they have the power to ascertain whether the facts are such or not ?—Under those circumstances they would have power, surely, to go in at any time to any house, and they have not got that.

13164. But supposing they know ?—How are they to know ?

13165. There must be means of finding out, if proper steps are taken to do so, what number of persons may be in any one of these tenements ; they must know what the extent of a family is, or they could easily obtain the knowledge ?—I am afraid it would be rather difficult to carry out.

13166. I should have thought that the Charity Organisation Society in their investigations might very often provide the knowledge that is necessary ?—Certainly, but we are not yet, of course, so much in touch with them that we can very well do it. Then it is not the people who say they live there, but it is the people who do live there.

13167. I suppose the number of children that any given couple have is a matter of common knowledge ?—Not necessarily.

13168. The school attendance officer must know something about the conditions ?—Yes.

13169. (*Colonel Onslow.*) They are not always of the same family ?—No. You may have nurse-children

brought in on the quiet. The school attendance officer does not know exactly how many rooms these people have got. It is just like an ordinary dwelling house, you go up the stairs, and there is a door here and a door there. There may be one family occupying both rooms, or one in each room. It is very difficult to find out whether that is so. You cannot compel the landlord to give you any information.

13170. You think there is no remedy ?—I would say in any case where a man is found to be letting his place out in tenements he should be made to put in a stove of some kind or the other so that, at any rate, cooking can be done decently.

13171. You would make the owner responsible for the supply of proper cooking apparatus to any house let in tenements ?—I would make the man who lets the house out in tenements responsible. He is often a man who has got the fag-end of a lease ; he is for the moment the owner, and he is doing it simply as a speculation, simply for profit, and of course profit without any regard to the circumstances. The Finsbury death-rate of the one-roomed tenements was 38·9.

13172. (*Dr. Tatham.*) We had evidence a few days ago from Dr. Vincent. In that evidence he made certain statements about sterilised milk, and I said to him, " You know that in the medical profession it is certainly a very common practice to recommend that the ordinary milk supply shall be boiled before it is taken for the purpose of preventing the spread of enteric and other fevers," and he said " Yes." Then I asked, " Do you think that is a wise precaution ?" and he said " No." I asked, " What would you do, then," and he replied, " I would prevent it. I have a little homily on the heating of milk. The whole principle is to prevent the development of these bacteria." Do you agree with the condemnation of the practice of boiling milk before it is taken ?—Yes, I do. What I should like to see would be to go down to the bed-rock, and have so much supervision from London of all dairies, the registration of dairies, so that we could have proper milk, and know that the surroundings where the milk was obtained and where the cows were milked were such that the risk of germs and the risk of bacilli was very much reduced.

13173. But having regard to the conditions under which the present milk supply is obtainable, do you think it would or would not be advisable to boil the milk ?—I think it is advisable to boil it.

13174. You do not think the boiling of the milk or sterilising it would take away its properties ?—It might, but I think it is less dangerous than the other.

13175. You think that the practice of the profession in recommending the sterilising of milk is a good one ?—Yes.

13176. Under present conditions ?—Yes.

13177. Is illegitimacy on the increase according to your experience ?—Immorality is. But owing to the way in which pernicious literature is able to be bought now, I should say that actual illegitimacy is not any greater ; I do not think it is increasing. But, of course, you have to remember the enormous sale and advertising of various suggestions to people for prevention of children. In many places you cannot go into a single public urinal without seeing an advertisement which has been gummed up there. Of course they are taken down very soon, but there is somebody round again who puts them up again. There is not much self-control among the people. The excitement produced by drink and a want of self-control leads to immorality. I think that very little drink is quite enough to upset them. There is another point of course, namely, the abuse by big girls of little boys. A girl who has arrived at puberty not wanting to take the risk of having anything to do with a man gets hold of a little boy. I had several cases of that.

13178. (*Colonel Onslow.*) What aged boys ?—About nine, ten, or eleven. Of course the surroundings in which they live make it almost impossible for them to have very much moral control. The language of the women is so dreadful. Nice decent looking women, directly they get a little bit out of temper simply let fly the most foul and filthy oaths. Of course there is also the self-abuse which goes on amongst small boys pretty generally. The life of being herded up in these model dwellings has great

disadvantages. One bad woman on a stair will do no end of damage. They get drink in their houses; they send out for beer. It is the sly drinking in the house which is the curse.

13179. (*Dr. Tatham.*) In the neighbourhood where you live is it known to you whether the mortality is very much greater amongst illegitimate children than it is amongst legitimate children?—No; I do not think it is except where there is destruction immediately at birth. Afterwards, I think not. A very funny thing is that where you have illegitimate children they are generally the children of some rather respectable girl who has been led astray. It is not the down-right rough-and-tumble person who comes to grief in that way. Somehow or other they manage to escape. It is this unfortunate girl of rather a better class. I know there are a number of children going about now who are nominally the children of certain people. The child grows up when they remain perfectly respectable. There has not been lustfulness; it has been a temporary departure from the moral standard, and, of course, the children are as much cared for as if they were legitimate.

13180. We have had evidence here that illegitimate children die at a very much greater rate than legitimate children?—They are put out at these nursing places sometimes.

13181. Do you know the mortality in England and Wales, for instance?—I should say most distinctly that these nursing places are kept by horrible people. Every now and then I come across some of them. They are dreadful women. I think the supervision there needs regulating distinctly. I do not refer to licensed nurses—but when the child is nursed out on the quiet.

13182. (*Mr. Lindsell.*) Have you considered this question of feeding in schools, providing meals at the school itself? You say, of course, that when a child is badly fed it is principally the fault of the parent?—Yes.

13183. Of course, as you know, there are certain parts of London which provide meals for the children at school?—Yes.

13184. Would you be in favour of that being a municipal affair?—No, I am afraid not.

13185. It would do a great deal more harm than good?—I think so. And you have to remember this, that you must pick out cases by investigating them. If you have definite signs of the necessity for it, then I think it might be possible. But you must remember that if one child goes and is known to have a free breakfast, although that child may absolutely need it on account of the abject poverty of the home, immediately the other neighbours will all be up in arms and want to have their children fed; and they will lie to you about their earnings.

13186. Suppose the parent had to buy so many coupons and there was a bureau established by the school authority where the parent could go and either purchase that, or state that his poverty did not enable him to purchase it and so obtain it, each case would be investigated on its merits. If the parent did not pay there would be some means of recovering the cost?—Yes.

13187. Either as a debt or by some summary process unless the parent could prove absolute poverty preventing him from paying. He would have to prove absolute disability to purchase the thing before some duly constituted authority?—Yes; I quite see what you mean, but it seems to me if you are going to that point it would be very much better, if you are going to feed a child in that way, to take him away out of his environment; you are reducing the personal responsibility of the parent in that way. Where they pay for the food you are not. Of course you must have a proper sum, you must not cut the throat of every provision dealer all round, because that is what you are doing. You are taking the bread out of the mouths to some extent of the smaller dealers who would have supplied that food in the ordinary way. You do it on a big scale; that is all very well, but of course there are other people to be considered first. If feeding is carried out by the authorities, efforts should be made not to crush the small provision dealer who is hardly able to make a living.

13188. Is not the condition of the child almost the first thing to be considered. If you insist on the child coming to school and compel him to go through a certain school

curriculum, and the medical adviser tells you that the child wants proper food and is therefore unable to go through that curriculum, ought you not first to feed the child and then deal with the parent according as he is able to pay or not?—You must have powers of punishing the parent very considerably.

13189. For neglect?—You have got to take the condition of the parent himself. If you give him half an inch he will take it, and, of course, that is the difficulty. It is not as if that money which is saved by the parent—because there would be some saved—was put by and there was any thrift. In such a very large proportion of cases that money is simply going on to the publican.

13190. But if the court made a payment order on the parent by some summary process like the bastardy order?—You are referring to people who are absolutely poor?

13191. No; I am talking of those who drink and neglect their children rather than those who are unable to feed them?—You might get it out of them.

13192. There would be a power of discrimination?—Without absolute and close investigation and the power of severely punishing them, I do not think you could do it. You must have that. You must have some deterrent, and a strong deterrent, behind you. You must have every possible power.

13193. *Dr. Macnamara's* opinion was that the teacher would be absolutely capable of forming an opinion as to what children in his school were suffering from want of food?—That may be.

13194. He would report the case to the school authority, who would instruct the school officer, who would investigate the circumstances of the parent, which they do, of course, now to a great extent?—But how can the school officer possibly investigate? You want to increase your staff of school inspectors enormously.

13195. They say they could do it without a large increase?—You have to verify earnings. You must do that. You have to verify every blessed point you have got. As a worker of the Charity Organisation Society I have gone into some of these details, and I know how perfectly ridiculous it is without very close investigation and very elaborate investigation to really get at the truth. Remember that in a large number of our cases we are absolutely and deliberately deceived. We do not find the truth, especially in regard to what is being earned. You must verify where the man is being employed if you want to get the actual facts. We even know that a man will pay his foreman to misstate his wages.

13196. If a case was one of extremely bad surroundings you could send the child to a day industrial school where he would be fed.—That would be the thing—get him out of the way. You want a healthy place where the boys can go. But I know there is a difficulty about the parents. I should like to take them all away really, but there is the question of parental responsibility, and one does not quite know where to draw the line. If you relieve parental responsibility, take it all away from them, they simply go on; they will breed fast enough then.

13197. You would be in favour, if free meals were given at all, of giving them at special schools?—Yes.

13198. And not give them in the public elementary schools generally?—No, certainly not.

13199. You would not be in favour of a scheme for grouping certain schools round a cookery centre where meals were supplied to every child, and those parents could pay for it should do so?—No, absolutely not. I would take certain parts which are bad and are known to be bad. But remember this, that the part which is bad to-day may be inhabited by well-to-do workmen later on. You have started a system, and no matter what changes take place in the neighbourhood you go on with that system, and therefore that is where one of your great dangers will be. Take Hoxton; you know Hoxton by repute, possibly?

13200. Yes.—That is one of the worst areas going. But that is gradually being improved. If you have a system of free feeding there, all the children of respectable people who come there will expect to have free feeding for their children. In the same way a neighbourhood may suddenly go down.

Dr. Hawkes.

Dr. Hawkes. 13201. You know that free feeding is one of the demands of the Labour Party?—Yes, but I do not agree with them

13202. But you know it is mooted?—Yes, I think the whole thing is quite ridiculous. Then of course the original idea which I had when I came fresh to it, of taking every child away from his parents and putting it into a home, is what you are bringing it to, because you are feeding and clothing the children, and all that the father and mother have to do is to provide a roof for them to sleep under. You are not doing them any good.

13203. In Lambeth there is at present a large system of free meals undertaken by a charitable agency?—That is all right, because they will probably take care that things are not overdone. But that is not the State. Just in the same way with regard to the milk supply for children: I am not at all in favour of a municipal milk supply, but I am in favour of its being carried out by private agencies. It is less likely to be red-tape. I think the stereotyped condition of anything which is done by the State makes such a difference.

13204. I think the idea was that the school authority should provide all the paraphernalia and machinery, and only carry it out so far as it paid its way, any deficiency being made up not by the State but by voluntary benevolence.

13205. The tendency, you think, is for the voluntary agency to die out?—Yes, it would be absorbed and they would not have the power of resistance against the others.

13206. (*Colonel Onslow.*) With regard to the milk in small shops, does not that come under the Adulteration of Foods Act?—Yes, and when they are found out they are fined. But for one person who is found out, there are plenty of others who are not.

13207. You were speaking of the Queen's nurses: the work which they do appears to be very similar to that done by the Ladies' Health Society in Manchester: do you know the working of that Society?—No, I know you have Queen's nurses there.

13208. There is an Association: they are under the aegis of the Corporation, I believe?—Yes.

13209. Women go about and instruct the mothers not only how to keep the children clean but how to keep their houses clean, what they ought to eat, and so on. It is a voluntary Association. They have paid women who have come from the lower orders themselves, and they are superintended by ladies. They are not a charitable institution?—You must actually teach by demonstration, then they may learn. It is a very singular thing: I cannot understand the mental development of these people, because you tell them apparently a simple thing and they will not remember it. They will listen to a long conversation between other people and they will go out and repeat it word for word. I used to be very much struck with that.

13210. I understand that with regard to this Health Society, when they hear of a birth they will go in and see how the mother is getting on; they ingratiate themselves into the people's good graces and they take charge, rock the baby, and look after things generally, and teach the mother practically there and then what to do?—Quite so.

13211. I presume that is similar?—That is the thing; it is the practical example. It is no good talking to them.

13212. A great deal might be done if that system, either by a system of Queen's nurses or health societies, were started all over the kingdom in town and country?—Yes, but it should always be provided in these cases that these nurses and people do not give any money at all.

13213. It should be neither religious nor should it give money?—No. The Bible-woman nurse is a most awful person—dreadful.

13214. You mentioned just now that it is not the custom in New Zealand, and it was also not the custom some years ago in this country, for young girls to go into public houses; do you know that it is a common practice now for young men to take young girls into public houses?—Yes.

13215. That was not a common matter years ago?—No, I know.

13216. It was not the correct thing to do, but now it is common?—Yes, and it is extraordinary how high up you see that. People who have got on a little bit used to go to the public houses when they were younger, and they still go. Of course some of them go to the saloon bar. Men apparently quite respectable will do that.

13217. The railway refreshment bar do you mean?—No, the saloon bar of a public house. They pay a little extra and get just the same sort of stuff. I do think that the liquor question is a very important one—the control of the liquor. I maintain that half of these ailments which people suffer from are due to beer and bad spirits. It produces a constitutional condition which ends in a state of irritability which makes them lose their self-control easily.

13218. (*Chairman.*) I think I understood you to say that the local authority was unable to enter any house at night with a view to determining whether there was overcrowding or not?—Yes.

13219. Are you familiar with the Public Health Act of 1875?—No.

13220. Would you be surprised to learn that by one section it is distinctly laid down that it is the duty of every local authority to cause to be made from time to time an inspection of their district with a view to ascertain what nuisances exist calling for abatement under the powers of the Act; secondly, would you be surprised to learn that by section 102 the local authority, or any of their officers, shall be admitted into any premises for the purpose of examining into the existence of any nuisance thereon; and would you further be surprised to know that by section 91 (5) a nuisance is defined, among other things, as "any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family"?—You must give them legal notice, I suppose?

13221-5. No?—I was certainly under the impression that you must give notice of what you were going to do. Surprise visits are the only thing to be of any good, but I am not a Medical Officer of Health, and so am not familiar with the details of the Acts.

13226. There is no question about what the powers under the Act are?—The question is whether it says that any notice is to be given.

13227. No, there is no notice?—They are like rabbits. If at the top of the street it is found that anyone is making an inspection they run out into the backyard and into the back street. There is the question of having to do it in such a way that the people do not get to know. In Whitecross Street, which used to be one of the most important market streets in London, if the weight inspector suddenly appears, practically before he has had time himself to test a weight the knowledge has gone on both sides up and down the street.

13228. I have no doubt that is the case?—And that is the difficulty with inspections.

13229. (*Colonel Onslow.*) That is exactly what the police say with regard to finding criminals?—Yes.

13230. (*Chairman.*) But it is difficult to say that these inspections are not necessary, because they are the absolute duty of the local authority?—I will discuss that point with Dr. Newman. I am sorry you have not got him to give you a little evidence. He has done more for Finsbury in the short time he has been there than anybody else.

13231. I fancy the local authorities and medical officers are very often not fully aware of the powers they have?—I think that may be so.

13232. I am afraid the Local Government Board do not do what they might to bring to their knowledge the powers they possess?—No.

TWENTY-FIFTH DAY.

Wednesday, 11th May, 1904.

PRESENT

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. H. M. LINDSELL.
Colonel GEORGE T. ONSLOW.

Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Dr. AIRY, H.M.I., called; and Examined.

13233. (*Chairman*.) How many years were you at Birmingham?—Twenty-eight, but the dinners have only gone on for about twenty years.

13234. They have been in operation for about twenty years?—Twenty years, more or less.

13235. What was the first idea of the establishment of these dinners there?—The first idea was that they should be self-supporting, and we took the idea from Mr. Moore Eade, of Gateshead, who was really the pioneer of this.

13236. He was the Chairman of the Newcastle School Board, was he not?—I am not sure. His experiment was at Gateshead. We started by having penny dinners with the idea of having no such thing as charity entering into the matter, and that they should be self-supporting.

13237. Was it the School Board who started it?—No; it was started by Mr. George Dixon, who was the Chairman of the School Board. It was done with the goodwill of the School Board.

13238. You had their concurrence and sympathy?—Yes. It was a complete failure, because we found we were doing a rapidly declining business among the wealthy and aristocratic classes. So after a short experimental time we gave that up absolutely. It was a failure, because we found at once that the children who could pay a penny for a dinner preferred to pay a penny at home.

13239. Is that always the case? I do not know whether the employment of women is considerable in Birmingham?—Yes, it is very large, and that is the only exception. Under the normal state of things where there was a parent who could prepare the dinner, both the parents and the children preferred the dinner to be given at home for children who could afford as much as a penny. We then reduced the cost to a halfpenny, and then came a revelation which was astounding to me, that there were many hundreds of children, and even thousands, who could no more find a halfpenny for a dinner than they could find half-a-sovereign.

13240. That is so in Birmingham?—Yes, and it is so in London. It did not touch the starving children at all, and it was the starving children that we had in our minds. We did not know when we started that the children who could afford a penny were not starving; we did not know that the children who could afford a halfpenny were not starving. We thought things over, and we decided to throw Herbert Spencer to the winds, and our old idea with regard to its being self-supporting, and about its being a charity; we threw all those considerations to the wind, and became a charity, and decided to give a dinner free to the starving children. Then we had to consider the principles upon which we would act, and we decided in the first place that only those should be helped who could expect practically nothing if we did not give it to them. Secondly—and this is most important, and I emphasise it in any such scheme—that only such a meal should be given as would not compete in any way with the meal which could be provided even in a very poor home.

13241. You mean in respect to its quality?—I mean that if a child could get a decent dinner at home at all it was far better that it should get it there than that it should come to us.

13242. The test was whether it would turn up its nose at the dinner you provided or not?—No, I should put it

rather more strongly than that. If the child could get a dinner at all which would carry it through, we would not interfere with the home arrangements. We considered that we were bound to take only what you may call starving children, from whatever cause they were starving.

13243. Neglect may have been one of the causes?—Yes. Then we decided that cases for help should be selected with the greatest care. That is done by three different people—by the head teacher of the school, by the class teacher in whose class the boy or girl is, and by the visiting officers.

13244. The class teacher is the first to suggest a child, I suppose?—Yes.

13245. And you find the co-operation of the three is sufficient to secure the object you have in view?—Quite sufficient, I believe.

13246. That, of course, was Dr. Macnamara's point—the collaboration of the three?—I should say at once that I have not the slightest doubt there is a little abuse. I am willing to admit it at once. There may be 5 per cent of abuse, but if you can show me any charity which has less than 5 per cent. of abuse I shall be surprised. I do not think there is 5 per cent. or anything like it, but I will put it at that. Then we tried to ascertain about how many children there were in a normal state of starvation in Birmingham, apart from all accidental circumstances such as the parents being thrown out of work or anything else—how many you might be sure either got nothing at all in the middle of the day or, at the outside, got a little bit of bread with a little lard or grease scraped on it. That took us a little time to do, but we reckoned there were in Birmingham then about 2,400 or 2,500 children for whom we ought to provide in any normal state of things. There was a population of about 400,000 people. Then there was a varying amount of children who depended on the state of employment.

13247. What difference did that make to your estimate?—In one winter—

13248. It was in the winter, of course?—Yes. We only feed the children during the winter months—for want of money, for one thing. I am sorry that I have not got our figures here for all the years we have been at work. But you can take it from me that in one year when there was a very prolonged winter the number of meals doubled—that instead of there being about 200,000 dinners distributed there were about 400,000 dinners. I wish to press this particularly, that the moment the conditions of employment improved the number fell off again to its normal state. By our system of not competing with the home, of only giving a dinner that will carry a child through, we avoid the slightest appearance of pauperisation. So far from causing this the case is rather the contrary. In many cases that I know of, parents who have been helped have been ashamed of themselves and have started helping their children.

13249. Should you say that the fluctuations of employment in Birmingham were greater or less than in most other big manufacturing centres?—I should say

Dr. Airy.

Dr. Airy. on the whole less, because Birmingham does not depend upon one employment.

13250. It has a great variety of employments?—Yes. But the moment you get a severe and prolonged winter it touches all employments almost.

13251. In regard to female labour, is there a large proportion? There is, of course, not so much as in the textile industries?—There are many girls employed.

13252. But not married women? There are not many employments which would draw married women into the factory or workshop?—No.

13253. We should like to hear your description of the methods employed?—This is a point on which I venture to suggest I may possibly say something useful to the Committee. We began with ten centres. We had large coppers for soup at ten centres, to which the children came from all outlying schools. The School Board allowed us in each of those centres to canvas off some twenty or thirty yards of playground, perhaps five yards wide, and the cooking was done at one end. There the soup and the bread and jam, which I will tell you about presently, were prepared. The process was simply this: we had to do everything to simplify matters. It had to be a rough business, but it was an effective one. The children come, and form file, and then they walk up, and as they walk up they take a spoon out of a basket and go up to where the voluntary helpers are distributing the soup. They take their bowl of soup and go on to benches on the other side of the canvassed shed, and sit down and eat their soup. The moment they have done they put their basin and spoon into another basket, and as they go out they take a large slab of bread and jam, and eat that in the street. The School Board allowed us to do this without any rent, and they gave us the gas.

13254. What are the constituents of this soup?—It is chiefly lentil soup now.

13255. Is there any animal stock in it?—Yes, there is a certain amount but not very much. It has been found by incessant experiment—because this has been an experimental business year by year—that lentil soup was the best. A starving child cannot take anything good; its stomach rejects it at once. We gave far too good soup at first. It had to be found out by experiment what they would stand.

13256. Those were mid-day meals, of course?—Yes; I will come to the breakfasts in a moment. Then the cooking of those meals is done by paid labour, but the distribution is done by the voluntary help of ladies at each centre. There is a rota at each centre and there are two ladies who attend each day. Our manager I will refer to directly—he is a most capable, suggestive man. We were very much distressed at the fact that the children would come a mile or a mile and a half to eat this poor dinner, and they would come through slush and snow and wet, and we wanted to prevent that. A system of baskets was invented. There is a system of baskets at present in use by which the soup can be kept absolutely hot for more than an hour. I have tried it at both ends, and I find it is almost as hot as when it comes out of the copper. We reduced the number of centres to four or five, and now all the outlying schools send their baskets with a paper saying how many dinners they want. Those dinners are put into the basket at a quarter to twelve or twelve o'clock, and then the staff of the school help in distributing the meals at that school.

13257. That is an economy, is it not?—Yes, but we do not do it for that purpose.

13258. But it has that further effect?—Yes, it is extremely useful. The staff of the school are very ready now to help. But the whole thing has come through constant improvement in the machinery. Starting with the principles which I mentioned, we said, "We are going to give a dinner in the rough, but something which is good enough to keep starving children going, and help them," and what the teachers think of it is shown by the fact that a considerable proportion of the money raised is raised by the teachers themselves. I have told you what the dinner is. Now comes the most astounding economic fact with which I have ever come in contact.

We give that dinner, a large bowl of soup—in fact they have two or three bowls if they like—and a large slab of bread and jam, for less than a halfpenny, and in that expense is included £150 or £100 a year to the manager. We spend deliberately nearly a third of our money upon the manager's salary, and the whole of our success has depended upon that. I have had to defend that over and over again, and the defence is complete. If we can give that dinner for a halfpenny, and if we can give it merely because of the excellence of the management, then I say that is defence enough. Somebody may say, "If the manager will take £50 we could give £50 more on dinners." "Yes," I say, "but the dinners will cost you a penny instead of a halfpenny, and they will be bad at that." Then I have spoken about there being no pauperisation at all, and there is no increase of numbers except under those circumstances which I mentioned, stress of weather, or loss of employment, from any particular cause. Then there come the conditions upon which all this depends, and I have put them down in the *précis*. First of all you must have a condensed population of the sort you want to help; they must not be far from you.

13259. They must be all concentrated?—Yes. Then, secondly, you must have the goodwill and the help of the local authority, and, thirdly, you must have a kind of heaven-born manager. That we had the good luck to get. He was an officer in the Navy who had retired, and he came to us when we were in great difficulties as to how we were to go on, because things were pressing at one time. And he said, "I should like to try and manage this if you will allow me, for nothing."

13260. He was a born organiser?—Yes, and not merely that, but with his own hands he can do things. He is the ablest man I have ever met for such work, and with enthusiasm for it. He did it for nothing at all for two years, and at the end of that time we said: "We will give you £150 a year." When subscriptions fell off I put it to him that things were not very bright, that he was worth more than £150 a year to us, but that we should be glad if he would take £100; he said that he would, and he is now paid £100 a year. He is a man who not only can deal with actual work, and finance, but with the ladies, and that is a great point.

13261. You get a quantity of voluntary assistance in that form?—Yes. Of course all voluntary assistance is liable to interruptions. We have had policemen come; there is always a policeman in each place. They will do anything to help this work.

13262. You have not made any attempt to recover from the parents if you thought they could pay?—No, we have not thought about parents at all. On the subject of pauperisation may I say that people have said: "You will encourage this drunken parent to do so and so." I have said at once, "I have looked into the matter very carefully, of a drunken parent who neglects his children, and he will not drink a pint less or more for anything that we do for his child; it will not make the slightest difference." It is useless to begin with the parents. We begin with the children and stick to the children, and we have been rewarded, as I say, by the number falling off. We have not got so many who want help now in Birmingham; each year the number has diminished.

13263. Is that because the employment in Birmingham is better?—I think it is simply that.

13264. The pressure upon you might be more acute this year or next year?—Yes. We are very elastic. We are always prepared to double our numbers if necessary under stress.

13265. Is any difficulty found in distributing these dinners in the schools themselves?—It depends on the number. It is only a small number in any school, and they take it in the lavatory or somewhere where they will not make a mess.

13266. The system has not been on a scale which would enable you to attempt to associate the teaching of cookery in the schools with the distribution of these meals?—No.

13267. Do you think in any circumstances that it might be possible?—I do not think it is advisable to do the cooking in the schools. I think there would be the smell and a nuisance.

13268. I mean if proper arrangements were made?—These were in the playgrounds of the schools.

13269. There are a certain number of the schools which have apparatus for teaching cookery?—Yes, but they have not the apparatus we want. They have got stoves and ranges.

13270. Is it not possible that the apparatus which they provide at elementary schools for the teaching of cookery is really beyond what is required? It would be more useful to the children if you could adapt the conditions of the teaching at the schools to such as prevail approximately in their own homes?—I think you would be causing embarrassment to the cookery school without sufficient reward for it if you used them for our dinners.

13271. Is it not the case that a great deal of the teaching of cookery in schools is above the requirements of the class which you aim at benefiting?—I am hardly prepared to say that. I think it may have been so in a good many cases, but I do not think it is so generally. No, I should say not, at any rate I do not think that touches this case.

13272. It is only incidental at any rate?—Then with regard to the breakfasts, we have got a system of that sort, but it is nothing to do with us except that we help one another. There is a gentleman in Birmingham who gives breakfasts of cocoa and milk and bread, every morning, to all the necessitous children in about twenty schools in Birmingham.

13273. At one centre?—No, at each centre. That was a great blessing. We could not do that because we live on voluntary subscriptions.

13274. And he is willing to meet any demand of that sort throughout Birmingham?—I do not say any demand but he is extending it by degrees. Every now and then I have gone and said to him, "There is another school in a very bad way; can you help it." He said, "Well, it is getting rather a big job, but still I will do it."

13275. Those meals cost less per head than the dinners, I suppose?—No, I believe they cost more.

13276. That is perhaps due to lack of management?—I think the milk is very expensive.

13277. Did he ever think of giving porridge?—No, he has never given porridge.

13278. Is that meal made use of by the same class of children in Birmingham which take the mid-day meal?—Yes.

13279. Is it given upon the same scrutiny of home conditions so as to justify it?—I am not quite sure about that. But I think that it is practically the same.

13280. You think that a scheme of this kind is quite capable of general application?—I cannot see why it should not be applied to London, if it were tried on our plan, that is dividing London into districts, and not being afraid of having a manager for each who would do the thing. We have a committee, of course, which meets pretty often, but the details all depend upon the manager.

13281. In London there is a larger quantity of children to supply, because their mothers are employed in factories or workshops?—In those cases they should pay $\frac{1}{2}$ d. for their dinner. We allowed people to pay for their dinner but the result was this. I think we had about 300,000 dinners last year and there were on the whole only 2,300 halfpennies. It practically comes to that. But in a great many parts of London it would be a waste of money to do it. I was in a Board School in Southwark not long ago, and I said to the master, "You have got a kind of middle-class school here," "Oh, no," he said "they are poor." I said, "Poor! you do not know what it means." They were all well-booted boys and not one of them would want a dinner under any circumstances.

13282. (*Colonel Fox.*) What percentage of the children do you provide dinners for?—We reckon there are about 2,400 or 2,500 that are in a normal state of wanting it; that is with a population of 400,000 or 500,000.

13283. (*Chairman.*) What proportion of child population does that represent—about $2\frac{1}{2}$ per cent.?—About 5 per cent.

13284. (*Colonel Fox.*) We heard that in London about 20 per cent. of the children require free food?—The point is what you mean by requiring free food. I do not think

there are 20 per cent. of the children who are starving. There are 20 per cent. of children who do not get an ample supply of food. We have not been able to consider them.

13285. You said there were 400,000 people?—There were between 400,000 and 500,000 people in Birmingham then.

13286. What sort of rough percentage do you think you deal with?—I do not know. I should have to think.

13287. (*Dr. Tatham.*) You say that you deal almost exclusively or quite exclusively with the Board Schools, do you not?—Oh, no,

13288. Then I misunderstood you?—The kitchens are situated in the playgrounds of the Board Schools, but children from all the schools come. That is how it comes about that I was Chairman from the very beginning, as being the Government Inspector. Mr. George Dixon, who was Chairman of the School Board, when he started this at the meeting, came to me and said, "We do not want to have any distinction between Board Schools and Voluntary Schools; will you be the Chairman, and then people will know there is no distinction." That is the only reason I took it.

13289. That is very important?—Yes. There is not the slightest distinction. In fact at some of the kitchens the bulk of the children are from very poor Voluntary schools.

13290. (*Colonel Fox.*) This includes all elementary schools?—Yes

13291. (*Dr. Tatham.*) Amongst the witnesses who have appeared before this Committee there has been a general consensus of opinion that whatever you do you must feed starving children. The only difference of opinion seems to be as to how to do it without pauperising them?—Yes.

13292. You seem to have got over that difficulty?—I claim that we have solved it absolutely without any question. If you only feed starving children, and if you take care not to give too good a dinner, there is no pauperising effect whatever.

13293. You will understand that as a medical man I am very much interested in the composition of the food you give; do you object to tell me exactly what your food consists of?—I would not object for a moment if I knew. I will find out in a couple of posts. I know it is chiefly lentil soup and a large piece of bread and jam.

13294. But as regards the composition of lentil soup?—I will find that out and send it.

13295. It would be interesting if we could get that, because I think I may say that we are all very glad to hear of the fact you have brought before us that a dinner of this kind can be provided for less than $\frac{1}{2}$ d.?—It is a most astonishing thing. I do not say that I should like to make my lunch on it every day, but I have lunched on it with satisfaction. The bread and jam is very much valued.

13296. (*Mr. Lindsell.*) You confine your attention entirely to what you consider starving children?—Yes.

13297. Where do you draw the line between a starving child and a child who is imperfectly fed?—It is almost impossible to say, but practically it comes to this, that these three people investigate very carefully the circumstances of the child—I admit in a somewhat rough way, but in an effectively correct way. They say "This child is a good recipient for this ticket."

13298. It is done by ticket?—It is not exactly, but it comes to that. Each day one child from the school goes with a slip of paper telling the controller at the kitchen how many children he is bringing from that school and they are counted as they go in.

13299. How do you take care that an unworthy recipient does not get it—I mean one who has no claim?—I think, as I said, there may be 5 per cent. of abuse.

13300. How do you know that the child who is selected for this meal free is the one who comes?—Because we give no temptation to a child who can get a decent dinner to come. There is no temptation whatever for him to come; our dinner is not good enough. That is where we have been very careful.

13301. Do you see any reason why this should not be extended in such a way as to include not only the charitable free meal to the absolutely starving child but also

Dr. Airy.

a meal, better at any rate than he could get at home, to the child who is imperfectly or improperly fed?—Only the general objection that I do not like to have charity where it is not absolutely needed.

13302. Then you would not be in favour of the plan which has been placed before us by Sir John Gorst and Dr. Macnamara that this feeding should be carried on at schools to a much greater extent than it would be possible to do by a pure voluntary agency, and that, in fact, any child attending a school which was in a neighbourhood where the families generally were, if not in great poverty, at any rate in poor circumstances, should be entitled to have this meal on receiving a ticket from the school authorities, that ticket being purchased by the parent, and that if the parent in the opinion of the local authority failed to provide his child with a proper meal at home, the price of the meal should be recoverable by some penal process?—I should be very glad indeed to see a neglectful parent dropped upon, but the machinery would be very elaborate for such a thing as that.

13303. Dr. Macnamara in his evidence stated that there were three committees of the London School Board by whom this question of feeding was considered and the third committee, that of 1898, was the one which dealt most closely with the question and came to a definite opinion on the subject. As he admits there, the recommendations of the committee were not accepted by the School Board itself. The first proposition as you will see in answer to question 12377 was, "It should be deemed to be part of the duty of any authority by law responsible for the compulsory attendance of children at school to ascertain what children, if any, come to school in a state unfit to get normal profit by the school work whether by reason of underfeeding, physical disability, or otherwise, and that there should be the necessary inspection for that purpose?"—But how would that necessary inspection be carried out? It could only be carried out in the pupils' houses. That would be impossible, I take it.

13304. We want your criticism upon this?—I cannot imagine a system being tolerated by which any inspector could at any moment go into a house.

13305. But he could inspect a child at the school?—But how are they to tell whether a child is unfit by want of food unless they know what food the child has had.

13306. He was asked what he meant by necessary inspection, and he said: "I mean inspection both on the part of the board's officials, and I imagine, in regard to physical disability, a medical inspection. But with regard to underfeeding, the Board itself has, or could have had, machinery other than medical machinery for testing that question. I do not think that you require a medical examination. There are attendance officers and teachers, and so on, who could do that." That is very much what your people do?—That is only by inquiry. They cannot go to the house and see what is going on at the house.

13307. He says that there should be an examination of the condition of the child's home?—I think that would be very difficult.

13308. (*Chairman.*) The visiting officer comes in there?—He goes to see why a child has not come to school, but he does not go into the house to see what the child is having to eat.

13309. It was said that these visiting officers know a great deal about the condition of the child's home?—Yes, they cannot help doing that, by inquiring and one thing and another; but I do not see how you can ever find out whether the child had had food or not. It would be a most difficult thing, I imagine, and would lead to a great deal of trouble.

13310. (*Mr. Lindsell.*) Their second proposition was: "Where it is ascertained that children are sent to school underfed"—this would go beyond starvation—"it should be part of the duty of the authority to see that they are provided under proper conditions contained in Clause 6." That makes it the duty of the local authority, besides their duty of imparting instruction, to give food to those that are not sufficiently fed to profit by that instruction?—Is it not the case that they would come under the disabilities of the Poor Law?

13311. No. I think you will find afterwards that they object to Poor Law treatment at all. They would have a new power of providing food; it would be under the Education law?—I do not think my views are sufficiently matured to be of use to the Committee. I might say something unadvisedly. I really thought the only good I could be to the Committee would be to describe our machinery and what we have done.

13312. I will not ask you, if you cannot answer that?—I would answer gladly if I could.

13313. As an inspector, from your knowledge of the whole thing, we should like to know whether those things are really visionary or whether they are at all practical?—As far as I can think at present, I do not think that the inspection of the homes for the purpose of ascertaining whether a child has had a proper amount of food is practicable or practical.

13314. Then I will not trouble you with the question of how the parents are to be dealt with who could provide their children with proper food but do not. The general idea is that such a parent should be treated as culpably negligent, and by some machinery or other—under the Prevention of Cruelty to Children Act, or some other Act—made punishable and made to pay the money?—I do not know whether that would come under the terms of the Prevention of Cruelty to Children Act or not.

13315. (*Chairman.*) Neglect figures largely there?—I cannot remember the terms.

13316. (*Mr. Lindsell.*) It would require legislation to fit it in, but that would be one way of dealing with the parent?—Nobody would be more delighted than I should be, but with our limited outlook and means, and our difficulty of working altogether, we have purposely neglected the parents, and all questions concerning the parent.

13317. If your dinner practically only costs a halfpenny, do you see any objection to enlarging the scope of it, and not merely giving the starving children a meal free, but letting those who like pay for it?—We let them pay now, but none come—practically none.

13318. What Dr. Macnamara would like would be that they should be able to say, "This child has a parent who does not feed it properly, but can afford to pay; and, therefore, this child shall come and have our meal as well as the absolutely starving child."—I think the child will come fast enough if he cannot get enough at home, whether the parent has £1,000 a year or 5s. a week, and we let the child come if we are satisfied that its parents, even if they are well-to-do, absolutely refuse to feed it.

13319. (*Chairman.*) You would not attempt to get anything from the parent?—No, not with our machinery. We do not care what child it is that is starving. The fact remains that the number never increases, but diminishes.

13320. Machinery of that kind is easily grafted on to your scheme?—Yes.

13321. (*Mr. Lindsell.*) What would be the advantage of this idea of virtually providing meals for nearly every child in the school?—I do not like it myself; I would rather not see it.

13322. And it might dangerously weaken the sense of parental responsibility?—I think so. Certainly, if you carried it to that extent, I think it would.

13323. (*Chairman.*) Does that sense of parental responsibility exist now? Because you cannot diminish a thing which does not exist?—I think the great bulk of the working classes have it and are very careful of their children.

13324. (*Chairman.*) We have had evidence here which tends to disprove that theory.

13325. (*Mr. Lindsell.*) You say you carried this thing on under the *egis* of the school board?—Yes, under their goodwill.

13326. To a certain extent they give you the ground?—Yes, and the gas.

13327. Would you see any objection, assuming the meals themselves were found by voluntary charity, to the machinery being placed more in the hands of the school authority, so that it would not be a question of free meals out of the rates at all?—No.

13328. I mean if they found the gas, and a place in the playground, might not they find a room and more apparatus?—It is not necessary to find a room. It probably means interference with something else, if they do find a room.

13329. If it is on a large scale they would require more apparatus than is required at present?—No. It would only require more centres. My idea is that you might carry on precisely the same system in more places.

13330. If your local authority took up the question and provided machinery and distributed meals, and did the whole of the work, it might be left to some charitable organisation to supply money for the meals in those cases where they were not self-supporting? The bulk of the children would pay a penny and the charity would make up any deficiency?—Do you mean give a much better meal?

13331. Give a rather better meal?—I do not see any harm in that.

13332. Sir John Gorst instanced the case of life boats, in regard to the Government: they provide all the facilities, but the life boats themselves are provided and supported by a private society?—Yes.

13334. You might have all the machinery found by the school authority?—Yes.

13335. But any deficiency caused by the provision of free meals to poor children might still be made up by some voluntary agency?—Yes. I think as long as the machinery for getting poor and starving children was good that would be all right. I do not mind about the children who pay—I do not feel any interest in them in this respect.

13336. (*Chairman.*) It is a question of convenience for them rather than anything else?—Yes, I do not feel any interest in them.

13337. (*Mr. Lindsell.*) Do you know there is an agitation on foot which seems to be growing in force in some quarters, that if you compel a man to send a child to school you should feed it?—I am absolutely opposed to that in principle.

13338. (*Colonel Onslow.*) There is only one point I wish to ask you. You mentioned that the cooking of the meals is done by paid labour, the washing of the dishes and so on?—Yes.

13339. You do not employ the children to do anything of that sort themselves?—No.

13343. And also I suppose the baskets are sent round by paid helpers?—No, the children are sent for the baskets. They come on a little trolley; it is no labour; and the children who bring them get some little reward for it. That is really paid service.

13341. But it is done by the children?—Yes, the baskets are an enormous help.

13342. (*Mr. Struthers.*) You find normally about 2,500 children in Birmingham?—It was a good many years ago that the census was taken.

13343. Do you think the numbers have greatly increased since?—No, I do not think they have.

13344. Are these children selected, or do they simply report themselves, and say they want a dinner?—The children are asked, "Who wants a dinner?" In many schools nobody does. If a child says "I do," its circumstances are carefully investigated as far as can be done without intruding on the home itself by these three people. There are also other indications. I was interested in the matter by noticing that pink flush on the children's faces which means starvation and not health.

13345. Have you had any cases brought to your notice in which children who do not ask for a dinner were reported by the teacher, or other people connected with the school, to be obviously starving?—Yes. Some of the children have a sort of reluctance, even when starving, to come and ask; but that is not a large number. Still there have been such cases.

13346. Supposing you add on all the children of that type to that 2,500, do you think it would very greatly increase the number?—No.

13347. So that you would be safe in saying something

about 3,000 at the outside was the number of children in the normal state who were what you might call starving?—Yes.

13348. In the sense that they have got nothing during the day, except possibly a piece of bread. Are there not a considerable number of children in addition to that who do not get anything like sufficient nourishment?—I do not know what sufficient nourishment is. But it comes to this that if a child can produce a halfpenny it does not come to our dinners. That is almost an answer to what you are asking. They get a dinner which is sufficient for them at home.

13349. Of course there is this to be said, that a child who is underfed, but who has a halfpenny, may prefer to spend it in another way; he is not aware of the necessity of food, except that he, perhaps, has an abnormal craving for sweets, or something of that sort?—I do not mean those who have a halfpenny in their pockets, but those who can procure a dinner at home which corresponds to the halfpenny.

13350. Do you think that the meal which you give them, the bowl of lentil soup, and the bit of bread and jam, is sufficient to keep these children in fair condition?—Yes.

13351. You find it so from experience?—Yes; I do not say in the condition which I should like a child to be in, but in a very different condition to what it used to be.

13352. The practical point is, can they do the ordinary school work—not excessive work, but the ordinary school work on that?—Yes; the teachers report that the difference is perfectly extraordinary. After all, he gets as much as he can eat very often.

13353. Do you think that these children get much food except this meal?—I do not know how much they get. A great many of these children will pick up a penny by minding a horse, or something of that kind, or by doing some little trick in the town. What they spend that on I do not know. Sometimes it is cigarettes, and sometimes it is sweets.

13354. But your scheme aims at nothing more than securing that no child shall be compelled to starve—there are the means there of getting a certain amount of food?—Yes.

13355. If the child itself wishes it, or if its attention is properly directed to the possibility of getting a meal?—Yes.

13356. (*Chairman.*) Do you think that a medical inspection of schools, as a re-inforcement of the system which you have described, would be a useful thing to fall back upon in case of doubt?—Of course medical inspections for certain purposes are carried out already, for the eyes, and so on.

13357. I mean in regard to the question of starving children. Or do you think that there are no cases of doubt where it would be necessary to submit the point to the arbitration of a medical inspector?—Unless the medical inspection was very thorough, would it be very much use?

13358. Would not a medical man, *prima facie*, be a better judge as to whether a child is in a starving condition than any teacher?—I suppose he would. I do not claim perfection for our plan at all; I think it is very rough, though I think it has been a very effective way of meeting the need. Of course a medical man would know more about it.

13359. On general grounds, do you think a medical inspection of schools would be a useful expedient with a view to determining, and possibly correcting, conditions unfavourable to the health of the rising generation?—I have no doubt it would.

13360. (*Mr. Lindsell.*) May I assume that you think that your system practically meets the difficulty of starving children in Birmingham?—It mitigates the evil enormously. I cannot say it meets the difficulty, because one meal in a day cannot meet a difficulty of that kind. But it takes all the keenness off the difficulty.

13361. (*Chairman.*) Then you say it is supplemented by these breakfasts?—Yes, but that is incidental; you would not get that done in London. That has only been going for one year in Birmingham.

13362. You think a mid-day meal is of more importance than a meal the first thing in the morning?—I do

Dr. Airy. not say that. All I say is that we started a dinner and stuck to it.

13363. We had a distinguished medical authority here—Dr. Hutchison—who said that as long as a child got a certain amount of nourishment during the twenty-four hours, it was a matter of minor importance what period of the day he received it?—I think that is quite possible. As I say, we started our plan, and found it useful, and found everybody wanted to keep it on; and we found that the teachers helped. The Birmingham Board School teachers alone raised something like £800 for various

charities for the children in the schools, of which our dinner scheme is one.

13364. What is the total cost of this?—It costs between £300 and £400 a year, but we do not begin till the end of October, and we go on to the beginning of May.

13365. You do not think any such system is wanted in the summer time?—I will not say that, but it is not nearly so much wanted. It is quite curious how our members drop off when the warm weather begins.

13366. Automatically?—Yes. In the warm days they can pick up many more things.

The Hon. Maude STANLEY, called; and Examined.

Hon. Maude Stanley. 13367. (*Chairman.*) You have had considerable experience among the workpeople in Soho?—Yes, thirty-four years.

13368. Is that in connection with girls' clubs?—No, in connection with the parish. I went there when I lived in London altogether, because my brother was a curate there. Then it was a very well-worked parish. There was a vicar and four curates, and district visitors, and Sisters, but when the vicar died (he had been a Ritualist) they were very anxious to make a change, and they put in a clergyman who never did anything. He was there for twenty-nine years, and all the district visitors left the parish except myself. So that it came to my lot to do anything there was to be done in the parish. That is how I became so very well acquainted with them, more than I should have been in the ordinary way. There were 6,000 in the parish, all poor, and I think I knew every house.

13369. You did house-to-house visiting?—Yes, and I also undertook other work for them. First of all I began with boys' classes, night schools, and Sunday schools, and then I went on to girls, and then had mothers' meetings, so that I knew the people thoroughly; I could not have known them better.

13370. It is on the physical condition of the girls that you especially wish to speak, I think?—Yes. I started a club for girls in 1880—that was ten years after I began to work in the parish, and it has been working ever since—twenty-four years.

13371. On what sort of basis was that club established?—It was established for any girls to come to who liked to do so, and their homes were visited to see if they were respectable. There was no difficulty in that way, but I wished to prevent the possibility of such a difficulty.

13372. It was open every evening, I suppose?—It was open five nights a week.

13373. What instruction was given?—They had classes of all sorts and kinds, and besides that they had dancing once a week. We had School Board teachers and voluntary teachers.

13374. Did you attempt to equip them for the conditions of domestic life by giving them lessons in hygiene, and the management of children, and so on?—They had classes of hygiene laundry and cookery, but they do not like going to service. It is very rare that I have been able to induce them to go to service.

13375. I meant with a view of being properly equipped for home duties?—They attended nurse classes, needlework and dressmaking, but I have not been able to induce them to go to service.

13376. I was putting the question from the point of view of equipping them to become useful mothers. That appears to be the great lack at the present day. A great deal of physical degeneration, of which we hear, is said to be due to the extraordinary ignorance and want of interest that a mother takes in the obligations of maternal life?—It has never been so in Soho, though Charles Booth marks it as one of the blackest spots on the map. There is more phthisis in part of Soho than in any other part of London, because it is so overcrowded.

13377. There is a great deal of overcrowding there?—Yes, tremendous. Before the Charing Cross Road and Shaftesbury Avenue were built it was very bad indeed.

13378. It is better now?—Yes. I have been very much struck by the submissiveness of the girls to their mothers; they bring home their wages and the mother gives what she likes to them as pocket money and keeps the rest to dress and feed them.

13379. Do you think the mother attempts to familiarise them with what their duties will be when they become mothers in turn?—No, I do not think the mothers are very much educated. I think the girls will do better towards their children.

13380. You think that with regard to that the conditions are improving?—Yes.

13381. Would you say that the physical conditions of the girls have improved?—Yes. I never saw any evidence given of such improvement in the newspapers, and therefore I was anxious to say what I could. I have not statistics, but the experience of those who really work among the poor is that they have improved. You can see that by the appearance of the girls coming into the club—some sixty or seventy girls every evening. They are very well grown.

13382. What are their ages?—They come in at fourteen and stay till they marry.

13383. What are they employed at during the day?—More than 50 per cent are occupied as tailoresses. That is the principal trade in Soho.

13384. Are they employed in their own homes or in workshops?—In workshops—by sweaters very often.

13385. Are the sanitary conditions in those workshops desirable?—I suppose they are—they are inspected.

13386. We are told that it very often happens that many of these slum workshops escape inspection?—I do not think they do now. I think the inspection is very good.

13387. You think in regard to ventilation every precaution is taken?—I cannot really answer that.

13388. You would assume it was so from the improved physique of the girls who come under your observation?—Yes. I attribute the improvement in the working class people to the enormous amount of work done by the School Board, and by thousands and thousands of volunteer people who have taken them for holidays in the country.

13389. What proportion of the girls at the age you mention, do you suppose, get a holiday in the country?—There are very few who only get the Bank Holidays, but there are a certain number.

13390. Are they taken out into the country by means of those organisations which are devoted to the purpose?—Yes.

13391. For ten days or a fortnight?—According as they can afford the time. I always ask my girls how long they can spend in the country—a week or a fortnight or three weeks.

13392. Are they eager to have the opportunity?—Yes. Then I ask them how much they have to spend towards it, and I deal with the matter accordingly. I have some invitations for which they would have nothing to pay.

13393. Some contribute the whole cost of their holiday?—Yes. Really the work has been done very thoroughly in every way by the School Board. There are many other things which the School Board do; they send round doctors and nurses to the schools and see if they are out of health in any way.

13394. Have you been acting as manager for the School Board of any schools?—I have been Manager of the Charing Cross Road School for the last thirty years.

13395. You have never been a member of the School Board?—No, I have enough to do without that. Really

I do not think you could say there was physical deterioration except that caused through overcrowding and drink. I have also to deal with feeble-minded children. I am a member of the Metropolitan Asylums Board, and we have homes for these feeble-minded children. They live in our homes and go to the special schools of the School Board. If you look into their histories you will find that almost all of them are children of drunkards and that is what brings them there. If you go into special a school where you have such children you will see them in classes of forty, and it is a most distressful state of things to see those poor children who are all impeded for life in some way or other, either by being feeble-minded or with some other physical defect.

13396. Are any of them susceptible to improvement?—Yes. We have had a home in Lloyds Square started for five years and it seemed to be working very discouragingly in one sense, but I thought that the work we did would prove to the Legislature that these children never could be really left to take care of themselves. We did everything we could for them; they were kept in a good home and were sent for four weeks to the sea-side, but that will never put brain power into them. I have a girl that I put to service at the Club in Soho. When she first went they did not think they would keep her, but I tried to induce them to do so, to bear with her, and after two years she is absolutely reformed and makes an excellent servant. I can now trust her to go to Camberwell to see her sister alone. She is absolutely a good servant but she will never be fit to take care of herself in the world.

13397. She is a proof of what can be done in meeting the conditions up to a certain point?—Yes, up to a certain point. I hope people in England will see that they must be kept for ever shut up, as they are in America.

13398. Do you think there should be a class of school which will take a child, not technically defective, but still one that comes from the worst and most neglected kind of home, so that it should be, at any rate for some years of school life, brought up under somewhat special conditions?—That is what we do with these feeble-minded children.

13399. But there is a class which can hardly be included among feeble-minded children but who are unfit for the ordinary school curriculum. What I wished to put was whether the system of special schools might not be to some extent extended, so as to meet that particular class?—I think it is very bad for the parents to know that they need not do their duty to their children because they will be taken care of by the State.

13400. But if you have a vast number of children suffering from neglect, do you not think that the children are of the first importance?—There are truant schools which are established.

13401. It is an extension of the system that I was referring to?—I saw a great change in the parents when the law first came into force that the children complained of could be sent to homes. I found the parents all telling me that their children were not able to be taken care of at home and so on, in order that they should be taken to homes, and they asked me how they could get them put into homes. I think it would very soon demoralise the parents.

13402. Supposing the parents were made responsible for a large portion of the cost?—You cannot get it from them.

13403. (*Dr. Tatham.*) I understood you to say that in consequence of the considerable alteration which has taken place in Soho the general condition of the place has improved?—Yes. Soho is built upon a very deep bed of gravel and it is very healthy, although crowded in some respects. When there was a case of fever, it never spread, although there was a houseful of families including children. It hardly ever spread from one room to another. I never found the sanitary condition affected the health of the children. I think the overcrowding did, and the quantity of people in one house breathing the same air.

13404. But did I not understand you to say that considerable improvements had taken place?—Improvements have taken place by not allowing so many to be in the same room or in the same house.

13405. Not by the demolition of houses?—Yes, there has been demolition of houses.

13406. But the general effect has been to improve the

houses?—Yes, the houses have been improved. But I really base the improvement upon the work which has been done in the schools and for the older girls. There are at present about 400 clubs for working girls in London, and for boys about double that number. And during all that time the girls and boys have had every sort of advantage for health—athletics for the boys and physical exercises for the girls, and so on. There has been improvement in all those sorts of ways.

13407. You spoke of a club with which you were connected?—Yes.

13408. You look upon that as an enormous advantage to the poor people?—It is quite an enormous advantage to them. Then the kindnesses which are shown to these girls get spread about among all the relations. It does them good and makes a better and kindlier feeling in that way. They take a great interest in what the girls learn. I started a club eighteen months ago in Walworth, because I heard of its being the very worst part in London, and the most neglected. I could not have imagined that the girls could have been so demoralised in their conversation, and in their actions as they were. When I went there they used to use very dreadful language, and say very terrible things; they used to run about in the forms, escaping from the lady who had charge. However, we went on, and now we have a place to ourselves in Walworth. There are eighteen acres of land belonging to the Ecclesiastical Commissioners which have fallen in, and they are going to remodel that estate altogether. I have an old beer-house for the club. These girls are so absolutely changed that I took twenty of them down on last Bank Holiday to Virginia Water. I took them to St. Anne's Hill and then to tea, and they behaved perfectly well. Many of these girls had passed the Seventh Standard at school, and could recite pieces of Shakespeare and Tennyson, and so on, but I felt it was an absolute waste, because after they had left school they went about the streets with no companionship but that of the costers, with whom they talked. Now I think there are more hopes of bringing them back to that which they know was decent and proper. These girls were certainly demoralised, but they were not physically deteriorated, though they were in this low condition. Very likely hawking about the streets has been good for them. But still they were not physically deteriorated although they were so demoralised. I have carefully observed the boys who sell newspapers, and I see they are not physically deteriorated; they are not weak little creatures, but are rather sturdy, and that is the lowest class of employment for a boy to take.

13409. With respect to the district you know best, you think there is no evidence of anything like physical deterioration increasing?—I say it is quite the contrary.

13410. It is the reverse?—Yes.

13411. You spoke just now of the prevalence of phthisis; do you think that it is less now than it was?—I have not the means of judging of that. I could not tell you. I know that Booth puts it as one of the worst places, but I could not tell you.

13412. From your own experience you have no reason to think that it has increased, at any rate?—No, it is certainly not increasing.

13413. It is rather the reverse?—Yes. Occasionally we get girls who have got it, but I have no statistics to bear out anything of that sort.

13414. Is it the practice to facilitate the removal of these girls to the various Sanatoria which are being established now for the treatment of consumption?—Yes. Mrs. Roberts, of Wardour Street, left £50,000 to send these people away. I belong to this committee. We have £1,500 a year to spend on sending people away who live in St. Anne's parish, or who work there. We are only allowed by the Charity Commissioners to send those who belong to this parish, and also we must send them to Convalescent Homes in Kent, because that is what Mrs. Roberts said in her will. If we have a surplus, which we have at the present time, we can send them to our open-air treatment hospitals. We can send anybody in that particular parish who applies, to places for open-air treatment, and we do so.

13415. Do you hope to do that to any considerable extent?—At the last census there were only 3,000 in St. Anne's parish who were English, all the rest were foreigners.

Hon. Maude Stanley.

Hon. Maude Stanley. 13416. What kind of foreigners ?—A great many were Jews. A large number of Jews are there working as tailors.

13417. Do you think there will be any objection on the part of Jews to leave home and go there ?—No ; they come before this Committee if they wish to go, and we send them.

13418. They do not object ?—No. They are rather lax. At one time in Soho the parents would not let their children go to any Home unless there was a Jewish butcher there, but now they do not seem to mind.

13419. It is the religious question ?—Yes. I say to them, "There will not be meat of your own sort there," and they say that they do not mind.

13420. We have had evidence here that the Jews take care of their children very much better than the Christians do ?—I think the Christians take very good care of their children, except the drunkards.

13421. Is not drunkenness very uncommon amongst Jewish mothers ?—Yes, there is none, so that you might say they all look after their children. I am sure that the Christian mothers take equal care of their children except those who drink. It is not a question of religion ; it is a question of drink.

13422. Do you think that, as a matter of fact, drunkenness is increasing amongst the women in Soho ?—I do not think it increases amongst the poorer classes. I think it has increased amongst the people of the better class of dressmakers and shop girls. I do not think so amongst the poor working classes. I do not think during all the years I have been in Soho, and amongst the thousands of girls I have known, that I have known more than four girls who have taken to drink.

13423. Is it married women who drink ?—No ; I think it is more the girls, because it is the custom with some when they leave their work to go off to places where they sell wine, and then the boys treat them. There are some girls able to manage five or six glasses, I do not say without bad results, but with bad results.

13424. Is there a tendency amongst the poor girls of a district to marry earlier now than they used to do ?—That was my very great object in starting the club, to prevent early marriages. They used frequently to marry without a bit of furniture or even a bed. Now our girls rarely marry before they are twenty-six. That I consider is to the girl's advantage. I have known many instances of our girls being engaged and giving up the young man when they found that he drank ; they looked upon that matter as so important.

13425. (*Mr. Lindsell.*) Did you say that you had a Home for defective children ?—Yes ; it is not mine. I am Chairman of it, but it is under the Metropolitan Asylums Board.

13426. It is connected with the Asylums Board ?—Yes. It is a rate-paid Home.

13427. You know now there is an Act of Parliament by which these schools for defectives can be established under the Education Act ?—No, I did not. I know we can keep these until they are twenty.

13428. There is an Act of Parliament enabling these schools to be established for defective children ; it has been a dead letter till last year when, with great difficulty, a short Act was passed removing those parts of the Act which made it impossible to carry it out, and now the London County Council are largely availing themselves of this opportunity of starting these special schools ; that will do a great deal of good, will it not ?—Yes. I suppose they will take them from all the schools ? We only have pauper children.

13429. They will be taken from the ordinary school class ?—Yes.

13430. They will be sent to special schools instead of ordinary schools. Sometimes a class is attached to the ordinary school ?—Yes, I know that a class is often attached to an ordinary school now, and the children live at home.

13431. Do you think that will cover the ground between the child or the young person who has to go to an asylum, and the person who is able to take care of himself ?—There seems to be that difficulty, that as long as the defective person is so defective that there is no doubt about his being

committed to an asylum or to a proper home, it is well looked after, but below that there is a certain stage where the person is able to take care of himself which is uncared for at present ?—They come to these schools.

13432. You were mentioning a girl that was able to go to work, and quite unable to look after herself ?—This girl is accustomed to obedience, and to do what she is told, and she goes to Camberwell and comes back, but I should not like her to go into another home, where there would not be the same looking after her. I do not know how she would take care of herself if anybody attempted to do anything wrong to her.

13433. Is there any further organisation in this place which you think desirable ?—Nothing, except to keep them shut up for ever if they are not able to take care of themselves. They do that in Massachusetts. You can only keep them to a certain point at school. You can improve them somewhat ; but in a general way those children who are feeble-minded do not become imbecile. There is a great difference between feeble-minded and imbecile children.

13434. (*Chairman.*) They very rarely become self-supporting ?—What we hope to do is to have a laundry. We can keep them till they are twenty years of age now, and we hope to have the girls in that and make their work remunerative.

13435. (*Mr. Struthers.*) Your point is that they must always be under control ?—Yes, or else they will go out and come back every year or so, as formerly, to have a child. You must make the place so pleasant that they will not feel it like a prison.

13436. (*Mr. Lindsell.*) Is there that control at present ? Do they go out as a matter of fact ?—I do not know, because we are going to keep them till they are twenty, till now we have only been able to keep them till they were sixteen. We think if we can keep them until they are twenty, and have a nice home they, perhaps, will not want to leave us. But there will not be any other control.

13437. (*Colonel Onslow.*) You mention the fact that in Soho a very large proportion of the population are foreigners. Are any of those girls concerning whom you have been speaking, foreigners ?—A great number of them have got foreign names, but they never look upon themselves as foreigners if they are born in England. Some of them I have known who have got Swedish fathers who have never learnt to speak English, and can only speak indifferently to their children, but the girls do not call themselves foreigners.

13438. They are of foreign extraction, but English born ?—Yes, they have foreign fathers.

13439. Did you notice any difference between the girls who are purely English and those with foreign parents, so far as physique, or stamina, or intelligence were concerned ?—No. We have had Jews, and the Jews I think are much cleverer. We used to remark on that in our schools.

13440. You do not find a better physique in a girl who is the daughter of a Swede ?—No, I do not think so.

13441. (*Mr. Struthers.*) Do you have girls in your club from all classes ?—Yes.

13442. Foreigners and Jews as well as others ?—No, not Jews ; because they have a Jewish club in the next street—a club of 300 girls—and they all go there.

13443. Would there be different grades, such different grades as there are in the district ?—Yes. We have errand girls, and we have experienced dressmakers or forewomen. We have never had any difficulty in mixing them.

13444. I think I heard you say that you make some inquiry to see whether their homes are respectable ?—Yes.

13445. Do you expect only the well-behaved girls to join your club ?—No ; it was by way of seeing that nobody with a bad character should come in. But it was not necessary, because those poor things would not try to come in. I did it originally because I thought it might be convenient.

13446. Then the girls that you have are representatives of the population of Soho ?—Yes.

13447. And excluding those who drink or who have

Hon. Mr. Stanley.

not any means of living for one reason or another, you think they are fairly well-fed and their homes are fairly well looked after if there is a reasonable income?—Yes. For the last ten years I have not visited much, because I have had so much other work, but I used to visit them frequently. I have found that the French people always had a much nicer cuisine, and much nicer food for their children than we do, but I think the English are very much improved from the cookery lessons given to their children; the children go home and tell their mothers how to do the cooking; they have improved very much in that way.

13448. Do you believe that these cookery lessons in the board schools have had an effect on the homes in Soho? Yes, I think so.

13449. And you think that if there is really a sufficient income in the family, that the members of the family, especially the boys and girls, do get decently cooked food and sufficient of it?—Yes, I think so. Of course they are under the drawback that they often go to work at a distance and must take something with them for their dinner, and they cannot have a regular dinner. They none of them have supper. They only have real dinners on Sunday. They come to us at the club always straight from their work, and then they have refreshments which the girls manage themselves—they have coffee or cocoa, and light refreshment.

13450. We have been told that even when there is a fair income in the family, 30s. or 40s. a week, the mother is often so intensely ignorant, and so uninterested in her children that she cannot give them decent food before they go to school or when they come back?—I do not think that is so in Soho. I am perfectly sure that it is not so there. It may be so in other parts of London.

13451. That does not agree with your experience?—No, nor with what the girls tell me. I assure you that the mothers are very good there. I have a party once a year, where I ask the fathers and mothers of the girls to come and tell me what they think of the club. They all take the greatest and deepest interest in the girls and what they are doing.

13452. Your girls come from such a variety of classes that they must be said to be fairly representative of the population of Soho?—Yes.

13453. Excluding the absolutely degraded and unfortunate?—Yes.

13454. The working class population?—Yes. The rents are enormous now. I was at our Soho school last week where they told me they were losing a number of their children because so many are going away as the rents are becoming excessive. They are going to Hampstead and other parts because they cannot afford to pay the rents in Soho any more. I was rather glad for one reason, because Hampstead is very healthy.

13455. Do you think the Christian mothers are really less devoted to their homes than the Jewish mothers?—Most decidedly not.

13456. You think not?—Certainly not. I have always been struck with the goodness of the mothers, and I should not have started the Club to take them away from their homes except for the fact that when you find a family living in two or three rooms—children and father and mother—they cannot have any employment there in the evening, and therefore they will walk about the streets. Therefore, the Club is a good thing for them in that sense. I ask some of them why they have not been present on a certain occasion, and they say, "That is the day that mother wants me to help her in the washing." The Club does not take them away from helping their mothers.

13457. Do the mothers wash at home themselves?—Yes, or at the baths. There are baths where they can wash their clothes.

13458. Do you know from experience that a number of those girls, tailoresses and so on, who are occupied during the day, help their mothers in washing, and looking after things generally?—Yes. Many of them say: "I can only come to the Club three days a week because I help at home."

13459. That is to say they help generally?—Yes, there is really a very good feeling between the children and their parents. Another thing which struck me very much, having lived in the country previously, was that

the girls in London are very much more moral than girls in the country. They live in Soho, which is of course the worst place in one sense in London, but the immorality there does not touch them in the very slightest degree; they know how to take care of themselves in the streets. I consider them indeed highly moral. Occasionally I find some of them have been going to the dancing places, where they can go for a shilling a dance. At one time I employed my superintendent to see what they were like, and she told me they were terrible places and quite unfit for any respectable girl. Now, if I find out that they go there, I speak to them about it. To one girl whom I knew very well I said:—"I hear you go to that dancing place and pay a shilling," and she said, "Yes, I have been." Then I explained to her that I did not think it was nice for her or for me to have the companionship of the women to be found there. She said: "I had never thought of that; you are quite right." After some conversation she said: "I thank you very much for speaking to me and I will never go there again," so that she was quite open to the reasoning that it was not a nice place. I tell them they must choose between the two. We give them dancing to keep them from these places.

13460. (*Chairman.*) Do they have young men to dance with?—Yes. We have had them always at a Christmas party. We have asked them: "Whom would you like to ask?" and we have sent cards to the young men. We now have four in the year, as the girls asked us to give them four if we were quite satisfied with their behaviour, and we agreed.

13461. (*Mr. Struthers.*) Do these girls take an interest in their homes and help their mothers?—Yes, I think they do, very much.

13462. A considerable proportion of your girls have married, no doubt?—Yes. Of course they become quite a different sort of girl; they have been for so many years accustomed to see ladies and nice people who have been there to speak to them that their manners are very good. They are rather favoured in that way, and they make better marriages than they would otherwise have done.

13463. You know a great deal about them after they are married?—Yes.

13464. You still keep in touch with them to a certain extent?—Yes.

13465. And you find as a rule they are perfectly able to look after a home of their own?—Many of their husbands have told me that they advise all their friends to come to the Soho Club to get wives, because they get such good ones from our club.

13466. So far as a knowledge of cookery and laundry work and the management of a house generally are concerned, they are quite competent?—It is not very difficult to do that if they are intelligent.

13467. Do you think the instruction they get in the board schools has something to do with it?—I think it has; it gives them an idea of handling things. Of course it is not difficult. With a cookery book they can manage.

13468. You lay considerable stress upon the part the School Board has played in the work of the improvement in the condition of the population in this district?—Yes.

13469. In what other ways do you think the School Board has improved the condition of the people directly or indirectly except by cookery lessons in the schools?—I think by being more in the open air and the physical exercises. They often go out in playtime and have a play outside in the playground, and so on, and the physical exercises which they are always doing are very advantageous to them. Another thing which is very advantageous are the swimming lessons.

13470. It is not your idea that the children in these schools are kept indoors too long and kept too tight at their desks during school hours?—No, I do not think it is very long that they are at their desks.

13471. It is not a very long day at the most, is it?—No.

13472. And it is very much broken up as a rule?—Yes. I daresay that you know the School Board allows it to be considered as an attendance if they go out to visit the Museum or the Tower or anything of that sort.

13473. Up to a certain point, of course?—Yes; they must have the School Board members' leave for it. It is only a certain amount.

Hon. Maude Stanley. 13474. Have you been struck by any necessity of providing free meals for children attending schools in your district?—No; I had dinners for a long time and then I had misgivings as to whether they really wanted them or not, and I said instead of giving dinners I would give them breakfasts. I thought if they were really hungry they would come to the breakfasts. They came, for a little while but they did not seem to care for it and I thought they could not be very hungry if they did not come for breakfast.

13475. Would you say that there is a very large proportion of children in the schools in the district who are underfed, who do not get anything like sufficient nutriment?—I do not suppose they get as much as they ought to have.

13476. But I mean so much less as to materially injure their physique?—I have no doubt they would be very much better for more, some of them. Our extreme poor have gone away. The very, very poor lived in what was called the Newport Market, houses where the house door was never shut and people slept on the stairs—that class of house. Girls used to go about called the “Forty Thieves,” and boys also—that is the name they give to that rough sort of people. That class have altogether gone from there.

13477. With regard to the proportion which remains, do you think there is any crying need to institute a system of feeding children attending the schools, finding out those that are underfed and feeding them?—No, certainly not in Soho.

13478. Do you think there is any necessity in the district of taking in the children who are underfed and feeding them and compelling the parents to pay?—Certainly not in that neighbourhood.

13479. I rather gather that your experience is that if the parents are able to feed them they do feed them?—Yes.

13480. (*Colonel Fox.*) On the question of physical

training, have you anything to say in favour of the system that now goes on in the schools?—Yes, I think it is admirable. It does not over-fatigue them but it helps them very much. It does them a great deal of good and is not too severe.

13481. And you also find that there is marked improvement since it has been established in the schools?—Yes. I think the look of the children is altogether better.

13482. You think they are brighter?—Yes.

13483. You think they are brighter, in addition to being of improved physique?—Yes. I have that sort of experience of children that I have always kept this one school to myself to send the children to the country who wished to go, and I always examine every child. I used to examine their heads to see they were all right, before there was a nurse, and send them away in the country. So that I know the look of the children altogether, and the children are improved. Everybody who has really worked in the same way says the same thing—those who really have intimate acquaintance with the poor in this respect. There is another thing which I daresay you have had in evidence, and that is that the reason that some of these people are so defective is because hospitals and dispensaries have so much increased the number of children who are kept alive, who would otherwise have died, and who grow into very poor specimens.

13484. (*Chairman.*) I am afraid that plenty of them die as it is?—Perhaps it would be happier for them if more of them died.

13485. (*Colonel Fox.*) At all events, in addition to improving their general physique these exercises have put more life into the children and made them brighter?—Yes.

13486. You find that very marked?—Yes, very marked indeed. On Saturday I am going to a competition of physical exercises at the Northampton Institute, where there will be 350 girls competing, all work girls from different parts of London.

TWENTY-SIXTH DAY.

Monday, 20th June, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Mr. JOHN LITHBY, called; and Examined.

Mr. Lithby. 13487. (*Chairman.*) What is your position in the Local Government Board?—I am an Assistant Secretary of the Local Government Board in charge of the Public Health Department.

13488. That does not include the housing of the poor, does it?—No.

13489. The appointment of medical officers of health falls within the cognisance of your Department?—Yes.

13490. Do all local authorities appoint medical officers of health?—The local authorities who appoint medical officers of health are the county councils.

13491. They may, or may not, as they like?—They may, or may not. Also the metropolitan borough councils, the urban district councils, the rural district councils, and the port sanitary authorities.

13492. Are some of those obliged to appoint them?—The urban and rural district councils are obliged to appoint them.

13493. The qualifications differ in different cases, or is there one general set of qualifications in force?—The county medical officer of health is required, if appointed since the 1st of January, 1892, to hold a diploma in sanitary science, public health or State medicine, or to have been during three consecutive years preceding the year 1892 a medical officer of a district, or a combination of districts with a population of not less than 20,000, or to have been, before the passing of the Act of 1888, for not less than three years a medical officer or inspector of the Local Government Board. In London the qualification is generally similar to that of the medical officer for a county. Medical officers of health for urban and rural districts are appointed under Section 190 of the Public Health Act 1875. They are not required to possess a special sanitary diploma, although in many cases candidates now possess such diplomas. The medical officers whose salaries are repaid are subject to the Order of the Local Government Board of the 23rd March, 1891. They hold office for such period as the sanitary authority may,

subject to the approval of the Local Government Board, determine at the time of their appointment, or until they die, or resign, or are removed by such authority with the assent of the Local Government Board, or are removed by the Local Government Board, or are proved to be insane. Medical officers of health whose salaries are not intended to be repaid out of county funds hold their offices subject to the agreement arrived at between them and the authority appointing them, and the Local Government Board have no voice in the matter.

13494. What proportion of them hold office under that tenure?—I cannot tell you exactly.

13495. There is a considerable difference both in the conditions of the appointment and in the tenure?—Yes.

13496. How does that work out in practice. Do you think it is better than a uniform system?—Probably it is, because the conditions on which they hold their offices are so various. It is easy in respect of large urban districts to lay down the rule that a medical officer of health shall possess certain qualifications beyond those which he holds as a member of the medical profession. As regards some rural districts it is very difficult to say that a local medical practitioner of good standing shall not, if he wishes, hold this appointment. Local authorities are generally anxious to have local men, and on the whole I think they prefer to have a man they know living in the district and practising among them. Therefore, two points have to be considered: first, can they employ a man giving his whole time to the work? If they can, must the appointment be limited to someone who possesses the qualifications in State medicine?

13497. (*Dr. Tatham.*) Will you kindly say whether, in the opinion of the Local Government Board, at present it is held to be desirable to appoint medical officers of health over large areas in preference to appointing practitioners, such as you said, all over small areas?—On the whole I think I may answer that question in the affirmative.

13498. That is the general policy of the Board?—That is the general policy of the Board—I may qualify that just a little by saying that at the outset when the Public Health Act was being brought into operation the opinion was very decidedly held, and, as a consequence, large districts were given to medical officers of health—for instance, Dr. Thursfield held a large district in the Midlands, and in other parts of England there were several large combinations. I do not say that those did not work well, but at the same time they left something to be desired. In a large area it is quite impossible that the medical officer should move about with the celerity that some of the local authorities desire. A case of infectious disease breaks out in a district; the medical officer possibly lives thirty miles away. He cannot visit the case at once because he has other engagements, perhaps many miles on the other side of his home. So those old combinations are fewer now than they were, and when vacancies occur there is a tendency for the local authorities to try and get smaller districts.

13499. Even though, in the opinion of the Local Government Board at any rate, they do not think the work will be so well carried out?—Of course, much depends on the personal equation; that is the difficulty.

13500. (*Chairman.*) Is it not desirable that the area should be large enough to employ a man for the whole of his time, rather than it should be combined with private practice?—Certainly

13501. That is a good thing?—Certainly.

13502. You deprecate the combination of the duty of a medical officer of health with a continuance of private practice where it can be avoided?—Certainly. In the Local Government Board the preference is decidedly in favour of those men who devote their whole time to it, who have special qualifications, and who do not engage in private practice.

13503. I suppose in the cases of the employment of such it would be more easy to guarantee them a greater security of tenure?—I think so.

13504. Where they are efficient officers?—Yes, I would not say the others are not efficient according to their lights, but where the officer is giving his whole time to the work, and has a diploma in sanitary science, it is the practice of the Board now to invite local authorities to appoint him either permanently or for a longer period than the one year which is often proposed.

13505. I suppose in all the big towns a man does give his whole time to it, does he not?—Not always. We press for his whole time.

13506. But you have no power to enforce?—We have power to withhold approval, and that carries with it the inability on the part of the local authority to get repayment from the county funds. That is a strong power to wield, and it is sometimes successful, but not always.

13507. (*Chairman.*) What proportion is paid out of the county funds?

13508. (*Dr. Tatham.*) Hal, I think, is it not?—Yes.

13509. (*Chairman.*) Indirectly you have the power of insisting?—Indirectly. But we also have to bear in mind that the system is a system of local government.

13510. It is local government tempered with judicious interference?—Yes. Many of these men are very competent medical men. We had a case some time ago where a leading physician in the county was acting as medical officer of health for a small district. He had the confidence of the whole neighbourhood—I may say of the whole county. It is a difficult thing to say that such a man shall not act as a Medical Officer of Health in a small rural district about which he is always going.

13511. (*Dr. Tatham.*) The question seems to be that in the case of an energetic Medical Officer of Health who really wishes to do his duty, and to do it quite in conformity with the wishes of the Local Government Board, the fact that he does his duty is sufficient to lose him his office. I have in my mind now the case of a man who was quietly told by his Council, a Borough Council too, that if he continued to exercise his discretion and to try and improve the sanitary condition of his district, they would get rid of him. They told him that deliberately. I know that that was done. That seems to be the great objection to allowing local authorities absolute power of dismissal?—As to that, of course, I can only say what has officially come before the Local Government Board. There have been a few cases of that kind. We have heard of others. We have seen newspaper reports of others, but very few cases have been specially brought to the notice of the Board in which that has occurred.

13512. I am speaking of a period now of some fifteen years ago. Perhaps it was more common then than it is now?—There have been cases.

13513. (*Chairman.*) But if the Local Government Board have no effective power of interference they would not bring them to your notice, would they?—The successor, or some friend of the retiring officer, usually writes and says: "So and so is happening, can you prevent it?"

13514. I suppose you say that you cannot?—As a rule we can not. As a rule we can only make inquiries and give advice, and, if the new officer is appointed, the Board may decline to approve that appointment. The Committee will see that it is a serious step to take, because the new officer may be a perfectly competent officer, against whom nothing may be known, and it would be an arbitrary exercise of power if the Board were to say that they will not recognise the incoming good man because there is an outgoing good man whose services are no longer required by the local authority.

13515. And, in fact, you never do so, I suppose?—I cannot say. We have prevented the dismissal of officers in some cases.

13516. Do you not think, with a view to placing your power of prevention upon a satisfactory basis, that it would be a very good thing to vest in the Local Government Board the right of veto; then there could be no question?—Whether the time is ripe for such an exercise of the power of the Board I am not quite sure, but I think the time is approaching.

13517. And, granted that the time has arrived or is approaching, you think it would be a very good thing?—There would be difficulty in many districts. Local authorities do not like to have their officers interfered with, and in cases where the Board have shown a certain amount of resistance to local authorities, in regard to the appointment of their officers, difficulties have arisen.

13518. (*Mr. Legge.*) In fact, you anticipate passive resistance?—Yes. A local authority says this: "We cannot work with this officer," and if they cannot work

Mr. Lithiby.
—

Mr Lithiby. with that officer it would be, I think, unfortunate if a central department insisted on that officer being retained.

13519. (*Chairman.*) True, but do you not think the fact of your being vested with a veto would lead to local authorities being extremely careful how they dismissed a man without due cause? They would know that, if you were appealed to, you would make a searching investigation into the causes, and they would have to state very clearly and very fully the considerations which had led them to part with a deserving officer?—I do not think that would have much more effect than the remonstrances that we employ now.

13520. Except that the remonstrances which you employ now are made after the act has been committed, whereas the explanations that they would have to offer would be anterior to the dismissal being complete?—Yes.

13521. That surely makes a great deal of difference?—One's experience of them is that they would say "We cannot work with this officer." We might induce them to retain him for a year, but the difficulties they would make are considerable; I am speaking from actual cases. The names I cannot give, but we have had cases.

13522. (*Colonel Onslow.*) If you could call upon them to state their full reasons why they cannot work, would not that bring it out?—Yes; it does bring it out.

13523. (*Chairman.*) You put them on the defensive?—We do it now.

13524. Except that the thing is done when you do it?—Yes.

13525. It is *ex post facto*?—Yes. In that respect I think there might be an advantage in the course you suggest.

13526. (*Dr. Tatham.*) Does not the statement you have mentioned, and which I know has been made frequently, "We cannot work with this officer," really mean "This officer wants to do his duty, and we, his masters, will not let him"?—I think it is very often a question of personal fact.

13527. (*Chairman.*) In suggesting that the Local Government Board should exercise a veto, I must be understood to presuppose that the Local Government Board would exercise that veto discreetly and intelligently?—Provided you recognise the fact that it is the personal equation that is to be dealt with in many of these cases, I agree.

13528. Would you just state briefly what you hold to be the duties of the medical officer of health?—The duties of medical officers of health are set out as regards London in the Sanitary Officers (London) Order 1891, and as regards the urban and rural districts in orders made by the Board in March 1891. They are set out in Article 18 of the latter orders, and I will read them to the Committee:—
 "(1) He shall inform himself as far as practicable respecting all influences affecting or threatening to affect injuriously the public health within the district. (2) He shall inquire into and ascertain by such means as are at his disposal the causes, origin, and distribution of diseases within the district, and ascertain to what extent the same have depended on conditions capable of removal or mitigation. (3) He shall by inspection of the district, both systematically at certain periods, and at intervals as occasion may require, keep himself informed of the conditions injurious to health existing therein. (4) He shall be prepared to advise the Sanitary authority on all matters affecting the health of the district, and on all sanitary points involved in the action of the sanitary authority, and in cases requiring it, he shall certify for the guidance of the sanitary authority or of the justices, as to any matter in respect of which the certificate of a medical officer of health or a medical practitioner is required as the basis or in aid of sanitary action. (5) He shall advise the sanitary authority on any question relating to health involved in the framing and subsequent working of such byelaws and regulations as they have power to make, and as to the adoption by the sanitary authority of infectious diseases (Prevention) Act, 1890, or of any section or sections of such Act. (6) On receiving information of the outbreak of any contagious, infectious, or epidemic disease of a dangerous character within the district, he shall visit without delay the spot where the outbreak has occurred, and inquire into the causes and circumstances of such outbreaks, and in case he is not satisfied that all due precautions are being taken, he shall advise the persons competent to act as to

the measures which may appear to him to be required to prevent the extension of the disease, and take such measures for the prevention of disease as he is legally authorised to take under any statute in force in the district, or by any resolution of the sanitary authority. (7) Subject to the instructions of the sanitary authority, he shall direct or superintend the work of the inspector of nuisances in the way and to the extent that the sanitary authority shall approve, and on receiving information from the inspector of nuisances that his intervention is required in consequence of the existence of any nuisance injurious to health, or of any overcrowding in a house, he shall, as early as practicable, take such steps as he is legally authorised to take under any statute in force in the district, or by any resolution of the sanitary authority, as the circumstances of the case may justify and require. (8) In any case in which it may appear to him to be necessary or advisable, or in which he shall be so directed by the sanitary authority, he shall himself inspect and examine any animal, carcass, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, or milk, and any other article to which the provisions of the Public Health Act, 1875, in this behalf shall apply, exposed for sale, or deposited for the purpose of sale, or of preparation for sale, and intended for the food of man, which is deemed to be diseased, or unsound, or unwholesome, or unfit for the food of man; and if he finds that such animal or article is diseased, or unsound, or unwholesome, or unfit for the food of man, he shall give such directions as may be necessary for causing the same to be dealt with by a justice, according to the provisions of the statutes applicable to the case. (9) He shall perform all the duties imposed upon him by any bye-laws and regulations of the sanitary authority duly confirmed where confirmation is legally required, in respect of any matter affecting the public health, and touching which they are authorised to frame bye-laws and regulations. (10) He shall inquire into any offensive process of trade carried on within the district, and report on the appropriate means for the prevention of any nuisance or injury to health therefrom. (11) He shall attend at the office of the sanitary authority, or some other appointed place, at such stated times as they may direct. (12) He shall from time to time report in writing to the sanitary authority his proceedings, and the measures which he may require to be adopted for the improvement or protection of the public health in the district. He shall in like manner report with respect to the sickness and mortality within the district, so far as he has been enabled to ascertain the same. (13) He shall keep a book or books, to be provided by the sanitary authority, in which he shall make an entry of his visits, and notes of his observations and instructions thereon, and also the date and nature of applications made to him, the date and result of the action taken thereon and of any action taken on previous reports, and shall produce such book or books, whenever required, to the sanitary authority. (14) He shall also make an annual report to the sanitary authority, up to the end of December in each year, comprising a summary of the action taken, or which he has advised the sanitary authority to take, during the year, for preventing the spread of disease and an account of the sanitary state of his district generally at the end of the year. The report shall also contain an account of the inquiries which he has made as to conditions injurious to health existing in the district, and of the proceedings in which he has taken part or advised under any Statute, so far as such proceedings relate to those conditions, and also an account of the supervision exercised by him, or on his advice, for sanitary purposes over places and houses that the sanitary authority have power to regulate, with the nature and results of any proceedings which may have been so required and taken in respect of the same during the year. The report shall also record the action taken by him, or on his advice, during the year, in regard to offensive trades, to dairies, cow-sheds, and milk shops, and to factories and workshops. The report shall also contain tabular statements (on forms to be supplied by Us, or to the like effect) of the sickness and mortality within the district, classified according to diseases, ages, and localities. Provided that, if the Medical Officer of Health shall cease to hold office before the thirty-first day of December in any year, he shall make the like report for so much of the year as shall have expired when he ceases to hold office. (15) He shall give immediate information to Us of any outbreak of dangerous epidemic disease within the district, and shall transmit to Us a copy of each

annual report and of any special report. He shall make a special report to Us of the grounds of any advice which he may give to the sanitary authority with a view to their requiring the closure of any school or schools, in pursuance of the Code of Regulations approved by the Education Department, and for the time being in force.

(16) At the same time that he gives information to Us of an outbreak of infectious disease or transmits to Us a copy of his annual report or of any special report, he shall give the like information or transmit a copy of such report to the county council or county councils of the county or counties within which his district may be situated. (17) In matters not specifically provided for in this Order, he shall observe and execute any instructions issued by Us, and the lawful orders and directions of the sanitary authority applicable to his office. (18) Whenever We shall make regulations for all or any of the purposes specified in Section 134 of the Public Health Act, 1875, and shall declare the regulations so made to be in force within any area comprising the whole or any part of the district, he shall observe such regulations, so far as the same relate to or concern his office." Duties are also imposed upon Medical Officers of Health by the Factories Act of 1901. Under Section 132 of that Act, the Medical Officer of Health is required in his annual report to deal specially with the administration of the Act in factories and workshops, so far as the matters under the charge of the District Council are concerned. Those duties are stated, in a Memorandum issued by the Home Office in March, 1903, to be as follows:—"Under Section 132 of the Act, the Council's Medical Officer of Health is required for the future in his annual report to the Council to report specifically on the administration of the Act in workshops and workplaces, so far as the matters under the charge of the Council are concerned, and to send a copy of his report, or of so much of it as deals with this subject, to the Secretary of State. The matters which the report should specially deal with are indicated in the instructions issued by the Local Government Board to Medical Officers of Health in England and Wales. It is also the duty of the Medical Officer, if he finds any woman, young person, or child employed in a workshop *in which no abstract of the Act is posted up*, to inform the District Inspector of Factories in writing." The matters referred to Council by factory inspectors are as follows:—"The factory inspector will, on finding in a factory or workshop any act, neglect, or default in relation to a drain, water-closet, earth-closet, privy, ashpit, water supply, nuisance, or other matter which is punishable or remediable under the Public Health Acts, but not under the Factory Act, give notice to the Council of such act, etc.; and it will then be the duty of the Council to make inquiry into the matter, take such action as may seem proper, and inform the inspector of the proceedings taken. If proceedings are not taken by the Council within one month, the inspector is authorised to take the same proceedings as the Council might have taken, and to recover from the Council the expenses incurred by him which have not been recovered from any other person, and have not been incurred in any unsuccessful proceedings." Then the Local Government Board issue annually to medical officers of health a memorandum in which they advise as to the points which should be included in the report of the medical officer of health.

13529. That is the form in which information reaches you as to what has been done?—Yes.

13530. Does the medical officer of health provide you with that directly, or is the authority which employs him responsible?—It is the duty of the medical officer of health to make his report to the authority and to send a copy of it to the Local Government Board at the same time. He is also required to send to the Local Government Board a copy of any special reports which he may make from time to time to his authority.

13531. The local authority is not charged with the duty of providing you with any information as to the character or efficiency of its administration?—The authority itself is not.

13532. Would it not be a good thing, with a view to do bringing this responsibility home, to see that it should so?—I think we get as much information from the medical officer of health as we should be likely to get from anyone.

13533. But with a view to emphasizing what the direct responsibility of the local sanitary authority is in matters of that sort, would it not be a good thing to require that it should provide you with information as to what it is doing?—I do not think there would be any practical advantage.

13534. What points does the annual report of the medical officer of health cover?—It covers all the sanitary work with which the local authority has to deal.

13535. Does it include such a thing as the infant death rate, the number of cellars or back-houses, or of one-roomed or two-roomed tenements with so many occupants in each, the minimum of cubic feet to each person, or the character of the water supply, and sewage arrangements?—The direction in the order is:—"He shall also make an annual report to the sanitary authority, up to the end of December in each year, comprising a summary of the action taken, or which he has advised the sanitary authority to take, during the year, for preventing the spread of disease, and an account of the sanitary state of his district generally at the end of the year. The report shall also contain an account of the inquiries which he has made as to conditions injurious to health existing in the district, and of the proceedings in which he has taken part or advised under any Statute, so far as such proceedings relate to those conditions; and also an account of the supervision exercised by him, or on his advice, for sanitary purposes over places and houses that the sanitary authority have power to regulate, with the nature and results of any proceedings which may have been so required and taken in respect of the same during the year. The report shall also record the action taken by him, or on his advice, during the year, in regard to offensive trades, to dairies, cow-sheds, and milk shops, and to factories and workshops. The report shall also contain tabular statements (on forms to be supplied by Us or to the like effect) of the sickness and mortality within the district, classified according to diseases, ages, and localities."

13536. You get full information about action, but no information about inaction?—If he does nothing, we write to him and inquire why.

13537. There may be many insanitary conditions in existence which, if they do not happen to be made the subject of action, you do not get informed upon?—In that case we should certainly communicate with the authority and probably require a Supplementary Report giving the information on the points omitted.

13538. (*Mr. Struthers.*) How are you to know how much is omitted?—The reports are always carefully analysed, abstracted and tabulated. Every report is examined carefully, and if it is found that no information is given with regard to the action of a rural authority in reference, say, to the Dairies and Cowsheds Order, or if no information is given by the medical officer of health that he has made systematic sanitary inspection during the year, we write and ask specially for the information.

13539. But suppose the report says that twenty insanitary houses have been closed in the district during the year, there may be, as a matter of fact, 200 of those houses, or there may be 400, and you have no means of finding out?—In that case, we should not have any means of checking the statement of the medical officer of health.

13540. (*Mr. Struthers.*) But it is desirable that you should have means, is it not?

13541. (*Mr. Legge.*) Suppose you had, through the Registrar General, mortality figures affecting the area of a serious nature, that would give you a basis for action, such as sending down a special inspector?—The practice now is to examine the Quarterly Returns of the Registrar General as they are made. In fact, we get a copy in advance, before publication. That report is examined in detail, and, if it appears that there is an undue prevalence of any particular infectious disease associated usually with insanitary conditions, inquiry is made and a report from the medical officer of health is asked for.

13542. (*Chairman.*) Have you ever made a high infant death rate the subject of any special examination?—A high infant death rate from preventable causes, certainly, that is to say, from preventable diseases, but I am not

Mr. Lithiby.

Mr. Lithiby. aware that there has often been inquiry into a high infant death rate in any particular district.

13543. (*Mr. Struthers.*) On the ground alone of its being a high death rate?—That is so.

13544. (*Mr. Lindsell.*) Has every urban area a right to appoint its own medical officer of health?—Yes, every urban area.

13545. The county medical officer would not have jurisdiction in any urban district, however small?—No.

13546. Except by arrangement, I suppose?—Under the Act of 1888 the county medical officer of health can by agreement with the local authority exercise the powers of the district medical officer of health, but that is not often carried out in practice. The medical officer of health of a county acts as advisory officer, as a rule, and not as an executive officer. The reports of medical officers of health are sent to the County Council, and in some counties where medical officers of health have been appointed the reports are examined, and if there are any shortcomings apparent in those reports the matters are looked into by the county medical officers, and in some cases a representation is made to the Local Government Board under Section 19 of the Local Government Act, 1888.

13547. In cases, for instance, of closing schools in consequence of the outbreak of an epidemic, that is generally done by the order of the medical officer?—That is done on the recommendation of the local medical officer of health, not the county medical officer.

13548. Has each rural area, then, a medical officer of health as well as the county man?—Either by itself, or acting in combination with some other authority.

13549. (*Mr. Legge.*) Do you make any use of your annual Blue-book to gibbet local authorities?—We only publish in the Blue-book the results of correspondence, unless some legal action has been taken. If there has been any complaint of default of local authorities made to the Local Government Board we refer to that in the Report. For instance, on page 148 of the 32nd Annual Report of the Board, we refer to cases in which the Board's action was asked for under Section 299 of the Public Health Act, 1875. The result of the action taken is there stated. On the same page reference is made to the orders made by the Board under Section 42 of the Public Health Act, 1875, which is practically a tion taken against authorities who refused to undertake or contract for the removal of house refuse from the premises—scavenging, in fact.

13550. But if these local authorities were positively gibbeted in your Report, the names and addresses given as it were, would not that have a good effect? I do not mean descending to such minute particulars as you find in the "Truth" pillory. I mean something of the sort in a more dignified style?—In the cases in which the Board's officers have investigated the complaints, opinions are often freely expressed as to the action of local authorities.

13551. But that is in a letter to that local authority, is it not?—No, that is in the published Report, and many of those Reports, the more important ones, are included in an Appendix to the Board's Report, containing the report of the medical officer. I think it will be found in several of those cases that some very strong opinions are expressed. I do not know that they always have the effect desired. If an authority is going to do its work it does not want that, and if an authority is not going to do its work it will not do it by any pressure short of legal compulsion.

13552. (*Chairman.*) They have no sense of shame, I suppose?—Some of them have no sense of shame whatever.

13553. (*Colonel Onslow.*) Do I understand the local authority can get rid of its medical officers of health without the approval of the Local Government Board?—Yes, some of them can. They cannot in London, but they can in the urban and rural districts.

13554. Would the Local Government Board ask the reason why they are getting rid of him?—Sometimes, but not always.

13555. Not necessarily?—It depends on circumstances.

13556. That points to the fact that a man who may be a most excellent man, tactful, and so on, but who really conscientiously tried to do his duty in reporting, say, some very insanitary house, may be got rid of if that house happens to belong to an influential member of the local authority?—I do not know that I can add anything to what I said before with regard to that, except this—that I think we must recognise that the local authorities generally desire to do their duty. There are black sheep among them, no doubt, and, as I have said, we have heard of a few cases in which this has happened. We have also heard of a few cases—a very few—in which local authorities have objected to the reports made by medical officers of health as containing matter which, in the opinion of the authority, should not have been put there. When that has come to the knowledge of the Board, the Board have remonstrated with the local authority, and in a few cases the Board have insisted on the original Report being sent to them as it was prepared; and they have told the local authority that it is the duty of the officer to report to them and to send to the Board a copy of that Report. Further than that we have not gone at present.

13557. (*Mr. Struthers.*) You spoke of the distinction between medical officers who gave their whole time, and others who only gave part of their time; I suppose those who give their whole time are in the big municipalities, such as Manchester, Birmingham, and so on?—Yes.

13558. They only form a small proportion of the whole number you think?—Yes, but the proportion is increasing.

13559. Can you give us the figures of the proportion of medical officers who are whole-time men? Perhaps you could tell us roughly and supply the figures afterwards.—The following tables give the information desired. The second is from page clxxxv. of the Report of the Board for 1902-3:—

(1). *Districts in which Medical Officers of Health give whole time to their duties as such—or to Public Health work generally.*

Mr. Lithiby.

	No. of Districts.	Total No. of Medical Officers of Health.	Medical Officer of Health giving whole time as Medical Officer of Health.	Medical Officer of Health not giving whole time, but not taking private medical practice	Whole time as Medical Officer of Health with other known public appointments.

Mr. Lithiby. "In addition annual reports were received from sixty medical officers of health acting for port sanitary districts, and from thirty-one medical officers of health acting for districts in London, as well as from four medical officers of health whose duties are not prescribed by the order."

"The total number of medical officers of health appointed under the Board's Order was 1,353, of whom 1,098 acted for a single district or for one division of a rural district and 255 for two or more districts."

13560. But, ordinarily, it is only the large municipalities who have whole-time men?—Yes, and districts acting in combination.

13561. And the ordinary medical officer of health is the officer who is in private practice otherwise?—In very many cases it is so.

13562. Is it not in the larger number of cases?—Probably it is.

13563. There is a medical officer for each urban and rural district?—Yes.

13564. And many of the urban and rural districts are sub-divided for such purposes?—No: a rural district may be, but not an urban district.

13565. In a rural district you may have more than one medical officer?—Yes, sometimes we have. The table I read to you shows that.

13566. (*Mr. Linasell.*) The rural district being a union, I suppose, less urban councils?—Yes.

13567. What is the relation of the county man to the rural district?—He acts for the county. He has, ordinarily, no powers over the districts.

13568. (*Chairman.*) While on that point I will ask you this: Would it be a desirable thing to give the county councils a general power of interference where the local authority is in default—the local authority, of course other than a municipal borough?—Some powers exist now under Section 16 of the Local Government Act, 1894. The parish council are entitled to appeal to the county council if they complain that the rural district council has neglected its duty in regard to matters referred to in that section, water supply and drainage matters, which it is the duty of the council to deal with.

13569. (*Mr. Struthers.*) The parish council is not a body which is very likely to complain if the district council are slack in the matter; I should not think there is much remedy by having that appeal?—I am not at all sure about that. It was supposed by those who constructed the Act that the parish council would be a thorn in the side of an inactive district council. Possibly the parish councils have not been so active as was expected.

13570. Would not the county authority be a more vigorous thorn in their side than the parish authority?—I do not know whether you have any idea of the opposition that would be aroused to any such measure.

13571. I think I have, but I wish to discuss the question in a general way apart from that?—My answer would be that it could not be done without legislation, and probably there would be great opposition if legislation of the kind were proposed. A suggestion was made some years ago of giving county councils powers over non-county boroughs. The non-county boroughs opposed so strongly that the powers were not given.

13572. Do all county councils have a medical officer of their own?—No.

13573. Any large proportion of them?—Yes. A considerable proportion are without them.

13574. (*Mr. Lindsell.*) The county, you say, have a man, but he has no jurisdiction?—He has no definite jurisdiction; he is the adviser of the county council. The county council receive all the reports of the medical officers of health of the districts, and those are generally examined and form the basis of any action or advice that may be given to the county council by their medical officers of health.

13575. He is a sort of consultative adviser of the county council?—He is. At present he has no more powers.

13576. (*Mr. Struthers.*) But in the first place he does not always exist?—I should like to add in reference to what I was asked just now that the London County Council have under Section 100 of the Public Health (London) Act a power to prosecute in certain cases of

default of the sanitary authority, and by Section 101 they may make complaint to the local Government Board of default of sanitary authorities in London. I think the London County Council have not exercised those powers except, perhaps, in one or two small cases. They have generally found it more desirable to exhort than to compel.

13577. But of course they are in a much better position to exhort if they have powers behind them?—They have powers, but they do not use them for the reasons I suggest to the Committee. There would be a difficulty in extending the powers of the county councils.

13578. But you agree it would make all the difference in the effect of their representation on the smaller body if they had the knowledge that they had those powers behind them. You, the Local Government Board, have certain definite powers, and although you do not always put them in force, but prefer to proceed by suasion, that suasion is all the more effective because you have certain definite powers behind you?—Do I understand the suggestion is that compulsory powers should be given to county councils?

13579. My suggestion is rather that the practice which prevails in certain counties should, somehow or other, be made universal—having a county medical officer of health who would give his whole time to that work, and who would exercise a certain amount of supervision over these smaller districts within the county?—So far as the desirability of having medical officers of health for every county is concerned there would be certainly no objection on the part of the Local Government Board—quite the reverse.

13580. At present, though, it is not the case that each county has a medical officer?—It is not.

13581. And it is admitted that it is desirable in the view of the Local Government Board that it should have such an officer?—I think I may say so.

13582. Has the Board taken any steps to put that view of the matter before the county councils?—As a matter of general policy I do not know that they have.

13583. Take the case where there is a county medical officer; he has no statutory powers of interference, or, rather, the county council on his advice has no statutory powers of interference with the district sanitary authority?—They have powers under Section 16 of the Local Government Act, 1894, of superseding the local authority in certain cases.

13584. (*Mr. Lindsell.*) They could insist on a system of drainage being introduced, could they not?—Section 16 says: "Where a parish council resolve that a rural district council ought to have provided the parish with sufficient sewers, or to have maintained existing sewers, or to have provided the parish with a supply of water in cases where danger arises to the health of the inhabitants from the insufficiency or unwholesomeness of the existing supply of water, and a proper supply can be got at a reasonable cost, or to have enforced with regard to the parish any provisions of the Public Health Acts which it is their duty to enforce, and have failed so to do, or that they have failed to maintain and repair any highway in a good and substantial manner, the parish council may complain to the county council and the county council, if satisfied after due enquiry that the district council have so failed as respects the subject matter of the complaint, may resolve that the duties and powers of the district council for the purpose of the matter complained of shall be transferred to the county council, and they shall be transferred accordingly." There you have the power on the part of the county council to supersede a district council after inquiry, an inquiry in which the medical officer of health would, no doubt, be extremely useful.

13585. (*Mr. Struthers.*) Do you know that these appeals are made frequently?—No, I do not think they are.

13586. (*Mr. Lindsell.*) Is there any similar power in the case of an Urban District Council?—Not of supersession by the County Council.

13587. Nor a power of complaint—there is no parish council there to complain?—Anyone can complain to the Local Government Board under Section 299 of the Public Health Act, 1875.

13588. (*Mr. Struthers.*) Do the County Councils make any representation to the Local Government Board at present on sanitary matters?—Yes, they do sometimes.

13589. Under the virtue of this Act which you referred to, or under any other Act?—Section 19 of the Local Government Act of 1888 says:—“(1) Every medical officer of health for a district in any county shall send to the County Council a copy of every periodical report of which a copy is for the time being required by the regulations of the Local Government Board to be sent to the Board, and if a medical officer fails to send such copy the County Council may refuse to pay any contribution, which otherwise the council would in pursuance of this Act pay towards the salary of such medical officer. (2.) If it appears to the County Council from any such report that the Public Health Act, 1875, has not been properly put in force, within the district to which the report relates, or that any other matter affecting the public health of the district requires to be remedied, the Council may cause a representation to be made to the Local Government Board on the matter.”

13590. And you do get such representations?—Yes we get representations under that section.

13591. Sometimes, I suppose, from counties which have no medical officer of their own?—Yes, in several instances.

13592. Their representations will be lessened in value, I suppose?—In that case we have asked them whether they have caused any separate inquiry by a medical officer appointed by them to be made into the circumstances.

13593. They have power to direct their medical officer not merely to examine the reports sent in by the district medical officer, but actually to conduct an inquiry on the spot?—They have no statutory power to do so with regard to ordinary matters. They have a statutory power under the Isolation Hospitals Act to do as you suggest, and they very commonly do it without any statutory powers, and I think I am right in saying that the assistance and advice of the county medical officer is generally welcomed.

13594. But as a matter of fact it seems to be the case that the County Council as a health authority, and the county medical officer, where he exists, are more or less extra statutory authorities. That is to say, they are not within the machinery for administering the Public Health Act, there are excrescences which are not fitted in?—Yes, that is so.

13595. (*Chairman.*) I will go on to the next question now. Can you tell us whether the attention of the Local Government Board is often called to the quality of milk sold to the consumers?—In the reports of the public analysts the examination of samples of milk bulks very large, and in many of the reports from the medical officers of health which we have recently received the matter is referred to.

13596. The Board of Agriculture now fixes the standard for milk?—Yes.

13597. Does not the public analyst report to them instead of to you?—No. It is the duty of the public analyst under the sale of Food and Drugs Act, 1875, to send to the Local Government Board a copy of the four quarterly reports made to his authority during the previous year. He has to do that every January, and until 1899 the Local Government Board had no other function than to receive the annual reports.

13598. What class of information do they cover?—The reports of public analysts are supposed to deal with all the samples which have been examined by the analyst in the previous year.

13599. Merely to see whether it has been diluted?—Adulterated. As a rule they only deal with adulteration.

13600. They do not deal with dirt or the presence of anything due to carelessness on the part of the dairyman or cowkeeper, or anything of that sort?—No; ordinarily they would not.

13601. Can you tell us with regard to this milk question whether local authorities do take steps to secure their districts from the sale of impure milk—it is more impure milk than adulterated milk that I am concerned with, milk which is in a filthy condition and tends to early decomposition?—The matter has not been dealt with so much by the Local Government Board, I think, as by the Board of Agriculture. The Board of Agriculture are very much

interested in the milk supply, and powers are given to them as well as to the Local Government Board by the Sale of Food and Drugs Act of 1899. Sections 2 and 3 of that Act are important in this regard. Section 2 says: “The Local Government Board may, in relation to any matter appearing to that Board to affect the general interest of the consumer, and the Board of Agriculture may, in relation to any matter appearing to that Board to affect the general interests of agriculture in the United Kingdom, direct an officer of the Board to procure for analysis samples of any article of food, and thereupon the officer shall have all the powers of procuring samples conferred by the sale of Food and Drugs Acts (*a*), and these Acts shall apply as if the officer were an officer authorised to procure samples under the Sale of Food and Drugs Act, 1875.” Then there are certain exceptions, and then Sub-section 2 says: “The Board shall communicate the result of the analysis of any such sample to the local authority, and thereupon there shall be the like duty and power on the part of the local authority to cause proceedings to be taken as if the local authority had caused the analysis to be made.” Then Section 3 gives power under similar circumstances for the Local Government Board or the Board of Agriculture, as the case may so be, to act in default of the local authority. The Board of Agriculture have taken up this matter and have sent inspectors to the various local authorities, both in London and outside London, for the purpose of inducing them to take action under the Sale of Food and Drugs Act. They have been successful, or someone has been successful; at any rate, the number of samples taken has materially increased since the Act was passed, and the number of samples reported as adulterated has diminished.

13602. All that points rather to remedial steps for evils which exist, and preventive steps, so that these evils should not come into existence. It seems to me that the whole crux of the question, as far as milk is concerned, lies in the powers which were conferred originally upon the Privy Council, but transferred to the Local Government Board under the Act of 1875, empowering them to make orders for the registration of dairy keepers, the regulating of lighting and ventilation, cleansing, drainage, and water supply of dairies and cow-sheds in the occupation of persons following the trade of cow-keepers or dairymen, for securing the cleanliness of milk stores, milk shops and all milk vessels, and for prescribing the precautions to be taken by purveyors of milk and persons selling milk?—That, of course, is a matter outside the public Health Act.

13603. It is?—Yes.

13604. It has a very important bearing upon it?—It is public health, but outside the Act, and it is outside the Sale of Food and Drugs Act. These powers do exist, and since the work was transferred to the Local Government Board a good deal has been done in the matter.

13605. You have distinct bye-laws for urban and rural districts in these matters?—Yes.

13606. You do not compel local authorities?—We have no power. They must keep a register of cow-keepers, dairymen, &c., and they are empowered to make regulations. The Board cannot compel them to make regulations.

13607. You can only authorise. But you can make them yourself, can you not?—No, I do not think so.

13608. Cannot the Local Government Board, under the Contagious Diseases (Animals) Act, 1878, make orders for all these things?—We have no power to put the order in force in any district.

13609. Cannot you make these orders yourself?—No.

13610. Surely you can by the Act of 1878?—The Board have power, under the Public Health (London) Act, to make orders of the nature of the Dairies, Cowsheds and Milk Shops Order, 1885. They make the order laying down the rules just as the Privy Council Office used to do, but they cannot enforce anything. The regulations under the order are made by the local authorities themselves. They make regulations and the Board approve them.

13611. The regulations are the substantial thing?—Yes.

13612. (*Mr. Struthers.*) Must they make the regulations, or is it optional?—It is optional; but they often make them; there is no great difficulty there. The difficulty is in enforcing them.

Mr. Lithiby. 13613. (*Chairman.*) But if you make these orders then they are obliged to enforce them?—The order which the Privy Council Office made is still in force, and is supplemented by one which the Local Government Board have made.

13614. It merely lays down what the local authority *can* do?—Yes.

13615. And you have no power of compelling them to do that?—No.

13616. At least, you have no powers to compel them to enforce regulations under it?—We have no power. They can make regulations, and do.

13617. But you do not see that they make them?—No.

13618. And, therefore, they may disregard this order altogether?—In effect, yes.

13619. Do you not think it would be desirable that the Local Government Board, in the event of the local authority not making orders for these purposes, should do it themselves?—The regulation is as follows: "A local authority may from time to time make regulations for the following purposes or any of them."

13620. This is the Order?—This is the Order of 1885—the Council Office Order: "(a) For the inspection of cattle in dairies; (b) for prescribing and regulating the lighting, ventilation, cleansing, draining, and water supply of dairies and cow-sheds in the occupation of persons following the trade of cow-keepers or dairymen; (c) for securing the cleanliness of milk stores, milk shops, and of milk vessels used for containing milk for sale by such persons; (d) for prescribing precautions to be taken by purveyors of milk, and persons selling milk by retail, against infection or contamination."

13621. That is practically what I have read, but you say little is done?—They make regulations, and, so far as we are concerned, there the matter ends.

13622. But they do not always make regulations, I think I understand you to say?—I think most of them do.

13623. It is their duty to do so?—It is "may"; it is not incumbent upon them.

13624. Your order is merely an information to them what they may do?—That is so.

13625. And they very often do not do it, and ever if they do there is no power of enforcing their observance of their own regulations?—That is so.

13626. Do you not think it is desirable that the Local Government Board should have that power?—That is a matter of policy on which I would express no opinion.

13627. Do you not think it might be useful to bring indirect pressure to bear upon them extending the power now enjoyed by a local authority under the Infectious Diseases Act to prohibit supply from an infected dairy so as to exclude the supply from areas where the Contagious Diseases (Animals) Act is not in operation? That is a matter which, no doubt, will have to be considered by the Government, and by several of the Departments later on, when the Report of the Royal Commission on tuberculosis has been made. At present it is very difficult to initiate legislation. On the one hand we are met by the farmers—this has been a matter which has been considerably discussed for some years past—and we are told that there is no danger whatever, for instance, in the matter of tuberculosis.

13628. That has been upset?—That has been supported by Dr. Koch. A Royal Commission is now inquiring into the matter, and they report that they do not agree with Dr. Koch; Dr. Koch has rejoined that he does not agree with the Commission. There the matter rests at present. No doubt, when the Commission's final report is made, consideration will have to be given to the whole question. In many local Acts clauses have been inserted giving the local authorities certain powers in regard to tuberculosis. Those clauses were settled at a conference held between the Local Government Board, the Board of Agriculture, and the Central Chamber of Agriculture. They were settled after a great deal of discussion, and not without some difficulty. They have been very strongly opposed in Parliament in the agricultural interest, the dairy interest, and so on, and although they are still inserted it would be extremely difficult, I think, to go farther at present.

13629. Do you think the dairy interest should reserve as a privilege the right to poison the community?—I must not express any opinion upon that. That is a question for Parliament.

13630. Do you not think that it would be desirable to give the county councils, in this particular, the power to step in?—I think that is a point that might very well be considered when the whole question comes up, as it must do.

13631. You would not, so far as you are prepared to express an opinion, be opposed to such a suggestion?—Certainly not.

13632. In regard to any general powers, apart from milk, for the prevention of adulteration of food stuffs, you desire to put in these answers which you gave in examination before the Arsenical Commission?—Yes.

13633. As to the powers of the Local Government Board?—Yes.

13634. They are very limited, I understand?—The powers of the Local Government Board are practically limited to those given in the two sections of the Act of 1899, which I have read. In the evidence which I gave before the Royal Commission on Arsenical Poisoning, I went at considerable length into the Board's position under the Sale of Food and Drugs Act generally, and if I might refer the Committee to that I think it will save their time.

13635. Do you think it would be practicable for the Local Government Board, if it had the power, to fix a standard for all food stuffs, instead of leaving it to the rather happy-go-lucky result of prosecution upon the action of public analysts?—That I dealt with in my evidence before the Royal Commission on Arsenical Poisoning, and I would only repeat now that the suggestion made in various reports, first, I think, by the Select Committee on Food Adulteration in 1896; secondly, by the Departmental Committee on Food Preservatives in 1899, and again by the Royal Commission on Arsenical Poisoning in 1903, was that a Court of Reference or a Consultative Committee should be appointed to advise the Government Department concerned with regard to the standards that should be fixed for foods.

13636. A sort of advisory committee?—Yes.

13637. Its functions might be extended to cover some other matters very easily, might it not?—The President of the Local Government Board said in Parliament not long ago that this matter was under his consideration, that he had communicated with the Departments concerned, that the Departments concerned had not all agreed as to the policy of this matter, and that in the autumn he was hoping to arrange for a conference between those Departments. There the matter rests at present.

13638. The view of the Local Government Board is not in opposition to the idea of an advisory committee?—No, I think I may say that the view of the Local Government Board is decidedly not in opposition.

13639. It is rather in favour of it than otherwise. Would you go so far as to say that they would favour its dealing with other matters touching public health?—Not as regards public health generally. The idea was to constitute a court of reference of the kind indicated in the evidence taken before the Select Committee on Food Products Adulteration. They went into it very thoroughly, and their proposal was that the Government chemist, and some representatives of the Departments, and some representatives of the trade interests concerned, should meet and decide what standards should be selected for certain articles; of course, it is an exceedingly difficult thing for any Government Department to fix a standard. The Board of Agriculture fixes it with expert assistance, and it is alleged—I do not know with what truth—that the standard in the case of milk had necessarily to be so low, as not to interfere with the milk of the poor cow. The result of that has been, so some say, that, in fixing a standard sufficiently low to take the milk of the poor cow, the standard has enabled the skilful adulterator to water the milk down to that standard. Therefore, it is not altogether certain that to fix a standard for the various ingredients of food would be without its compensating disadvantages.

13640. Unless it was fairly high, and unless you ignore the poor cow?—Yes.

13641. (*Mr. Struthers.*) With regard to the supply of milk to towns, the big municipalities, as a rule, have regulations as to dairies and milkshops, and so on, which they enforce in their own district under the order which you have just read?—Yes.

13642. Do they make representations to you upon that subject at all?—No. We get references to it in the reports of medical officers of health, and it is one of the points to which special attention is given in considering the reports.

13643. When they have reason to complain of the milk supply which is outside their own district, which comes from, say, fifty miles off, there is a procedure they may take to stop the milk coming from that dairy or farm to their town, is there not?—Section 4 of the Infectious Diseases Act of 1890 contains a provision on the subject of inspection of dairies in certain cases and power to prohibit the supply of milk:—"In case the medical officer of health is in possession of evidence that any person in the district is suffering from infectious disease attributable to milk supplied within the district from any dairy situate within or without the district, or that the consumption of milk from such dairy is likely to cause infectious disease to any person residing in the district, such medical officer shall, if authorised in that behalf by an order of a justice having jurisdiction in the place where such dairy is situate, have power to inspect such dairy, and if accompanied by a veterinary inspector, or some other properly qualified veterinary surgeon, to inspect the animals therein, and if on such inspection the medical officer of health shall be of opinion that infectious disease is caused from consumption of the milk supplied therefrom, he shall report thereon to the local authority, &c."

13644. Would that milk supplied from that particular dairy or farm be prevented from coming into the towns?—It may have that result, and in addition there are clauses in many local Acts where tuberculous milk may be dealt with under a more drastic procedure.

13645. But at the very best it does not go the length of prohibiting that milk being supplied to anybody whatever?—No.

13646. It would be very desirable from the purely health point of view, putting aside all those considerations which you have properly taken account of, the feeling of opposition which is likely to be aroused and the feeling between local authorities, it would be very desirable that the county authority should have the power to inspect farms in its district and to prevent the supply and the distribution of milk from that farm or dairy if the sanitary condition of the place was not satisfactory, or if there was danger to public health?—Personally, I should have no objection to any such suggestion.

13647. Is not that a reasonable thing in the interests of public health, putting aside the other considerations which I think you very properly take account of—the possible opposition?—I see no objection to it. I may draw the attention of the Committee to Sections 116 and 117 of the Public Health Act, 1875, which are useful, I think, in the direction in which you are looking for a remedy. The medical officer of health, or inspector of nuisances, "may at all reasonable times inspect and examine any animal carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, or milk exposed for sale, or deposited in any place for the purpose of sale, or of preparation for sale, and intended for the food of man, the proof that the same was not exposed or deposited for any such purpose, or was not intended for the food of man, resting with the party charged; and if any such animal carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, or milk appears to such medical officer or inspector to be diseased or unsound or unwholesome or unfit for the food of man, he may seize and carry away the same himself or by an assistant, in order to have the same dealt with by a justice." Then by Section 117 the justice has power to order the destruction of any of those articles.

13648. But in the case of milk he does not have power to prevent a further supply till the condition is improved?—No. He has only power to take that milk, and if he found it dirty, for instance, in the way suggested just now, he might take that to a justice and cause it to be destroyed.

13649. (*Chairman.*) How often is that done?—We do not know. *Mr. Litchby.*

13650. (*Mr. Struthers.*) My question is rather this, that the present district authorities, which in many cases are small and not very active, would not be likely to take a satisfactory action as regards a matter of widespread importance like this of milk supply, and that the county authority would be likely to do the thing much more efficiently?—That is a matter of opinion. There are various considerations to be weighed in connection with it. In the first place, you have in a local authority, no doubt, farmers and others who are interested in the sale of milk, men who would be unwilling to damage the trade of their neighbours. Then, on the other hand, you have in the county a great number of people who are also interested in their own agriculture and their own affairs, and they say: "Well, the milk is not used in our district; why should we bother?" That is an argument which I have heard used.

13651. Do you think that that argument is likely to hold in the case of a large county, as against a small district?—Probably it would be held less than it would in a small district, but the municipalities say that power should vest in them, because they are the consumers of milk themselves, rather than it should be in the hands of anybody else.

13652. The power of the municipality to exercise control as regards its own supply need not interfere with the power of the county to exercise control as regards the general supply from the district?—I should see no objection to the county having those powers, but whether they would be sufficient without concurrent powers being given to the municipality is another matter.

13653. And there is the important difference between the smaller district and the larger county, that in the latter case you almost necessarily have a man, or very frequently have a man, whose business it is to look after public health, a whole-time medical officer, whereas in the other case you have a man who only gives such time as may be necessary?—The medical officer of health could not possibly do it in any large county; he could not possibly do all the work himself. He would have to have a large staff, and the suggestion which you are putting is one of many suggestions which have been made for giving larger powers to the county councils and superseding the local authorities altogether.

13654. My suggestion is not to supersede them, but to have concurrent powers. Let the local authority have its medical officer only employed part time, but have the county with a proper medical officer full time, and have certain powers of supervision, and, in the last resort, of supersession of the smaller authority?—It is a very difficult question to determine. It is a great question of policy as to what extent county councils shall have given to them over-riding powers.

13655. (*Chairman.*) I suppose the municipality of Manchester, for instance, might be armed with powers to prohibit the introduction into Manchester of milk coming from any farm in an area where due precautions are not taken by the local authority?—Many Corporations have that power now, under their local Acts, as regards tuberculosis.

13656. But should it not be made general, so as to enable them to exclude any supply from a source where the ordinary precautions to prevent contamination are not taken?—It might be extended by Parliament, but no such power has been given yet.

13657. Turning to the question of general health administration, you have told us that the Local Government Board receive reports from the medical officers of health from time to time. Can you explain what further action is taken if there appears to be a defective administration in any area?—The practice is to examine all the reports, and to bring forward those that indicate laxity of administration on the part of a local authority. Those reports are considered and very often letters are written to the local authorities.

13658. Is it always easy to detect indications of laxity?—The medical staff of the office know pretty well what are the conditions of many places in England. The Public Health Act was passed nearly thirty years ago, and the reports have been examined systematically ever since that time. At one time or another the

Mr. Lithiby. medical inspectors have made reports on a considerable number of the districts of England. Those reports are always available, and it is with a knowledge of these reports and the conditions disclosed by them, and the conditions reported in past annual reports, that the examination of the report for any given year is made.

13659. Should you be inclined to say that much of the improvement which has taken place in the last thirty years has been due to this system?—I think there can be no doubt that sanitary progress in England during the last thirty years has been enormous.

13660. Should you attribute it to this machinery very largely?—To a large extent. Also social causes have been operating, and changes in the habits of the population have been made. But I think that improved sanitary administration must take a share of the credit for improved conditions that have been noticed in the last century. I would draw the attention of the Committee, if they are interested in that part of the subject, to a report, which I have here, made by Dr. Franklin Parsons, the assistant medical officer of the Board, on "Half a Century of Sanitary Progress and its Results."* The report is a continuation, practically, of another report which was made by the late medical officer of the Board, Sir Richard Thorne, on the same subject, "Progress during the Victorian Era." The effect of this is to show that a great deal of improvement has been made, and that some, a not inconsiderable amount, of the lowering of the death rate has been due to sanitary improvements.

13661. I presume you would admit that it has had a very unequal local distribution?—Sanitary improvement began, I suppose, in 1848 with the Public Health Act of that year. That was practically the time of the great advance. Since that time there has been a considerable movement of the population from the country into the towns. Nevertheless, the death-rate has materially lowered during that time, and unless sanitary improvements in towns had been very great the movement of the population would have produced a higher death-rate; I suggest to you, than it has done.

13662. Where there has been no diminution of the infant death rate, which is perhaps a more crucial test?—I do not know that I follow you in saying that it is a more crucial test of sanitary progress.

13663. Because they are more susceptible to insanitary conditions?—The conditions, as I say, are very different. I should not like to express any opinion upon that without having the figures before me.

13664. But you would not claim universality for this improved local administration?—Yes, decidedly. I do not say that it has advanced to the same extent in every place.

13665. We were told in evidence here that the local authority in the Potteries, for instance, was as inefficient as you could find anywhere?—I agree with that.

13666. Most of the bad houses are owned by members of the local body, and the sanitary inspectors are too much in awe of their employers to carry out their duty. The lady who gave that evidence was in a good position to know. She said: "The only hope of a change, short of a drastic interference from headquarters, lay in a registration of the owners of slum property, and the rendering of a medical officer of health independent of the local authority?—There is no doubt that in the Potteries the sanitary progress has not been so rapid as one would wish; indeed, the condition of some of the Pottery towns has been shown by reports made by inspectors of the Local Government Board to be extremely bad. The Local Government Board have, to my own knowledge, drawn the attention of the local authorities to that condition of things.

13667. Have they done anything which would merit the description of: "Drastic interference from headquarters?—I think they have done all they could with the powers they have.

13668. But there is Section 299 of the Public Health Act. Have you brought that into operation?—I cannot say.

13669. By which you can set a time limit to the enforcement by the local authority of any duties they are called

upon to perform?—Practically, Section 299 is limited to matters of drainage and water supply.

13670. Limited in practice, but not in intention?—In theory it is not, but in practice it is. So far as the experience of the Local Government Board is concerned it does not enable them to go beyond that. The conditions in the Potteries are, of course, many of them trade conditions. In the Pottery districts and the nail-making districts in the Midlands, the conditions are very bad. But even there they are vastly better than they were sixty years ago.

13671. We were told by one witness that in Sheffield an insanitary area, for which a Provisional Order was obtained fifteen years ago, is not cleared yet. That is not a proof of any great vigilance either locally or from headquarters. That was a statement by a lady employed as one of the sanitary inspectors of Sheffield. You are not directly concerned with the Housing Acts, but you are familiar with Section 31 of the second part of the Housing Act?—Yes, the medical officers of health are empowered by Section 31 and 32 to make reports, and some of them do so.

13672. Has the Local Government Board ever issued an order under Section 31:—“(1) If within three months after receiving the said complaint and opinion or representation of the medical officer, the local authority not being in the administrative county of London, or not being a rural sanitary authority in any other county, declines or neglects to take any proceedings to put this part of this Act in force, the householders who signed such complaint may petition the Local Government Board for an inquiry, and the said Board after causing an inquiry to be held may order the local authority to proceed under this part of this Act, and such order shall be binding on the local authority.” That is dealing with insanitary dwellings and so on?—I cannot say to what extent action has been taken under that Act. It has not come to my notice.

13673. You have given us the limitations of the Local Government Board, what should you say are their powers?—Their compulsory powers are practically limited to those under Section 299 of the Public Health Act, 1875.

13674. That you limit to sewage and water?—Practically. Section 101 of the Public Health Act (London), 1891, also enables the Board to act on a complaint of default on the part of a local authority. The powers of the Board, though not very extensive, often succeed in getting work done.

13675. By diplomacy?—Yes, that is what it comes to.

13676. You have very little direct power?—Very little direct power.

13677. Do you think direct power, if you had it, could be usefully employed?—No doubt, in some cases it could, but what I should point out is that if local authorities in this country will not go you cannot drive them. I can give you an instance now where direct powers are possessed by the Board, that is, under the Vaccination Act. We have the greatest difficulty in administering the Vaccination Acts. Cases go to the Law Courts, and the Law Courts decide that the orders of the Board have the force of law, but yet the law is not enforced.

13678. (*Mr. Struthers.*) There is a strong public prejudice on the question of vaccination, which scarcely applies to the general administration of the Health Act?—There is a strong public prejudice against an increase of rates in many cases, and that is the difficulty that has to be met.

13679. (*Chairman.*) I should have thought that the improvement of the public health would have diminished the rates rather than raised them?—The rates have risen considerably during the last few years. A large amount of the increase in the expenditure has been due to matters such as drainage, water supply, and other matters bearing on public health. I do not say by any means that the local authorities are doing all they ought to do, but I do say they are doing a very great deal; and that to compel them to spend more money is to put their backs up. Here is a return on page 127 of the Report of the Local Government Board for 1902-03 showing sanctions which have been granted from 1871 onwards for the borrowing of money in urban and rural districts. In 1871 the amount sanctioned for borrowing was £267,562; in 1872 it was £602,000, and so on in

* Printed in the Transactions of the Epidemiological Society: Vol. 18—1898-9.

increasing proportions down to 1902, when the amount borrowed was £11,466,647.

13680. (*Mr. Struthers.*) Do you mean in the year?—Yes. The borrowing sanctioned by local authorities in those years, 1871 to 1902, amounted to £137,750,000. In the following pages are shown the purposes for which the money was borrowed. In 1883 for sanitary and other purposes in urban districts the amount borrowed was £2,162,000. For sanitary and other purposes in the rural districts the amount borrowed was £95,704. In the year 1902 the amount borrowed for sanitary and other purposes in urban districts was £10,414,000, nearly five times as much as in 1883, and for sanitary and other purposes in rural districts it was £713,186, or over seven times the amount borrowed in 1883.

13681. (*Chairman.*) How much of that do you think was misappropriated owing to carelessness or stupidity?—I am not in a position to say.

13682. Is it not consistent with the expenditure of these huge sums that a great deal may have been wasted?—Before any sanction is given, a local inspection is made by an inspector with competent knowledge, and so far as plans are concerned, and so far as the information we have goes, the money is employed in necessary purposes, useful purposes and permanent purposes.

13683. (*Mr. Struthers.*) You said "sanitary and other purposes"?—Yes.

13684. What are the other purposes?—Allied purposes. We show the purposes; for instance, the construction of a mortuary, or a fever hospital, or a small-pox hospital, would be a sanitary purpose—any purpose which may be connected with the Public Health Act. Market purposes would be a purpose introduced there, and, of course, a great many others. Sea defences would be included there, and land for sanitary-depôt purposes.

13686. (*Mr. Struthers.*) With regard to Section 299 of the Public Health Act of 1875, I understand you to say that cases are only considered of complaints against insufficient sewers or supply of water, and that the complaints do not refer to other breaches of the Public Health Act?—What I meant to convey was that practically the only powers which the Board can exercise under this section are those which relate to drainage and water supply. Other complaints do come to us.

13687. How is it you can only exercise your powers in regard to these two matters, because others are mentioned in the same way—"or that a local authority has made default in enforcing any provisions of this Act which it is their duty to enforce"—several are specified where it is the duty of the local authority to do certain things?—We can make an order, and the ultimate procedure is a mandamus.

13688. Or supersession?—I think it will be fairly obvious that the Local Government Board cannot supersede the local authority. There is power, but it practically cannot be carried out.

13689. (*Chairman.*) The Board of Education used to do it surely with School Boards?—It is a very different thing. The difficulty of getting the Court to grant a mandamus is practically the measure of our power in giving the order. The Local Government Board cannot make an order unless they are perfectly sure that they can get the Court to enforce it.

13690. (*Mr. Struthers.*) But you are speaking of procedure by mandamus?—Yes.

13691. I want to come back to this other alternative, supersession. I quite understand what you said just now, but why may not the county council supersede a defaulting district?—That would be a way. I said just now I saw no objection myself to the powers being given.

13692. That might be a useful way of exercising this power of supersession?—They have a power now under Section 16 of the Act of 1894 on the complaint of the Parish Council. They have power now in London under Section 100 of the Public Health (London) Act, 1891. The London County Council have not utilised that power to any great extent; indeed they have scarcely utilised it at all. They gave reasons for that conduct I believe before a Select Committee of the House of Commons which was sitting the other day; they said it did not do; they worked persuasively as far as they could.

13693. They followed your policy of diplomacy?—*Mr. Lithiby.* Yes. I would not say they followed us in anything. But that is practically the line they take, as I understand. It is difficult to drive a local authority which will not go.

13694. What I am proposing is not to give the county council power to supersede the local authority at its pleasure. The case I am putting is quite different. Suppose a complaint is made to you that some local authority is not putting into effect the present Act, you say you must go by mandamus, but you might replace it by a county council for that specific case?—I make no remark upon that suggestion at all, except this, that we have not the power at present. Whether it would be desirable to take such power is, I think, a matter which might be fairly considered when any amendments of the Public Health Act are made.

13695. The county council cannot be accepted a "person" for this clause, I suppose?—No, I think not.

13696. But a small amendment of that clause would enable the county council to be brought in, and it would be desirable in your view if it could be done?—I should not like to express any opinion upon it. I know that there would be very strong opposition to it.

13697. I am arguing on the merits of the case. In the interests of effective administration of the Public Health Acts, would it not be desirable that the Board should have power to replace a recalcitrant or supine local authority by the county council in specified cases?—I have not sufficient experience to be able to answer that question in the affirmative. It is a matter, I think, that might clearly be considered. I can suggest a great many difficulties in the way of carrying it out.

13698. (*Chairman.*) I suppose we may assume that the immense congestion of business in the Local Government Board to a considerable extent hampers its power of decisive action, or would not you say so?—I do not think so.

13699. You do not think it does?—No.

13700. You do not think you have more to do than you can do?—If a thing went perfectly smoothly there would be no difficulty, but supposing the Board were to attempt to bring into operation Section 299 in any individual case, what happens? There is a lawsuit at once, and a very troublesome and difficult lawsuit. The court requires to be satisfied very fully as to the necessity before they grant a mandamus. Take the matter of drainage. I will give you an instance which comes to my mind, namely, the drainage of the large urban areas in the Lee Valley. What are you going to do with them? These towns have grown. Walthamstow has grown from a village thirty years ago to a population of, I dare say, 100,000 to-day. Walthamstow's drainage arrangements have not maintained the same rate of growth as its population, perhaps. The sewerage in the place itself may be all right, but the arrangements for disposal of sewage of a population of 100,000 must be very different to the arrangements for the disposal of the sewage of a village. Next to Walthamstow comes Leyton. Leyton has similarly grown in the same period. The West Ham sewerage is now taken into the metropolitan system, but other districts higher up in the Lee Valley have the same difficulty. The Local Government Board may make an order, but it could not enforce that order within a very long period, and the Court cannot do much to assist. Leyton obtained an order from the High Court against Walthamstow, but the Court were obliged to allow applications to be made from time to time to postpone the execution of that order. It is impossible to proceed except by very slow means.

13701. Should you say that the Local Government Board has leisure enough to give due consideration to large questions of public policy in matters of health, amendments of Public Health Acts and so on?—I think the Local Government Board have quite as much leisure as Parliament has.

13702. That is not saying much?—We have some measures ready for Parliament. Mr. Long said the other day that he was ready to introduce a Public Health Bill when he saw any opportunity of making any progress with it in Parliament.

Mr. Lithiby. 13703. (*Dr. Tatham.*) As a result of the Board's examination of the annual reports of the medical officers of health, I suppose the Board frequently finds it necessary to hold a local inquiry?—Yes.

13704. Is it not a fact that the staff of the Board is so limited that it is quite impossible to conduct as many local inquiries as the Board would wish to do?—It would be impossible to carry on by the present staff, I think, all the local inquiries which the medical officer would like to have directed by the present staff.

13705. That is what I understood was the case :—That is so. Of course there is not quite the same necessity for local inquiries now that there was thirty years ago, because there is a considerable number of very competent medical officers of health in various parts of the country, and several of the county councils have very competent medical officers. Therefore, there is not quite the same necessity for directing local inquiries by medical officers of the Local Government Board as there was before the Act of 1888 was passed.

ADJOURNED SINE DIE.

INTER-DEPARTMENTAL COMMITTEE ON PHYSICAL
DETERIORATION.

APPENDIX

TO THE REPORT OF THE

INTER-DEPARTMENTAL COMMITTEE

ON

PHYSICAL DETERIORATION.

VOL. III.—APPENDIX AND GENERAL INDEX.

Presented to both Houses of Parliament by Command of His Majesty.

LONDON:

PRINTED FOR HIS MAJESTY'S STATIONERY OFFICE,
By WYMAN & SONS, LIMITED, FETTER LANE, E.C.

And to be purchased, either directly or through any Bookseller, from
EYRE & SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C.; and

APPENDIX VII.

MEMORANDUM AND TABLES RELATING TO THE PHYSICAL CONDITION OF CANDIDATES FOR ENLISTMENT IN THE NAVY AND MARINES, PREPARED BY COLONEL G. T. ONSLOW, C.B., INSPECTOR OF MARINE RECRUITING, A MEMBER OF THE COMMITTEE.

Admiralty Recruiting Department,
7, Whitehall Place, S.W.
7th December, 1903.

Sir,—

I have the honour to submit, for the information of the Committee appointed to inquire into the alleged Physical Deterioration of certain classes of the population, statistics compiled from Recruiting Returns of the Royal Marine Recruiting Officers raising recruits for the Naval Service.

It would be difficult to obtain perfect information from other Naval Recruiting Agencies, the R.N. Depôts at the Home Ports, Coast Guard, etc., owing to the fact that there would be danger of the same men being counted twice.

I have, therefore, not attempted this, and the Returns submitted refer only to Naval Recruiting in the Royal Marine Recruiting Districts, which cover the inland parts of the Kingdom and large Sea Port Towns, not Naval Ports, the number of recruits raised being 77 per cent. of the total R.N. and R.M. entries for the year 1902-3.

The remaining 23 per cent. raised by Naval Recruiters would come mainly from the Sea Coast and Naval Ports, and are generally of a class superior in physique to those inland.

All recruits are put through a course of instruction, attending the medical officer at his examination on first appointment, prior to being posted to an out-station. They are, consequently, capable of conducting a very close examination of recruits, and only pass on for medical examination men and boys who have a reasonable chance of passing.

The bulk of medical rejections are of candidates presenting themselves at the headquarter stations, who go direct to the medical officer without previous examination, except for height and chest measurements.

The number rejected by recruiters is very large; unfortunately, complete records have not been kept prior to August, 1903, but at a rough estimate it is between 30 and

40 per cent. of the total applicants. The rejections include defective vision, defective teeth, varicose veins, flat feet, deafness, general poor physique, deficiency in height and chest measurement, and any other defects observable by other than a medical expert.

In the attached tables the nomenclature of causes of rejection used in the Returns of the Director-General, Army Medical Service, are followed. Nos. 35 to 40 are omitted, complete records not being available.

The following tables are attached:—

Table "A." A return for the year 1st April, 1902, to 31st March, 1903, of candidates for the Naval Service examined by medical officers attached to the Admiralty Recruiting Stations Royal Marine Recruiting Districts, found fit and unfit respectively, for the Royal Navy and Royal Marines, showing District in which raised and previous employment, so far as can be ascertained.

Table "B." List of principal towns in which Admiralty Recruiters are stationed, as a key to the Districts enumerated in "A."

Table "C." A similar return to Table "A," showing numbers rejected as unfit, with causes of rejection classified by previous callings, and ratings in the Royal Navy and Royal Marines for which the candidate volunteered.

Table "D." A return showing number of candidates rejected at the Admiralty Recruiting Station in London only, during the three years 1st April, 1900, to 31st March, 1903, with causes of rejection, classified approximately according to ages of candidates.

I have the honour to be,

Sir,

Your Obedient Servant,

G. T. ONSLOW,

Colonel, R.M.L.I.,

Inspector of Marine Recruiting

The Chairman,

Physical Deterioration Committee.

TABLE A.—RETURN FOR THE YEAR 1ST APRIL 1902 TO 31ST MARCH 1903 OF NUMBER OF RECRUITS FOR R.N. AND R.M., EXAMINED FOUND FIT AND UNFIT ON MEDICAL EXAMINATION IN THE RECRUITING DISTRICTS, ROYAL MARINE RECRUITING SERVICE, SHOWING PREVIOUS EMPLOYMENT.

APPENDIX VIII.

MEMORANDUM AND TABLES FURNISHED TO THE COMMITTEE BY THE METROPOLITAN POLICE COMMISSIONERS.

There are no figures available which admit of direct comparison with those given by the War Office in the Memorandum of the Medical Director-General forwarded by the Home Office. The only information we have which is of any practical utility, and which is readily obtainable, is contained in Table No. 1 annexed. This shows the number of men who have applied to join since 1893, the number selected for medical examination, and the numbers actually accepted, also the numbers of men who have left the Force each year, on medical grounds, with less than three years' service, and the total strength in each year. It will be observed that the retirements through ill-health of men of less than three years' service amounted to twenty-six only in 1902, and that in none of the years under review was there any very marked deviation from the average, except in 1894 and 1895, when the figures were well below the average; and in 1899 and 1900, when they exceeded it. These years, however, were the first two years of the South African War, and the figures are affected by some of the Army Reservists who were called up to rejoin the Colours, and were ultimately found unfit to rejoin or to continue Police duties owing to illness or wounds resulting from active service in the field.

Table No. 2, taken from the Commissioner's Annual Report for 1902, shows the number of men who joined from the years 1860 onwards who are still serving; and Table No. 3, also taken from the Report, shows the length of service of the men now serving who joined from the years 1880 onwards.

There is no satisfactory basis of comparison between Army and Police recruiting, simply because the governing conditions of these two fields of employment are essentially different. In the first place, military service is usually regarded either as an opening for young men in which the early years of manhood can be passed, and which may probably lead the way to more or less permanent employment at its termination, or as the last refuge of a number of young men who, from lack of ability or other causes, are unable to find anything better. Police service, on the other hand, is, speaking generally, sought after as a permanent means of livelihood, and is one of the best paid and promising fields for the employment of unskilled labour. A further reason which militates against any useful comparisons being drawn lies in the difference in the physical tests applied to the recruits for the two services. The military tests for physical fitness are *qualifying* ones only. Under normal conditions the Army can utilise practically all the material which offers itself, providing it comes within a minimum physical standard, which is not an unduly exacting one. Our tests, on the other hand, are *selective* ones, applied for the purpose of securing that the limited numbers of men we are able to take shall be the best of the material available, as more men present themselves than we are able to take. The result is that our requirements in the matter of physical fitness are more severe than those of any other organised service. But, bearing in mind that Police employment is permanent and well paid, and that its arduous and wearing character is compensated for by a very liberal pension scale, and a comparatively limited period of qualifying service, these tests are not too severe. Approximately about 50 per cent. of the recruits who present themselves for medical examination are accepted. These represent the best of those who offer to join, and it must not be assumed that the remaining 50 per cent. are physical degenerates unfitted for ordinary avocations, as is understood to be the case with Army rejections. A large por-

tion of them—say from 35 per cent. to 40 per cent.—would be physically fit for military service according to existing standards, and for most of the ordinary callings of civil life. We reject a large number of men for no specific defect whatever, but merely because they do not come up to our standard of height, five feet nine inches, weight, ten stone, and chest measurement, thirty-four to thirty-five inches. Under a normal condition of the labour market these high standards have been maintained without difficulty. Under abnormal conditions (during the South African War, for instance, when the labour market was considerably disturbed) it has been found that a reduction of the standard of height by half an inch is sufficient to secure all the men wanted without sacrificing any of the real essentials of physical fitness.

In the lowest stratum of the population there always has been, and as far as can be foreseen there always will be, a large proportion of weaklings and incapables. But there is no data available to determine whether that proportion is increasing or not. The experience of Police recruiting affords no help in that direction, and the Medical Director-General's figures do not conclusively bear out the view that there is any such marked increase as is suggested. The only thing they appear to indicate at all clearly is that a large proportion of Army recruits is drawn from a lower social class than was formerly the case; and it is obvious that the lower the class the greater will be the proportion of weaklings and degenerates in that class. The Table in the Memorandum showing the occupations of recruits is too indefinite to be of any great value. But taking it as it stands, it may fairly be assumed that craftsmen belonging to the callings enumerated are, in the majority of cases, at any rate, failures as such, or at least that they are not up to the average of capability. Otherwise they would not forsake well-paid and permanent callings for a less remunerative career in the Army. The disadvantages of such a career in most cases are that it is irksome in its restraints and but poorly paid. Marriage is practically precluded, and, moreover, there are no means of providing for the bringing up of a family. Further, it, in the great majority of cases, ceases and leaves a man without paying occupation at an awkward age in life, when he is too old to learn a trade in which he must compete with younger men, and, as a consequence, the only occupations left open for him are those open for the casual employment of unskilled labour. The spread of education and the growth of facilities for communication, and of the Press, are all factors which, in combination, have had the effect of enabling most men of the class which formerly gravitated towards the Army as a natural course to aspire to less irksome callings in civil life, for which they would not have been eligible a few generations ago, and in which they not only escape the restrictions of military life, but earn better wages, enjoy greater freedom, and are free to marry when they choose.

The Police are not in a position to say that the figures given by the Medical Director-General do not indicate a condition of degeneration so widespread as he suggests; but it does appear in the light of the experience gained in Police recruiting, as well as from the fairly general knowledge obtained by the Police of the life and habits of the lower classes in London, that the figures equally suggest that the calling of a soldier has ceased to attract the class of men who formerly enlisted, and that, as a consequence, a larger proportion of the residuum of the population come under the notice of the Army Recruiting Authorities.

GEO. H. GARDNER.

APPENDIX IX.

The following is a list of the principal groups of anthropometric statistics, other than those mentioned in the Report, which have been collected in the British Isles since 1883.

1885. *Galton*. At the Health Exhibition Galton measured 9,337 of both sexes and various ages, including 4,726 adult males, and 1,657 adult females. (*Jour. Anthropological Institute*, Vol 14, pp. 205, 275.)

1886-1891. *Galton*. At the Anthropometric Laboratory, South Kensington, 3,678 persons, including 350 adult males, were measured. In this and in the previous case the persons measured were drawn from all classes and all

parts of the country. (*Jour. Anth. Inst.*, Vol. 21, p. 32. *Proc. Roy. Soc.*, Vol. 45, p. 135.)

1888. *Venn*. Venn published an analysis of the measurements of Cambridge students made up to that date. The number of persons measured was 1,450. (*Jour. Anth. Inst.*, Vol. 18, p. 140.)

1901. *Macdonnell and Garson*. Macdonnell published an elaborate analysis of 3,000 criminals measured by Dr. Garson and his assistants. (*Biometrika*, Vol. 1., p. 175.)

1902. *Hay and Mackenzie*. Six hundred children in Aberdeen and 600 in Edinburgh were measured by Drs. Hay and Mackenzie. ("Report of the Royal Commission on Physical Training (Scotland).")

APPENDIX IX.A.

APPENDIX IX.B.

MEMORANDUM BY MR. EDWARD W. HANGE UPON A RETURN AS TO THE WEIGHTS (AND HEIGHTS) OF BOYS ADMITTED TO THE TRUANTS' INDUSTRIAL SCHOOL AT HIGHTOWN IN THE CITY OF LIVERPOOL DURING THE YEARS 1893 AND 1903.

[*Note.—This Memorandum and the Returns referred to therein did not reach the Committee in time to be noticed in their Report; the Summary Table is here printed together with the Memorandum.*]

The accompanying returns relate to children admitted to the Truants' School at Hightown, established by the late School Board for Liverpool. That institution contains two distinct sections—for Protestant and Roman Catholic children respectively; and in addition to children from Liverpool itself, receives, so far as there is room, children from other districts—a preference being given (i.) to those from the adjoining districts, and (ii.) to those from other parts of Lancashire and Cheshire. For the purpose of comparison, the particulars have been taken for the last complete year (1903), and for the corresponding period ten years earlier. The particulars recorded with regard to each child comprise in both sections:—

- (a) Its exact age on admission,
- (b) Its weight on admission,
- (c) The period of its detention,
- (d) Its weight on leaving;

and, in the Protestant section

- (e) Its height on admission.

These particulars have been tabulated in the present returns (i.) for each section, as well as (ii.) for each year, separately, and under headings relating to the main localities from which the children were drawn. The number of children admitted were—

Protestant section	166 in 1893 (from Liverpool 88)
" "	100 in 1903 (" " 74)
Roman Catholic section	98 in 1893 (" " 61)
" "	83 in 1903 (" " 58)

The particulars of all these are shown in the returns themselves; but for the sake of comparison the summary is restricted to the ages (nine and a half to twelve and a half) common to both sections in both years; and it embraces, therefore, only the following numbers—

Protestant section	145 for 1893 (from Liverpool 81)
" "	74 for 1903 (" " 54)
Roman Catholic section	90 for 1893 (" " 56)
" "	62 for 1903 (" " 42)

The total admission show a considerable falling off (sixty-six in the Protestant and fifteen in the Roman Catholic sections) between 1893 and 1903—mainly among the children from outside educational districts, a circumstance due, no doubt, to the opening of a new Truants' School in the midland counties. The numbers included in the summary show a still further reduction between the two dates, largely among the Liverpool children themselves; this is due to a relaxation (consequent upon the school age being raised from thirteen to fourteen) of the former rule which restricted the admission of children over twelve and a half years of age—with the result that seventeen Protestant and fifteen Roman Catholic boys over thirteen years of age were admitted in 1903 as compared with one Protestant boy in 1893.

In the returns and summary alike the children are grouped according to their last completed half year of age; as, however, scarcely a single child is ever admitted exactly on the day he completes such a half year, the particulars for each group show, in months, the total excess of the children in that group over the half year under which they are arranged. For example, the three Liverpool boys between nine and a half and ten years of age admitted to the Protestant section in 1893 had between them exceeded nine and a half years of age by five months or by an average of 1.6 months per child. In the returns these extra months do not in any way affect the calculations which give the actual figures for each group without any allowance for such excess. The same remark applies also to the summary until the "normal yearly increase" in weight (or height) shown by these particulars is calculated, but in this calculation, and in that (resulting therefrom) of the "normal weight" (or height) for each half

year of age (as well as in the application of these last particulars to the actual ages of the boys) due allowance needed to be, and has been, made for the excesses in question.

For the purposes of comparison with statistics of more general application, there have been inserted in the summary under the heading "Theoretical weight (or height) for the given age" particulars derived from statistics supplied from medical sources through Dr. Eichholz.

The most striking features shown by these returns appear to me to be—

1. The almost universal (absolute among the Protestants and with only two exceptions among the Roman Catholics) and, in most cases, serious, falling off of the actual as compared with the "theoretical" weight.

2. The striking and increasing inferiority in this respect of the Protestant children as compared with the Roman Catholics.

3. The extraordinary, and in the case of the Protestant children, almost phenomenal, improvement in the rate of increase in weight among the children while in the institution, compared with that among the same children before admission.

On each of these points it may be well for me to make a few observations.

1. If we take one child at each of the ages ten, eleven, and twelve, their combined "theoretical" weights would be 214.25 lbs. The "normal" weights of an equal number of children of these particular ages committed to the Truants' School, would be.

Protestants 186.03 lbs. in 1893 and 185.73 in 1903.
Roman Catholics 193.74 in 1893 and 197.04 in 1903.

These figures show that while the Roman Catholics at Hightown exceeded the Protestants by 7.71 lbs. (or by 4.15 per cent.) in 1893 and by as much as 11.31 lbs. (or 6.09 per cent.) in 1903, they fell short, even in the latter year, of the theoretical figures by no less than 17.21 lbs. (or 8.03 per cent.)

2. The difference between Protestants and Roman Catholics shown in the preceding paragraph results from a comparison of only three out of the seven age periods included in the summary; but it is confirmed by a similar comparison for the whole of the periods, which gives the following totals for what, for the sake of convenience, I may call a "complete group"—

Protestants 434.07 lbs. in 1893, and 433.41 in 1903.
Roman Catholics 452.06 in 1893, and 459.76 in 1903.

The difference here in favour of the Roman Catholics is 17.99 lbs (or 4.14 per cent.) in 1893 and 26.35 lbs. (or 6.08 per cent.) in 1903. It will be observed that while the Roman Catholics show an improvement of 7.7 lbs. in the ten years the Protestants show a slight falling off (.66 lb.).

The corresponding figures for Liverpool alone would be.

Protestants 430.03 lbs in 1893 and 437.5 in 1903.
Roman Catholics 442.13 lbs in 1893 and 456.45 in 1903.

Where the percentage in favour of the latter would be 2.81 in 1893 and 4.33 in 1903.

In 1893 the children from Liverpool—Protestants and Roman Catholics alike, were in physique below the average of the admissions to Hightown—the former to the extent of 4.04 lbs. and the latter of 9.93 lbs. for each "complete group;" but in 1903 the former showed an excess of 4.09 lbs. and the latter a deficiency of only 3.31 lbs. In other words, the Protestants of Liverpool showed an improvement during the ten years of 7.47 lbs. per complete group against a deterioration of .66 lb. in the general average, and the Roman Catholics an improvement of 14.32 lbs. against one of 7.7 lbs. in the general average.

3. On the other hand the improvement during residence which was among the Roman Catholics at the satisfactory rate of 14·88 lbs. per annum in 1893, and at that of 13·73 in 1903, was among the Protestants at the extraordinary rate of 21·72 lbs. in the former and of 24·19 in the latter year. These figures bear eloquent testimony to the effect of judicious feeding! It is possible that the effect of improved diet and healthier surroundings is greatest during the first few months succeeding the change and that it would not continue indefinitely at the same rate; but so far as the Roman Catholics are concerned the results obtained here closely tally *pro rata* with those secured for a much longer period of residence and with regard to boys considerably older, at the Anerley School for the Deaf and Dumb. The difference between the Protestants and Roman Catholics is probably due to a considerable extent to the greater "leeway" which the former had to make up; but it appears to indicate that their physical inferiority to the others as shown by these particulars does not arise so much from any inherent cause as, in some way not at present clear, from greater antecedent defects in nourishment. One explanation which has been hazarded, that the difference is due to the less general habit among Protestants than among Roman Catholics of mothers nursing their own infants, seems hardly sufficient, or to be quite consistent with the greater susceptibility to improved conditions displayed by the Protestant children. The same remark would seem also to apply to another explanation which would account for the difference by a difference of race, the Roman Catholics being mainly of Irish and the Protestants of English origin and the former having been town dwellers for fewer generations than the latter. The figures tend however, to confirm the accuracy of the "theoretical" weights; for they show that if the children of ten and eleven years of age were retained for twelve months in the institution, they would probably attain to or exceed the theoretical weight for their advanced age.

Protestant Children.

1893.

<i>Normal Weight at</i>	<i>Annual Increase</i>	<i>Weight at</i>	<i>Theoretical Weight</i>
10—56·25		11—77·97	72
	21·72		
11—62·01		12—83·73	76·75

Roman Catholic Children.

<i>Normal Weight at</i>	<i>Annual Increase</i>	<i>Weight at</i>	<i>Theoretical Weight</i>
10—60·02		11—74·9	72
	14·88		
11—64·58		12—79·46	76·75

In conclusion I may remark that the contrast between the figures derived from Liverpool and those relating to the general average is certainly not due to any large importation of fresh blood into this city, and it can hardly be attributed to any other cause than to an improvement in the local conditions affecting the classes from which the children mostly come. This improvement is probably due not to any one circumstance but to the combined effect of a variety of causes; amongst which the most obvious appear to be (a) the extensive demolition of insanitary property which has been effected in Liverpool during recent years by the Corporation, (b) a considerable growth in the operations of the Liverpool Food and Betterment Association and similar agencies, and possibly (c) to some extent the efforts of the schools to disseminate elementary notions of hygiene and of the proper preparation of food. This latter cause is, however, probably more largely operative amongst classes from which this particular institution does *not* draw its inmates.

The general results would appear to me to point to the following conclusions:—

1. That any inferiority in the children in this neighbourhood to the theoretical standard is due to imperfect nutrition and to defects in environment.
2. That it tends to diminish with an improvement in general local conditions, and
3. That it rapidly disappears under healthy surroundings and adequate nourishment;

and to afford some indications as to the forces which can be called into play not merely to check deterioration where it actually exists but to promote a general improvement in the physical conditions of the child population.

EDWARD W. HANCE.

Education Office, Liverpool,
22nd July, 1904.

APPENDIX X.

FUNCTIONS AND COMPOSITION OF THE "COMITÉ CONSULTATIF D'HYGIÈNE PUBLIQUE DE FRANCE."

Loi du 15 Février, 1902, Art 25.—Le Comité consultatif d'hygiène publique de France délibère sur toutes les questions intéressant l'hygiène publique, l'exercice de la médecine et de la pharmacie, les conditions d'exploitation ou de vente des eaux minérales, sur lesquelles il est consulté par le gouvernement.

Il est nécessairement consulté sur les travaux publics d'assainissement ou d'aménée de l'eau d'alimentation des villes de plus de 5,000 habitants et sur le classement des établissements insalubres, dangereux ou incommodes.

Il est spécialement chargé du contrôle de la surveillance des eaux captées en dehors des limites de leur département respectif, pour l'alimentation des villes.

Le Comité consultatif d'hygiène publique de France est composé de quarante-cinq membres :

Sont membres de droit : le directeur de l'assistance et de l'hygiène publiques au ministère de l'Intérieur ; l'inspecteur général des services sanitaires ; l'inspecteur général adjoint des services sanitaires ; l'architecte inspecteur des services sanitaires ; le directeur de l'administration départementale et communale au ministère des Affaires étrangères ; le directeur général des douanes ; le directeur des chemins de fer au ministère du Commerce, des Postes et des Télégraphes ; le directeur de l'enseignement primaire au ministère de l'Instruction publique ; le président du Comité technique de santé de l'armée ; le directeur du service de santé de la marine ; le président du Conseil supérieur de santé au ministère des Colonies ; le directeur des domaines au ministère des Finances ; le doyen de la Faculté de médecine de Paris ; le directeur de l'École de pharmacie de Paris ; le président de la Chambre de commerce de Paris ; le directeur de l'administration générale de l'assistance publique à Paris ; le vice-président du conseil d'hygiène et de salubrité du département de la Seine ; l'inspecteur général du service d'assainissement de l'habitation de la préfecture de la Seine ; le vice-président du conseil de surveillance de l'assistance publique de Paris ; l'inspecteur général des écoles vétérinaires ; le directeur de la carte géologique de France.

Six membres seront nommés par le ministre sur une liste triple de présentation dressée par l'Académie, des sciences, l'Académie de médecine, le Conseil d'Etat, la Cour de Cassation, le Conseil supérieur du travail, le Conseil supérieur de l'assistance publique de France.

Quinze membres seront désignés par le ministre parmi les médecins, hygiénistes, ingénieurs, chimistes, légistes, etc.

Un décret d'administration publique réglera le fonctionnement du Comité consultatif d'hygiène publique de France, la nomination des auditeurs et la constitution d'une section permanente.

2	1	8	Wife "delicate."
5	1	8	Wife narrow-chested, probably tuberculous.
2	1	7	Wife has internal complaint.
3	1	4	Baby wasting.
2	1	8	Wife "delicate"—internal complaint.

REMARKS.

TABLE I. Shows that in this district the head of the family is, for the most part, a labourer or hawker.

TABLE II. This table shows that overcrowding is confined to the families occupying one, two, and three rooms, and is worst where the rooms are sub-let as lodgings.

TABLE III. Shows that disrepair is the principal sanitary defect noted, though there are also noted damp, dirt and defective drainage. Back-to-back houses are badly ventilated and the closet is a pail closet exposed to the public.

TABLE IV. Requires some explanation. I have constructed a number of diets from 8d. down to 3¼d. on which a man, doing moderate work, can be fed, fulfilling Atwater's Dietary. P. 125 grammes, F. 125 grammes, C. 425 grammes, or nearly so.

I have taken 3¼d. as the lowest possible for sufficient diet. On this basis the greatest deficiencies are found in two and four roomed dwellings; the total number of households below the limit necessary for healthy life being eleven out of forty-six. See diet tables.

If we take 7d. as the limit, which we generally may, owing to the inability of families to choose a diet properly, there are twenty-three out of forty-six without sufficient food. It should be noted that the average diet available is considerably larger in one roomed occupancies than in two or four roomed houses.

From TABLE V. we see that in this district the deficiency of diet falls more heavily on those having three to five in the family than on those having six to nine, if we take the diet at 3¼d.; but more heavily on the larger families if we take 7d. as the limiting diet for efficiency. The importance of diffusing knowledge on this subject is thus illustrated.

TABLE VI. Is not quite satisfactory. It is impossible to trace the effect of intemperance, except now and then, as in the fourth family shown. The effects of disease, slackness of work, death of the bread-winner are clearly shown. This table shows by a X where the rents are not regularly paid. This is most frequent in four roomed houses.

TABLE VII. Shows the relation of disease to the question of housing and food. All the one-roomed occupancies are in houses let in lodgings and we perceive that the ailing condition of the wife has much to do with the recourse to this class of dwelling. The prevalence of tuberculosis amongst these people is painfully in evidence.

TABLE VIII. More rent in proportion is paid for one room because this is let furnished. But it is remarkable how closely the rents of two roomed approximate to those of four roomed houses. The reason probably is that the former are scarce in this district.

TABLE VII.

SPECIAL REASONS FOR POOR DIET OR OVERCROWDING.

No. of Family.	No. of Rooms.	Diet.	Reasons.
6	2	d. 2	Earnings 10s. to 16s. weekly.
4	2	5	Earnings 13s. to 15s. weekly.
3	2	0 $\frac{3}{4}$	Earnings 5s. to 12s. weekly. Wife has rheumatism.
6	2	2	Earnings 10s. to 15s.
2	2	4	Earnings 9s. to 12s. for two workers.
5	1	2 $\frac{1}{4}$	Husband in prison. Wife earns 1s. a day covering umbrellas at 4 $\frac{1}{2}$ d. per doz.
4	2	4 $\frac{1}{2}$	Husband out of work. Wife earns about 10s. per week.
6	2	2 $\frac{3}{4}$	Man and wife together earn 14s. to 18s.
3	2	4 $\frac{3}{4}$	Mother and two daughters earn 11s. weekly.
5	2	3 $\frac{1}{4}$	Son out of work.
4	2	3 $\frac{3}{4}$	Hawker and wife earn 13s. to 24s.
3	2	6	Man and wife earn 15s. to 21s.
4	2	3 $\frac{1}{2}$	Man earns 10s. to 20s.
6	3	4	Earnings of father 15s. to 20s. (Married son assists family.)
3	2	3 $\frac{1}{2}$	Three persons earn 6s. to 8s. total.
6	2	3 $\frac{3}{4}$	Man and wife earn 14s. or 15s.
2	2	4 $\frac{3}{4}$	One earns 6s. to 8s. Another out of work.
5	2	4 $\frac{3}{4}$	Man and wife earn 15s. to 20s. Man drinks.
5	3	3 $\frac{3}{4}$	Two workers earn 16s. weekly.
3	1	2 $\frac{3}{4}$	Father earns 10s. to 20s. (Out of his usual work.)
2	1	3 $\frac{1}{2}$	Man and wife earn 10s. to 25s. (Rent 4s. 8d.)
4	4	6 $\frac{3}{4}$	Man and two children earn 22s. Mother ill.
5	3	5 $\frac{3}{4}$	Man earns 20s. to 25s.
4	1	2 $\frac{1}{2}$	Man and wife earn 12s. to 18s.
5	3	4	Man earns 12s. to 15s. (Out of his usual work.)

TABLE VIII.
SHOWING THE CONDITIONS AS REGARDS ILLNESS IN THE ABOVE 42 FAMILIES.

No. of Family.	No. of Rooms.	Diet Scale.	Illness, etc.
6	2	d. 2	Wife "delicate."
3	2	$0\frac{3}{4}$	Wife suffers from rheumatism.
6	2	2	Confinement six months ago.
6	2	$2\frac{3}{4}$	Confinement five months ago.
4	2	$3\frac{3}{4}$	Confinement four months ago.
6	3	4	Eldest daughter appears delicate. A son has chorea.
5	6	$6\frac{1}{2}$	Mother seems delicate. Confined six months ago.
4	4	$6\frac{3}{4}$	Mother suffers from "bronchitis."
5	3	4	Confinement three weeks ago.
7	4	$7\frac{3}{4}$	Son had pleurisy a few months ago.

REMARKS.

The second district to which a report relates is partly in Angel Meadow on the North of the Manchester Township. This district contains many common lodging houses of a low type.

The number of houses taken was 42.

These contained (Table I.) 75 workers whose occupations are given.

Insanitary conditions were found in connection with 37 houses (Table II-). In fact 23 of the houses were back to back, and these are, *ipso facto*, insanitary.

As in Deansgate, overcrowding is confined to the smallest houses, or to rooms sublet (Table III.). The amount of overcrowding here is, however, comparatively small.

From Table IV. we see that the best diet falls to those families living in one furnished room. Those having 2 or 3 rooms fare much worse.

The average diet here is lower than off Deansgate.

From Table V. we see that the families are not large, and that in this district the depth of destitution increases with the size of the family.

Table VI. shows lower rents than in Deansgate and the difference in rents between two roomed and four roomed houses is here quite marked.

Table VII. gives an idea of the reasons causing poor diet and overcrowding.

Table VIII. shows a comparatively small list of illnesses. The tendency is to tuberculosis and heart disease.

It will be noted that out of the above 42 households 11 are unable to get a diet on the scale of $3\frac{3}{4}$ d. per man; 19 are starving, except for help; while 26 are unable to live at the rate of 7d. per man, which in their ignorance of foods probably means insufficiency.

SPECIAL REASONS FOR POOR DIET OR OVERCROWDING.

No. of Family.	No. of Rooms.	Diet.	Reasons.
2	2	d. $2\frac{1}{4}$	Mother and daughter earn 6s. weekly.
5	4	$2\frac{1}{4}$	Daughter out of work, son earns 10s.
3	2	$3\frac{1}{2}$	Three persons earn 17s. in winter.
4	2	$4\frac{3}{4}$	Father out of work, mother and son earn 17s.
4	1	$2\frac{1}{4}$	Father cuts firewood, 10s. weekly, and pays 5s. 6d. for one room.
8	4	$5\frac{3}{4}$	Three persons earn 29s. weekly.
4	4	$5\frac{1}{4}$	Two persons earn 17s. 6d. weekly.
7	2	6	One person earns 22s. weekly.
5	4	$3\frac{1}{2}$	Father and mother earn 15s. weekly.
4	2	$2\frac{1}{2}$	Father earns 9s.
3	2	5	Two daughters earn 14s.
4	2	$4\frac{3}{4}$	Son earns 7s. Not known what father earns? 13s.
2	2	$2\frac{1}{2}$	Two persons earn 7s. 6d. (Rent 3s. 6d.)
3	2	$5\frac{1}{2}$	Soldier sends 8d. per day home, and Government allows 1s. 1d. per day. (Rent 3s. 1d.)
4	2	4	Father earns 13s.
5	2	$4\frac{1}{2}$	Man and wife earn 14s.
8	2	$3\frac{1}{2}$	Man earns 14s.
3	2	6	One son in hospital, and one out of work. When working 17s. weekly.
6	2	$6\frac{3}{4}$	Father earns 10s. in winter.
1	2	$3\frac{1}{2}$	Earnings 5s. 6d. weekly. (Rent 2s. 7d.)
2	2	$2\frac{1}{2}$	Mother earns 6s. to 8s. Husband does nothing.
2	2	$3\frac{3}{4}$	Man earns 8s. Wife broke ankle and cannot work.
6	2	5	Man earns 20s.
4	2	4	Daughter earns 14s. Father does the housework.
4	1	7	One person earns 20s. (Rent 6s.)
5	2	$7\frac{1}{4}$	Four persons earn 30s. A son out of work.
2	1	$3\frac{3}{4}$	Earnings 10s. weekly. (Rent 4s. 8d.)
6	2	$4\frac{3}{4}$	Father earns 18s.
4	2	4	Mother and son earn 11s.

TABLE VIII.
SHOWING THE CONDITIONS AS REGARDS ILLNESS IN THE ABOVE FAMILIES

No. of Family.	No. of Rooms.	Diet.	Illness, &c.
1	2	d. 8	Rheumatism for a month.
4	1	2 $\frac{1}{4}$	Mother has a bad foot through accident.
7	2	6	Child ruptured ; has been in hospital.
5	4	3 $\frac{1}{2}$	Confinement eight months ago.
3	2	8	Grandmother (lives here) ill at present.
3	2	6	Son, aged 17, in workhouse hospital with pneumonia.
6	2	6 $\frac{3}{4}$	Confinement six months ago.
2	2	2 $\frac{1}{2}$	Father (aged 73) not able to work.
2	2	3 $\frac{3}{4}$	Wife broke ankle five months ago.
4	1	7	Confinement three months ago.

REMARKS.

The third district in which an investigation has been made is a part of Ancoats in the Manchester Township. The portion of the Ancoats district enquired into contains no common lodging houses and only a small number of houses let in lodgings.

The number of houses taken was forty-eight.

These contained (Table I.) eighty-seven workers whose occupations are given.

Insanitary conditions were found in connection with thirty-two houses (Table II.) and twenty-six of the houses were back-to-back.

As in Deansgate and Angel Meadow overcrowding is confined to the smallest houses, or to rooms sublet.

Here again, however, the amount of overcrowding is small (Table III.).

In Table IV. we find that out of six families occupying tenements of one room three were able to provide an 8d. diet and one a 7d. diet. The average, however, only allows a 6d. diet, this being lower than that in the other two districts mentioned.

The average diet for all the families is higher than in either Deansgate or Angel Meadow.

In Table V. we see that the families are not large, and that the depth of destitution in creases with the size of the family. This is not so marked, however, as in the Angel Meadow district.

Table VI. shows that the rents for the two roomed and four roomed houses are lower than in Deansgate or Angel Meadow. The difference between the rents of two roomed and four roomed houses in Ancoats is less marked than in Angel Meadow.

Table VII. gives an idea of the reasons causing poor diet and overcrowding.

Table VIII. shows a remarkably small list of recent illnesses.

Out of the forty-eight households, ten are unable to get a diet on the scale of 3 $\frac{3}{4}$ d. per man, while twenty-seven are unable to live at the rate of 7d. per man.

1902	2·08	0·29	0·35	0·49	1·07	1·63	3·22	4·49	2·84
1903	1·85	0·34	0·24	0·50	1·02	1·52	2·88	3·78	2·50

This table shows a considerable reduction in the total death-rate from phthisis in the twenty-three years, 1881-1903, interrupted by a slight increase in the years 1901, 1902. At ages under 5 a reduction is manifest in the last three years. At ages 5-9 no steady improvement is apparent. At ages 10-14 the last three years show retrogression. On the whole, at school ages there has been an increase in the death-rate during the last three years. On the other hand, at ages 15-19, 20-24, and 25-44, a decided improvement is manifest. At ages above 45 the death-rate from phthisis has increased. It should be observed that less importance attaches to the death-rate from phthisis at the earlier than at the later ages. The total death-rate is so small that errors in diagnosis (which are more likely to occur at the earlier stages) would have a much greater effect on the rate at the earlier ages. With this caution, it may be said that the figures show a decided improvement at ages under 5, a tendency to retrogression at school age, a marked improvement in adolescents and adults, and an inclination to retrogression at advanced age.

V.—TABLE SHOWING THE NUMBER OF DEATHS UNDER 1 YEAR PER 1,000 BIRTHS OF LEGITIMATE AND ILLEGITIMATE INFANTS RESPECTIVELY.

Year.	Legitimate.	Illegitimate.
1891	184	375
1892	170	367
1893	190	498
1894	150	338
1895	193	395
1896	167	375
1897	187	374
1898	187	401
1899	196	425
1900	179	432
1901	188	463
1902	147	263

APPENDIX XIII.

Appendix to Evidence of Mr. Shirley Murphy.

EXTRACT FROM MEMORANDUM WITH TABLES OF FIGURES.

I have no other test of the physical condition of the population than that of its ability to resist disease and death ; but dealing in this way with London as a whole, the statistics available show that progress is being made.

Thus the death rate of the London population has for a long period been steadily decreasing, as will be seen from the following table :—

Period.	Death rate.
1841-50	24·8
1851-60	23·7
1861-70	24·4
1871-80	22·5
1881-90	20·5
1891-1900	19·2
1901	17·1
1902	17·2
1903	15·2

The following figures extracted from life tables relating to three decennia, further emphasise this fact.

MALES.

Expectation of life, at particular ages, in years.

Age.	1861-70.	1881-90.	1891-1900
0		39·9	41·0
5	47·5	50·4	51·6
10	44·6	46·8	47·8
15	40·1	42·4	43·4
20	36·7	38·3	39·1
25	33·1	34·2	35·0
35	26·3	26·9	27·3
45	20·3	20·4	20·7
55		14·6	14·8
65		9·7	9·8
75		5·8	5·9

The figures relating to females are in the same direction.

With respect to the physical condition of the poorer classes of the population, I have again no other test than that afforded by their ability to resist disease and death, compared with the corresponding ability of the classes better circumstanced.

The sanitary areas of Southwark and Hampstead may be taken as illustrative of a poor and of a well-to-do district, and the following figures showing the expectation of life in the two districts enable comparison to be made between them in respect of viability.

MALES.

Expectation of life, 1897-1900.

Age.	Hampstead.	Southwark.
At birth.	50·8	36·5
5	57·4	48·7
10	53·3	45·0
15	48·7	40·6
20	44·2	36·4
25	39·8	32·4
30	35·5	28·6
35	31·3	25·0
40	27·5	21·9
45	23·8	18·9
50	20·3	16·2
55	17·0	13·6
60	14·1	11·3
65	11·5	9·1
70	9·2	7·0
75	7·1	5·2

Further opportunity is given of comparing the death-rates of populations differing in social condition, by grouping the London sanitary areas according to the proportions of population occupying tenements of less than five rooms to the extent of more than two persons to a room.

Metropolitan Borough.	Proportion of total population living more than two in a room in tenements of less than 5 rooms.	Proportion of total population living in tenements of 1 and 2 rooms.
Lewisham - - - - -	2.67 %	4.8 %
Wandsworth - - - - -	4.46 %	5.6 %
Stoke Newington - - - - -	5.52 %	10.1 %
Hampstead - - - - -	6.37 %	11.1 %
Woolwich - - - - -	6.60 %	11.0 %
Greenwich - - - - -	8.30 %	10.3 %
Deptford - - - - -	9.06 %	13.0 %
Camberwell - - - - -	9.65 %	12.9 %
Hackney - - - - -	10.18 %	14.4 %
City of London - - - - -	10.85 %	19.3 %
Fulham - - - - -	10.85 %	13.0 %
Battersea - - - - -	10.89 %	15.2 %
Hammersmith - - - - -	11.76 %	17.0 %
Lambeth - - - - -	12.22 %	19.6 %
Westminster - - - - -	13.03 %	24.3 %
Paddington - - - - -	13.57 %	22.1 %
Chelsea - - - - -	14.43 %	25.0 %
Kensington - - - - -	14.84 %	22.1 %

* Proportions in C.L.H.'s starred are those in excess of the corresponding London proportions.

In insanitary areas the death rates are frequently 35 and 40 in the 1,000 of the population.

A noteworthy exception is to be found in Jewish populations who when living in houses of the sort usually demolished under the Housing of the Working Classes Act nevertheless have death rates which, compared with those of the district or of London, are in no way high. This is, I believe, due to the better care these people take of their health, especially of their children, and to their temperance.

It would appear from the tables that there has been an improvement in the power of the London population to resist disease and death, and in all probability a considerable cause of this improvement is the better feeding of the population.

It is deserving of notice, however, that infant mortality has not shown corresponding reduction.

The following table shows the annual number of deaths of infants under one year of age in 1,000 births in London in successive periods.

Period.	Annual Mortality of Infants.
1841—50	157
1851—60	155
1861—70	162
1871—80	158
1881—90	152
1891—1900	160

The improved food supply of the population as a whole has, perhaps, not been shared by infants, and it is significant that their mortality rate has remained practically stationary.

APPENDIX XIV.

TABLE IV.
HOURS OF EMPLOYMENT OF WOMEN AND GIRLS UNDER THE FACTORY ACT, 1901.

	Period of Employment.		Meal Times.		Overtime for Press of Work and Perishable Articles (Women over 18 years).	Sunday and All-Night Work.	Annual Holidays.
	Monday to Friday.	Saturday.	Monday to Friday.	Saturday.			
Textile Factories:							
Women - - - - -	{ 6 a.m. to 6 p.m. or 7 a.m. to 7 p.m.	{ 6 a.m. to 12.30 p.m. (if one hour for meal) or 6 a.m. to 12 p.m. (if $\frac{1}{2}$ hour for meal), 7 a.m. to 1 p.m. (if $\frac{1}{2}$ hour for meal).	Two hours at least, of which one at least to be before 3 p.m.	Half-an-hour at least.	Prohibited in Textile Factories except for ware-house processes (same as for press of work in Non-Textile Factories), or to recover time lost by drought or flood in water mills.	Prohibited.	Christmas Day, Good Friday, and four Bank Holidays, or other days substituted by notice.
Young Persons (under 18 years) - - - - -	Same as women.	Same as women.	Same as women.	Same.			
Children (under 14, or 13 if with educational certificate, and over 12 years) - - - - -	{ Either on alternate days as above, or in morning and afternoon sets: 6 a.m. to 1 p.m. 7 a.m. to 1 p.m. 2 p.m. to 6 p.m. and 7 p.m.	{ Same as young persons, but not on two successive Saturday days	Same.	Same.			
Non-Textile Factories and Workshops:							
Women - - - - -	{ 6 a.m. to 6 p.m. 7 a.m. to 7 p.m. 8 a.m. to 8 p.m. (In a few industries 9--9.)	{ 6 a.m. to 2 p.m. 7 a.m. to 3 p.m. 8 a.m. to 4 p.m.	One and a half hours at least, of which one before 3 p.m.		1. For press of work in many processes, specified by Order of Secretary of State:—Two hours on three days a week and thirty days a year with extra half hour for meal. 2. For perishable articles specified by Order of Secretary of State:—Two hours on three days a week, and fifty days a year with extra half-hour for meal.	Prohibited (outside overtime permitted).	Same as Textiles.
Young Persons - - - - -	Same as women.	Same as women.	Same.				
Children - - - - -	{ Either on alternate days as above, or in morning and afternoon sets: 6, 7, or 8 a.m. to 1 p.m. 2 p.m. to 6, 7, or 8 p.m.	{ Same as young persons, but not on two successive Saturday days.	In all cases work not to continue over 5 hours without a break of at least half-an-hour.		In Creameries, exceptional hours and Sunday and holiday employment permitted, with restrictions, by Order of Secretary of State. (See also below Special Exemptions from the Law.)		

Women's Workshops (where no young persons or children are employed).	A specified period of 12 hours taken between 6 a.m. and 10 p.m.	Aspecifiedperiod of 8 hours taken between 6 a.m. and 4 p.m.	One and a half hours.	Half-an-hour.	No overtime.	Prohibited between 10 p.m. and 6 a.m.	Same as Textiles, etc.
			Five hours' spell may be exceeded.				
Women's hours, meal times, holidays, etc., entirely unregulated in Domestic Workshops.							
Domestic Workshops (where only family living there are at work):							
Young Persons	Outside limits:— 6 a.m. to 9 p.m. (10½ hours exclusive of meal times.)	6 a.m. to 4 p.m. (8½ hours exclusive of meal times.)	4½ hours (unspecified).	2½ hours (unspecified).	No overtime beyond the ordinary period limits.	Prohibited (for young persons and children).	Not provided for.
Children	6 a.m. to 1 p.m. or 1 p.m. to 8 p.m.	6 a.m. to 1 p.m. or 1 p.m. to 4 p.m. not two successive Saturday afternoons.	Work not to continue over 5 hours without a break of at least half-an-hour for a meal.				
Laundries (in which over two persons besides the family are employed):	Daily Limits: (Exclusive of meal times).		Meal Times.		Overtime on three days a week, 30 days in a year, without extra meal time.	Both permitted for women, young persons, and children.	Same as Factories and Workshops.
Women	Fourteen hours.		Work not to continue more than five hours continuously without half-an-hour for a pause.				
Young Persons	Twelve hours.						
Children	Ten hours.						
	Weekly Limits: (Exclusive of meal times).		No other provision for meals.				N.B.—Certain processes normally under the Factory Act or as regards sanitation and safety are specifically exempted from regulation for hours of employment:— Preserving and Curing of Fish on arrival of fishing boats (women and young persons throughout the year). Preparing and Cleaning of Fruit on arrival at a factory or workshop; women and young persons in June, July, August and September.
Women	Sixty hours.						Flax Scutch Mills where women only employed and work intermittent, not more than six months in the year.
Young Persons	Sixty hours.						
Children	Thirty hours.						

APPENDIX XVI.

Appendix to Evidence of Mr. W. McAdam Eccles and Dr. Robert Jones.

STATEMENTS UPON WHICH THE EVIDENCE ON THE RELATION OF ALCOHOL TO PHYSICAL DETERIORATION WAS BASED.

NAMES OF THE MEDICAL MEN INTERESTED IN THE SUBJECT WHO MET IN CONFERENCE.

Sir THOMAS BARLOW, Bart., K.C.V.O., M.D., F.R.C.P., Physician to University College Hospital.
 FLETCHER BEACH, M.B., F.R.C.P., Physician to the West End Hospital for Diseases of the Nervous System.
 HARRY CAMPBELL, M.D., F.R.C.P., Physician to the North-West London Hospital.
 W. McADAM ECCLES, M.S., F.R.C.S., Assistant Surgeon to St. Bartholomew's Hospital.
 C. F. HARFORD, M.D., M.R.C.S., Physician to the St. James-the-less Medical Mission, Bethnal Green.
 Sir VICTOR HORSLEY, F.R.S., B.S., F.R.C.S., Surgeon to University College Hospital.
 T. B. HYSLOP, M.D., M.R.C.P., Physician and Superintendent at Bethlem Royal Hospital.
 ROBERT JONES, M.D., M.R.C.P., F.R.C.S., Physician and Superintendent at the London County Asylum, Claybury.
 T. N. KELYNACK, M.D., M.R.C.P., Physician to Mount Vernon Hospital for Consumption.
 J. J. RIDGE, M.D., M.D. (State Medicine), B.S., Medical Officer of Health for Enfield.
 T. CLAYE SHAW, M.D., F.R.C.P., late Physician and Superintendent at the London County Asylum, Banstead.
 G. E. SHUTTLEWORTH, M.D., M.R.C.S., late Medical Superintendent, Royal Albert Asylum for Imbeciles.
 E. CLAUDE TAYLOR, M.D., M.S., F.R.C.S., Medical Officer, Hampstead Workhouse.
 A. J. WHITING, M.D., M.R.C.P., Assistant Physician to the Tottenham Hospital.

There were also present—

JOHN Y. HENDERSON, Chairman of the National Temperance League.
 E. STAFFORD HOWARD, C.B., Director of the United Kingdom Temperance and General Provident Institution.
 A. F. HARVEY, Secretary of the Central Temperance Legislation Board.
 JOHN T. RAE, Secretary of the National Temperance League.

I.—EFFECT OF ALCOHOL ON GROWING CHILDREN.

By SIR THOMAS BARLOW, Bart., K.C.V.O., M.D.,
Physician to University College Hospital; late Physician to the Hospital for Sick Children, Great Ormond Street.

Disease in Children due to Alcohol. I have been asked to give my experience on the question of the administration of alcohol to children.

In answering the question whether any appreciable amount of actual disease is caused in children by the prolonged administration of alcohol, it is immensely difficult to give statistics, but it is easy to give illustrations.

Some years ago I saw large numbers of out patients at the Children's Hospital, Great Ormond Street, and I satisfied myself that definite cases of alcoholic disease existed.

Cases. Thus, in a boy, aged about ten years, who was under my observation for several weeks, there was well marked evidence of gin-drinker's liver, with abdominal dropsy. He had for a long time carried to his father, who was a cabman, his daily meal, of which some spirit was one of the constituents. The cabman had given the boy little "nips" of spirit, and he had got to like it.

Again, a boy, aged between four and five years, was brought to me with abdominal dropsy and enlargement of the liver. He had been given a certain daily quantity of beer for several months. The beer was stopped, and suitable remedies were given. The dropsy rapidly subsided, and subsequently the liver slowly lessened in size and the boy recovered.

Effects of Alcohol on Tissues of Children. The occasional administration of gin to children for flatulence is very common amongst certain classes of the London poor. The production of fibroid changes, or, in other words, the hardening and toughening of certain of the viscera of a child during the period of development, may be very far-reaching in its ultimate effects.

II.—PREVALENCE OF ADULT MALE INTEMPERANCE.

British Medical Association Investigation, 1887. In August, 1887, the report of the Collective Investigation Committee of the British Medical Association on the "Connection of Disease with Habits of Intemperance" was published.

It related to the 4,222 men between twenty-five and sixty-five years of age who had died during the preceding three years.

Only 40 per cent. were reported as habitually temperate. 55 per cent. were more or less intemperate, viz. :—

25·6 per cent. careless drinkers,
 12·9 per cent. free drinkers,
 16·5 per cent. decidedly intemperate,

the rest were unclassified.

This shows the prevalence at that time of intemperance among adult males. Taking the average duration of life of the habitually temperate as the standard, one-sixth of the 4,222 men had shortened their lives on the average ten years, two in every thirteen five years, and the rest on the average from two to three years.

Comparative Mortality of Adult Males, Publicans and Abstainers.

The Registrar-General has ascertained that of 61,215 men between twenty-five and sixty-five in the community, 1,000 die in one year ;

but of 61,215 publicans, 1,642 die in one year ;
 but of 61,215 Rechabites (abstainers), 560 die in one year.

III.—ABSTRACT OF A PAPER read before the INSTITUTE OF ACTUARIES, on the 30th November, 1903, on the COMPARATIVE MORTALITY AMONG ASSURED LIVES OF ABSTAINERS AND NON-ABSTAINERS FROM ALCOHOLIC BEVERAGES.

By R. M. MOORE,

Actuary of the United Kingdom Temperance and General Provident Institution.

The paper is based upon the experience of the United Kingdom Temperance and General Provident Institution from its establishment in 1841 to the year 1901 : a period of sixty-one years. There were 125,000 policies issued by the institution ; about one-half of which were on the lives of abstainers, the remainder being on non-abstainers ;

Experience of the United Kingdom Temperance and General Provident Institution.

the continued abstinence of the former class being ascertained by an annual declaration. These two classes are known respectively as the "temperance" and the "general" section. The policies were further divided into sexes, and classes of assurance (viz., whole-life, endowment assurance, or otherwise); those policies which were accepted on higher terms than ordinary being also separated: the remaining policies, issued at ordinary rates of premium, being described as "healthy lives."

It is upon the experience of healthy male lives assured under whole-life policies in the temperance and general sections respectively (being the bulk of the institution's business) that the conclusions arrived at are mainly based; though these conclusions are completely supported by the experience of other classes of policy, and of female lives.

After describing the various actuarial processes by which the results are arrived at, the writer shows that the experience of the general section, from age thirty-four upwards, was practically identical with the most recent experience of the life offices generally, known as the O^m Table, published under the authority of the Institute of Actuaries.

That the experience of the general section of the office is sufficient in quantity is indicated by the fact that it consists of 467,000 "years of life"; in other words it is the equivalent of 467,000 persons of various ages from ten to ninety-nine being under observation for a year: technically called "exposed to risk." As an indication how closely the experiences agreed, it may be mentioned that the actual deaths, 1841—1901, in the general section of the institution were 8,947. Had the mortality been at the O^m rate (the average rate of the life offices generally) the number of deaths would have been 8,911: a difference of less than one-half per cent.; thus showing that the lives assured in the general section of the office were good average lives.

In the temperance or abstainers' section there were 398,000 years of life under observation, or "exposed to risk." The deaths "expected" among these lives, if the ordinary average rate of mortality (O^m) had prevailed among them, would have been 6,899. Or, if the mortality of the general section had prevailed, the deaths would have been 6,959. But the actual deaths among the

abstainers were only 5,124: being less than 75 per cent. of the "expected" deaths according to the average rate of mortality of assured lives.

The higher vitality of the temperance lives is also shown by the fact that out of 100,000 persons aged thirty, according to the average rates of mortality (or the experience of the general section of the institution), some 44,000 would survive to age seventy. But according to the experience of the abstainers, over 55,000 would reach age seventy; or 25 per cent. more.

Again it is shown that the average number of years of life enjoyed after age thirty by ordinary assured lives is thirty-five years. But among abstainers it is thirty-eight and four-fifths years: about 11 per cent. more. At age forty these figures are twenty-seven and one-third years among ordinary assured lives and thirty and one-third years among abstainers; a gain of about the same proportion.

The results throughout are based on the experience of "policies" and not "lives"; that is to say, every separate policy on one life is regarded as a separate risk: but the writer shows that the two methods of dealing with the data produce practically identical results.

It is also shown, by an exhaustive examination, that the results are not affected by transfers from the temperance to the general section and *vice versa*: such transfers being proportionately very few in number.

In conclusion, the author claims:—Firstly: that the non-abstainers assured in the institution are good average lives, generally equal to the best accepted standard of assured life, namely, the O^m table. Secondly: that the abstainers show a marked superiority to the non-abstainers throughout the entire working years of life for every class of policy, and for both sexes, however tested. Thirdly: that this superiority has not been brought about by the operation of the transfers between the two sections. Fourthly: that the financial working of the institution in the allotment of bonuses, as between the abstainers and the non-abstainer sections, has not been influenced by such transfers.

The detailed experience in quinary groups of ages of healthy male lives assured under whole-life policies, non-abstainers and abstainers respectively, is appended:— refer to original paper).

IV.—ALCOHOL AS A CAUSE OF MENTAL DEGENERATION, AND ITS ACTION INDIRECTLY UPON OFFSPRING.

Report of ROBERT JONES, M.D., M.R.C.P.,

Chief Medical Officer, London County Asylum, Claybury.

There are probably at the present time more than 114,000 certified insane persons in England and Wales alone, of whom approximately 52,000 are males and 62,000 females.

If the fifty-seventh Report of the Commissioners in Lunacy to the Lord Chancellor, 1903, be consulted, the proportion per cent. of instances in which alcohol has been assigned as the cause of insanity to the yearly average number of patients admitted into asylums in the five years, 1896-1901 inclusive, is 21 per cent. for males and 9.2 per cent. for females, and probably the proportion for Scotland is much higher.

During the year 1902, which is the last upon which there are at present published records, there were 22,851 persons (male 11,217, females 11,634) admitted into lunatic asylums in England and Wales, and the Lunacy Commissioners who compile these numbers state that of these alcoholic excess was the assigned cause in 23.1 per cent. males and 9.6 per cent. females—a higher ratio than for the average of the five previous years. I believe that upon the lowest computation, and after making the necessary deduction for the more rapid death in some cases, such as those of general paralysis, a disease which certainly bears an indirect relation to alcohol, that at the present time there remain in asylums no less than about 11,000 males and 6,000 females who are mentally decrepit, mainly through the effects of alcohol.

During the last ten years, 1893-1902 inclusive, 35,916 persons (16,356 males and 19,560 females) have been admitted into all the London County Asylums. Of these 5,727 persons (3,497 males, 2,320 females) have been admitted whose insanity was assigned to drink as a cause, a proportion of 21 per cent. among the men and 11 per cent. among the women.

During the time that the London County Council's Asylum at Claybury has been opened, now over ten years (1893-1904), a period of which I have direct experience as medical officer, 9,544 patients (males 4,251, females 5,393, including private patients) have been admitted

thereto, of whom 965 males, 699 females, a proportion of 22.7 per cent. of the males and 13.1 per cent. of the females, were definitely ascertained to owe their insanity to drink.

A total, therefore, of 1,664 persons of both sexes have been thus rendered incapable of productive work through their own act, and have been or are being compulsorily and of necessity detained, supported and clothed, at the ratepayers' expense. During last year, 1903, in Claybury asylum, out of a total of 607 persons among the poorer classes (296 males, 311 females) admitted, no less than 113 males and 69 females, a proportion of 37 per cent. of men and 22 per cent. of women, were brought into the asylum insane, their condition being in some way directly or indirectly connected with alcoholic excess, indirectly contributing through loss of inhibition or self-restraint to the contagion of syphilis and to incurable general paralysis—a disease which is higher in proportion among those who drink than among the general population.

This fact certainly lends favour to the view that drink favours general paralysis—a disease which is without hope of relief, but which, on the other hand, is entirely preventible, and a form of insanity to which, above all others, our service men—soldiers and sailors—are most prone. Of these 182 drink cases admitted into this asylum about one-third have been discharged during the year, in many cases probably again to relapse, but 47 of the males remained in the asylum during a total aggregate of 640 weeks and 17 of the women 260 weeks. The cost of their maintenance, apart from their certification, previous infirmary residence and conveyance hither, falling upon the already over-burdened ratepayers.

Of the other 119 cases many, perhaps most of them, are probably doomed for the rest of their lives. Nor is this all, for out of these 70 per cent. men and 80 per cent. women were married, had families dependent upon them, upon and the cruelty of neglect induces a feebleness in their descendants which it is impossible correctly to estimate. Of the cases brought into this asylum, no less than 30 per cent. of the men and 56 per cent. of the women (where this could be ascertained) were country born, showing that their town environment, to say the least, was not favourable to their self-restraint. They were also brought at their best age, men between thirty-five and forty, and

Insanity due to Alcohol

Syphilis and General Paralysis in Soldiers and Sailors.

Effect of Alcoholic Dependents

women twenty-five and thirty-five, although many chronic cases of long-continued drink are admitted after the climacteric period.

I am certain that other factors, such as competition, insecurity of trade, insanitary surroundings, poverty—in some cases starvation and want—improper food in kind and quality, may have induced their alcoholism.

Of this, there is in my mind no possible doubt. The proportion of women whose insanity is ascertained to be due to drink is higher in Claybury than in the other asylums of London—possibly owing to the fact that it is the territorial asylum for the East-end of London, where so many women are employed in factory work.

This view is supported by the fact that in the City of Nottingham, where so many women are employed in lace factories, twice as many women as men are received into the asylum whose insanity is ascribed to drink. In Sunderland, on the other hand, where the prosperity of the mechanic and the miner is evidenced by higher wages and abundant work—and here also the question of climate as well as occupation may have to be considered, for the Northerner drinks habitually more than the Southerner—the proportion reaches 38·6 per cent. as compared to 21 per cent. among the women, the combined average being the exceptionally high one of 38 per cent. In Scotland this proportion is even higher. The statistics from this year's report of the Gartloch Asylum for the City of Glasgow gives the high percentage of 45 per cent. for males, 26·8 per cent. for females.

In marked contrast with this is the case of Cornwall, which for men and women gives the combined average of under 2 per cent., and of rural Kent, which gives a combined average of 3·8 per cent. For the whole county of London the total average for the same period was 19 per cent. for males, 10 per cent. for females, and it is a sad reflection that every year over 600 persons (over 400 men and 200 women) become inmates of pauper asylums in London from this cause alone. The misery and cruelty resulting to the family, and the absolute degradation of the home as the result of intemperance, are too well known to need description or reference.

Alcohol perverts the moral nature, affects the judgment and impairs the memory, it moreover especially affects the motor system, and creates an enormous loss to the community through destroying the productiveness of the skilled craftsman; no less than 30 per cent. of the admissions at Claybury during 1903 were of this class, who, as breadwinners, not only lose their trade, but have, moreover, to be detained, with others to look after them, in an asylum, leaving their dependents to swell the list of the "legal poor" or the criminal class.

In regard to the effects of alcohol upon the descendants, anything which devitalizes the parent unfavourably affects the offspring, and clinical experience supports this in the lowered height, weight, and impaired general physique of the issue of intemperate parents. It also records the fact that no less than 42 per cent. of all periodic inebriates relate a history of either drink, insanity or epilepsy in their ancestors.

It is also my experience that cases of alcoholic insanity are more prone to phthisis than other varieties—possibly owing to their susceptibility to the inimical effects of cold and exposure. They also suffer—more especially women—from the various forms of peripheral paralysis and from renal disease, which, with other deleterious effects of alcohol, induce arterio-sclerosis and premature senility. I can point out, not one, but many cases in my own experience of men at fifty-five years of age who are "played out" through what their friends describe as "moderate drinking," but it has been a constant indulgence, due to loss of self-restraint.

The fact pointed out by the Lunacy Commissioners that the proportion per cent. of alcoholic admissions to total admissions into asylums bears a ratio in the private class of 18·5 per cent. for males and 8·8 per cent. for females, showing a loss of self-restraint and a moral weakness which prefers immediate gratification to ultimate good among the poorer classes, proves the need there is for cultivating a greater inhibition, and the need also for encouraging a healthy public opinion in this class which will tend to make the drunkard a reproach even among his own people, instead of, as is too often the case, an object of pity. There is probably less drinking, in proportion, among the well-to-do classes than among the poor, and the effect of social ostracism is more felt among them. It is among

the poor that the increase of alcoholic insanity occurs, and the Lunacy Commissioners state this as a sad fact throughout the Kingdom.

It must not be surmised from the above that I am a strict and stern advocate of total abstinence; I think it involves too many limitations upon the demands of reasonable men and women, and I also think it is a counsel of perfection; but I believe it, nevertheless, to be the best working hypothesis for the cure of and the prevention of drunkenness. Could not this Committee advocate some such measure as the compulsory sale of food with drink. If "licensed victuallers," where does the *victual* come in?

V.—THE RELATIONSHIP OF ALCOHOL TO TUBERCULOSIS AND SYPHILIS.

By Dr. A. E. T. LONGHURST.
Late Surgeon-Major in the Army.

Both clinical research and practical observation prove that the use, and especially the abuse, of alcohol, predisposes to, and aggravates both tuberculosis and syphilis in the human system.

At the British Congress on Tuberculosis, held in London in 1901, Professor Koch and others expressed very strongly the opinion that the intemperate were much more liable to fall victims to tuberculosis infection, and that the disease once established in such persons takes an unfavourable and rapid course.

With regard to syphilis, there is abundant evidence that intemperance seriously predisposes to the contraction of the disease, deadens sensibility, making the persons indifferent as to the consequences of infection, and regardless of cleanliness, and other precautions calculated to protect them from reception of the virus. And no one who has had any experience of the disease and its treatment, in either soldier or civilian, can fail to realise its injurious action, and how seriously it militates against successful treatment.

Alcohol predisposes to Tubercle and Syphilis.
Tuberculosis.
Syphilis.

VI.—RECHABITE STATISTICS.

ALCOHOL AND LIABILITY TO DISEASE.

The Rechabite Directory for 1903-1904 contains the Annual Report for 1902 by the High Secretary, Mr. Richardson Campbell, from which we make the following extract:—

M.U. New Experience.

The new investigation into the sickness and mortality experience of the Manchester Unity of Oddfellows, by Mr. Alfred W. Watson, F.I.A., has now been published, and the sickness experience per annum in weeks, as compared with ours, is as follows:—

Age.	M.U.		I.O.R.		M.U.		I.O.R.	
	Weeks.	Weeks.	Weeks.	Weeks.	Advantage.	Advantage.	Weeks.	Weeks.
18	0·952	1·095	0·143	—	—	—	—	—

95	39·022	26·000	—	—	—	—	13·022	—
100	39·022	26·000	—	—	—	—	13·022	—

Members admitted to Rechabites at fifteen years old.
Members admitted to Oddfellows at eighteen years old.
... a much larger proportion of young members.

From the Report of the Public Actuary of South Australia, Mr. H. Dillon Gouge, F.S.S., in accordance with the South Australia Friendly Societies Amendment Act, 1892 :—

“ In S. Australia there are three Societies which may be regarded as being conducted on strictly teetotal principles—the Albert District of Rechabites, the South Australian District of Rechabites, and the Sons of Temperance ; and I have selected the three largest of the mixed societies for the purposes of comparison ” :

Average Rates.		
Society.	Mortality per cent.	Sickness—Weeks.
Rechabites (S.A.)	0·620	1·267
Rechabites (Albert)	0·687	1·140
Sons of Temperance	0·724	1·291
Abstainers' Average	0·689	1·248
Foresters	1·133	1·828
Oddfellows (M.U.)	1·351	2·208
G.U. Oddfellows	1·658	2·915
Non-abstainers' Average	1·381	2·317

From the foregoing figures it will be observed that in the first column (mortality) the non-abstainers' average is more than double, and in the second (sickness) nearly double, that of abstainers.

From another standpoint, also, the figures of the actuary tell a similar tale, *i.e.*, the mortality per cent. of the members actually sick, and the average weeks of sickness of such. These are as follows :—

Society.	Mortality per cent. of the Members actually sick.	Average Weeks of Sickness per Member Sick.
Rechabites (S.A.)	3·333	6·81
Rechabites (Albert)	3·616	5·99
Sons of Temperance	3·638	6·49
Abstainers' Average	3·557	6·45
Foresters	5·840	9·43
Oddfellows (M.U.)	6·789	11·06
G.U. Oddfellows	6·966	12·24
Non-abstainers' average	6·532	10·91

These figures show the mortality per cent. of members actually sick among non-abstainers is nearly double that of abstainers, and the fact that the non-abstainers experience ten weeks' sickness for the six weeks of the abstainers, is a strong argument in favour of abstinence.

Many of the Foresters and Oddfellows are abstainers. If they were removed the difference would be greater still.

VII.—THE QUESTION OF PHYSICAL DETERIORATION PRODUCED BY ALCOHOL, WITH SPECIAL REFERENCE TO THE LOWER ORDERS.

By T. CLAYE SHAW, M.D., F.R.C.P.,
Late Chief Medical Officer London County Asylum, Banstead, etc.

Alcohol is indirectly responsible for many lesions from accidents, and for placing people in false conditions, where they contract disease and commit themselves socially.

By the indulgence of parents in it, children are deprived of necessary food, clothing and warmth, thus becoming starved, stunted, and more liable to be killed by inter-current disease.

At the Banstead Asylum. 30 to 40 per cent. of the admissions were due, directly and indirectly, to excessive alcoholism.

As to the question of direct influence of alcoholism in the parents on the progeny there is little doubt in the experience of alienists.

We must be careful to eliminate, in the case of the father, the time when he became an excessive alcoholic. One often sees the later members of a family of worse development than the earlier ones, because the father began his excessive indulgence after the earlier children were begotten.

Remembering the undoubted facts of the frequent Hereditary similarity in features, gait, mental peculiarities, of children Trans- to one or other of their parents, there is every reason to mission. believe in the hereditary transmission of qualities quite independent of the influence of environment. I can quote one family where the impulsive and periodic craving for alcohol has been a notable feature for the last three generations.

The influence of the mother is probably greater than the Alcoholism father. It has been shown that pregnant women who are in the decided alcoholics miscarry to a much greater extent than Mother. others, and that when deprived of alcohol at an early stage of pregnancy (as when sent early to prison, and subsequently delivered there) they may go through the full period of gestation.

Again, the influence of the alcoholised blood of the mother on the microkinesis and the micropsychosis of the foetus must be very pernicious.

One can recall cases of early convulsions in children, of Develop- developmental insanity, of imbecility, and of epilepsy mental which can only be accounted for by the known inebriety Insanity. of the parents. Alcoholic amenorrhœa and dysmenorrhœa point to the effect of the poison on the genital system of the mother.

Finally, if alcohol in excess sets up a condition in which Deteriora- people commit acts which, when free from the influence, tion caused they recognise as injudicious and the result of a lowered by condition of responsibility, then it (alcohol) does by the Alcoholism. very setting up of this condition cause deterioration.

Experiments are not wanting—they are in daily evidence. We have inebriate mothers and either abortions or de- generate children. The teleological relationship of the two seems to be as certain as any other conditions of cause and effect.

The effect of food in the breeding of animals is acknow- ledged ; why should not it be recognised in humans ? Evidence from Animal Breeding. Place the foals of a thoroughbred and of a cart mare in the same environments, you will never be able to eradicate either the nervous or the organic differences.

Breed from sickly parents, the result is either an abortion or a degenerate. If there is nothing in the theory of heredity, if qualities are not transmitted, but everything depends upon environment, then there seems to be no reason why imbeciles should not marry, nor why epileptic and insane people should not be allowed to add to the race on the off-chance of creating a Hercules or a genius.

VIII.—EFFECT OF MATERNAL INTEMPERANCE ON EMBRYOS. THE OFFSPRING OF FEMALE CHRONIC DRUNKARDS IN LIVERPOOL PRISON.

By W. C. SULLIVAN, M.D.,
Deputy Medical Officer, H.M. Prison, Pentonville.

The death-rate among the infants of inebriate mothers was nearly two and a half times that among the infants of sober mothers of the same stock. Death-rate of Infants.

In the alcoholic family there was a decrease of vitality in successive children : *e.g.*, in one family the earlier born children were healthy, the fourth was of defective intelligence, the fifth an epileptic idiot, the sixth still-born. Deterioration in Offspring.

Of 219 children of drunken mothers which survived, nine became epileptic—4·1 per cent.

Taking women of the same class he found
Twenty-one drunken mothers with 125 children—
sixty-nine died under two years—55·2 per cent.

Twenty-eight sober mothers with 138 children—
thirty-three died under two years—23·9 per cent.

(Paper read before the Society for Study of Inebriety, 1900.)

IX.—PARENTAL ALCOHOLISM AS A CAUSE OF MENTAL AND PHYSICAL DEGENERACY IN OFFSPRING.

By G. E. SHUTTLEWORTH, M.D.,
Formerly Medical Superintendent, Royal Albert Asylum for Idiots and Imbeciles, of the Northern Counties, Lancaster ; Medical Expert, Rochester House Institution for Improvable Imbeciles, Metropolitan Asylums Board, etc.

Many loose statements have been made as to the in- Loose temperance of parents being, in a preponderating number Statements. of cases, the sole and sufficient cause of mental degeneracy (idiocy, imbecility, and feeble-mindedness) in the offspring.

Effects of Alcohol.

Indirect Effects on Offspring.

Banstead Asylum Statistics.
Direct Influence of Alcoholism in Parents on Offspring.
Alcoholism in the Father.

Starting with the Massachusetts Statistics presented by Dr. Howe's Commission (of three) to the State Legislature in 1848, the statement deduced therefrom that "out of 300 idiots 145 had drunken parents" has been again and again quoted.

An examination of the original tables, however, shows that this statement is inexact, Dr. Howe's own figures being that out of 359 idiots the condition of whose progenitors were ascertained, ninety-nine were the children of drunkards. From a detailed account of forty-five of the cases it would appear that the parents of eleven (one-fourth) were of intemperate habits, and it appears also that in all but one "they were not in a normal state of health," and ten of the cases are noted as scrofulous as well as idiotic.

From a similar inquiry made in 1856 in Connecticut, it would seem that out of 235 cases in which the habits of parents were investigated, there were seventy-six (less than one-third) in which intemperance was noted, and details show concurrent etiological factors in all of those set forth fully.

(It is open to question as to amount of drink taken which connoted "intemperance" in these documents.) Dr. Kerlin, the late able superintendent of the Pennsylvania Institution for Imbeciles, calculated that alcoholic taint was a factor in 38 per cent. of his cases, but he took into account the habits of grandparents as well as parents (*i.e.*, six progenitors in all). So far, as regards oft-quoted statistics of American origin.

In this country Dr. Graham, the Superintendent for fifteen years of the Earlswood Asylum, stated that out of 800 cases tabulated by him, in six cases only is intemperance of parents assigned as the probable cause, and in two of these there was also insane heredity.

Dr. Shuttleworth, after seven years' experience at the Royal Albert Asylum, with 418 cases of idiocy and imbecility, made a scrutiny in 1877 of the history of 200 male and 100 female congenital idiots, in which full information had been obtained, with the following results:—

(*Vide* *the Paper in British Medical Journal*, 1877, and *American Transactions*, 1877.)

Of the 200 males, nine had intemperate parents, classed thus: seven, intemperate fathers; one, intemperate mother; and one, both parents intemperate.

Of the 100 females, seven had intemperate parents. In two of these cases the mothers were intemperate, and in five the fathers were intemperate.

Of the 300 patients, sixteen had intemperate parents, eight of whom are described as habitual, and eight as occasional drunkards.

Applying to the examinations of these cases a method akin to that suggested by Dr. Bucknill for the estimation of the drink-etiology of insanity, they may be arranged in the following classes:—

	Males.	Females.	Total
CLASS A.—Parental intemperance the direct or only ascertained cause	4	5	9
CLASS B.—Parental intemperance complicated by hereditary tendency to insanity or nervous disease	2	0	2
CLASS C.—Parental intemperance complicated by adverse physical circumstances affecting parents (<i>e.g.</i> , ill-health, phthisis, and consanguinity)	1	2	3
CLASS D.—Parental intemperance complicated by adverse mental circumstances (<i>e.g.</i> , emotion or anxiety of the mother while pregnant, etc.)	2	0	2
Total	9	7	16

It is to be noted that the 300 cases are congenital cases, or cases in which idiocy was observed as an early consequence of fits during dentition; cases resulting from falls and other clearly accidental causes being excluded.

After a more mature experience, *viz.*, in 1890, Dr. Shuttleworth collaborated with Dr. Fletcher Beach in an article published in the late Dr. Hack Tuke's "Dictionary of Psychological Medicine." The former furnished etiological statistics with regard to 1,200 cases fairly well investigated at the Royal Albert Asylum, the latter with

regard to 1,180 cases who had been under care at Darenth. Dr. Shuttleworth's histories gave a percentage of 13.25 of his cases with evidence of alcoholic parentage. Dr. Beach's 19.57 with regard to the Darenth patients, derived, it will be understood, from a lower social stratum than those at the Royal Albert Asylum. If grand-parental as well as parental histories were taken into account, the latter percentage was raised to 21.44.

In both Asylum groups, however, the concurrence of other factors was recognised, such as neurotic, insane and phthisical heredity and frights and accidents to mothers, these contributory causes appearing in nearly half of Dr. Shuttleworth's cases. Generally parental intemperance was more marked than that of mothers (but information for case books was usually given by the latter). It is interesting to note that the late Dr. Langdon Down stated in his Lettsomian Lectures (1887) that in 12 per cent. of the fathers and 2 per cent. of the mothers of patients noted by him there was "avowed and notorious intemperance," though he found that the proportion varied extremely with the stratum of society from which the records were taken.

The latest English writer on the causation of Congenital Amentia, Dr. A. F. Tredgold, who has had exceptional opportunities of investigating the family histories in 150 selected cases of idiocy and imbecility under care at the London County Asylums, Darenth and Earlswood, states that "alcoholism is present in the antecedents of 46.5 per cent. of the 150 cases, in the greater number in combination with insanity or other neuropathic conditions." (*Mott's Archives*.)

My own conclusions may be summarised as follows:—

(1) That parental intemperance is a large factor in the degeneracy of offspring, both mental and physical.

(2) That intemperance (*per se*) is not so large a factor as has been sometimes assumed in the causation of congenital mental defect; but that in combination with other heritable taints (*e.g.*, tuberculous, neurotic, insane, and syphilitic) alcoholism is a prevalent though not altogether predominant cause of idiocy, imbecility and feeble-mindedness. Parental intemperance is sometimes a consequence of a neurotic or insane heredity, and in such cases the latter must be looked on as the predominating factor.

X.—STATISTICS IN RELATION TO THE EFFECT OF ALCOHOL IN INDUCING PHYSICAL DETERIORATION IN THE OFFSPRING OF ALCOHOLIC PARENTS.

By FLETCHER BEACH, M.B., F.R.C.P.,

Physician to the West End Hospital for Nervous Diseases; formerly Medical Superintendent of Darenth Schools for Imbecile Children.

On examining this question some years ago with reference to the influence of intemperance in the parents causing idiocy and imbecility in the children, I investigated 1,180 cases at Darenth Asylum, and found that intemperance in the parents was assigned as a cause of the idiocy and imbecility in 231 cases, or 19.57 per cent.

In 196 of these cases, however, intemperance was combined with the following causes:—Phthisis, insanity, imbecility, syphilis, consanguinity, excitability, chronic neuralgia, abnormal conditions of the mother during pregnancy, premature labour, disease of the brain, and paralysis.

Further analysis showed that intemperance was combined with one cause alone in ninety cases, the most frequent associations with it being insanity, phthisis, and worry of the mother during pregnancy. Intemperance was combined with two other causes in fifty-eight cases, with three in twenty-five, with four in eighteen, with five in four, and with six causes in one case. From these figures it will be seen that in only thirty-five cases was intemperance given as the only cause, or 2.96, certainly not a large percentage.

It was found that intemperance was chiefly marked in the father, but in twelve cases the mother drank, and in seven cases both father and mother gave way to drink. In a few cases, intemperance was found to be a family failing; thus, in three cases the father's side of the family were described as intemperate for several generations. In one case only was the mother's side of the family given to drink, but the result was very marked, for, not only was the patient in the asylum an imbecile, but her two cousins were imbeciles also. In two cases

Latest Statistics from Darenth and Earlswood.

Conclusions.

Statistics of Darenth Asylum.

Intemperance combined with other causes.

Intemperance in Father, in Mother, in both Parents.

sporadic cretinism was present in the children, and in one case three children in the family were microcephalic idiots.

The higher percentage of intemperance in my cases, 19·57, compared with 13·25 of Dr. Shuttleworth's, is explained by the fact that my cases were all paupers, and in the lower classes intemperance is not looked upon as a disgrace.

XI.—COMPARATIVE STATISTICS OF FRANCE, BELGIUM, NORWAY AND SWÉDEN.

By DR. LEGRAIN,

Superintendent of the Asylum at Ville Evrard, Paris.

Another proof, if more proof were needed of the inevitable connection of drinking with the increase of vice, crime, and the deterioration of the race and character, is afforded by some remarkable diagrams, recently compiled by Dr. Legrain, of Paris. By his permission these have been re-drawn and translated into English, and are deserving of careful study.

The first deals with France, and shows the increasing consumption of spirits (proof) per head since 1830 in litres. Coincident with this there is an increase of accidental deaths and suicides due to alcoholism, a large increase in lunacy, also of common crimes and recom-mitals; and, particularly, a definite increase of the percentage of conscripts refused as unfit for service.

In Belgium again we see a similar upward trend of Belgium, drink and its consequences.

On the other hand, there are two countries of Europe Norway, where the consumption of drink, largely owing to wise legislation, has been steadily decreasing. The first is Norway, where it has come down from sixteen litres, containing 50 per cent. alcohol in 1830, to 3·68 litres in 1895; mortality from alcohol, suicides and crimes generally have, of course, diminished in like manner; paupers have become fewer, and the average wealth of the people increased.

Turning to the neighbouring country, Sweden, we find the same thing. Serious crimes, such as murder, rape, common assaults, and even quarrels and lawsuits, have diminished; suicides are less frequent; also deaths from alcoholism, of course, and even syphilitic diseases, and here is a further reverse of the picture in France, for the percentage of conscripts refused has steadily diminished, showing an elevation in the standard constitution of the people.

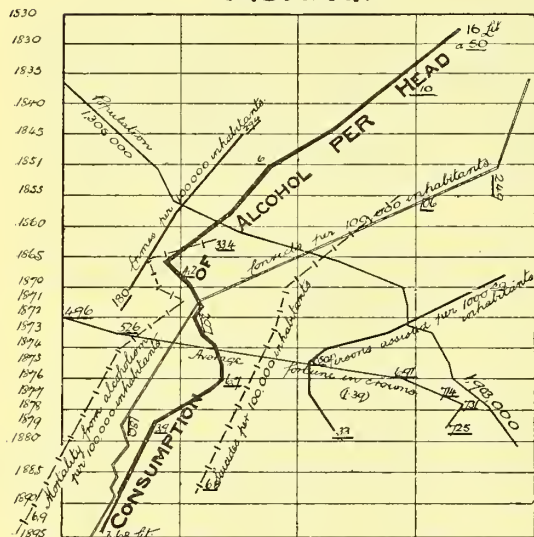

No one should assert that the rise and fall of crime, disease, lunacy, death-rate, etc., is only affected by the amount of drink consumed. There are undoubtedly several other causes at work in both directions. But no reasonable man can fail to be convinced that, as far as it goes, the increase of the consumption of alcohol is shown hereby to be injurious to the health of a nation, and thus tends to its physical deterioration.

Alcohol as one of the factors of Physical Deterioration.

XII.—ACTION OF ALCOHOL ON THE LIVING CELL.

By J. JAMES RIDGE, M.D. and M.D. (State Medicine), B.S., B.A., B.S.C. LOND.,

Medical Officer of Health for Enfield.

It is a truism to say that the human body is composed of cells and their products. It originates from a single cell, which, by repeated cell division, is multiplied and then differentiated to form the various organs and tissues. When we know how alcohol behaves to individual cells, we can very certainly understand what its effects will be on the billion-celled mass which we call the human body.

An interference with the natural growth of protoplasm by the action of alcohol was noticed by me in 1879 in the growth of the seeds of cress. It is always a matter of astonishment to me that as little as one drop in a quarter of a pint of water can exert an adverse influence on the growth of protoplasm.

The same effect is seen on the growth of geraniums, as I showed in 1891, plants watered occasionally with water containing one per cent. of alcohol soon beginning to droop and wither.

I have watched the growth of common chara under the influence of 1 per cent. of alcohol, one drop in two ounces.

The chlorophyll loses its green colour; this accounts for the pale colour of the cress in the presence of alcohol.

The same fact has been established for animal protoplasm. Sir B. W. Richardson found that medusæ were killed by one in 4,000 of alcohol (one drop in 8 oz). I have observed a similar deleterious action of alcohol on *Daphniæ* in proportion to the amount down to one drop in a quart of water.

The effect on the development of eggs is very marked. Action of The eggs of a blowfly kept moist with alcohol and water Alcohol on do not mature so quickly or not at all. A precisely the develop- similar interference can be evidenced with the develop- ment of Eggs. ment of frog's spawn, small percentages of alcohol having an incredibly bad effect. Feré has noticed the same injurious influence of the vapour of alcohol on the development of hens' eggs.

These facts are of immense importance, as we realise the Effect of great increase of drinking among women in recent years. Alcoholism In past centuries there have been many instances of among drunken nations, whose vitality does not seem to have Women. been greatly interfered with. I attribute this to the fact that in those days the women, the mothers of the race, were sober. But if the mother as well as the father are given to drink, the progeny will deteriorate in every way, and the future of the race is imperilled.

APPENDIX XVII.

[The Appendix originally intended to have been numbered XVII. has been printed in Volume I. as Appendix VA.]

APPENDIX XVIII.

(a) LEAFLET ISSUED BY THE HEALTH DEPARTMENT OF SHEFFIELD.

"ADVICE ON THE FEEDING AND REARING OF INFANTS."

Issued by the Health Department, and intended to be followed in all cases except where a Doctor is in attendance and gives special instruction.

1. Infants should have no food but Milk for the first six or seven months of their life.

2. They should, if possible, be fed at the breast, because breast-fed infants are much healthier than bottle-fed infants. They should have the breast every two hours during the day, and every four hours during the night for about ten minutes, and as they grow older, less frequently. Irregular feeding upsets the infant's digestion. The infant must not be allowed to go to sleep at the breast. In order that her milk may be wholesome, the mother should lead a healthy life, eat only plain and wholesome food, and not take intoxicating drinks, such as spirits and beer. If her nipples are sore, she should wash them with warm water before and after the child is fed and apply glycerine to them.

3. If from want of milk or other absolutely unavoidable cause the mother cannot suckle her infant, it will be necessary to feed it on fresh cow's milk. For a newly-born infant the cow's milk should be mixed with an equal quantity of water, and should be sweetened and boiled before use. If the milk curdles on the child's stomach, barley-water may be used in its preparation instead of plain water, or one or two tablespoonfuls of lime-water may be added to each pint of milk and water. As the infant gets older, the amount of water should be lessened, until at the end of six months about one and a half pints of pure milk without any water are given. Infants are often starved by being given too much water with their milk. The newly-born infant should be fed every two hours during the day, and every four hours during the night. As the infant grows older its meals should be less frequent. Irregular feeding upsets the infant's digestion.

Bottles should not have long tubes, because it is impossible to clean a long tube. The best kind of bottle has a rubber teat, which can be turned inside out and properly cleaned. Only sufficient milk for one meal should be put in the bottle at a time, and both bottle and teat should be thoroughly cleaned with water and soda after each time of using, and boiled once a day. If any old milk is left in the bottle or its fittings it will sour the next meal, and give the infant diarrhoea or a disordered stomach.

4. Diet from Six Months to Twelve Months old.

First meal, 7 a.m.—A suitable quantity of some infant food, such as Mellin's, Ridge's, Frame, Benger's, Neave's, etc., prepared accordingly to the directions, with twelve tablespoonfuls of milk.

Second meal, 11 a.m.—Twelve tablespoonfuls of pure milk which has been brought to the boil.

Third meal, 1.30 p.m.—Same as first.

Fourth meal, 5.30 p.m.—Same as second.

Fifth meal, 10 p.m.—Same as first.

Diet from Twelve to Eighteen Months old.

First meal, 7 a.m.—Bread boiled in milk, or oatmeal porridge with plenty of milk.

Second meal, 11 a.m.—Twelve tablespoonfuls of milk.

Third meal, 1.30 p.m.—Bread crumbs and gravy, or a lightly-boiled egg and bread and butter, or a milk pudding.

Fourth meal, 5.30 p.m.—Bread and milk.

Fifth meal.—Milk to drink.

5. Infants should on no account be given all sorts of things to suck, such as carrots, turnips, raw potatoes, or unripe fruit, neither should they be given bits from their mother's or father's plate to get them used to it.

A LOW GRADE TOWN SCHOOL IN A NEGLECTED DISTRICT (LONDON).

(1) *Lambeth.*

Johanna Street Board School.

(2) *Honeywell Road* (Standard).*Note.*—Irregular growth and severe retardation of a very grave nature.

A LOW GRADE TOWN SCHOOL IN A CRIMINAL AND NEGLECTED AREA (LONDON).

(1) *Notting Hill.*

St. Clement's Road Board School.

(2) *Honeywell Road* (Standard).*Note.*—Conspicuous retardation in growth, only less than Johanna Street.

MANCHESTER.

(1) *Ducie Avenue Board School.*

A school of the best type.

(2) *Sharp Street.*

A notably bad slum area.

(3) *London.*

Honeywell Road (Standard).

x — x Johanna Street (London) limits.

Note.—Good population in Manchester practically as good as best in London (Apparent falling off in Ducie Avenue at later ages, probably associated with the transference of the best children to the Central Higher Grade School and other higher schools).

Curve of worst population is flatter than corresponding curve in London. Adolescent population more stunted (rickets). The difference between best and worst is very serious.

SALFORD.

(1) *Grecian Street Board School.*

Better class.

(2) *John Street Board School.*

Poorer class.

(3) *Honeywell Road, London (Standard).*

x — x Johanna Street (London) limits.

Note.—Good population in Salford as good as best in London.

Difference between worst and best not so great as in London.

Salford low type population is not so bad as corresponding population in London.

Low type curve in Salford flatter than low type curve in London (more rickets in northern towns).

LEEDS

(1) *Brudenell School.*

Good Type.

(2) *Sweet Lane Board School.*

Poorer neighbourhood.

(3) *Honeywell Road (Standard).*

× — × Johanna Street (London) limits.

Note.—Good type Leeds School almost as good as best London Schools, though somewhat depressed at senior ages.

The divergence between "good" and "bad," though significant, is not so acute as in London.

Leeds poorest population on the whole much better than poorest in London.

No flattening of curves as in Manchester and Salford (Probably less rickets).

A POOR GRADE SCHOOL IN AN IMPROVING NEIGHBOURHOOD (LONDON).

(1) *Bethnal Green, Virginia Road.*

Improving circumstances: Erection of modern dwellings by London County Council.

(2) *Honeywell Road (Standard).*

Note.—Children fairly good—just short of the best.

A SCHOOL IN A POOR INDUSTRIAL NEIGHBOURHOOD UNDER EXCELLENT DRILL EXERCISES AND ORGANISED GAMES FOR TWELVE YEARS (LONDON).

(1) *Eltringham Street Boys' School, Wandsworth.*

(2) *Honeywell Road (Standard).*

Note.—Shows recovery of physique at limit of school age.

A BOARD SCHOOL FREQUENTED BY CHILDREN OF ALIEN IMMIGRANTS (JEWISH), LONDON.

(1) Houndsditch Gravel Lane Board School.

(2) Honeywell Road (Standard).

Note.—A high grade rate of growth.

A SCHOOL FOR FEEBLE MINDED CHILDREN.

(1) St. Clement's Road Centre, Notting Hill, London.

(2) Honeywell Road (Standard).

Note.—Growth irregular and retarded. Retardation severe.

WEIGHT MEASUREMENTS—WHOLE SCHOOLS.

(FROM DR. HALL'S NUMBERS.)

(1) *Country School (Ripon).*(2) *Good Town School (Brudenell School, Leeds).*(3) *Poor Town School (St. Peter's and Sweet Lane, Leeds).**Note.*—General retardation of poor children.

General parallelism between rural and better town children.

Weight curves show discrepancies less distinctly than height curves. As both curves show similar results, height curves are preferable for statistical purposes on account of their distinctness.

LANT ST. BOARD SCHOOL (SOUTHWARK), 1875.
Lowest type.

HOLLAND ST. BOARD SCHOOL, BLACKFRIARS.
Lowest type : present time. Compare with Lant St., 1875, and note improvement.

LANT ST. BOARD SCHOOL (SOUTHWARK), 1878.
Slight improvement.

HONEYWELL RD. BOARD SCHOOL, WANDSWORTH COMMON.
Best type of London child, present time.

LANT ST. BOARD SCHOOL (SOUTHWARK), 1902.
Great Improvement.

MENTALLY DEFECTIVE CHILDREN, IRWELL ST. SALFORD.

APPENDIX XX.

*Appendix to Evidence of Mrs. Greenwood.*CASES OF RICKETY CHILDREN INVESTIGATED
IN SHEFFIELD.

(1). 20, Court, A—Road.

A back to back house containing three rooms, rent 3s. 9d. per week, occupied by a man and wife and five children. Eldest boy twelve years, at school; a boy ten years has a diseased spine, girl three years, small; child seventeen months, cannot walk, and a baby ten weeks at the breast. Husband gives wife 20s. per week.

History of child seventeen months. Was weaned at three months and fed on "pobs" (bread boiled in water) and 1d. worth of milk each day until it was twelve months old, when no more milk was given, now lives on bread and butter and tea, dinner same as others. At the present time 1d. worth of milk taken daily for whole family.

(2). 28, W—B—Road.

A back to back house in the suburbs, with three rooms, rent 4s., occupied by a couple and three children. Eldest three years, second child two years, very rickety, cannot walk (fontanelle not closed) and a baby seven months at the breast.

Husband gets up early and makes own breakfast, wife never gets up until about 9 a.m.

Diet of children, breakfast, bread and butter and tea; dinner, potatoes, gravy and tea; at 5 p.m., bread and butter and tea; supper, tea and a piece of cake, several slices of bread and butter between meals. No milk taken at all. The woman rarely goes out except to see mother in next street; has no mail-cart, husband gives wife 20s. per week.

(3). 16, H—L—

Back to back three-roomed house occupied by a couple and two children, husband gives wife 20s. week, rent 3s. 6d.

Child fifteen months cannot walk, was brought up on the bottle which it left off at twelve months; now it has breakfast, bread and butter and tea; dinner, potatoes, Yorkshire pudding, etc.; tea, bread and butter and tea; supper, bread and butter and a "sup" of milk. Slices of bread and butter in between meals whenever it wants it. Appearance pale and flabby, there is another child eight weeks old having the breast. They rarely go out.

(4). 4, A—St.

Emma D., aged three years, small, enlarged joints, knock-kneed. An illegitimate child whose mother goes out cleaning, has never had breast or bottle, was reared from the beginning on "pobs" (bread boiled in water) and a little milk added, has had no milk since twelve months old, now lives on bread and butter and tea, with "whatever is going" for dinner. Is eating all day pieces of bread and butter.

(5). 7, S—x St.

Occupied by a couple and four children, contains a small shop, living room behind and two bedrooms; youngest child sixteen months, not weaned, puny and white; Freddy, three years, very rickety, small and deformed; George five, and Nellie eight, both small for age. One pint of milk taken daily for whole family. Mother very ignorant and indignant when told the children were not having the right kind of food. Man gives wife 23s. week, and she sells pastry and sweets.

(6). 2 Court, 3 House, H—St. (Two bedrooms).

Occupied by a man and wife and four boys, aged ten, eight, seven and three years. The youngest cannot walk, his food is the same as the others but he is eating bread and butter all day long. No milk taken. Man gives wife 23s. per week.

(7). Back of 147, C—St. (Two bedrooms).

This is a back to back house with a small scullery, containing sink and copper, built out in front of the door and keeping light and air from the living room. In addition the house is so situated with regard to other buildings that it receives less sunlight and air than it otherwise would. It is occupied by a man and wife,

seven children and grandmother. They have lived in this house eleven or twelve years. The eldest son, eighteen years, is strong and well; Annie, thirteen years, is pale and thin; Ellen, eleven years, legs very deformed; Willie, nine years, ditto; Clara, six years, bow legs and eczema; boy four years, very rickety, and a baby sixteen months not yet weaned and getting rickety. The house is generally dirty and the windows are seldom opened, several of the children have been operated on to straighten their legs. Cause of this condition, overcrowding, want of sunshine and air and improper food. No milk has been taken until recently and by the advice of the lady inspector. The old grandmother who is paralysed sits over the fire and nurses each child as it comes so that it rarely goes out or uses its limbs and no breath of fresh air is allowed in the house.

It is a most pitiable sight. Mrs. F. has at last promised to remove to another house.

(8). 2 Ct., 1 H, B—St.

A back to back house, very dark, occupied by a couple and three children. Has had six but three died of convulsions, the youngest seven weeks, at breast, the next, aged two years and eight months, has a large head and enlarged joints and all the symptoms of rickets. Mother says she suckled him until he was over two years old, indeed she was pregnant with her next child. Had to be told by the doctor to wean him.

(9). 65, S—St.

An infant seven weeks old being fed on breast, arrow-root biscuits and gravy, and sometimes given a mussel to suck..

INSTANCES OF WASTE OF LIFE.

Mrs. R.—

Age about thirty-five, had been married fifteen years. Husband a hawker, wife works at a rag pickers. Very degraded people who both drink. Two children living, eleven and twelve years.

Mrs. R. was visited owing to an inquest held on a boy burned to death. When questioned as to number of children lost, she seemed much afraid of incriminating herself, but finally admitted the following facts.

That when she lived in S—Street, she lost a child named Florrie, six months, of bronchitis. In M.—Street, she lost Harriet, four months, of convulsions. She removed to C—Street, where she lost one or two children (she could not quite remember, but knows Maggie, six months old, died there.) When asked of what disease she said "oh, the same complaint." She then removed to H—C.—(all houses in the lowest part of the city) where John five-and-a-half years was left alone in a room with an unprotected fire, and was burned to death. During the inquest it came out that she was in the habit of leaving the children alone. She has since lost another infant, seven months, of "*Marasmus enteritis*," the child was a "bonny baby born."

Mrs. S.—

Aged forty, been married twenty-two years, has had fifteen children born alive. Seven living aged, twenty-two, twenty, eighteen, thirteen, eleven, and six years, and an infant seven months. Mrs. S. has lost three sets of twins all under or about twelve months, and two other infants eleven months and three months.

Mrs. B.—

Has lost seventeen children, stillborn and living; cannot remember the names and ages of those who died in infancy except the following:—John, James, and Charles (triplets,) lived twenty-four hours only, Charles H., lived to nine months, "teeth," cause of death. Sarah Ann, nine months, died of convulsions, Joe, five months, died of convulsions. Eliza, the 18th eighteenth child lived, and is now twenty-one years old, she is the only one who survived the first year of life.

T

INSTANCES OF OVERCROWDING.

(1). 58 *M—Street*.

House contains two bedrooms, a living room, and scullery. The occupier was Mrs. T. a widow, and living with her were three daughters, Nellie, twenty-one, Emily, nineteen, and her infant, and Ethel sixteen years. In addition there were Mr. and Mrs. F. (Mrs. T's father and mother); Tom F. (a brother of Mrs. T.) his wife and their two children, seven and two years; Emily F. (a sister of Mrs. T.), and Tom R. (who were living together as man and wife), and their two children; also William F. (an unmarried brother) and Lena F. another sister of Mrs. T. Upon a visit from the inspector these people dispersed, and the F's have been again proceeded against in another part of the town for overcrowding.

(2). 28, *S—Square*.

Containing two small bedrooms, a living room and scullery. Occupied by John B. and his wife; a married son and his wife and infant; three other sons, aged twenty-one, twelve, and eight years; a daughter, nineteen years, and her infant; and Sarah and Edwin F. and their three children. These people left the house shortly after a notice was served to abate the overcrowding.

(3). 18, *N—Street*.

A small house with one sleeping room, and one living room. The occupier was John S. a widower with two girls, thirteen and eight years. In the same bedroom slept Samuel S. (a brother), his wife and four children.

(4). 10, *K—Street*.

A house with a living room, bedroom, and garret. In the bedroom slept four persons over ten years of age, and in the garret six persons over ten years.

(5). 12, *M—Lane*.

House containing one living room and two bedrooms, larger one 875 cubic feet, smaller one 513 cubic feet. In the two bedrooms were sleeping father and mother, five sons, aged twenty-three, nineteen, seventeen, eleven, and seven years and three daughters, twenty-one, fourteen, and five years.

(6). 2, *N—Lane*.

A house with one bedroom in which slept man and wife; widowed daughter and her two children, eight and ten years; other daughters, twenty-two and ten years, and sons, fifteen and thirteen years. There were fourteen fowls sleeping in two cupboards in the living room below.

Out of 100 houses specially investigated and measured, twenty contained two rooms only, forty contained three rooms and forty contained four and sometimes five rooms. In twenty houses not more than two persons occupied the bedroom or bedrooms. In eighty houses more than two persons occupied each bedroom.

Out of the latter number (eighty) fifty-one were not overcrowded taking 300 cubic feet as a standard, but in twelve cases there was not sufficient separation of the sexes. Twenty-nine were badly over-crowded in every sense of the word. In fifteen houses the over-crowding was quite unnecessary as there were other rooms not made use of.

(Mrs.) F. J. GREENWOOD,
(Sanitary Inspector),
Sheffield.

APPENDIX XXI.

Appendix to Evidence of Mr. T. C. Horsfall

We have in Manchester two classes of boys whose working-time is spent chiefly in the open air, the boys who are employed to sweep up horse-droppings in the busiest streets, and the boys, called in Manchester "nippers," who work under lorry-men. Both of these sets of boys get much exercise. Their physique, though often not very good, as a rule is superior to that of the boys who work in mills and offices, and they have much more spirit.

Mr. Charles Russell, who has a very large amount of knowledge of the poorer classes of Manchester boys, tells me that the sons of "navvies" living in miserable homes in Manchester, if they become out-of-door workers, generally grow up into strong men. If exercise in the impure open air and under the dim light of Manchester causes the boys who take it when their school-years are over to be comparatively healthy and strong, it is only to be expected that Manchester children, living under home-conditions which are unfavourable to health, and who are destined to work in mills and offices, will suffer seriously from being kept in crowded school-rooms for a large part of five days a week, during the years when they are most susceptible to the influence of unfavourable conditions, unless great attention is paid to keeping the rooms well-ventilated, well-lighted and, in winter, adequately warmed, and unless the children are enabled and encouraged to take much varied physical exercise, and unless the mental training they receive is well-chosen and given in right ways. I have not visited very many elementary schools in Manchester, but I have recently had occasion to visit nine schools in Cheshire, some denominational and some provided, which doubtless have much in common with many of the denominational and smaller provided schools in other parts of the land, and I have found in a considerable proportion of them conditions in respect of ventilation, lighting and warming so bad, that they seem to me to be sufficient by themselves to ensure the stunting of the growth, and much injury to the health, of most of the children attending the schools. In the school in which the conditions were the worst, a school the average attendance at which is about 170, not only were the rooms badly lighted, and miserably ventilated, but also so badly heated that the temperature, taken by a thermometer, whose accuracy I tested, had been at 10 a.m. on four

successive days 43°, 42°, 45°, and 45°. Most of the children and of the teachers looked sickly. I hardly need mention that until recently no physical training of any value has been given in a large proportion of our elementary schools, and that the amount now given, which often does not exceed the minimum fixed by the Code, an hour a week, is quite insufficient in the case of most children. The influence of the poor teaching given in many schools by pupil-teachers, Article 68 teachers, and many teachers, who, though they have been trained in training colleges, have never thrown off the bad effects of the habits which they formed when they were pupil-teachers, in causing physical deterioration receives far too little attention. Such teaching, on the one hand, makes it impossible for children to gain the knowledge and the habits of attention and industry which will enable them to earn good wages, the tastes and habits which will keep their minds and bodies healthy and prevent the temptations of drink, betting and licentiousness from being irresistible to them; and, on the other hand, it irritates the brains of the few children who continue to attend to it. The habit which many managers have of allowing children of three years of age, and of still lower age, to come into the infants' class makes it exceedingly difficult for teachers to deal with that class, as the teaching needed to enable children of nearly five to learn the subjects, of which they require some knowledge when they pass into the standards, is quite unfit for mere babies, and simply trains them to hate lessons and to form, often for life, the habit of closing their minds to them. In a Working Men's Club in Manchester, I sought in vain to find in the minds of the members, who had been "educated" in elementary schools in Manchester, some kind of knowledge, some kind of interest, which could make the study of some subject attractive to them. It is not generally known in England that our pupil-teacher system, which has hitherto made interesting teaching impossible in a large proportion of our schools, was tried in Germany when its supposed success in England in the days of Lancaster and Bell had called attention to it there. Dr. Petersilie, in his work on "Das Oeffentliche Unterrichtswesen im Deutschen Reiche" says that the German authorities soon came to the conclusion that in this

matter "England's best was Germany's worst" and discontinued the experiment of employing ignorant children as teachers.

The experience of Germany, where in many large towns all the elementary schools are supervised by medical men, has shown that schools can cause much injury to children which cannot be directly the effect of bad air, but must be in part the effect of keeping children too long in one position and of not letting them have enough varied exercise. Bardenheuer and Castenholz found that, while in the German schools which they examined there were no cases of appreciable curvature of the spine among children in their first school-year, 6 per cent. of those in their second year, 19 per cent. of those in their third school-year, 27 per cent. of those in the fourth, and 52 per cent. of those in the fifth and sixth school-year, suffered from curvature. Scholder, Weith and Combe, who examined 1,290 boys and 1,024 girls in Lausanne found curvature of the spine in 23 per cent. of the boys, and in 26·7 per cent. of the girls. The number of cases increased rapidly as the length of time passed in school increased, till nearly the end of school life.

	Girls per cent.	Boys per cent.
Children in their 8th year of age	9·7	7·8
Children in their 9th year of age	20·1	16·7
Children in their 10th year of age	21·8	18·3
Children in their 11th year of age	30·8	24·2
Children in their 12th year of age	30·2	27·1
Children in their 13th year of age	37·7	26·3
Above the 13th year of age	26·8	33·3

Dr. Wilhelm Schulthess of Zurich, from whose book on "Schule und Rueckgratsverkrümmung" (Leopold Voss in Hamburg) I take these statistics, indicates as the means needed to counteract the tendency of school to cause curvature of the spine, a considerable shortening of the time during which children are compelled to sit, the giving an interval for play every hour, systematic gymnastic exercise for an hour each day, the proper lighting of school rooms, and the provision of suitable school benches and desks.

In the year 1877 Geheimer Regierungs-Rat Dr. Finkelnburg showed by the publications of the Prussian Statistical Bureau that of 17,246 young men, who were entitled by their higher education to serve as One-Year Volunteers, only 20 per cent. were physically qualified to serve, while of the ordinary recruits who were less highly educated, from 50 to 55 per cent. were physically fit for service.

It seems to me impossible to doubt that the confinement of children in schools in which the conditions needed for health have not been provided, has been one of the principal factors in the production of physical deterioration since 1870. Mr. Marr, the Warden of the Men's House of the University Settlement in Ancoats, tells me that at the meetings at, and in connection with, the Settlement, which bring together a large number of working people, he notices that "usually the older men and women are better built and taller than the younger ones (i.e. those from twenty to thirty)." Other observers say that they have noticed similar inferiority on the part of young men and women to men and women of the immediately preceding generation in villages as well as in large towns.

Much injury to health is certainly caused in Manchester and Salford by the bad ventilation and lighting of a very large proportion of the offices in which clerks do their work. As clerks are often compelled to work until very late at night, it is very desirable that the rooms they occupy shall be well ventilated and well lighted and warmed. It is certain that as a rule offices which are not inspected are less wholesome than the rooms in mills which are inspected periodically. In the majority of cases the neglect of employers to provide the conditions necessary for health for their clerks, is due to thoughtlessness, and a single visit to each place where persons work for hire by a competent inspector would doubtless suffice to ensure a great improvement in the conditions of work for thousands of people. One of the most unwholesome rooms that I have known in Manchester was one occupied by a clerk of one of the most enlightened and kind-hearted members of the Manchester Town Council. The late William Morris, who hated impure air and water as much as any man I have ever known, told me that the usefulness of inspection was brought home to his mind when

his attention was drawn by an inspector to the fact that his works at Merton Abbey were polluting a stream by an escape of colouring matter of which Morris was not aware.

All those members of the Sanitary Association, and of Manchester associations with cognate aims, who have given attention to the habits of the people with regard to food, agree in believing that bad health and physical weakness are largely caused by bad choice of food, due in some cases to poverty, in others to ignorance, and in very many to depraved appetite. Miss Margaret Simpson, who does excellent work in connection with the Church of England Temperance Society, tells me: "There is no doubt that numbers of working girls in Manchester and Salford have totally insufficient food. Roughly, I believe the following reasons account to a large extent for the underfeeding:—

1. From childhood the girls are used to all sorts of unsuitable food, pastry, cakes, etc., instead of nourishing food, and to taking it in snatches, probably standing at table and eating hurriedly. So they do not acquire a taste for sensible food, and get into the habit of eating irregularly and uncomfortably.

2. When the girls go to work they nearly always hand over their wages to their mothers, who give them a trifle for pocket money, and if they cannot return for dinner, a copper or two only for dinner. Some of the better mothers make up little dinners for the girls to take out.

3. The girls have no taste for sensible food, and the heated rooms in which they work tend to make their appetites jaded and unhealthy, so instead of making the best of the few pence they have, they buy cakes and pastry, or chipped potatoes, or fried fish and pickles, anything they consider "tasty."

4. Low wages. In many cases the girls really do not earn a living wage, so cannot get proper food. We had a girl at the "Cosy Corner" who had twopence once a week to spend on her dinner. I do not know what she did on other days.

It is most difficult to get the girls to eat sensible food and in really sufficient quantities, even when provided. One of the girls, who belongs to St. Philip's Club, said that she had not tasted bread for more than a week. She takes biscuits to work for breakfast in preference to bread and butter, and so on. The same girl comes for dinner once a week to the club, and at first it was difficult to get her to take some of the most ordinary food. She would not touch potatoes, and declined minced beef, because she did not like it. Yet this girl comes, we know, because she has poor wages and hard times at home, and she is a most respectable, well-meaning girl. This sort of thing is typical. The girls do not want to have good food in many cases. They do not seem to know what a healthy appetite is. If we go for a day's picnic into the country with them, we find that they do not eat anything like what we ourselves require. The only time that I have seen them really enjoying good platefuls of meat and vegetables is when we go away with them in the summer for a week at the seaside. Then they have real appetites and appreciate proper food."

Miss Simpson, Miss Hobbs, Mr. Russell, Mr. Marr, all believe that the general use of stewed tea does very much to ruin health in our towns. Unfortunately the habit of using tea which has been long boiled or stewed is very general in country places as well as in towns. When I was a boy the finest set of people I used to see were the inhabitants of Craven, in Yorkshire. Mr. Walter Morrison, who lives in Craven, tells me "Charles Kingsley drove with me to Settle on market day. On coming back he described the men as the biggest and the handsomest in the world, and I agree with him. A doctor spoke to me about the farmers somewhat in this fashion: 'You know what big hearty chaps our farmers seem to be. Now I am old enough to have doctored their fathers, who lived largely on porridge with plenty of milk to it. They used to eat eggs and bacon and some meat. They got drunk once a week on gin and water, and their horses took them home. They lived as hale and hearty men till eighty. Their sons, some of them, think that porridge is not genteel; they eat white bread, not baked at home. They think it is not genteel to get drunk, so they make tea and leave it on the hob to stew. Only we doctors know how indigestion tortures them. They will not live to be eighty.' So far, my friend, I think myself that tea is doing as much harm as alcohol."

In my summary of evidence I mentioned as causes of bad health, children's lack of sufficient sleep, and filthiness of person and clothes among persons of all ages, due partly to the foulness of the air in manufacturing towns, partly to many other causes. Fifty years ago all but the principal streets in our towns were very dimly lighted, and so were the great majority of workpeople's dwellings and most shops, and comparatively few places of instruction and recreation, accessible to working people, were open late at night. Children had therefore much fewer reasons for wishing to leave their homes at night than they have now, and as a rule went early to bed. Now both homes and many streets even in poor parts of the towns are well lighted, and innumerable evening classes, boys' and girls' clubs, music halls and other places of wholesome and unwholesome recreation and instruction, and the interest of well-lighted streets have trained the majority of children to spend much of their evenings away from home, and to stay out of doors till very late. Nor can it be doubted that children have been made much more independent of their parents by modern habits. A large number of children are sent on week-days to the elementary school when they are mere babies, and to Sunday schools on Sundays, and if they go to church or chapel it is under the charge of Sunday school teachers and not of their parents. As many of the children who are thus separated from their parents by our educational system are also separated from them in the evenings by the influences of which I have already spoken, it is not to be wondered at that a parent's wish that children shall go early to bed often receives little attention.

Although many homes in our towns are kept surprisingly clean, workmen's houses in manufacturing towns as a rule are very inferior in respect of cleanliness to workmen's houses in the country, and Germans who have visited our towns, and English people who have visited workmen's houses in large German towns, say that English town homes are much less clean than the homes of German town-workpeople. Mr. James Johnston, who for many years has had a camp of Manchester girls of the working-class at the sea-side, tells me that lice are found on the heads of a large proportion of the girls. Miss Hobbs says that as a rule a mill-girl wears a chemise night and day for a week.

There is abundant evidence to prove that if better conditions of life were created and maintained in Manchester and Salford the majority of the population have all the innate good qualities needed to enable them under the new conditions to rise to a much higher level of physical, mental, and moral health, of efficiency in work, and of good sense in recreation and rest, than that at which the majority of the population are now living. The high level of public spirit and of intellectual and moral life attained by Manchester men and women in the University Settlement in Ancoats would by itself suffice to prove that this is the case, while the admirable results given by the Ardwick and other industrial schools show that the class most strongly affected by evil conditions can by an improvement in the influences affecting it be enabled and induced to gain a satisfactory degree of physical and moral health and strength.

If the town councils of our large towns obtain and use powers to ensure that all new dwellings shall be potentially wholesome in respect both of their interiors and of their environment, that streets shall be wider, that there shall be a larger supply of playgrounds and parks and of vegetation in the new parts of the towns than in the old,

and will inspect, or obtain the inspection of, all workmen's dwellings and of all places where hired persons are employed, including the sleeping places of servants in all houses, the reform of our school system, which has now been begun, will suffice to effect a very great improvement in the health and the physique of the inhabitants of our towns. The chief object to be aimed at by all these means is to give the people more air and light, and another of the chief objects is to give them more wholesome exercise of body and mind.

I have already mentioned that Manchester boys who work in the open air have better physique than mill and office boys. The work of the Manchester and Salford Country Holidays Fund, which during the last nineteen years has sent nearly 15,000 children into the country for a holiday, lasting three weeks, has proved that the health of Manchester children, as a rule, at once improves very greatly under the influence of fresh air and exercise and good food. And there can be no doubt that, by the right use of our school system, the great majority of children can be enabled to feel both during and after their school life the good influence of fresh air, exercise, and good food.

As the most remarkable proof of the power of air, good food, and cleanliness of person to restore health and muscular strength that the world has ever known has been given in the last half dozen years by the new German sanatoria for the treatment of insured persons suffering from consumption and other diseases, and as the results obtained in the sanatoria are hardly known in England, it may be well to give here a part of a statement published in the German Reichs-Arbeitsblatt for October, 1903.

The statistics of the cases of illness treated by the Infirmary-Insurance Institutions in the years 1898 to 1902 have recently been published by the Reichs-Versicherungsamt. All the figures show progressive improvement from 1898 to 1902. The number of persons treated has greatly increased. The number in 1898 was 13,758; in 1899, 20,039; in 1900, 27,427; in 1901, 32,710; and in 1902, 35,949. Of the 35,949 persons treated in 1902 16,518 suffered from tuberculosis, and 19,433 from other diseases. The average time spent in a sanatorium by a patient who suffers from tuberculosis is about three months. The treatment of such persons consists mainly in an abundant supply of fresh air, plentiful food, attention to the skin, and instruction respecting health. A larger proportion of the persons who have recovered power to work in recent years have retained it than was the case in earlier years. Whilst of all the tuberculous patients treated in 1898 45 per cent. were still able to work after the lapse of the first, and 38 per cent. after the lapse of the second, year following the close of the year of treatment, the returns of the tuberculous patients of 1899 show 48 per cent. and 40 per cent. still able to work after the lapse of one year and of two years, and those of 1900, 49 per cent. and 41 per cent. Of the whole number of tuberculous patients treated in 1901 no smaller a proportion than 55 per cent. were still able to work after the lapse of a year from the close of the year of treatment. In the case of the tuberculous patients of the years 1898 and 1899, the diminution which took place in the number of those who were still able to work, from the end of the second year following the close of the year of treatment, to the end of the third year, was only 5 per cent. And after the end of the fourth year the diminution in the number of those still able to work is only small—about 2 per cent.

APPENDIX XXII.

MEMORANDUM, BY MR. E. T. CAMPAGNAC AND MR. C. E. B. RUSSELL, ON THE PHYSICAL CONDITION OF WORKING CLASS CHILDREN IN ANCOATS, MANCHESTER.

There is little doubt that the prime factor as regards physique of boys after leaving the Elementary Schools is the nature of their employment. In the great number of cases, the conditions of their home life remain the same as when they were at school, and the want of proper feeding from which many children suffer in the poor districts of the city continues, but there are in addition other factors which make considerably for physical deterioration.

BOYS.

1. Owing to the large amount of liberty given to youths when they commence to become wage earners, and the lack of sufficient parental control, boys from fourteen to seventeen or eighteen years of age frequently acquire habits of roaming the streets until a late hour at night, and fail to get that amount of rest before the next day's work which is necessary to maintain them in good health.

2. Unfortunately, the conditions of work in many of the factories and warehouses leave very much to be desired. There is not even yet sufficient inspection of these places, and in some of the subsidiary industries connected with the cotton trade, such as "hooking," "making up," &c., during the process of which dust from the chemical materials used in the production of the goods fly about, much harm is done by the particles of dust entering the mouths of the young persons engaged in the work, causing many to become anæmic and often to contract phthisis.

3. Another fruitful and one of the most unsuspected causes of deterioration lies in the long ingrained habit of tea drinking at breakfast and other times in the factories and foundries of the city. Tea drinking, if it really were so, might not be harmful, but, unfortunately, the mixture drunk can hardly be called tea at all. More frequently than not, boiling water is poured on to too large an amount of poor tea leaves and is left to stand until the tea has become almost a stew, and this dark and nasty mixture is drunk, sometimes three and four times a day, by hundreds of young lads, setting up frequently various forms of varicocele, and is responsible for several kindred evils (excessive costiveness, &c.) We were informed by the late Chief Recruiting Officer in Manchester some time ago that a very large proportion of young men rejected for the Army had been refused on account of ailments brought about by this practice.

4. The exceedingly low cost at which cigarettes may now be obtained is no doubt the cause of the grave increase in juvenile smoking, and this is having a serious effect upon the physique of many youths. Outwardly there is perhaps little sign of this, but considerable experience has caused us to notice that youths who smoke cigarettes largely are generally unable to take a prominent part in athletic exercises. Further information gleaned from the recruiting authorities goes to show that large numbers of young men are rejected because they have contracted a form of valvular heart disease through excessive cigarette smoking and are consequently unfit to undergo prolonged physical exertion.

5. We would point out that youths who follow outdoor occupations, although they may be living in the most overcrowded and unpleasant parts of the city, and are frequently on very short commons, more often than not develop fine physiques; it is the boy who enters the factory, workshop or office, who is ill-fed and unaccustomed to physical exercise, and given to smoking, who steadily goes down the hill.

6. As previously stated, many youths deteriorate considerably in muscular development after leaving school owing to following sedentary occupations. There being but little proper provision for gymnastic or outdoor

exercises made in the larger cities, the failure to teach gymnastics at school leads to an utter want on the part of large numbers to develop their bodies at all after leaving school. In later years many youths cannot get up enough energy to play football, even if a ground is available, and are content to moon about the streets at nights, smoking more or less bad cigarettes, as their only form of exercise, with the result that in later years, when they marry and settle down, their children are weak and puny.

We would point out that it is erroneous to suppose that alcoholic drinking on the part of youths is a fruitful cause of physical deterioration. As a matter of fact only a very small minority of boys up to eighteen years of age drink alcoholic liquors. It is not until later years, about manhood as a rule, that a young fellow falls a victim to the curse of drink.

7. Speaking generally, physique after school-days depends more on occupation than anything else, but there can be no reasonable doubt that, with better feeding, more exercise and gymnastic training when young, the avoidance of excessive cigarette smoking, and the substitution of some other drink for workshop consumption than tea, a very great improvement would be seen in no very long time in the general standard of physique of working class youths.

8. We are convinced that nothing would be more useful than regular medical examination in the elementary schools, particularly with reference to height, weight, and chest measurement, of the children from time to time, as inquiries could then be made with some degree of reliability as to the causes of the deterioration which might be noticed in given districts and given schools.

9. As to whether physique is regained at a later age depends upon many circumstances which we can hardly go into here. Provided a man remains steady and sober, more frequently than not we are of opinion that there is an improvement in physique, particularly if he marries wisely, but so frequently do young men (twenty-one and upwards) acquire drunken habits, with results destructive of all physique, that we do not care to state any positive opinion except as regards the man of sober and steady habits referred to above.

GIRLS.

In the case of girls, it would appear that at the outset work in factories and mills is found to be a great strain when, as is too often the case, girls entering upon such work are insufficiently or unwisely fed. They suffer an arrest of development and perhaps are permanently enfeebled. On the other hand, it seems to be perfectly clear that many of those who painfully feel the strain grow accustomed to it and recover their vigour. On the whole, the main cause of their poor physical condition seems to be ignorance. Ignorance as to food and its preparation, as to proper care of the body, the need of cleanliness and the need of good ventilation, and, like the boys, they suffer also from want of rest and sleep, and still more than the boys from want of wholesome exercise in the fresh air.

Perhaps it may be added that they suffer also from lack of interest; they have fewer sources of amusement than their brothers. It should be remembered further that the working girl's work is not always finished when she leaves the factory. She has duties at home to perform while she is living with her parents, and at an early age she undertakes at marriage still heavier duties in her own home and continues, at great cost of energy and freshness, the double task of housekeeper and wage earner even when she is the mother of several children.

Here the circle begins again—an enfeebled and hard working mother is unable to give careful attention to children who are especially in need of it.

APPENDIX XXIII.

LETTER FROM MR. BENNETT, CAPTAIN OF THE 1ST CADET BATTALION "THE QUEEN'S," ROYAL WEST SURREY REGIMENT, AND TABLES OF MEASUREMENTS OF BOYS IN THE BATTALION.

Headquarters,
Queen's House, 31, Union Street,
Southwark, S.E.,
7th May, 1904.

DEAR SIR,—

Physical Deterioration Committee.

In reply to your letters of 22nd October, 1903, and 20th April 1904, I now forward you a statement of the result of my investigations, and I must confess that, considering the labour it has involved, the result is very poor and disappointing, and I fear will be of little use to your Committee.

This Cadet Battalion was started in Southwark in 1889 and now has companies in eight different districts in London; Southwark, St. Pancras, Stepney, Westminster, Chelsea, Pimlico, Bethnal Green, and Hackney Wick, but no regular records of the nature required have been kept except in Pimlico (height and chest and occupation), and Southwark (height and occupation). The standard of height for enrolment has always been not less than four feet eleven inches in all the companies, but there is no standard of chest measurement. The age limit for service in a Cadet Battalion up to 1901 was fourteen to seventeen, in that year it was raised by War Office authority to eighteen. About 10 per cent. of applicants are rejected as being below standard of height.

The class of boy, and with it the physique, varies much according to the district, the East End boy being badly developed compared to the West End. Stepney supplies the poorest class, and Pimlico the highest, Southwark being a medium between the two. All must be genuine working boys, and pay an entrance fee (by instalments) of from 2s. 6d. to 5s. according to district.

Boys' clubs (with gymnasium in most cases) are attached to each company. The effect of a month or two of drill and gymnastics is most marked in the manner in which boys carry themselves and walk, and is not lost after they leave.

About 10 per cent. of the Cadets pass into Regular Regiments and about 65 per cent. into Volunteer Corps. A larger number would join the Regulars but are rejected on account of height and chest, or bad teeth, which latter is a common disability, caused, I think, by careless feeding when young. Varicose veins are also a frequent cause of rejection, this appears to occur in cases where boys are messengers or errand boys constantly on their feet and running about.

"Occupations" have been difficult to classify, but I have endeavoured to distinguish as follows:—

Clerks.—Sedentary occupation, indoors.

Messengers.—Running about outdoors, and van boys.

Warehouse and office.—Includes packers and boys working partly in and partly out of doors, where skill is not required.

Skilled trades.—Includes "printers' devils" and machine minders and boys learning a trade.

My experience in Southwark has been that a very large number of boys commence their working career in some branch of the printing trade, but they do not appear to stay long at it if they can get other work, and it does not seem healthy or suitable for boys, particularly in the case of those who carry the damp paper about to the machines.

Between 250 and 300 of the Cadets are annually taken to a military camp with some Volunteer Brigade for a week in August, and the amount of work they do and their capacity for marching are surprising, and the improvement in their condition at the end of the week (after good and regular feeding) is naturally very marked.

The Southwark boys wages vary between 7s. and 15s. a week, and when trade is slack many boys are out of work for weeks at a time.

I have little knowledge of their normal home surroundings, but when I have visited their homes (in sickness) I have always found them clean and comfortable and better than I expected.

I have been an officer of the Southwark Company for nearly fifteen years, during which period over 2,000 boys have passed through our hands in that district.

I am, Yours faithfully,
LANCELOT W. BENNETT (*Captain*),
1st Cadet Battalion "The Queen's."

The Secretary,
Physical Deterioration Committee:

I.
SOUTHWARK DISTRICT.

Year.	Age.	†Number of Boys.	Average Height.
1894	14	4	ft. in. 5 0
1900	"	11	5 1½
1901	"	20	5 0¾
1902	"	11	5 1
1903	"	10	5 0¼
1894	15	19	5 0½
1900	"	49	5 2
1901	"	54	5 2½
1902	"	27	5 2½
1903	"	27	5 1½
1894	16	7	5 2
1900	"	23	5 2¼
1901	"	29	5 2½
1902	"	33	5 3½
1903	"	41	5 3

Remarks.

In Southwark records of height only were taken in these years, 1894, 1900–3; and in 1894 the height appears to have been only roughly taken.

Very few boys were enrolled here over the age of 16.

ST. PANCRAS DISTRICT.

Remarks.

Clerks—Sedentary occupation, indoors.

Messengers—Running about outdoors, and van boys.

Warehouse and Office includes packers and boys working partly in and partly out of doors, where skill is not required.

Skilled Trades includes “printers’ devils” and machine minders, and boys learning a trade.

III.

CHELSEA DISTRICT.

The officer commanding this Company reports as follows:—

“The average height of the recruit at the age of fifteen is five feet one-and-a-half inches.

“They appear on the whole fairly well developed when they join but muscularly weak. They grow rapidly, and in the majority of cases seem underfed, or rather fed on unwholesome diet.

“The boys coming from the Chelsea district appear to be of a lower class socially than those who join from districts further away, such as Fulham and Notting Hill Gate.

“It has struck me rather forcibly that no boys in this class of life have ever learnt the proper way to walk and thus tend to slouch and are consequently hollow-chested.”

APPENDIX XXIV.

TRANSLATION OF THE RESOLUTIONS UNANIMOUSLY ADOPTED BY THE BRUSSELS CONGRESS OF 1899.

I.

Proposed by M.M. Fournier and Le Jeune:—

“The Conference desires to see the various Governments employ all their powers to suppress absolutely prostitution among girls under age (en état de minorité civile).”

III.

Proposed by M.M. Fournier, Pavdoff, Jonathan Hutchison, Doutrépoint, Lesser, Peterson, De Sturmer, Neisser, Wolff, and Mracek:—

“The Conference considering that a profound knowledge of Venereology forms one of the best means for effectually combating the spread of venereal diseases, recommends urgently to the various Governments to provide for the education of truly competent medical practitioners by the institution in every University of complete and compulsory courses, the subject of which shall form part of the State Examinations. The Conference requests that the examiners may be specialists.”

VI.

Proposed by the British Medical Association and moved by Dr. Saundby:—

“The Conference requests the various Governments to constitute in each country a Commission charged: (a)

To determine the frequency of venereal diseases among the civil population apart from temporary variations. (b) To enquire into the Institutions actually in existence for the treatment of venereal diseases, the distribution of hospitals, the number of beds available in different places, and to propose the most efficacious measures for the treatment of these diseases. (c) To collect opinions as to the best means for preventing and limiting the spread of venereal diseases among the civil population and to formulate conclusions upon the subject.”

VII.

Proposed by Professor Lassar (Berlin):—

“The various Governments are requested to seize every favourable opportunity for drawing public attention, and especially that of young persons, to the danger resulting from prostitution to the health of the young of both sexes, and to the terrible consequences of venereal diseases.”

VIII.

Proposed by M.M. Pierson and Fiaux:—

“The Conference desires to see the venereal statistics of all countries arranged upon uniform basis.”

APPENDIX XXV.

Appendix to Evidence of Dr. M^{rs}.

1. THE RELATION OF SYPHILIS TO GENERAL PARALYSIS OF THE INSANE.

In the adult form of the disease, males are affected about four times as frequently as females. In the juvenile form of the disease, where the chances of inherited affection are the same, the sexes are equally affected. As we rise in the social scale, females affected with general paralysis are rare, whereas it is relatively common amongst males. When it does occur in the upper classes there is generally, so I am informed, a history of the husband infecting the wife. Where syphilis is unknown, so also is general paralysis. This argument, however, is not convincing, because in many countries, where syphilis is very prevalent, general paralysis and tabes dorsalis are seldom met with. Another factor or factors are necessary, namely, those conditions of stress and excitement which tend to neurasthenia or the neuropathic or psychopathic constitution.

In 70 or 80 per cent. cases of general paralysis and tabo-paralysis—that is, general paralysis commencing with or being associated with locomotor ataxy—a history or signs of syphilis was found in 200 carefully reported cases.

Since I have pointed out the importance of syphilis as an etiological factor in this disease, the statistics from some of the asylums have conclusively proved and confirmed the important relationship of these two diseases. I may cite, as instances, Bexley Asylum and Hanwell.

Dr. Bolton, my late assistant at Claybury Asylum, in eighty-three carefully reported cases of general paralysis, made out 80 per cent. certain syphilis and 97 per cent. probable. His statistics included a number of private patients at Claybury Hall. It might be argued that in 20 per cent. there is no evidence of syphilitic infection, even on these statistics; but, on the other hand, Crocker has shown that in only 80 per cent. of undoubted syphilitic skin diseases can a history of syphilis be obtained. Moreover, I have found in quite 20 per cent. of certain syphilitic brain diseases no certain history can be obtained of previous syphilitic infection. One of the strongest arguments, however, of the syphilitic origin of general paralysis is afforded by the juvenile form of the disease, of which I have collected thirty cases, most of which I examined personally during life and *post mortem*. In 60 per cent. there were signs of syphilis on the body; in 80 per cent. there was definite evidence of the parents having suffered with the disease; and in the remaining 20 per cent. either it was probable, or the children were illegitimate, or no history was obtainable. In seventeen of the cases, the majority of which I examined personally and interviewed the parents, I found that the families added together were made up as follows:—

- 16 miscarriages,
- 25 still born children,
- 11 died in infancy,
- 6 diseased or weaklings,
- 17 general paralytics,
- 32 alive and well (offspring).

Some of those, however, said to be well, showed traces of congenital syphilis, imbecility or nervous disease.

As a proof of the cause of general paralysis being syphilis, I may here cite the experiments of Kraft-Ebbing, who inoculated nine general paralytics, who exhibited no signs of syphilis on the body, with the virus of a hard chancre. Cases were watched 180 days, but showed no symptoms, proving that they were immune to infection, and that although they showed no signs on the body yet had, in all probability, previously acquired the disease.

II. THE RELATION OF SYPHILIS TO OPTIC ATROPHY AND LOCOMOTOR ATAXY (TABES).

In seventy cases of tabes, and seventy cases of tabo-paralysis, antecedent syphilis was found in 70 per cent. or 80 per cent.

In a large proportion there was optic atrophy and blindness. The proportion with antecedent syphilis

should be much higher than this, because I have included some cases in which the history was unobtainable. Moreover, I have not included cases of gonorrhœa or soft sores, which should be probable cases of syphilitic infection.

Among these 140 cases were seven of conjugal affection—husband and wife dying of either tabes, tabo-paralysis, or general paralysis; the wife dying in most cases later than the husband, as would be expected, for the wife was infected by the husband. In all these seven cases I saw one or other, or both, and in all but one case, which was probably syphilis, infection could be proved.

	ISSUE.			
	Children alive.	Born alive but died in infancy.	Born dead.	Mis-carried.
23 married females suffering with Tabes or Tabo-paralysis, 7 of which were sterile - - -	10	11	18	31
54 married males suffering with Tabes or Tabo-paralysis - - -	151	75	52	49

Dr. Bailey, of Hanwell, obtained the following results as regards families of female general paralytics:—

- 118 female general paralytics
 - 102 were married women.
 - 2 were juvenile cases.
 - 3 certainly had cohabited.
 - 11 were ? virgins.

The 105 women had 129 children alive; 117 children born alive, but dead=2·3 per cent. instead of 4·5 per cent. 34·5 per cent of these women were sterile.

Statistics of Spencer Wells, Simpson, Sims, and Guttstadt show that normally 10·15 per cent. of women who are married are sterile. Therefore, the sterility of female tabetics and paralytics is two to three times as frequent. This may be explained by the frequency with which one finds *post mortem* in general paralytic women non-tubercular salpingitis; six to seven times as frequently as in other females dying in the asylums; this points again to venereal infection either before or after marriage. Both in tabes, tabo-paralysis, and general paralysis, signs of syphilis are found, *post mortem*, in rather more than 40 per cent. of the cases. In 213 male *post mortems* at Claybury there were eighty-six general paralytics, and 45·4 per cent. of these had some signs of syphilis on the body; of 127 remaining general paralytics 9 per cent. had some signs. In 249 female *post mortems* there were thirty-six general paralytics, of which 19·5 per cent. had signs on the body; 213 general paralytics remaining, only 2 per cent. had signs. In eighteen female general paralytics fourteen had non-tubercular salpingitis.

III.—NERVOUS DISEASES IN HOSPITAL PRACTICE.

In the first volume of the Archives of Neurology I collected from my practice at Charing Cross Hospital and the asylums sixty cases (v. Case 58, p. 161). In my hospital practice I invariably try anti-syphilitic remedies for nervous affections in men between the ages of twenty-five and fifty, even when there is no history of syphilis, sometimes with the very best results (v. Case 16, p. 60). A considerable number of these cases have been in the army.

IV.—ARTERIAL DEGENERATION.

Only in young people, the subjects of congenital syphilis, have I seen *post mortem* nodular fibrosis and atheromatous patches in the aorta. This I have observed in five or six of the cases of juvenile general paralysis the subjects of congenital syphilis.

We may put this fact by the side of other facts, viz. : that these children were of stunted growth, and showed in the generative organs signs of infantilism, even though they had arrived at an age considerably past puberty.

With regard to the questions of degenerative changes of the aorta as a result of syphilis acquired, the statistics of *post mortems* made by my assistant, Dr. Watson, at Claybury Asylum, confirms my previously recorded experiences. As degenerative changes in the large vessels are properly regarded as evidence of senile decay and physical deterioration, I shall not take into consideration those cases of death which have occurred after forty-five.

Out of a total of 176 patients who died during the last year, fifty-five—forty males, fifteen females—were general paralytics.

Of the forty males, twenty-two had signs of syphilis; eleven had probable signs.

Of the fifteen females, ten had non-tuberculous tubal disease.

Of the cases under forty-five, there were forty-one general paralytics, twenty-seven males and fourteen females.

There were thirty non-general paralytics, seventeen males, thirteen females.

Of the fourteen female general paralytics under forty-five, nine showed marked degenerative changes in the aorta—all showed some changes, and with the exception of one case, every one exhibited fibrous patches—two had certain signs of syphilis on the body, two had doubtful signs, and six had signs of venereal infection by old non-tubercular tubal disease.

Whereas of the seventeen female non-general paralytics three showed no arterial degeneration; eleven showed very slight degeneration; only two showed fairly marked degeneration.

Two only of the seventeen had tubal disease, and one of these exhibited marked atheroma and fibrosis of the aorta and was probably syphilitic.

Of the twenty-seven male general paralytics under forty-five, fourteen showed positive signs of syphilis, three doubtful, and ten no signs. Two suffered with aneurism, which was the immediate cause of death, in both of which there was a positive history of syphilis; with one exception all showed pearly nodular fibrosis, and in quite half the cases the degenerative changes of fibrosis and atheroma were either marked, or very marked. In no case was a degenerative case absent.

Of the thirteen non-paralytic males, three showed nodular fibrosis, but one of these certainly had syphilis, and two others doubtful signs on the body.

In three cases there were no degenerative changes at all, and the remainder only showed slight atheroma, but no fibrosis.

APPENDIX XXVI.

Appendix to Evidence of Dr. Wiglesworth.

TABLE I.

Showing the total number of pauper lunatics in the County of Lancaster and the proportion to population.

TABLE V.

SHOWING THE INCIDENCE OF INSANITY IN THE DIFFERENT UNIONS OF THE COUNTY OF LANCASTER, ARRANGED ACCORDING TO DENSITY OF POPULATION.

Unions in which the Population Aggregated in any one Town does not exceed 50,000.

Name of Union.	
Ashton-under-Lyne - - -	Mainly urban, but with considerable rural district. Chief industries: cotton factories, iron works, hat mills, and coal mines, especially the first named, in which women are largely employed; factories furnish the chief employment even in the rural district.
Barton-on-Irwell - - - -	Largely urban and residential with a distinct rural element.
Chorley - - - - -	Largely rural but with considerable industrial element in the shape of cotton manufacture, etc.
Clitheroe - - - - -	Almost entirely rural and agricultural, but cotton mills in the borough of Clitheroe, and a few villages.
The Fylde - - - - -	Most of the population is at seaside health resorts, where no industries are carried on, the remainder is entirely rural and exclusively agricultural, with the exception of a few cotton mills.
Garstang - - - - -	This is purely rural and the population almost entirely employed in agriculture.
Haslingden - - - - -	Mainly urban but with a large rural district. Leading industries: cotton factories, felt and slipper manufacturing and engineering, rural population largely employed in cotton mills. Women largely employed.
Lancaster - - - - -	Mainly urban but with considerable rural element; the rural parishes are almost entirely agricultural. Chief industries: table baize and linoleum, cotton manufacture, furniture making, wagon building, and ironworks. Women and children employed in factories.
Leigh - - - - -	Mainly urban but with a moderately rural element. Leading industries: coal mining and cotton factories; women largely employed in the latter.
Lunesdale - - - - -	Solely rural and mainly agricultural. Table baize and cotton factories employ about 7 per cent. of the population.
Ormskirk - - - - -	Rather more than one-half of the population is comprised in the seaside health resorts of Southport and Birkdale; rural population mainly agricultural; there is one small mining town; population, 5,700.
Stockport - - - - -	Exclusively urban, mainly industrial, but partly residential. Chief industries: cotton spinning and weaving, engineering trades, and hat manufacturing. Women largely employed in cotton mills and hat manufactures. The major portion of this Union is in Cheshire, and were it not for the artificial division of the Union, partly in Lancashire and partly in Cheshire, the aggregate population would transfer it into the succeeding column of population over 50,000.
Ulverston - - - - -	Mainly rural and agricultural. Leading occupations: iron mining and iron working, grouped chiefly at Ulverston and Dalton-in-Furness.

Unions in which the Population Aggregated in any one Town is between 50,000 and 100,000.

Name of Union.	
Barrow-in-Furness - - - -	Mainly urban but with small rural element in which the population is almost entirely employed in agriculture and fishing. Leading industries: shipbuilding and iron and steel works; there are a few factories.
Burnley - - - - -	Mainly urban and industrial but with considerable infusion of rural population, which however is engaged more in industrial occupation than in agriculture. Leading industries: cotton weaving, loom making, general engineering works, and coal mines, especially cotton weaving and textile fabrics. Women and children largely employed.
Bury - - - - -	Mainly urban but with a large rural district. Chief industries: cotton spinning and weaving, iron works, textile machine makers, woollen, paper, bleach works, and calico printing. In nearly all the rural portions there are large works, either bleaching, woollen, or cotton. Women largely engaged in woollen and cotton factories.
Prescot - - - - -	Mainly urban and industrial but with considerable rural element. Rural population chiefly agricultural and residential, with a few coal mines and copper manufactories. Leading industries: coal mining, glass and bottle manufacturing, chemical and soap manufacture, copper manufacture, iron foundries, brickmaking, watchmaking, and electric cable manufacture. No mills, and women not largely employed, such as are chiefly in glass works and watchmaking.
Rochdale - - - - -	Almost entirely urban and industrial. Leading industries: cotton, woollen, engineering, and machine making. Women largely employed. A great centre of the cotton manufacture. The Union has been somewhat reduced in size during the last decade, which accounts for a decrease in population.
Warrington - - - - -	Mainly urban, contains also a large rural district, which is mainly but not wholly agricultural. Leading industries: iron works, wire works, soap works, wagon works, engine works, collieries, cotton factory, fustian cutting, paper works, breweries, and tanneries. Women and children largely employed in cotton factories and fustian cutting.
Wigan - - - - -	Largely urban and industrial but with considerable rural element. Chief industries: coal mining and cotton manufacture.

Unions in which the Population Aggregated in any one Town exceeds 100,000.

Name of Union.	
Blackburn - - - - -	Mainly urban but with a fair rural infusion. A large cotton-spinning district, which is the leading industry. Women very largely employed.
Bolton - - - - -	Almost entirely urban and engaged in industrial occupations, chief of which are cotton factories, iron works, bleaching, paper making, coal mining, and brick and tile making. Women and children largely employed in cotton factories and bleach works.
Chorlton - - - - -	Almost exclusively urban. Industries: engineering, cotton factories, printing, paper making, brick works, and rope works. A large portion of the city of Manchester is comprised in this Union.
Liverpool - - - - -	Exclusively urban, comprising a parallelogram of about three square miles in the heart of the city of Liverpool. The population has undergone a considerable and steady decline owing to demolition of residential property and the substitution of works and public buildings of various kinds, also the opening up of new and wider thoroughfares and the clearing away on sanitary grounds of many of the more densely populated districts. The extension of the dock system towards the north, outside the parish, has also exercised considerable influence. Hence there has been a shifting of large numbers of the labouring classes outwards into the surrounding districts. The most numerous body of labourers is employed at the docks, where the work is to a large extent casual and intermittent. A good many women employed in tobacco manufacture.
Manchester - - - - -	Exclusively urban. Leading industries, cotton and iron. The population has been steadily declining, mainly due to the demolition of residential property to make room for the erection of warehouses and other places of business, extension of railway stations, and municipal improvements.
Oldham - - - - -	Almost entirely urban and industrial; one of the chief centres of cotton manufacture in which women are largely employed. Engineering also largely carried on.
Preston - - - - -	Mainly urban and industrial but with considerable rural element; an important centre of cotton manufacturing. Women largely employed.
Prestwich - - - - -	Almost entirely urban; the Union is practically a residential one, consisting largely of dwelling-houses and shops, the houses occupied by persons who work in the township of Manchester. Industries, a few factories and bleach works. Much of the property is small, but there are also areas of good class residential houses. A large portion of the city of Manchester is comprised in this Union.
Salford - - - - -	Almost exclusively urban and industrial. Chief industries: engineering works, cotton factories, printing, dyeing, and bleaching. Considerable number of women employed in cotton factories.
West Derby - - - - -	Mainly urban with considerable rural suburban element. Comprises a large portion of the city of Liverpool and the county borough of Bootle, both densely populated. Women employed in tobacco works, jam works, rope works, and bobbin works. A large portion of the city of Liverpool is comprised in this Union.
Toxteth Park - - - - -	Almost exclusively urban; the docks employ the bulk of labour. The population is mostly densely aggregated in small houses, but there is also comprised in this Union a high-class residential district. A large portion of the city of Liverpool is comprised in this township.

APPENDIX XXVII.

SUMMARY OF REPORTS FROM SUPERINTENDENTS OF LUNATIC ASYLUMS.

The Lunacy Commissioners sent a circular letter in December, 1903, to the medical superintendents of all the county and borough asylums in England and Wales, asking for any physical statistics, information, or suggestions as to the lines on which steps to collect such statistics and information should be conducted. Nearly all sent replies, most of them of an inconclusive character. Those which appeared to be useful were forwarded by the Home Office for the use of the Physical Deterioration Committee, and a summary of them here follows.

I. COUNTY ASYLUMS.

Brecon and Radnor Asylum, Talgarth.

Dr. Ernest Jones suggested inquiry into the condition of families where the mothers have worked in factories from early youth; such women rarely bear healthy children; domestic work and cookery almost unknown to them; in rural districts all the best men and women go to the towns, and leave the mentally dull to marry and intermarry and "breed dullards and imbeciles worse than themselves."

Cumberland and Westmorland Asylum, Carlisle.

Dr. W. F. Farquharson had no definite statistics, but said it was obvious that of late years the cases admitted had been of a much more unfavourable nature than formerly; the number of pauper patients had been gradually rising for many years; gave table showing average number of pauper patients in each county; the number of lunatics in the workhouses also shows an increase; the larger industrial centres show the greater increase; the increase cannot be accounted for merely by the fact that the population is growing.

Percentage of cases caused by drink has diminished from 20·3 in 1900 to 12·3 in 1903.

Derby County Asylum, Mickleover, Derby.

Dr. Richard Legge had no statistics. Degeneration of dwellers in large towns only temporary, and would disappear in a generation if surroundings were equalised. Standard of health of patients not so good as twenty years ago, but this probably due to greater number of colliery and factory hands. Acute mania now less common; obscurer forms of nervous disease now more common. Deterioration of the race would require centuries to become noticeable, and no materials for trustworthy conclusions exist; still symptoms may appear; the changed views of sexual morality now common, the want of odium attaching to the production of abortion, and the tolerance of the idea of using checks to conception, may be such symptoms.

Dorset County Asylum, near Dorchester.

Dr. P. W. Macdonald said there had been an increase of late years of patients under twenty-three. Degeneration largely due to the emigration from the county of the most fit—as many as 10,000 during the last decade—and the "marrying and breeding like rabbits" of those left behind.

Conducted an inquiry in regard to the large number of young soldiers among the admissions since the outbreak of the Transvaal War. Found this not due to strain on active service, but to the "parental stock or raw material being sapped with hereditary predisposition to one or other of the various phases of nervous and mental disease."

There should be a careful review of the increase of premature dementia among admissions to the asylum during the last ten years.

Durham County Asylum.

Dr. W. St. J. Skeen sent average heights and weights of 100 men admitted in 1883 and 1903 respectively, as follows:—

Year 1883, average height per man, 5 ft. 5½ in.
Year 1903, average height per man, 5 ft. 5½ in.
Year 1883, average weight per man, 9 st. 1½ lbs.
Year 1903, average weight per man, 9 st. 2½ lbs.

The decrease of half inch in height in twenty years appears considerable, but then the weight has gone up. It would tend to show that height and weight are not necessarily correlative.

He also sent similar measurements for women, but for 1903 only.

Glamorgan County Asylum, Bridgend.

Dr. H. T. Pringle sent paper by his colleague, Dr. R. S. Stewart, on the relation between wages, intemperance, and crime in South Wales. This paper, accompanied by an illustrative diagram, shows that lunacy increases with the rise of wages and the greater spending power of the operative class; a falling wage-rate is associated with a decrease of drunkenness, crime, and lunacy.

In Glamorganshire there is no real upward progress, but the reverse. The raising of the standard of material comfort, accompanied as it is by great "unwisdom," is productive of the most detrimental consequences. "The people perish for lack of knowledge."

Joint Counties Asylum, Carmarthen.

Dr. Edwin Goodall suggested anthropometric comparison of large numbers of the population with an average standard, obtained by dividing the country into districts; the standard would differ for each district; has been working at a scheme of anthropometric examination, and has begun taking measurements; has by those means proved a man who had undergone imprisonment to have been a physical defective.

Lancaster County Asylum, Whittingham, Preston.

Dr. James F. Gemmel did not attach any great value to any measurements of the cranium which might be undertaken by an Anthropometric Survey. He called attention to the lack of statistics, but stated his opinion that physical deterioration was in progress.

Out of 1,100 admissions to the Asylum in the past two years, "fifty-five were admitted in all stages of pulmonary tuberculosis, 101 were ascertained to have a family history of tuberculosis, and 232 were admitted with well marked organic disease of the heart." Proceeding to a detailed discussion of the measures which have recently been adopted against tuberculosis, he pointed out that these do not at present greatly mitigate the attacks of the disease on the poorest classes.

He also stated his belief that boiled or sterilised milk is scorbutic in its tendency, and is not so good for babies as cow's milk.

Further he suggested the recording of statistics on the following points:—

(1) The number of cases of general paralysis, syphilitic insanity, and other luetic diseases of the nervous system in countries in which Contagious Diseases Acts are enforced, as compared with the number of cases in this country.

(2) The frequency of these affections of the nervous system among soldiers and sailors, a class prone to contract *lues*.

(3) The physical condition of patients on admission into asylums, together with an annual return of the principal diseases noted.

Leicestershire and Rutland Asylum.

Dr. Rothsay C. Stewart had no statistics, but would suggest as subjects for inquiry:—

(1) Mode of feeding the young.

(2) Age of marriage, *i.e.*, before individual is properly developed.

(3) Occupations of female sex.

North Wales Counties Lunatic Asylum, Denbigh.

Dr. L. F. Cox said that an examination of the statistics of this Institution did not indicate any remarkable or exceptional deterioration; in 1903 there were several deaths over eighty, none in 1875; cases of general paralysis about the same in number; causes of insanity much the same.

Three Counties Asylum, near Hitchin.

Dr. J. E. de Lisle had no statistics; thought there was a tendency to degeneration from the inter-marriage of near relatives of weak mind, of epileptics, of consumptives, and of chronic alcoholics; suggested "legislation and segregation."

Wilts County Asylum, Devizes.

Dr. J. Ireland Bowes said that "physical degeneracy has been a growing cause of insanity" in cases admitted. By this he appears to mean that there is an increasingly high percentage of insanity due to bodily disease; this is partly due to the fact that there has been much inter-marrying in the past in Wiltshire.

The best people leave the county, while the mentally and physically deficient remain.

Had no statistics, but suggested the submission of a series of questions as to statistics to superintendents of asylums.

II. LONDON COUNTY ASYLUMS.

Claybury Asylum.

Dr. Robert Jones sent a paper on "The Development of Insanity in regard to Civilisation," read before the British Medical Association in 1903. This paper is deeply interesting, and the author contends that physical degeneration is in progress, in spite of hygienic improvements; he mentions, among many other points, the pressing necessity of dealing with the ravages of syphilis.

Colney Hatch.

Dr. W. J. Seward's experience covers more than twenty-six years, during which some 17,000 patients have been under his treatment. He referred especially to three causes of insanity:—

1. *Alcoholic Excess*—this covers 20 per cent. of the cases; he advocates that instruction "as to the evils (mental, moral, and physical) resulting from intemperance should be made compulsory in all elementary schools."

2. *Syphilis.*

3. *Density of population* and its attendant evils; he sent figures showing a close correspondence between the proportion of pauper lunacy and the density of population in the various London districts.

Epileptic Colony, Ewell, Surrey.

Dr. C. Hubert Bond regretted the lack of statistics; advocates a uniform form of case-taking in asylums

throughout the country, and the collecting of family histories in a systematic manner.

Still more important would be "a well thought out scheme of anthropological examination of children attending Board Schools"; to this should be added an inquiry into the personal and family history of the parents of children who showed any marked departure from the normal.

III. COUNTY BOROUGH ASYLUMS.

Croydon Mental Hospital, Warlingham, Surrey.

Dr. E. S. Pasmore thought degeneracy was due to—

1. Drink—25 per cent.
2. Too early marriages.
3. Marriages of convenience.
4. Too long hours of work.
5. Marriages of people who have been insane.
6. Too frequent use of prepared foods.
7. Over-education in schools of subjects which are of no use, to the neglect of cookery, needlework, etc.
8. Scanty underclothing.
9. Defective methods of heating houses.
10. Emigration of the strong to the colonies
11. Low rate of wages in country districts.
12. Prevalence of venereal diseases—80 per cent. of locomotor ataxy and general paralysis is due to syphilis.

Suggested—

Legislation aimed at the following:—

1. Suppression of drink by closing public houses on Sunday; prohibiting confirmed drunkards (or any one suffering from a fatal malady) to marry; less hours of work, but no half-holidays.
2. Suppression of contagious diseases.
3. Institution in all schools of classes of cookery and hygiene.
4. Establishment of educational crèches, etc.

Middlesborough Asylum.

Dr. G. Stevens Tape sent a complete list of all admissions from March, 1898, to December, 1903, with ages, height, and weight.

(He gave the admissions in order of date, but did not specify the exact date, or even the year; and he did not distinguish male from female; so that it was impossible to draw any reliable conclusions for purposes of comparison.)

APPENDIX XXVIII.

I.

A BRIEF STATEMENT OF THE RESULTS OBTAINED BY A COMMITTEE OF THE BRITISH DENTAL ASSOCIATION APPOINTED TO INVESTIGATE THE CONDITION OF THE TEETH OF SCHOOL CHILDREN.

The examination of the teeth of school children in a number of schools (mainly Reformatories, Industrial-Schools, Training Ships, Orphanages, National and Board Schools, and the like) throughout the country was conducted by dental practitioners approved by the Committee of the British Dental Association, in order to obtain statistics for the following purposes:—

1. To acquire a more exact knowledge of the condition of children's teeth at various ages.
2. To show, by means of the facts thus acquired, the disabilities under which children frequently suffer in their growth and development, and the important bearing of those disabilities upon the future health of the individual.

The following table is a brief summary of the results of the examination, and contains merely those figures which are of the greatest importance:—

TABLE showing the results of an examination of the mouths of 10,517 boys and girls in English and Scotch schools, with an average age of about twelve years:—

Number of children examined	-	-	10,517
Temporary teeth requiring filling	-	9,573	18,009
Temporary teeth requiring extraction	-	8,436	
Permanent teeth requiring filling	-	13,017	19,096
Permanent teeth requiring extraction	-	6,079	

Total unsound teeth	-	-	37,105
Teeth already extracted	-	2,174	—

Sets of teeth free from decay - - - 1,508 = 14.2 per cent.

It is important to note that this statistical information was derived, not from the ordinary practice of dental surgeons or special hospitals, but from the inspection of industrial schools, training ships, and other scholastic institutions, and may thus be taken as typical of the condition of the teeth of the poorer classes both in England and Scotland, since the *healthy* teeth and mouths have been as carefully tabulated as the *unhealthy*.

An excellent comparison was afforded by two Edinburgh schools with a sufficiently large number of pupils, where the examinations were made by the same examiner; the children were all well fed and lived under perfectly sanitary conditions, and the average age in each school was exactly the same, viz., eleven and a half years. It was found that the ratio of defective permanent teeth per 1,000 children was 158.2 in the school for the children of well-to-do working people, and 273.9 in that for the children of a better class, professional men and merchants. This striking contrast was intensified by comparing the relative numbers of sets of teeth free from decay, viz., 11 per cent. in the poorer and 7.5 per cent. in the richer class school.

A fact which merits careful consideration is that out of the 10,517 children's mouths inspected, there were only about 1,508 which required neither fillings nor extractions, a little over 14 per cent., and that in all the others some condition existed which necessitated special attention, in order to procure, as nearly as is possible, a healthy mouth.

In the returns when all the teeth are free from decay and even if irregular, the denture is taken as *good*; if only one to four teeth are decayed or lost, as *fair*; if five to eight, *bad*; and if more than eight, *very bad*.

By grouping three yearly returns from seven onwards together as in Table B, in parallel columns, the early age

at which decay begins, the rapid increase from bad to worse in the decayed sets with each year of life, and the inevitable fate of such sets in the course of years, unless controlled by treatment during childhood, are proved to almost mathematical demonstration.

TABLE B. Showing the relative ratio per hundred children having sound teeth, defective temporary teeth, and defective permanent teeth, classified quaternarily, arranged in triennial age periods.

Age Period.	iv.-vi.	vii.-ix.	x.-xii.	xiii.-xv.	xvi.-xviii.	Quality.
No. Examined.	744	1,716	3,071	2,376	268	8,175
Sound (no decay) - -	23.8	14.2	16.1	14.1	6.4	Good
Defective Temporary Teeth only - - - -	67.4	43.3	18.3	5.1	0.1	Uncertain
Defective Permanent Teeth						
1-4	8.8	41.5	55.9	51.9	37.3	Fair
5-8	—	1.9	8.5	22.9	32.6	Bad
9 or more	—	—	1.2	6	23.6	Very Bad
	100	100	100	100	100	

The rise in the ratio of sound dentures until the third period is fully accounted for by the eruption of good permanent teeth in place of, for the most part, decaying temporary teeth, and perhaps by the fact that precocious development is not infrequently attended by exceptional susceptibility to decay. The rapid diminution of cases presenting only defective temporary, is only what might have been expected except in so far as they persist into the third and fourth age groups. The schools influenced in this tabulation comprised two very distinct categories, the poor not yet receiving dental treatment, and the rich with dental officers attached. The undue retention of these temporary teeth only occurred in the former class.

The rise and fall of the ratios in the *fair* class, the abrupt increase of those in the "*bad*" during the third, followed by the serious transition from *bad* to *very bad* during the fourth age period, is more than instructive, and demonstrates the urgency of treatment in the first and second age periods.

In 931 cases (Feltham, Shibden, Walsall) only about 13 per cent. were returned as *clean*, and 42 per cent. as *fairly clean*, while 42 per cent. were classified as *dirty*, and about 3 per cent. as *foul*. The presence of tartar was registered as *little* in over 43 per cent., and *much* in over 9 per cent. of the mouths examined.

(Signed) W. H. DOLAMORE.
Hon. Sec. B.D.A.

II.

REPORT DATED 8TH FEBRUARY, 1904, OF THE HYGIENE COMMITTEE OF THE BRITISH DENTAL ASSOCIATION ON THE ALLEGED INCREASE OF DENTAL CARIES.

The Committee, in submitting the present Report as to the alleged increase of dental caries, beg to point out that after an exhaustive search, no comparative statistics as to the prevalence of dental caries have been found, and they are of opinion that none exist.

Failing the exact proof which statistics alone can give, they beg to present the following evidence for whatever value it may possess.

A circular letter was addressed to certain dental practitioners who were able to speak from an experience extending over fifty years. All agreed that dental caries had increased, though some considered it had not increased to the alarming extent frequently alleged. The Committee have examined the collection of British skulls in the Museum of the Royal College of Surgeons of England. Dental caries, in skulls of ancient date, was almost

entirely absent, and, where present, it was trifling in extent. Skulls of modern date showed evidence of dental caries to a considerable extent.

The researches of Mummery, Cartwright, Coleman, and Sir B. W. Richardson, recorded in the transactions of the Odontological Society of Great Britain, show that the teeth of early British skulls correspond in character to those referred to in the above mentioned collection.

An examination was made of 181 jaws at University College, London, exhumed at Whitechapel, presumably from one of the plague pits (circa 1665.) These, despite the number of teeth missing, showed that dental caries was more prevalent than in early British skulls, although not nearly to the extent common at the present day.

With respect to dental caries at the present time the Committee beg to present the following facts:—

More than 3,000 men were invalidated home during the Boer War on account of defective teeth. This, however, did not fully represent the extent of dental disease, as the Government sent out several dentists to attend to the troops in the fields, besides employing the services of many local dentists for those at the base.

Hospital statistics show that a largely increasing number of patients require to be referred to the dental departments. There is also a largely increasing number of patients suffering from diseases of the stomach and from other indirect affections due to bad teeth, who require dental treatment.

The Royal College of Surgeons of England in their preliminary report to the Home Secretary points out that rejection of recruits due to bad teeth has increased nearly five-fold in the twelve years, 1891 to 1902.

Statistics have already been supplied to the Privy Council showing that dental caries occurs in the teeth of school children to the extent of at least 86 per cent.

The public press publishes numerous letters from laymen bearing testimony to the prevalence of dental caries.

If further evidence, or more definite statistics, of the increase of dental caries are required, the Committee beg to recommend that Government should undertake the conduct of an inquiry. The Committee, in addition, desire to strongly emphasise the importance of instructing the children of the public elementary schools, in the value and care of their teeth.

Signed on behalf of the Hygiene Committee of the British Dental Association.

WM. RUSHTON.
Hon. Secretary.

III.

REPORT OF THE WAR OFFICE AND ADMIRALTY INTER-DEPARTMENTAL CONFERENCE ON THE TEETH OF RECRUITS, DATED AUGUST 25TH, 1903.

The proposal to have a joint conference between representatives of the Admiralty and the War Office on the subject of the relatively large proportion of recruits for both Navy and Army who have to be rejected on account of the defective state of their teeth, arose out of a reply given in the House of Commons by Sir W. Anson, in answer to a question asked by Mr. Weir, that a large percentage of men were rejected as recruits for the Navy on account of bad teeth, while the Secretary of State for War had also been for some time attracted to the prominent position occupied in recent recruiting statistics for the Army by rejections for this cause.

It was pointed out that the Board of Education are considering the propriety of communicating with local authorities on the subject.

Mr. Brodrick offered to associate himself with Lord Selborne in making a joint representation to the Board of Education, with a view to steps being taken by that Department to check if possible the evil complained of, and to arrest the deterioration of physique among the working classes from which the recruits for both branches of the service are drawn. It was therefore agreed, before any representation on the subject was made to the Board of Education, that Admiralty and War Office representatives should consider the question with the object of reporting as to any steps which may be desirable to take in the matter.

Colonel G. T. Onslow, C.B., Inspector of Marine Recruiting, and Fleet Surgeon T. E. H. Williams, R.N., attached to the Admiralty Recruiting Department in London, were the Admiralty representatives, and Major-General H. C. Borrett, C.B., Inspector-general of Recruiting, and Major T. McCulloch, D.A.D.G., Army Medical Service, represented the War Office.

The meeting was held on the 20th July, and after discussing the general question it was decided to report as follows:—

Examination of the recruiting statistics for the Army for the years 1891 to 1902, shows a progressive increase in the numbers of men rejected for loss or decay of teeth from 10·88 per 1,000 in 1891 to 49·26 per 1,000 in 1902. Rejections for defective teeth had risen to twenty-six per 1,000 by 1898, and the figures remained fairly steady for the next four years; then a very large increase is shown for 1902, when about 5 per cent. of the men examined were rejected for bad teeth.

The only statistics available relating to Naval recruiting are those obtained for a period of one year, 1st January to 31st December 1902, from the Admiralty recruiting districts under recruiting staff officers, Royal Marines, dealing with about four-fifths of the total Naval recruiting.

These statistics show about 10 per cent. rejections for defective teeth by medical officers, but do not include rejections by recruiters.

The standard requirements in regard to soundness of teeth is probably higher for the Navy than for the Army.

The recruit for the Navy under 17 years of age is rejected if he has more than seven, or above 17 years ten teeth deficient or decayed, and both classes must possess some opposing molars and incisors.

There is no given number laid down as a guide to the acceptance or a rejection of a recruit for the Army, the rule being that acceptance or rejection will depend more upon the consideration of the relative position of the teeth which are no longer affected. And further, the loss of many teeth in a man of indifferent constitution would point to rejection, while a thoroughly robust recruit who has lost an equal number might be accepted.

The causation of a large prevalence of a defective state of teeth, among the classes whence recruits are mainly drawn, is a complex and difficult problem. It obviously bears a close relation to their general physical condition, a matter which is at present engaging much attention, and in connection with which a comprehensive enquiry has been proposed. But this much is certain, that deterioration of teeth is intimately connected with a variety of intricate causes affecting the general health of the nation.

There seems to be some divergence of opinion as to what the chief factors leading to early decay of teeth really are.

On the one hand, it is stated all are agreed that the great cause of decay of the teeth is improper or insufficient nutrition during infancy and childhood. That the development and growth of the teeth suffer in proportion to

the general malnutrition of the body resulting from defective feeding, which may be on account of ignorance on the part of the mothers, food adulteration, or actual inability of the parents to provide proper food. Some observers hold that formerly the children of the agricultural classes, from which recruits for both services were then largely drawn, were nursed by their mothers during infancy and were fed during childhood to a large extent on brown bread and good milk, and that throughout the period of dentition a diet was assimilated which favoured the production of good teeth and bone generally.

With the influx of the population in recent years to urban and suburban life, fewer mothers in all classes of life nurse their own children during infancy, while during childhood the children of the poor are fed to a great degree on watered milk and patent foods from which the husk has been removed.

Apart from this feeding having a poorer nutritive value, less mastication is required and possibly the development of teeth and jaws suffer from being less used. However that may be, we have no exact evidence as to the greater frequency of dental caries in the case of children who have been fed on artificial foods as infants, as compared with infants naturally fed. There can be little doubt that dietetic errors, poverty with insufficient food, inherited disease, and the unhealthy environment which poverty also usually entails, *e.g.*, defective housing, overcrowding and insanitary surroundings, must all be factors powerfully influencing the growth of the body, and actively antagonistic to healthy physical development of all its tissues and organs.

On the other hand, while we must give due weight to the point that soundness of teeth is most to be looked for as an accompaniment of health and vigour, the consensus of opinion amongst the latest authorities on the teeth is distinctly in favour of the view that decay of the teeth is the result of local influences, and that malnutrition plays but a very small part in the production of dental caries, as compared with the more common use of articles of food which readily undergo acid fermentation, and that it is neglect to keep the mouth clean that is chiefly responsible for the decay of teeth.

The Committee hold the latter view and consider the want of cleanliness is the chief cause of dental caries.

We are of opinion that no sufficiently comprehensive data are available which would enable us to compute the degree of dental deterioration existing at the present day. We believe such, however, to have increased.

We consider that the increase in the number of rejections among recruits for the Army during the last few years may be due in some measure to the greater attention now paid by recruiting medical officers to the condition of the teeth when examining candidates for the service than was formerly the case.

The importance of the care of teeth and of systematic cleansing should be impressed on all men serving.

We recommend that any representation which may be made to the Board of Education on the subject should press the following points:—

1. That the teaching of the elements of hygiene should be made compulsory in schools, and in this teaching the care of the teeth should receive special attention.
2. That daily cleansing of the teeth should be enforced by parents and teachers.
3. That systematic examination of the teeth of children by competent dentists, employed by school authorities should be practised where possible, to prevent caries extending, to stop carious teeth, and to remedy defects of the teeth.

A knowledge of the laws of health and the elements of sanitation should be spread abroad amongst the working classes by special lectures and by distribution of leaflets and pamphlets. Here, again, the care of the teeth should be an important part of the instruction. We notice with pleasure that Westminster is setting an example of this kind. Lastly, local authorities should enforce strongly the laws dealing with the adulteration of food, and especially should exercise a strict supervision over milk supplies.

The Committee have not gone into the question of the employment of dentists in the Army and Navy, nor of the provision of dentures for enlisted men, as they considered that these points were outside the scope of their reference.

APPENDIX XXIX.

CORRESPONDENCE BETWEEN THE NATIONAL ANTI-VACCINATION LEAGUE AND THE PHYSICAL DETERIORATION COMMITTEE.

The National Anti-Vaccination League,
50, Parliament Street,
London, S.W.

15th September, 1903.

Almeric Fitz Roy, Esq., C.V.O.

SIR,—In view of the appointment of a Departmental Committee to deal with the subject of Physical Degeneration, I am desired by the Council of this League to respectfully and earnestly ask that the enclosed memorial may receive consideration.

The Council venture to think that the grounds set forth in this Memorial make out a case for inquiry as to the effect vaccination has had upon the national health.

The Council therefore will be obliged by your bringing this matter forward, and I await the favour of your kind reply.—I am, sir, your obedient servant,

CHARLES GANE,
Hon. Secretary.

(ENCLOSURE.)

Physical Deterioration.

In view of the preliminary inquiry about to be conducted into allegations that have been made concerning the physical deterioration of certain classes of the population, it is important to bear in mind that a great many causes have been in operation during the last century, some calculated to raise and others to lower the physique of the people. Whether the net result of the plurality of causes at work has been to elevate or to deteriorate the national stamina is a very complex problem. It may well be that some practices intended to increase the resistant power of the body against certain perils have been productive of unforeseen results, and in the long run have contributed to the deterioration of the physique of the nation in unanticipated ways. Among such practices may be the inoculation of the vaccine disease, intended as a protection against the small-pox.

Mr. Herbert Spencer has called attention to this subject in his latest publication, "Facts and Comments." He says: "You cannot change the constitution in relation to one invading agent, and leave it unchanged with regard to all other invading agents," and he asserts that "the assumption that vaccination changes the constitution in relation to small-pox and does not otherwise change it is sheer folly." The same author, in analysing the causes tending to physical degeneracy, in his work, "Education" (page 157, footnote), suggests vaccination as a part cause in the production of constitutional debility. The view is not a new one and has been supported by many medical men and students of sociology. The late Dr. Felix von Niemeyer, Professor of Clinical Medicine in the University of Tübingen, in his clinical lectures on pulmonary consumption (published by New Sydenham Society, page 22) observed:

"The injurious influence which diseases have on the constitution, and thereby on the tendency to consumption, manifests itself most frequently and in the most lasting manner in earliest infancy. It is fortunate if children escape disease, particularly in the first years of their life, during which by far the most rapid development of the body takes place, and when by favourable or unfavourable external circumstances the foundation is laid, in a great measure, for a strong and robust, or a weak and delicate health. Even vaccination may, by the febrile disturbance preceding the eruption, as well as by that accompanying the suppuration, both of which are never absent, and according to my numerous thermometrical observations sometimes reach a very high degree, considerably weaken, more especially those children who are not very strong, and may leave behind it the germs of a disposition to consumption."

The hitherto unsuspected or unexplained potentialities of vaccination as paving the way for constitutional injury have recently, to some extent, been elucidated by the

researches of Fünck, Pfeiffer, Guarnieri, Wasielewsky, and in this country, Jackson Clarke. These researches indicate that a protozoan is found in the tissue of the vaccinated which presents a close similarity to those found in the constitutional affections of syphilis and in cancers, and the last-named suggests that the development of carcinoma and carcema may be due to the persistence of protozoan organisms in the tissues even twenty years or more after the original disease has appeared to terminate. (See "Medical Press," 11th March, 1903, "Protozoa and Disease, 1903," by Jackson Clarke.)

In France a relationship between vaccination and physical degeneration was alleged in a work by M. Carnot, "Essai de Mortalité: comparée avant et depuis l'introduction de la vaccine en France, Autun, 1849. . . . Analyse de l'influence exercée par la variole, ainsi que par la réaction vaccinale"; Autun, 1851; and "Parallèle de l'état sanitaire de Paris avant et depuis la vaccine"; Revue Medical, 1856; and in the sensational writings of M. Verdé de Lisle, "De la Dégénérescence Physique et Morale de l'Espèce Humaine déterminée par la Vaccine," Paris, 1855.

Apart from allegations of a general nature accusing vaccination of exerting a deleterious influence upon the national physique, there is abundant evidence, of unimpeachable character, of death and of the communication of specific diseases directly arising from the practice. No doubt, efforts have been made to controvert these damaging allegations, and the most notable of these is the work of Sir J. Simon, printed in 1857. He maintained that "against this vast gain (by vaccination) there is no loss to count. Of the various alleged drawbacks to such great advantages the present state of medical knowledge recognises no single trace." He especially and scornfully rejected the accusation that properly performed vaccination could communicate syphilitic disease. No medical man with a reputation to lose could maintain this view of Sir John Simon's now. He has abandoned it himself. He has been forced to admit that "it is certain that the vaccine lymph of the syphilitic infant may possibly contain the syphilitic contagion in full vigour, even at moments when the patient, who thus shows himself infective, has not on his own person any outward activity of syphilis." (Quain's Dictionary of Medicine, article "Contagium.") When a witness before the Royal Commission, Sir John was prepared to modify his views of 1857 (Q. 118-122), but his examination on this head was postponed by the Chairman, and though repeated requests were made for his re-appearance, and also for the examination of his successor, Sir George Buchanan, the just and natural curiosity of the public was never gratified.

The majority of the Commission, however, had no difficulty in recording their opinion on one part of this important question. They state, "It was at one time doubted whether syphilis could result (from vaccination), and it was even confidently asserted that it could not," but that "facts which were, not long after the issue of Mr. Simon's report, brought before the profession, and carefully investigated, made it certain that the negative conclusion which had been arrived at was a mistaken one, and from that time no doubt can have been entertained by any that it is possible to convey syphilis in the act of vaccination." In spite of the impossibility of further doubt upon this question it is a subject for the gravest censure that a pamphlet "revised by the Local Government Board and issued with their sanction," should have been widely distributed down to a very recent period in which it was emphatically maintained that "The fear that a foul disease may be implanted by vaccination is an unfounded one. . . . The alleged injury arising from vaccination is, indeed, disproved by all medical experience." In view of this reckless inaccuracy, published with the sanction of the Local Government Board, the failure of Sir George Buchanan to appear as a witness is the more inexcusable, and judgment must go by default against the value of the testimony of the medical depart-

ment of the Local Government Board. A perusal of the Majority and Minority Reports and of the evidence given before the Royal Commission shows that there is an active controversy as to the injuries that may and in some cases do result from vaccination. Thus the Dissident Commissioners (par. 185, Dissent Report) say "We are deeply impressed with the sad cases of severe illness, suffering and death which the investigations of medical men appointed by the Commission have after rigid scrutiny failed to disconnect from vaccination."

For the foregoing reasons it is of obvious importance that the influence of vaccination on public health should be considered by a body unbiassed by the supposed necessity of upholding that practice.

London, September 15th, 1903.

Privy Council Office,
Whitehall, London, S.W.

9th December, 1904.

SIR,—

Physical Deterioration Committee.

With reference to the memorial sent in September last by the National Anti-Vaccination League for the consideration of the Physical Deterioration Committee, I have the honour to inform you that the views therein expressed have received the careful consideration of the Committee.

In view, however, of the fact that an exhaustive inquiry into the whole question of the effects of vaccination was conducted as recently as 1896, by the Royal Commission appointed for the purpose, the Committee do not feel themselves called upon to discuss axioms of public health which are part and parcel of the law of the land.—I am, sir, your obedient servant,

ALMERIC W. FITZ ROY.

Charles Gane, Esq.

The National Anti-Vaccination League,

50, Parliament Street,
Westminster, S.W.,

19th December, 1903.

SIR,—

Physical Deterioration Committee.

I am directed by the Council of the National Anti-Vaccination League to convey to you their thanks for your communication of the 9th inst., which has had careful consideration.

I am further desired to express regret that your Committee could not acquiesce in the request to receive evidence as to any effect vaccination may have on the health of the community.

The Council respectfully point out that the Report of the Royal Commission of Vaccination was not unanimous, and there was very pronounced dissent from a minority of the Commissioners.

The Council also urge that the scope of the Committee's inquiry is unduly limited if it excludes the consideration of any question supposed to be protected by the law of the land.

In the matter of vaccination the suggested "axioms of public health" go, in practice, far beyond the law of the

land which enables conscientious objectors to obtain exemption on the ground of their conscientious belief that the operation will be prejudicial to health.

It has also to be remembered that the Departments violate the principle laid down in the Act of 1898 and force vaccination upon those in the service of the State, although the lymph is not guaranteed and is still the subject of experiment. Many large employers of labour follow the example of the Departments in this matter.

The Council, therefore, suggest that it cannot be maintained that compulsion as now practised is now an axiom of public health and part and parcel of the law of the land.

If, however, the Committee do not see their way to inquire into this subject, I am desired to ask whether it is their intention to publish in full this correspondence so as to indicate to readers of their Blue Book that the subject has been brought to their attention and to show on what grounds it has been excluded.—I am, sir, your obedient servant,

CHARLES GANE.

Hon. Secretary.

Almeric Fitz Roy, Esq., C.V.O.,
Privy Council Office,
Whitehall, S.W.

Privy Council Office.
Whitehall, S.W.,
20th January, 1904.

SIR,—

Physical Deterioration Committee.

Your letter of the 19th ultimo, has been submitted to the above Committee, and I am instructed to inform you that they are quite willing to accede to your request that the correspondence which has taken place between the National Anti-Vaccination League and the Committee shall be published in full.—I am, sir, your obedient servant,

ERNEST H. POOLEY.
Secretary.

The Honorary Secretary,
National Anti-Vaccination League.

The National Anti-Vaccination League,
50, Parliament Street,
Westminster,
London, S.W.,
1st February, 1904.

Almeric Fitz Roy, Esq., C.V.O.

SIR,—

Physical Deterioration Committee.

I am desired by the Council of this League to thank you for your kind favour of the 20th ult., and for your ready acquiescence in our request to instruct that the memorial and correspondence which has passed between us respecting Physical Deterioration and Vaccination shall be printed in the Blue-book of proceedings.—I am, sir, your obedient servant,

CHARLES GANE,
Hon. Secretary.
