CONSTITUTION OF COMMITTEE.

MR. ALMERIC W. FITZ ROY, c.v.o., Clerk of the Council (*Chairman*).

COLONEL G. M. FOX, H.M. Inspector of Physical Training under the Board of Education.

MR. J. G. LEGGE, H.M. Inspector of Reformatory and Industrial Schools.

MR. H. M. LINDSELL, c.b., Principal Assistant Secretary to the Board of Education.

COLONEL G. T. ONSLOW, c.b., R.M.L.I., Inspector of Marine Recruiting.

MR. JOHN STRUTHERS, c.b., Assistant Secretary to the Scotch Education Department.

DR. J. F. W. TATHAM, m.d., f.r.c.p., of the General Register Office.

MR. ERNEST H. POOLEY, Barrister-at-law, *Secretary*.

TERMS OF REFERENCE.

The original TERMS OF REFERENCE to the Committee were :—

To make a preliminary enquiry into the allegations concerning the deterioration of certain classes of the population as shown by the large percentage of rejections for physical causes of recruits for the Army and by other evidence, especially the Report of the Royal Commission on Physical Training (Scotland), and to consider in what manner the medical profession can best be consulted on the subject with a view to the appointment of a Royal Commission, and the terms of reference to such a Commission, if appointed.

These TERMS OF REFERENCE were subsequently explained and enlarged, as follows :—

(1) To determine, with the aid of such counsel as the medical profession are able to give, the steps that should be taken to furnish the Government and the Nation at large with periodical data for an accurate comparative estimate of the health and physique of the people ; (2) to indicate generally the causes of such physical deterioration as does exist in certain classes ; and (3) to point out the means by which it can be most effectually diminished.

REPORT.

TO THE LORD PRESIDENT OF THE COUNCIL.

MY LORD MARQUESS,

1. The Committee appointed by your Lordship's predecessor, the Duke of Devonshire, late Lord President of the Council, under His Grace's order of reference of the 2nd day of September, 1903, beg leave to report that they have sat on twenty-six days for the purpose of hearing evidence and that they have examined sixty-eight witnesses, from England, Scotland and Ireland, of whom fifty-four were men and fourteen women. Out of this number, twenty-three (twenty men and three women) held official positions, either under His Majesty's Government or under Local Authorities throughout the Kingdom, in connection with Local Administration, Schools and Factories; thirteen of the official witnesses were members of the medical profession, which besides was represented by twenty-one other witnesses, seven of whom were specially nominated to give evidence by the Royal Colleges of Physicians and Surgeons and by the British Dental Association; two witnesses were noted anthropologists, two were Members of Parliament, and the remainder were either independent authorities or representative of well-known organizations and charitable institutions.

2. For convenience sake this Report is divided into three parts, the first consisting of an examination into the evidence deducible from the War Office figures and a statement of the steps required to obtain reliable *data* for determining questions of national physique, the second and largest part dealing with the causes and indications of degeneracy in certain classes of the community and the means by which it may be arrested, and the third part containing a summary of the principal recommendations which the Committee desire to make.

PART I.

3. Before the Committee proceeded to take personal evidence they deemed it their duty under the terms of their reference to consider what information of a documentary character was available which could throw any light upon the questions they were directed to investigate.

4. The Memoranda issued by the War Office upon the responsibility of the Director-General of the Army Medical Service and the Inspector-General of Recruiting were necessarily the first to engage their attention. It appeared that soon after the publication of these Memoranda the Secretary of State for the Home Department had addressed a communication to the Royal Colleges of Physicians and Surgeons respectively, asking for observations on a proposed inquiry into the causes which have led to the rejection in recent years of so many recruits for the Army on the ground of physical disability, and the possible measures by which this state of things might be remedied. By the courtesy of the Secretary of State the Committee were furnished with copies of the replies of both Colleges, which, with subsequent correspondence, will be found in the Appendix.

Appendix I.

5. It is sufficient to state here that these replies appeared to point to the following conclusions: (1) that the evidence adduced in the Director-General's Memorandum was inadequate to prove that physical deterioration had affected the classes referred to; (2) that no sufficient material (statistical or other) was at present available to warrant any definite conclusions on the question of the physique of the people by comparison with *data* obtained in past times; (3) that a partial investigation, as for instance into the condition of the classes from which recruits are at present mostly drawn, might be very misleading, however carefully conducted, and might give rise to erroneous conclusions on the general question unless checked by expert knowledge.

6. The Royal College of Physicians were, however, disposed to think that an inquiry into the present physical condition of the nation would be of great value; but the Royal College of Surgeons, on the other hand, did not see any particular need for any such investigation on a large scale, deeming that the well-known facts relating to public health were sufficient to dispel anxiety.

7. Both Colleges having laid stress upon the fact that the figures included in the Memorandum of the Director-General did not appear to them to support the view that an increasing deterioration in physique is taking place in the classes of the population from which military recruits are chiefly drawn, and the Royal College of Physicians having failed to obtain information through the Home Office which might explain the apparent contradiction between the general tone of the Memorandum and the figures given, the Committee thought it expedient to ask the Secretary of State for War to obtain from the Director-General some further explanation of his views, and also to furnish any information in the possession of his Department that threw light upon the figures included under Head 1 of the first Table in the original Memorandum, comprising "labourers, servants, husbandmen, etc.," from which classes by far the largest number of recruits were drawn. To the first request the Secretary of State for War was good enough to respond at once, and in a Memorandum, which was supplemented by some valuable tables bearing on the existing state of facts, Sir William Taylor expressed the opinion that the idea of "progressive physical deterioration" had occupied a much too prominent position in the minds of those who had had to consider and report as to the advisability of inquiry. The Director-General went on to say:

Appendix I. & VI.

"I consider that it is impossible to obtain reliable statistical or other *data* regarding the conditions that have existed in the past; and, consequently, as no reliable *data* are obtainable for purposes of comparison, I do not see how the question can be dealt with from the progressive deterioration point of view. Whether or not there has been, or is, progressive physical deterioration among the classes now in question is a matter of very great importance, no doubt; but, in my opinion, it is not the chief question from a practical standpoint. To my mind the principal question for the Committee is to inquire into the causes and present extent of the physical *unfitness* that undoubtedly exists in a large degree among certain classes of the population. The question dealt with in my original Memorandum was not that there was evidence of progressive physical deterioration of the race, either in whole or in part, but that it is a most disturbing fact that from 40 to 60 per cent. of the men who present themselves for enlistment are found to be physically unfit for military service. Even if the proportion is no greater than in the past, surely it is a state of matters worthy of the closest investigation, and one which no thinking man can wish to see continue. Moreover, it would be out of keeping with the progressive spirit of the times we live in for us to be content with the consolation that we are no worse off than we were fifty or even twenty years ago. I trust that the inquiry may end in suggestions that will lead to the institution of measures which will result in bringing about a marked improvement of the physique of the classes from which our recruits are at present drawn."

8. The Committee proceeded to forward copies of this Memorandum and the accompanying Tables to the Royal Colleges of Physicians and Surgeons respectively, with the request that they would take them into consideration; and while favouring the Committee with any observations it was desired to make, would be careful to state whether the perusal of the supplementary matter so furnished suggested the modification in any degree of the opinions previously expressed on the subject.

9. In their replies, it was noted by both Colleges that some little misapprehension had been caused by the tenour of the first Memorandum as to the question which it was intended to place before them, but the College of Surgeons did not think it had appreciably affected their judgment, which remained the same after a perusal of the second Memorandum. The College of Physicians, on the other hand, while adhering to the opinion "that sufficient *data* were not available for forming a judgment on the extremely complex question of the occurrence or not of progressive degeneration in the classes from which recruits are mainly drawn," expressed themselves in favour of "an inquiry into the present extent and causes of the alleged physical disability for military service of certain classes of the population."

10. In supplement of the request for a more detailed sub-division of the classes denominated "Labourers" in the Recruiting Returns, under which head agricultural labourers and street loafers are included without discrimination, it was subsequently suggested to both the Admiralty and the War Office that the sub-heads might with advantage follow the classification shown in the Census Summary Volume for 1901, and the Committee have reason to believe that the Admiralty have already adopted the suggestion.

11. In their efforts to obtain information of a statistical or tabulated character which might form the basis of a comparative survey of the health and physique of the population the Committee were not very successful. As a matter of fact, no such information on a comprehensive or systematic scale exists.

12. Disjointed and partial inquiries have taken place from time to time in connection with which measurements of a number of persons were made, but these inquiries were not instituted in any relation to each other nor conducted on similar lines, so that the results obtained are of very little use for the purpose of comparison.

13. In 1873, at the instance of the Local Government Board, Dr. Bridges and Mr. Holmes investigated the conditions of employment in the Textile Factories in regard to its effect on the health of women, children, and young persons, in the course of which some 10,000 children were examined and measured, the principal indications of degeneracy noted, and certain general conclusions summarised. Had such an investigation been repeated decennially valuable material would have been collected for the purpose of the present inquiry; but as it was, it did little more than establish, in respect to the limited area covered, that the factory children of factory parents (urban and suburban) compared unfavourably with children in non-factory districts (urban and rural), and that the rate of mortality, particularly infant mortality, was unduly high in factory districts.

14. A few years later the British Association for the advancement of Science was responsible for a more ambitious effort in the same direction. A Committee, whose labours extended over five years, 1878-1883, was appointed for the purpose of making a systematic examination of the height, weight, and other physical characters of the inhabitants of the British Isles and collecting the results. During the period covered facts relating to the stature and height of 53,000 persons of all ages and both sexes were collected, 8,585 of whom were adult males, distributed as follows: England, 6,194; Scotland, 1,304; Wales, 741; Ireland, 346; but here again no later investigations on a considerable scale offer adequate material for comparison. In order to make such a comparison effective the samples must, in the first instance, be numerous enough; each must be taken in sufficient numbers, not less than a thousand, from districts so small that there is no sensible variation in the type of people within its boundaries; and the classes whose average dimensions are given must be carefully differentiated, so as to present, as far as possible, homogeneous material to the investigator. The British Association Report shows that there is a considerable difference in the average dimensions of the different classes of the population. The average stature, for example, of boys between the ages of eleven and twelve at public schools was 54.98 inches, while of boys of the same age at industrial schools it was only 50.02. There was thus a difference of 5 inches in the average stature of boys belonging to the two extreme classes measured. The difference in the statures of the two extreme classes of adults was not so great, being only $3\frac{1}{2}$ inches, but it was still considerable.

15. The bearing of these facts upon the taking of samples for comparison at different dates is obvious, and in only four cases since 1883, so far as the Committee are aware, have measurements been taken, by the aid of which a more or less legitimate comparison may be made with the figures then obtained, but in no case on any considerable scale.

16. Thus in the British Association's statistics it is found that the average stature of 109 adult males taken from the counties of Aberdeen, Banff, Elgin, and Nairn was 68·04 inches; in 1895–1897 measurements of 364 of the rural and urban population of East Aberdeenshire were obtained, showing an average stature of 68·02 inches. In the second case, where the conditions of accurate comparison are more nearly fulfilled, the British Association Report gives the average stature in the period 1874–75 of boys at Marlboro' College between the ages of 14 and 16 as 61·4 inches, whereas statistics for boys of the same age in the period 1899–1902 show an average stature of 61·96 inches, an increase of ·56 in 25 years. In the third case the British Association Report gives the average stature of 635 adult males from Connaught as 68·72 inches; Messrs. Cunningham, Haddon, and Browne have measured in Connaught, mostly on the West Coast, about 200 adult males with an average stature of 67·41 or 1·32 inches less than the other, but owing to the small numbers measured the possible variation of difference in samples is 1·05. To the extent, therefore, that the difference of the two averages exceeds this figure there may be evidence of deterioration, but it is not conclusive, as there is no guarantee that the racial type and class was the same at both dates. In the fourth case, a physical census in Industrial Schools in 1901 (the results of which, after being laid before the Royal Commission on Physical Training in Scotland, were corroborated by a further census in 1903) enables a comparison to be made with the height, weight and chest measurement of children forming the lowest class in physical development dealt with in the British Association's report of 1883. The result of the comparison, for what it is worth, clearly indicates improvement in the physical development of this class at the ages of 11 and 14.

Appendix IX.

17. A list of the principal groups of anthropometric statistics, other than those already mentioned, which have been collected in the British Isles since 1883, will be found in the Appendix, but they are of no use for the purposes of this inquiry.

18. In pursuance of the scheme of procedure dictated by the terms of their reference, the first evidence invited by the Committee was that of the Director-General of the Army Medical Service, Sir W. Taylor, and of the late Inspector-General of Recruiting, General Borrett, to which it will be necessary to allude at some length, together with that of General Sir Frederick Maurice, which was given on the same day in the same connexion.

Cunningham, 2188.

19. It may be as well here to state a general criticism on the value of the War Office figures, to which prominence was given by a later witness. In the opinion of Professor Cunningham, perhaps the most unreliable evidence is that which is obtained from the recruiting statistics,

"Because the class from which the recruits are derived varies from time to time with the conditions of the labour market. When trade is good and employment plentiful it is only from the lowest stratum of the people that the Army receives its supply of men: when, on the other hand, trade is bad, a better class of recruit is available. Consequently the records of the recruiting department of the Army do not deal with a homogeneous sample of the people taken from one distinct class."

Further confirmation of this view is to be found in the striking disparity from year to year of the educational qualifications of recruits as disclosed in the Returns.

Taylor, 10.

20. It is only fair to Sir W. Taylor to say that he most emphatically disclaimed any responsibility for the deductions that had been drawn from the figures published by his department. He appeared to attach very little value to the figures, and in reply to a question calling attention to a passage in the Report of the Inspector-General of Recruiting, where that officer speaks of the gradual deterioration of the physique of the classes from which recruits are principally taken, he said, "He is not justified in that. We have no *data* on which to form that opinion."

21. An apparent improvement in the last quinquennial period, as compared with that immediately preceding it, is accounted for by instructions issued to recruiters in 1897, to weed out those who present themselves, instead of sending them all on to the medical examiner, and the influence of the war on the character of the recruits is another disturbing element in any deductions that can be drawn from recent figures.

22. On the other hand, increased stringency in the requirements as to teeth has materially swelled the percentage of rejections for the last two years. In this connexion a table handed in by the Director-General may here be noted. This table, gives the ratio per 1,000 of the rejections under the four principal causes for the years 1901, 1902. These causes are, Want of Physical Development ; Defective Vision ; Disease of the Heart ; and Bad Dentition ; the ratio differing considerably according to the various classes of recruits tabulated.

Appendix VI.

23. It is, the Committee believe, recognised on all hands that dental caries does not necessarily or even commonly coincide with physical degeneracy in other respects, nor is it a defect that is peculiar to any particular class ; while defective vision, which in most cases means want of acuity, and can easily be remedied by glasses, cannot with any more justice be associated with depressed physique.

24. In this last connexion it may be as well to note here that Mr. John Tweedy, President of the Royal College of Surgeons, and a high authority on ophthalmic surgery, gave it as his opinion that where some lack of normal acuity was associated with a sound eye, it was undesirable to make it a ground of rejection, and that in all cases of comparatively slight deviation from the minimum standard of distant vision further investigation should be made, and, if expedient, the defect supplied by equipping the recruit with glasses, the objections to which course he did not think of any great weight ; for, as he reminded the Committee,

Tweedy, 3799-3808.

“While every soldier is theoretically expected to fight, in practice many thousands of soldiers take no part in action, and there are innumerable duties to be performed during peace and even on a campaign which these men might properly perform as efficiently as those who have perfect sight.”

Tweedy, 3808
(Addendum).

25. Both the Director-General and the late Inspector-General of Recruiting were fain to admit, on being pressed, that the real lesson of the recruiting figures was the failure of the Army, under present conditions, to attract a good type of recruit. Indeed, General Borrett gives up the case for wide-spread deterioration when he says, “It is a pity that the physique of the recruit-giving class is as poor as it is, so as to cause such a large percentage of rejections for the Army ;” and again when in answer to a question whether “the men who want to be soldiers” were not those people who have no opening in life, or have no occupation, and who drift to the recruiter in the vague hope that they may be passed, he replies, “There are a great many of that kind, no doubt ; I must confess a great many are that way.” In another part of his evidence he describes them as very largely “Rubbish,” and Sir W. Taylor could not deny that even if the number rejected by the recruiters was as large as some people suppose, it might merely imply that a great many

Borrett, 163.

Borrett, 179.

Borrett, 166.

“Not fit for or disinclined to permanent work present themselves to the recruiting sergeant on the chance of being passed, and that the condition of those rejected is only representative of the state of the wasters of the large towns who live by casual labour.”

Taylor, 20.

26. As another witness observed, it is the years after leaving school that determine so many lives ; by the time the boy has reached seventeen he has shown either self-improvement or self-deterioration, in which last case you may get him for a soldier. At seventeen, he goes on to say,

Eichholz, 560-2.

“You are landed with the failures, and the lack of self-improvement which they have exhibited is largely bound up with their physical condition. At seventeen they become street loafers—practically the only available source of recruiting for the army.”

27. Mr. Charles Booth gives a vivid description of these persons in the 4th Volume of the Series on London Labour :

"These men hang about for the 'odd hour' or work one day in the seven. They live on stimulants and tobacco, varied with bread and tea and salt-fish. Their passion is gambling. Sections of them are hereditary casuals ; a larger proportion drift from other trades. They have a constitutional hatred to regularity and forethought and a need for paltry excitement ; they are late risers, sharp-witted talkers, and, above all, they have that agreeable tolerance for their own and each other's vices which seems characteristic of a purely leisure class, whether it lies at the top or the bottom of Society."

28. Some figures furnished by Dr. Alexander Scott make it clear that there is a wide difference between the physical condition of the class referred to in the preceding paragraphs and that of the working classes proper. Of 83 candidates drawn from factories in the western district of Glasgow who presented themselves for the Army and 7 for the Navy (90 in all) 85 were accepted. One of the men rejected had presented himself with the same result at four different recruiting stations, a circumstance which suggests a line of possible explanation for a considerable proportion of rejections generally.

29. In short, the examination of the official representatives of the recruiting system left upon the minds of the Committee the conviction, confirmed as it was by the evidence of other witnesses, that it would be as reasonable to argue from criminal statistics to the morals of the great mass of the people, as it would be to argue to their physical conditions from the feeble specimens that come under the notice of recruiting officers.

Appendix VIII.

30. An independent examination of the Director-General's figures, undertaken by the authorities of the Metropolitan Police, brought them to the conclusion that "the calling of a soldier has ceased to attract the class of men who formerly enlisted, and as a consequence a larger proportion of the residuum of the population come under the notice of the Army Recruiting Authorities."

31. This conclusion appears borne out by the complaints of commanding officers as to the physique of many of those enlisted, and tends to explain the drain from desertion among those who find themselves disappointed in the hopes of an easy existence.

32. It must be understood that in so expressing themselves the Committee have in view the quality of the rejected candidates for enlistment. So far as they can judge, the efforts that are now being made to obtain a good character with every recruit are likely to result in raising the standard not merely of those actually accepted, but even perhaps of those who present themselves to the recruiter.

Maurice, 297, 8.

33. The evidence of Sir Frederick Maurice did not modify the impression produced by that of the two preceding witnesses, nor could the Committee accept the basis of the alarmist statement for which he is responsible, that of those who wish to be soldiers only two out of five are to be found in the ranks at the end of two years. Sir Frederick obtains this result by taking the 34·6 percentage of rejections by medical examiners, and the 2·1 percentage of those cast before the completion of two years, and adding thereto a purely conjectural percentage as to those previously rejected by the recruiters.

Taylor, 15, 16

34. It was stated by Sir W. Taylor that no record whatever of these latter was preserved, but the Committee think that if this could be done without involving too much labour, it might be useful to dispel false impressions as to the actual number. Looking, however, to the condition of the classes from which, as it has been seen, these people issue, the proportion, even if as stated by Sir F. Maurice, is not so very disquieting ; indeed, a very competent medical witness took the view that having regard to the circumstances under which the British Army is recruited, the fact that 40 per cent. of those that present themselves to the recruiting officers become

Eichholz, 563.

good soldiers is more to the credit of the physique of the people than the fact that under the German system of conscription only 16 per cent. of those liable to serve are rejected.

35. The Committee had the advantage at the same time of inspecting certain figures touching Naval and Marine recruits, which were furnished by the Admiralty through Colonel Jonslow and will be found in the Appendix.

Appendix VII.

36. A close comparison between Admiralty and War Office Statistics is hardly possible, as in the first place the Naval regulations for medical examination are more stringent, especially as regards eyesight and teeth, while on the other hand the great bulk of recruits for the Naval Service are probably drawn from a higher social level.

37. All Naval and Marine recruits must produce a good record of character from a reliable source. All must be fairly well educated, no illiterates being accepted, and arithmetic is required of Artificers and Artisan Ratings, who must also be certified skilled at their trade, while Boys, who form about 37 per cent. of the recruits, come from a decidedly superior class. Even in the case of Stokers and Marines, who are more on a par with Army Recruits, the standard of measurements ensures that they are not drawn from the "wasters."

38. Under these conditions, of 14,848 candidates who had passed the recruiters as satisfying the standards of height and chest measurement, and were subsequently medically examined in Royal Marine Recruiting Districts in 1902-3, 25·7 per cent. were rejected, as against 23·1 per cent. for the Army, and in three years, 1900-03, of 21,916 examined in London alone, 32·1 per cent. were rejected.

39. While deeming it their duty to make certain criticisms on the significance of the figures supplied by the War Office, the Committee are not insensible of much that is grave in the state of things disclosed, and that calls for fuller information and more complete inquiry, and to that end they early proceeded to consider what steps should be taken to furnish the Government and the nation at large with periodical *data* for an accurate and comprehensive comparative estimate of the health and physique of the people.

40. It appeared to them that the machinery of the ordinary type of Royal Commission was both unsuitable and inadequate; it has been seen that there are not sufficient facts obtainable from the labours of past investigators to be made the subject of comparison with any that a Royal Commission might elicit, and its *modus operandi* would be both slow and costly. What seems to be wanted is some permanent organization, not necessarily on a large or expensive scale, which, under expert direction, and in collaboration with all the Departments of State concerned, shall be charged with the duty of collecting and tabulating facts which throw light upon the situation, and thus provide means by which those interested in the subject may at any moment satisfy themselves of the progress of the nation one way or another.

41. Every witness who was examined on the subject testified to the great value of such facts in determining questions relative to the physique of the people. Though opinions differed as to the amount and method of observation necessary, it was admitted on all hands that anthropometric records were the only accredited tests available, and that if collected on a sufficient scale they would constitute the supreme criterion of physical deterioration or the reverse. It was also held that the school population and the classes coming under the administration of the Factory Acts offered ready material for the immediate application of any system that might be devised.

Appendix II.

42. The Committee found that by a singular coincidence the British Association for the Advancement of Science had, at their last congress, determined to resume the work which they had undertaken with such interesting results in the years 1878-83, and that a Committee had been appointed to organize Anthropometric Investigation, on the basis of (1) establishing uniform standards; (2) ascertaining which measurements are likely to prove the most fruitful in result; and (3) formulating broad lines of co-operation. The Committee lost no time in placing themselves in communication with the Chairman and Secretary of the British Association Committee, and both these gentlemen, Professor D. J. Cunningham, of the University of Edinburgh, and Mr. J. Gray, were good enough to attend and explain how they thought such a Bureau of Information might be formed, and the duties it should be called upon to perform. A scheme will be found in the Appendix for which they are jointly responsible, though Mr. Gray went with greater detail into questions of organization and cost.

43. In the evidence with which he prefaced a description of this scheme, Professor Cunningham expressed one or two scientific opinions of great value in their bearing on the subject-matter of the Committee's investigation. After referring to the manner in which poverty, with its squalor, its bad feeding and its attendant ignorance as to the proper nurture of the child, depresses the physical standard of the lower classes, he went on to say,

Cunningham, 2210.

"In spite of the marked variations which are seen in the physique of the different classes of the people of Great Britain, anthropologists believe, with good reason, that *there is a mean physical standard, which is the inheritance of the people as a whole, and that no matter how far certain sections of the people may deviate from this by deterioration (produced by the causes referred to) the tendency of the race as a whole will always be to maintain the inherited mean.* In other words, these inferior bodily characters which are the result of poverty (and not vice, such as syphilis and alcoholism), and which are therefore acquired during the lifetime of the individual, are not transmissible from one generation to another. To restore, therefore, the classes in which this inferiority exists to the mean standard of national physique, all that is required is to improve the conditions of living, and in one or two generations all the ground that has been lost will be recovered."

It is this constancy of physical dimensions under normal conditions that furnishes the scientific basis upon which depends the whole value of anthropometric statistics, as a test of physical deterioration.

44. In reply to a question whether, in his experience, as an anatomist, he had noted any changes in structure unfavourable to development, Professor Cunningham said,

Cunningham, 2219.

"No, with the one exception of the teeth. It is an obvious fact that the teeth of the people of the present time cannot stand comparison in point of durability with those of the earlier inhabitants of Britain. Those who have the opportunity of examining ancient skulls cannot fail to be struck with this."

Later he proceeds,

Cunningham, 2225.

"In the white races of Europe the jaws are undergoing a slow process of shortening. The stunted character of the wisdom or backmost teeth, the small amount of space allotted to them, their variability, their late appearance, and indeed their frequent failure to appear at all, bespeak this change in the jaws. Through it the teeth are reduced in size, more crowded together, and therefore more liable to disease. Indirectly this may tend to favour the early degeneration of the teeth which is so marked a feature of the present age; but I take it that the real cause of this degeneration is the striking change which has taken place in the character of the food."

Cunningham, 2245,
et seq.

45. In proceeding to explain his scheme for the establishment and working of a Central Anthropometric Bureau, Professor Cunningham asked leave to treat the matter under three headings:—

I. Consultative Committee.

46. To obtain absolute uniformity in the methods of procedure in each of the three countries it would be advisable, he thought, to appoint an Honorary Consultative Committee, which should consist of three members, one from each of the three kingdoms. These appointments should be

honorary, but the ordinary allowances for travelling expenses should be granted. The members of this Committee should be anthropologists of acknowledged reputation who are acquainted with the structure of the human body and the laws which regulate its development and growth. They should be likewise men of weight and influence. The duties of the Committee would be:—1. To determine the measurements and observations to be made; 2. To determine the instruments to be employed; 3. Along with the Director of the Central Bureau, to construct the form of card by which the observations are to be recorded; and 4. Each in his own country to advise and assist the permanent officers in any cases of difficulty that might arise, and above all to interest the people at large in the work.

II. Central Bureau.

47. The Central Bureau should be established in London, and should be organised somewhat upon the same plan as the Geological Survey Office. It would probably be necessary to appoint a Director and Deputy Director. One of these should be an anthropologist acquainted with the anatomy and development of the human body, and with experience in anthropometrical work; the other should be a statistician trained in modern scientific methods. A statistical department would also require to be organised in the Bureau. The work carried out in this office would be the following: 1. To keep the standard instruments and issue all the instruments required in the inquiry; 2. To issue the cards on which the observations are to be recorded to those engaged in the measuring, etc.; 3. To arrange surprise visits at intervals to different schools, etc., with the view of determining whether the surveyors were obtaining accurate results; 4. To receive the cards after they have been filled up, to classify them, to prepare the requisite statistical tables, and publish a yearly report; 5. To form in London a centre where the different classes of the people may be measured, and a centre also where the surveyors or measurers may be instructed in the methods of making their observations, and in those anatomical details which are requisite for the acquisition of accurate results; and 6. To disseminate information on anthropometrical work and create an interest in the public in regard to the importance of maintaining the national physique.

III. Surveyors or Measurers.

48. The real difficulty in devising a working scheme consists in determining how the measurements are to be taken and how the survey shall be carried out.

49. With regard to the measurements to be taken, Professor Cunningham thought that, in the event of the establishment of a Central Bureau, the decision as to what particular facts it would be expedient to note and classify might with advantage be relegated to the Consultative Committee. The measurements and tests would require to be selected with great care and judgment, and they should not be too numerous. Probably, the following would be sufficient, though information regarding parentage, district of birth, and conditions of living should also be obtained.

1. Height.
2. Chest girth (a) maximum.
(b) minimum.

This gives the range of the thoracic play, which is important.

3. Weight.
4. Head—length—breadth—height.
5. Breadth of shoulders (callipers).
6. Breadth of hips (callipers).
7. Vision Tested (1) by Snellens' type.
(2) by different colours.
8. Degree of Pigmentation.

The witness considered the eighth test of importance, in order to correct what might otherwise be erroneous deductions from racial peculiarities.

50. With regard to the method of survey, Professor Cunningham's scheme contemplates the appointment of a staff of skilled surveyors as measurers. The survey would be gradual and continuous, and each country (England, Scotland and Ireland) would be mapped out into a definite number of districts, severally to be the field of investigation for each year during a decennium; not only would care have to be taken to obtain samples in sufficient number and of a fairly representative type, but such districts would have to be so delimited as to secure so far as possible an homogeneous mass of material for periodic examination.

51. By the time the whole country had been covered, the survey would be recommenced at the same point and be proceeded with in the same order so that sets of facts, collected under as far as possible similar conditions and relating to the same areas would decennially be at the disposal of the State and serve as a basis for comparison, in the absence of which all witnesses agreed that allegations as to physical degeneracy must remain matter of impression or conjecture.

52. The Committee deemed it of special importance to obtain the opinions of the Royal Colleges of Physicians and Surgeons on the scheme as a whole, and were particularly careful to ask them to state the minimum number of tests they thought sufficient. The College of Surgeons was the first to report as follows :—

“Having regard to the fact that no trustworthy statistics or other *data* are available for the purpose of comparing the physical condition of the nation at the present time with that which obtained in the past, or for forming the basis of a comparison with that which may obtain in the future, the Council of the Royal College of Surgeons are of opinion that the adoption by Government of a scheme for an Anthropometric survey of the United Kingdom, such as that proposed by Professor Cunningham, is greatly to be desired.

“The scheme appears to the Council to be well calculated to elicit those facts, of which a knowledge is essential to the formation of any opinion as to the physical improvement or deterioration of the race, and they, moreover, believe that the results of the investigation would be of great scientific value and interest.

“With regard to the measurements and tests to be used, the Council approve those recommended by Professor Cunningham. They, however, think that the value of the investigations would be increased by the addition of the measurement of the lower extremities from the crest of the ilium.”

53. After prolonged consideration, the College of Physicians informed the Committee :—

“They are of opinion that the value of having trustworthy statistics and other *data* available for the purpose of comparing the physical condition of the population from time to time cannot be over-estimated.

“Whilst approving the measurements and tests suggested in paragraph 14 of Professor Cunningham's memorandum, they consider that in the case of children the circumference of the head should be ascertained as well as the other measurements.

“The College desire to bring to the notice of the Physical Deterioration Committee their opinion that the scheme for carrying out the Anthropometric survey—occupying ten years in its completion—would fail to give satisfactory standards for comparison for many years to come; they would, therefore, represent to the Committee the desirability that the Physical Census should be completed within a shorter period; and they further consider that it will be advantageous to the State that every child admitted to a Primary school should have its height, weight, and certain other data annually recorded during attendance at school.”

54. Without pledging themselves, therefore, to an approval of the plan proposed in all its details the Committee are emphatic in recommending the creation of an organisation on the lines indicated; and regard it of the highest importance towards the collection of authoritative information on the subject of the present inquiry that the survey should be undertaken at the earliest possible moment.

55. The Committee fully recognise the value of the scheme submitted by Professor Cunningham and Mr. Gray, but they are impressed with the importance of the concluding observations of the College of Physicians, representing the desirability of the Physical Census being completed within a shorter period, and pointing out the advantage of recording the physical

facts connected with every child admitted to a Primary School. This has led the Committee to consider whether some modification in the scheme which has been described above would not be feasible. Mr. Gray himself appeared to admit in the course of his examination that the machinery might be simplified, and the area of observation reduced, without injury to the objects the Committee had in view, as for instance by restricting to some extent the number of tests and measurements to be applied, by the employment, where possible, of School Teachers and Certifying Factory Surgeons, of course at a suitable fee, in lieu of professional Surveyors, and by limiting the observation of particulars relating to children of school age to two periods of their school life. The Committee cannot help feeling that some such modification of the scheme will cover the most fruitful field of investigation, and afford results which can be published annually. It is needless to conceal the fact that in all probability it will not be easy to induce people of all classes to submit to investigation. In the work which was carried out in Ireland this was a constant source of trouble, and in many cases, even with the assistance of the parish priest, it was only possible to obtain a comparatively small number of observations. On the other hand, there can be little difficulty in getting the facts as to elementary school children, especially if the Committee's recommendation in favour of a closer medical inspection of such schools be adopted. Nor will there be greater difficulty in obtaining the facts as to children when they leave school for the factory, or pass from the stage of children to that of "young persons," as defined by the Factory Acts. As it is, an immense number of children and young persons (over 375,000) are annually examined by the Certifying Factory Surgeons, and it will obviously be easy for the Factory Surgeon, when conducting his medical examination, to take the physical measurements decided upon. The Committee admit the need of scientific accuracy, but they hold that Certifying Surgeons and selected School Teachers may be relied upon to carry out definite instructions with the requisite care, and they are fortified in this belief by the declaration of Mr. Francis Galton in a communication to the Anthropometric Committee of the British Association, that "a vast deal of effort is wasted in minuteness of measurement."

Gray 3407—3419

56. While, then, they are in complete accordance with Professor Cunningham's view that the precise measurements to be taken can best be settled by the Consultative Committee referred to above, the Committee think that, as regards the actual survey, the main attack should be on the youth of the country. They recommend that two ages be selected at which every child in school attendance should be measured by a teacher or other officer selected by the Education Authority for the purpose, the particulars being recorded on a card provided by the Central Bureau. They recommend further that on every examination of a child or young person by a Certifying Surgeon the same particulars should be recorded. If this recommendation is carried out, the staff of professional Surveyors to be attached to the Central Bureau will be a limited one; their functions, important enough, being to advise where advice is sought in any quarter, or to check results where such a course seems called for at headquarters.

57. This recommendation will not militate against a more comprehensive and specialist survey, spread over a longer period, of the population of the country at large, or of definite districts. Indeed, the Committee are of opinion that such a survey will be of great value for the purpose of establishing and maintaining a standard for the guidance of the persons who may be engaged collecting *data* in schools and factories; and in an even higher degree for the purpose of obtaining statistics, based on careful sampling of various classes of the population, which shall serve as a standard of reference by which the results obtained in any particular case may be, in a sense, measured.

58. Allusion has been made to the probable difficulty of inducing the grown-up population to submit themselves in large numbers to an investigation; still, were the Bureau established and the Government thereby to indicate its interest in the work, the investigation would be placed upon a more favourable footing; the operations in the schools would familiarise people with the method, while there is a large number of associations or corporate bodies throughout the country who will probably co-operate readily enough. The following list

is not put forward as an exhaustive one, but illustrates the argument. First of all there are the Government offices, covering an immense number of employees, some of them including women as well as men: the Admiralty and War Office, General Post Office, Inland Revenue and Customs, Home Office, Board of Trade, Local Government Board, Board of Education, Civil Service Commission. Then there are County Councils and Municipalities, the Police, large manufacturers, hospitals, chambers of agriculture, trade unions and benefit societies, universities and public schools.

59. Insurance companies have not been included in the above list, since they stand upon a footing of their own, but special attention may be called to them as possibly a valuable source of information with regard to the physical characters of the adult population, could their cordial co-operation be secured. It should be easy to convince people that no secrets will be revealed: the record will not be one of names.

60. Finally, the Committee may here make a suggestion, in connection with their recommendations as to the medical examination of school children, that it should be a function of the Consultative Committee and the Central Bureau to standardize any tests used by local authorities, such as Education Committees, for testing the eyes, ears, or teeth.

61. The Committee have not thought it necessary to lay stress upon the scientific value of the results that will be obtained, but this is indicated in Prof. Cunningham's evidence; it is perhaps needless to add that if these recommendations are accepted by the Government, the British Association will gladly see themselves superseded in the matter.

62. In addition to the Anthropometric measurements of the people, it appears to the Committee in the highest degree desirable that a co-ordinate record should be kept concerning the health of those sections of the people whose sickness is treated at the public expense. Of great value for some purposes are the Registrar General's Statistics concerning the mortality of the whole population without distinction of social status; but, for the reason that no particulars are given on the latter point, these statistics are of little value in the present connection. However, as regards sickness that is not necessarily fatal, it appears that for many years past there has practically run to waste in this country an enormous mass of information, which, had it been arranged and analysed on suitable lines, would have been simply invaluable to the Committee at the present juncture. The records of sickness referred to are contained in the official returns of Poor Law Medical Officers, and also in the registers of the various hospitals and other charitable institutions throughout the country. And, as the Poor Law returns, at all events, relate exclusively to the very social stratum of the people among whom physical degeneration is most likely to occur, their value as a means of measuring the health of that stratum can scarcely be over-rated. Unfortunately, however, the official forms issued to Poor Law Medical Officers were designed for other purposes and without reference to the health of the paupers, and consequently, as may be seen by inspection, the information they contain is unsuitable for the purpose under consideration.

63. Many expert witnesses have acknowledged the importance that would attach to a properly classified record of sickness as complementary to the Anthropometric measurements now recommended by the Committee. As these returns are made weekly for every Poor Law district in the land, all that is required, in order to fit them for the purpose suggested, is that the forms of return should be modified accordingly. Inasmuch as these returns are required by the Central Authority as part of the routine duty of Poor Law Medical Officers, their modification in the manner suggested would be attended with little, if any, additional public expense. The Committee, therefore, strongly recommend that the assistance of the Local Government Board should be forthwith obtained, with a view to setting on foot and maintaining from year to year a register of sickness treated by the Poor Law Medical Services (not confined to infectious diseases) and by the other institutions mentioned. The Committee further believe that, with a view

Hutchison, 10972-4.

to rendering the returns thus obtained serviceable for the purpose in hand, their tabulation and analysis might usefully be entrusted to the General Register Office, which possesses a staff and other machinery appropriate for the work.

64. The Committee also believe that in connection with the Anthropometric Survey, which they recommend, an Advisory Council might, with great advantage, be brought into existence, representing the Departments of State within whose province questions touching the physical well-being of the people fall, with the addition of members nominated by the medical corporations and others, whose duty it should be to receive and apply the information derived from the labours of the Bureau with the whole weight of Government authority and scientific prestige behind them.

65. It would be their function to advise the Government on all legislative and administrative points in respect of which State interference in these matters was expedient; to them might be remitted for consideration and report all the problems affecting public health which the requirements of a complex social organisation are constantly bringing to the front; and their advice would doubtless be useful in guiding the action of the official representatives of this country at the deliberations of any international Bureau of public health, such as that the establishment of which was favourably entertained by the recent Brussels Congress, and which has been the subject of discussion at later conferences.

66. By Article 25 of the recent French law of Public Health (*Loi du 15 Février, 1902*) *Le Comité consultatif d'hygiène publique de France* was constituted and invested with specific duties towards the Government and the local administration. Its composition, which is of a very representative character, will be found in the Appendix. To this Committee, with its seat at Paris, all the local Councils look for guidance and regulation. By these means the sanitary administration of the whole country receives a uniform impulse, and the best resources of the State in matters of public health are placed at the service of the humblest administrative unit.

Appendix X.

PART II.

I. INTRODUCTORY.

67. It has now been seen that there are no sufficient *data* at present obtainable for a comparative estimate of the health and physique of the people, and the Committee have indicated the measures that, in their opinion, should be adopted in order to supply the want, but before concluding their task they deemed it their duty, under the fuller explanation of their commission, by which their Order of Reference was supplemented, to consider the causes and conditions of such physical degeneration as is no doubt present in considerable classes of the community, and to point out the means by which, in their opinion, it can be most effectually diminished, and more especially to discuss this aspect of the question as it affects the young during the three periods of infancy, school age, and adolescence.

68. It may be as well to state at once that the impressions gathered from the great majority of the witnesses examined do not support the belief that there is any general progressive physical deterioration.

69. The evidence of Dr. Eichholz contains a summary of his conclusions on this point, so admirably epitomising the results of a comprehensive survey of the whole subject, that the Committee cannot do better than reproduce it in full at this stage of their report:—

“ (1) I draw a clear distinction between physical degeneracy on the one hand and inherited retrogressive deterioration on the other. (2) With regard to physical degeneracy, the children frequenting the poorer schools of London and the large towns betray a most serious condition of affairs, calling for ameliorative and arrestive measures, the most impressive features being the apathy of parents as regards the school, the lack of parental care of children, the poor physique, powers of endurance, and educational attainments of the children attending school. (3) Nevertheless, even in the poorer districts there exist schools of a type above the lowest, which show a marked upward and improving tendency, physically and educationally— though the

Eichholz, 435.

rate of improvement would be capable of considerable acceleration under suitable measures. (4) *In the better districts of the towns there exist public elementary schools frequented by children not merely equal but often superior in physique and attainments to rural children.* And these schools seem to be at least as numerous as schools of the lowest type. (5) While there are, unfortunately, very abundant signs of physical defect traceable to neglect, poverty, and ignorance, it is not possible to obtain any satisfactory or conclusive evidence of hereditary physical deterioration—that is to say, deterioration of a gradual retrogressive permanent nature, affecting one generation more acutely than the previous. There is little, if anything, in fact, to justify the conclusion that neglect, poverty, and parental ignorance, serious as their results are, possess any marked hereditary effect, or that heredity plays any significant part in establishing the physical degeneracy of the poorer population. (6) In every case of alleged progressive hereditary deterioration among the children frequenting an elementary school, it is found that the neighbourhood has suffered by the migration of the better artisan class, or by the influx of worse population from elsewhere. (7) Other than the well-known specifically hereditary diseases which *affect poor and well-to-do alike*, there appears to be very little real evidence on the pre-natal side to account for the widespread physical degeneracy among the poorer population. There is, accordingly, every reason to anticipate RAPID amelioration of physique so soon as improvement occurs in external conditions, particularly as regards food, clothing, overcrowding, cleanliness, drunkenness, and the spread of common practical knowledge of home management. (8) In fact, all evidence points to *active, rapid improvement, bodily and mental, in the worst districts*, so soon as they are exposed to better circumstances, even the weaker children recovering at a later age from the evil effects of infant life. (9) Compulsory school attendance, the more rigorous scheduling of children of school age, and the abolition of school fees in elementary schools, have swept into the schools an annually increasing proportion of children during the last thirty years. These circumstances are largely responsible for focussing public notice on the severer cases of physical impairment—just as, at a previous stage in educational development, they established the need for special training of the more defined types of physical deficiency—the blind, the deaf, the feeble-minded, and the crippled. (10) The apparent deterioration in army recruiting material seems to be associated with the demand for youthful labour in unskilled occupations, which pay well, and absorb adolescent population more and more completely year by year. Moreover, owing to the peculiar circumstances of apprenticeship which are coming to prevail in this country, clever boys are often unable to take up skilled work on leaving school. This circumstance puts additional pressure on the field of unskilled labour, and coupled with the high rates of wages for unskilled labour, tends to force out of competition the aimless wastrel population at the bottom of the intellectual scale, and this, unfortunately, becomes more and more the material available for army recruiting purposes. (11) Close attention seems to be needed in respect of the physical condition of young girls who take up industrial employment between the ages of fourteen and eighteen. The conditions under which they work, rest, and feed doubtless account for the rapid falling off in physique which so frequently accompanies the transition from school to work."

70. Testimony is almost unanimous as to the improving conditions under which the denizens of large towns are called upon to exist. Rookeries are being dispersed, enclosed yards opened out, cellar-dwellings and back-to-back houses are disappearing. One-roomed, two-roomed, and three-roomed tenements, with more than two, four, and six occupants respectively are diminishing; the figures for the years 1891 and 1901 under each class in the Administrative County of London and in Lancashire are as follows:—

—	One-roomed tenements with more than two occupants.		Two-roomed tenements with more than four occupants.		Three-roomed tenements with more than six occupants.	
	1891	1901	1891	1901	1891	1901
London - -	56,727	40,762	55,020	50,304	24,586	23,979
Lancashire -	5,007	4,256	16,004	10,277	8,704	6,437
(Administrative County, together with 15 County Boroughs).						

from which it appears that the rate of improvement has been more marked in London in regard to the overcrowding of one-room tenements, and in Lancashire in respect of the other two classes. With an increase of wages a fall in the prices of food, coal, and clothing has taken place, more than counterbalancing the rise in rent, which, in itself, is largely due to the higher wages paid in the building trade.

Loch, 10121-10154.

71. Mr. C. S. Loch, in his interesting evidence, furnished the Committee with reasons for believing that improved resources have been accompanied by an upward movement in social ability or competence, with the result that a certain amount of advantageous expenditure has gone in better houses, and in the purchase of more food, and of food particularly good for children, and he also thought the same conclusion might be drawn from the large decrease in child pauperism.

Loch, 10178.

72. Further, the water supply has been enormously improved, both in purity and quantity; legislation has greatly extended the liabilities of

owners and occupiers under the Public Health Acts and the Housing Acts, and under the said series of Acts wide powers have been placed in the hands of local authorities for cleansing unhealthy areas, closing insanitary houses, preventing overcrowding, abating nuisances and enforcing generally a higher standard of sanitation; machinery exists for the inspection and purification of cowsheds and dairies, pauperism has diminished, better and more complete accommodation is provided for the sick poor, the conditions of labour touching young persons and women, in factories and workshops, have been greatly ameliorated, and all the children of the State in workhouse schools, reformatories and industrial institutions, are started in life under far better auspices than formerly.

73. On the other hand, in large classes of the community there has not been developed a desire for improvement commensurate with the opportunities offered to them. Laziness, want of thrift, ignorance of household management, and particularly of the choice and preparation of food, filth, indifference to parental obligations, drunkenness, largely infect adults of both sexes, and press with terrible severity upon their children. The very growth of the family resources, upon which statisticians congratulate themselves, accompanied as it frequently is by great unwisdom in their application to raising the standard of comfort, is often productive of the most disastrous consequences. "The people perish for lack of knowledge," or, as it is elsewhere put, "lunacy increases with the rise of wages and the greater spending power of the operative class; while a falling wage-rate is associated with a decrease of drunkenness, crime, and lunacy." Local authorities, moreover, especially in the rural districts, are often reluctant to use their powers, and in these circumstances progress, unless stimulated by a healthy public conscience in matters of hygiene, is slower than might be wished. Appendix XXVII., 7

74. An apt illustration of the widely different views held by competent observers is afforded by the interesting evidence of Mr. J. B. Atkins, London Editor of the *Manchester Guardian*, who, with a view to investigations of his own on the subject, has collected a large body of testimony, some of which he was good enough to lay before the Committee, showing in immediate juxtaposition what may be perhaps best described as the empirical and statistical methods of arriving at a conclusion. Atkins, 2863-3122.

75. The operation in different directions of the aforesaid ameliorative tendencies, and of the influences that incline towards the arrest of progress, combined with the spread of education, has, as Dr. Eichholz pointed out, had the effect of stratifying the population and concentrating the classes that require special treatment:

"There is an upper class, well-to-do and well cared for, to whom our methods afford every chance of mental and physical improvement. They come out well, and furnish a population probably not excelled by any in this country or in any other. At the other end of the scale we find the aggregation of slum population, ill-nourished, poor, ignorant, badly housed, to a small extent only benefited by our methods of training. They are the degenerates for whom this enquiry is presumably instituted. Between these two is the third and largest stratum consisting of the average industrial artisan population in which the breadwinners are in regular employment. It is the aggregation of the slum population which is largely responsible for the prominent public notice called to their physical condition." Eichholz, 429.

76. In a similar vein, Dr. R. J. Collie, one of the medical staff of the late London School Board, says—

"Physical infirmity is practically confined to the poorest and lowest strata of the population, whose children are improperly and insufficiently fed and inadequately housed, and where parents are improvident, idle, and intemperate." Collie, 3907.

77. If this be so, as the Committee are inclined to think, the task of dealing with a concentrated rather than a scattered evil manifestly presents fewer physical difficulties.

78. The Committee have advisedly abstained from framing an estimate of the number of persons living under depressed conditions on the basis of the calculations made by Messrs. Booth and Rowntree. First, they have not the Booth, "Life and Labour in London," Rowntree, "Poverty."

means of doing so; and, secondly, the different estimates of the number of underfed children, which they have had to consider, seem to show that there must be some very variable element which interferes with the acceptance of such conclusions as resting on generally accepted *data*. It may be stated also that Mr. Loch, in the course of his evidence, questioned the method on which the calculations leading to these conclusions had proceeded, and he subsequently put in a Memorandum explaining the grounds of his dissent. This Memorandum, which confirms the Committee in the belief that the matter is attended with great difficulty, will be found in the Appendix, and is a valuable contribution to the literature on the subject.

II.—URBANIZATION OF THE PEOPLE.

79. Turning to the general causes in operation that are calculated to arrest and depress development, the collection of the majority of the population in the large towns is the most evident and most considerable; but even here the evil is not so great as the form in which it is commonly stated might suggest.

80. According to the classification adopted in the Census returns for England and Wales the urban population is 77 per cent. of the whole, whereas fifty years ago it was only just over 50 per cent. It is the fact that for every person who in 1851 lived in a town, about three are so situated at the present time, but it must be remembered that the term "urban" merely means those districts that for the purposes of local administration have an urban organization, and that a large portion of the urban population is living under conditions as healthy as any that obtain in rural districts, and indeed enjoys superior advantages, owing to the greater completeness of sanitary legislation for such areas, and the higher conception of duty that governs their administration. Further, it is the case that towns have now a death-rate which is lower than was that of rural districts fifty years ago.

81. If a comparison could be made between the numbers living in slum quarters now and in the middle of the last century there might be some nearer approach to an effective conclusion as regards the results of urbanization, making due allowance for the improvement of life, even under the most degraded conditions, that has undoubtedly taken place. To this fact both Drs. Chalmers and Niven, Medical Officers of Health for Glasgow and Manchester respectively, testify on the strength of the evidence supplied by the vital statistics touching such quarters. In opposition to such testimony it is not sufficient to say, as one witness did, that he attaches little importance to an improvement of vital statistics, because it is simply raising an inferior limit. The theory that the processes by which life is preserved are themselves a cause of degeneration, by prolonging the lives of the unfit, is open to the criticism that of all the discriminating agencies to produce the survival of the fittest disease is the worst, for the injury to those that survive is so serious that all measures which combat disease tend to improve the race. But be the circumstances what they may on this point, there is reason to fear that the "urbanization" of the population cannot have been unattended by consequences prejudicial to the health of the people, and these have been considered under the three heads of (i.) *Overcrowding*, (ii.) *Pollution of the atmosphere*, and (iii.) *The conditions of employment*.

Chalmers, 5950.
Niven, 6273.

Rees, 4240.

Maurice, 293.

i. *Overcrowding.*

82. Overcrowding still stands out most prominent with its attendant evils of uncleanness, foul air, and bad sanitation.

83. The problem is by no means a new one, however its conditions may have become aggravated in recent times. ' So long ago as the year 1598 the Privy Council addressed a letter to the Justices of Middlesex, inveighing against the owners of tenement houses for the abuses they encouraged; "the remedie whereof cannot be sufficientlie provided in havinge an eye to these persons that take those howses, beinge so great a number, and they cannot

be justlie corrected untill they be taken with some offence, but in severe punyshinge those landlords that lett out those small tenements (parcells of howses and chambers) unto unknowne and base people and from weeke to weeke, not regardinge what the persones are that take the same, but to rayse a vile and unconscionable lucre."

84. This is not quite the official language of the present day, but among the opinions collected by the most modern investigator occur the following :

Booth : "Life and Labour in London."

"Overcrowding is the great cause of degeneracy"; "Drink is fostered by bad houses"; "Crowded homes send men to the public-house"; "Crowding the main cause of drink and vice."

85. The permanent difficulties that attach to the problem reside, as the same witness has shown, in the character of the people themselves (their feebleness and indifference, their reluctance to move, and their incapability of moving), and in the obstacle this presents to the best directed efforts on the part of the local authority to employ their powers.

Booth, 891.

86. It has been suggested that interference "by administrative action and penalties at each point at which life falls below a minimum accepted standard" is the way by which the problem must be approached, and the occupation of overcrowded tenements seems to afford the best opportunity for the application of the doctrine. The evil is, of course, greatest in one-roomed tenements, the overcrowding there being among persons usually of the lowest type, steeped in every kind of degradation and cynically indifferent to the vile surroundings engendered by their filthy habits, and to the pollution of the young brought up in such an atmosphere. The general death-rate in these tenements in Glasgow is nearly twice that of the whole city, and the death-rate from pulmonary tuberculosis is 2·4 per thousand in one-roomed tenements, 1·8 in two-roomed tenements, and ·7 in all the other houses. In Finsbury, again, where the population of one-roomed tenements is 14,516, the death-rate per thousand in 1903 was 38·9, yet the rate among occupants of four or more rooms was only 5·6, and for the whole borough 19·6. Similarly a comparison between the population of Hampstead and Southwark, in respect of their ability to withstand disease and death, shows an expectation of life very largely in favour of Hampstead, at birth the relative figures being 50·8 and 36·5 years, at five, 57·4 and 48·7, illustrating the waste of material during the first years of life. From another table, furnished by Mr. Shirley Murphy, the Medical Officer of Health for the administrative County of London, it appears that in seven groups of districts with an increasing amount of population living in overcrowded tenements the infant death-rate has followed the increase; that is to say, in districts with under 10 per cent. of the population living under these conditions the death-rate was 142 per thousand, and then, as the proportion of people living in overcrowded tenements increases, so does the infant death-rate, going from 180 to 196, and then to 193, and then going on to 210, 222 and 223.

Murphy :—Appendix XIII.

Appendix XIII.

87. Facts like these show where the root of the mischief lies, and surely the time is ripe for dealing drastically with a class that, whether by wilfulness or necessity, is powerless to extricate itself from conditions that constitute a grave menace to the community, by virtue of the permanent taint that is communicated to those that suffer under them, and of the depressing effect that the competition of these people exercises on the class immediately above. The Committee think that with a view to setting a term to these evils the Local Authority should, in the exercise of their power to treat "any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates" as a nuisance, and for the abatement of the same, notify that after a given date no one-roomed, two-roomed, or three-roomed tenements would be permitted to contain more than two, four or six persons respectively. The change might be brought into operation gradually, so as to treat the worst cases first, and render it easier to provide for the displaced families, but in every case handled it must be made plain that in the event of non-compliance recourse would be had to the compulsory closing of the tenement in question.

Loch 10155-10164.

Cameron 11024-
11034, 11070-4.
Ormsby 12593-5.
1260-95.

88. The problem of dealing with the persons affected would have to be faced, but this could be done with more confidence seeing that the difficulty involved is a terminable one and that security would be taken against a reproduction of the conditions that rendered action of the kind necessary. In this connexion Mr. Loch strongly advocated the firm grasp of the nettle. By taking the worst centres firmly and sternly in hand he believed in a piecemeal solution of the whole problem, and instanced the readiness with which in old days common-lodging-houses grew up with an increasing demand on the part of their *clientèle*, as showing how very instantaneous the supply would be when the demand was clearly expressed. The fact of these lodging-houses being now under the control of the County Council would greatly facilitate the process. Means would probably be found through the ordinary channels of supply and demand or within the sphere of municipal activity for housing all but the irreclaimably bad, and in the last resort the State acting in conjunction with the Local Authority would have for its own sake to take charge of the lives of those who, from whatever cause, are incapable of independent existence up to the standard of decency which it imposes.

Lamb, 11483-11504,
11669-11674.

89. "Colonel" Lamb, of the Salvation Army, was favourable to the adoption of similar methods, and suggested as an experiment the concentration on selected areas of every available agency for social reform, putting in a resident magistrate to enforce the law, which he believed was sufficient for the purpose, especially if the work of voluntary agencies were directed to the same end.

90. Some such expedients as have been suggested for disposing of habitual vagrants might also be adopted; the Committee are not prepared to indicate the exact lines upon which these ought to be modelled; a large latitude should probably be left to each locality in healing its own sores, but as a last resource compulsory detention in labour colonies would have to be resorted to, and the children of those made the subject of this experiment lodged in public nurseries, until their parents were improved up to the point at which they could resume charge.

Lamb, 11554-11786

91. The Committee took the evidence of "Colonel" Lamb, on the colony managed by the Salvation Army at Hadleigh, and paid the colony itself a visit of inspection, in the course of which they were much impressed by the order which prevailed in every branch of its administration, and by the opportunity the system appears to offer for the reclamation of some of the waste elements of society. They also had the advantage of reading the valuable Report of the Vagrancy Committee of the Lincolnshire Court of Quarter Sessions for Parts of Lindsey upon the colonies of the kind established in Belgium, and they consider that with proper co-operation between county authorities such colonies might usefully form an integral part of local administration.

92. A system of this sort once established and tested, it might not be impossible, having regard to the interest the community possess in the preservation of the young from contaminating and depressing influences, to apply similar treatment to the children of all parents who have proved unfit to discharge their obligations to those they bring into the world. With a view to the enforcement of parental responsibility the object would be to make the parent the debtor to society on account of the child and to empower the local authority to charge the former with the cost of a suitable maintenance, with the further liability in case of default of being placed in a labour establishment under State supervision, until the debt is worked off. It is not believed that any such extreme steps would be necessary in a very large number of cases; the fact of a few being so treated experimentally and the knowledge that the State had and might wield such power would exercise a most salutary effect in bringing home to parents the nature and extent of their liabilities, and might be expected to prove to the young a charter of immunity from the most crying evils by which they are at present oppressed.

93. It has been suggested that the system of municipal institutions prevailing in this country, under which the chief officers are elected annually, is not calculated to produce the vigilance and ability displayed in dealing with these problems in Germany, where the corresponding officers hold a more or less permanent position. This was the view of one very competent witness, Mr. T. C. Horsfall, who also advocated the adoption of what is known as the Elberfeld system, under which any citizen can be called upon by the municipality to act upon their behalf in much the same capacity as an officer of the Charity Organisation Society does in this country, and become the channel for the district under his charge of all information required by the Local Authority on matters touching the health of the people. In this way it is contended that a high standard of civic duty is inculcated, and the public conscience moved to reprobate social wrongs. On the other hand, a representative civic officer like Dr. Niven, of Manchester, declared that with the present machinery improvement was as rapid and well sustained as it was reasonable to expect, and many of those who were most impressed with the evils they saw around them took the view that they were the results of conditions which had in great measure been superseded, and that the course of the next few years would show a most decided amelioration.

Horsfall, 5629-5658.

Niven, 6280-3.

Booth, 1140-3.
Rowntree, 5194-5,
5248.
Loch, 10183-4.

94. In one respect Mr. Horsfall was able to show that an immense superiority rested with Germany. In England no intelligent anticipation of a town's growth is allowed to dictate municipal policy in regard to the extension of borough boundaries, with the result that when these are extended the areas taken in have already been covered with the normal type of cheap and squalid dwelling houses, which rapidly reproduce on the outskirts of a city the slum characteristics which are the despair of the civic reformer in its heart.

Horsfall, 5723-5741.

95. In some parts of Germany a different system appears to prevail. As soon as the original nucleus of a town has reached certain proportions, a broad zone with lungs something like the points of a star is drawn round it; within the zone and the avenues leading outward no population beyond a certain very limited density is allowed, and the increase of the town on the scale of population permitted in the centre is pushed back beyond this zone. No such town, therefore, in Germany, however large, would be without its proportion of open space in the immediate vicinity, and the lungs or avenues provide for the indraught of a due quantity of fresh air into the very heart of the city. Notwithstanding these precautions, the urbanization of the German people has been attended with some falling off in the physical characters of the conscript. Thus in the seven years between 1894 and 1901 the returns show that the fit have fallen 1 per cent., the unfit risen 1·3 per cent.

Shadwell :—
Appendix XIV.

96. It must be remembered, in defence of our laxity in this respect, that the industrial development of Germany took place fifty years later than ours, when sanitary science with its multiform applications to the actual conditions of urban existence had come to be much better understood and practised, and that here we do not start *de novo*, but have in a large measure to undo the consequences of previous neglect.

97. In this connection it would be expedient to secure the co-operation of Local Authorities in contiguous areas that are becoming rapidly urbanized.

98. The means to be adopted are, no doubt, in the main palliative, but their combined effect may be none the less considerable. It has already been indicated how, by the gradual pressure of hygienic law and disciplinary penalties, the impetus of improvement may be given to the people themselves, and however slowly municipal action is compelled to move towards the extirpation of social ills, it can and must provide against their reproduction in areas over the development of which it is not too late to watch.

99. A prescient sense of the conditions to be fulfilled and heedfulness towards the consequences of their neglect may surely be exercised in all cases,

when the extension of borough boundaries offers an opportunity for the laying out of new urban quarters. The vigilant enforcement of proper building regulations, which should include the maintenance of airways of sufficient breadth towards the centres of large towns, and arrangements for their being properly planted with, if possible, two rows of trees on either side; the determination to bring home to both landlord and tenant the duty of maintaining a minimum standard of decency and comfort; the provision of cheap means of transit on a comprehensive scale between the outgrowths and centres of large towns; and possibly some revision of the basis of local taxation, whereby sites should figure more largely than buildings in framing assessments, with the consequent probable removal of large industrial concerns to less costly surroundings, might all in their several degrees tend to amelioration.

ii. *Pollution of Atmosphere.*

100. The attention of the Committee was prominently called to the effect on public health of the pollution of the atmosphere.

101. In dealing with the Manchester district one witness said—

Rees 4234, 4329,
4266.

“The pollution of the air is worse than ever.” “I should trace much of the anæmia to the deprivation of sunlight and to the lessening of the vivifying qualities of the air.” “You have execrable air for the people to breathe.”

Another gave similar testimony—

Horsfall 5580.

“The condition of the air by its direct effect on lungs and skin is the cause of much disease and physical deterioration. By cutting off much of the scant supply of sunlight which is all that Manchester at best would be allowed by its gloomy climate to receive, it injures health.” “The filthiness of the air makes those inhabitants of all parts of Manchester who value cleanliness most unwilling to ventilate their dwellings.” “By killing nearly all vegetation and by its other effects, the foulness of the air contributes much to that general gloominess of the town which led Mr. Justice Day to say in explanation of the prevalence of drunkenness in the town, that to get drunk ‘is the shortest way out of Manchester.’”

Horsfall 5580.

102. To this influence is attributed the removal of all well-to-do persons from the town, which the same witness stated to be a most fruitful cause of the ignorance and bad habits of the poor, and of the failure on the part of the authorities to take sufficient cognizance of those districts in which the poor are congregated without admixture of other classes.

Rees 4266-4282,
4309-4317, 4448-
4456.
Horsfall, 5602-4,
5580.
Niven 6457-8.

103. The chief causes of this pollution are alleged to be the non-enforcement of the law for the prevention of smoke from factories, the imposition of inadequate penalties, the neglect to limit works which produce noxious vapours to special areas where they can be closely supervised and so do the least possible amount of harm; and lastly, the absence of any provision in the law compelling the occupants of dwellings to produce the least possible quantity of smoke.

Rees 4234-7.

Horsfall 5582-5591,
5608-9.

104. On the point of prosecutions, it was stated that there are people in Manchester who systematically pollute the air and pay the fine, finding it much cheaper to do so than to put up new plant. The trial of such cases before benches of magistrates composed of manufacturers or their friends creates an atmosphere of sympathy for the accused, and it was alleged that magistrates who had sought to give effect to the law encountered the indifference and sometimes the positive opposition of their colleagues. It was explained that although careless stoking is often responsible for the evil, the production of smoke is really the result of overdriven furnaces; with adequate room for boiler and furnace, and a well paid fireman under careful supervision, smoke can be prevented without any special appliances, but the greater part of the smoke is produced by furnaces that are too small for their work.

105. It is admitted, however, that a stricter enforcement of the law and a change in legislation, giving higher penalties, would produce a great improvement without imposing any serious burden on manufacturers.

The Committee think that cases of the kind should come before a stipendiary magistrate, and that it should be considered whether the responsibilities of the ordinary householder in regard to domestic smoke prevention might not also be dealt with gradually but firmly, as they understand is the case in Germany, for his present immunity from interference is said to produce a feeling of inequality that increases the reluctance to put the law in motion against the offending manufacturer.

Horsfall 5592-4.

LOCAL ADMINISTRATION.

106. These questions of air pollution and overcrowding raise directly the issue of the efficiency of local administration, and evidence of considerable variety was taken on this point. On the whole, it appears that the urban areas enjoy the greater advantage in this respect. Direct testimony was forthcoming that many local authorities are setting an example of persistent devotion to a high standard of civic duty, and others that for years were slack or indifferent are now said to have awakened to a sense of their responsibilities. Thus, in regard to the worst district in Manchester, Dr. Niven, the Medical Officer of Health for that city, stated—

“The conditions with regard to housing are very greatly improved. The majority of the worst type of houses have been entirely cleared away and a great many courts have been opened out. . . . Altogether, there has been a very great improvement in the condition of the houses in Manchester.”

Niven 6279.

107. It is admitted, however, that there are still 3,000 back-to-back houses in the city, and in the centre 206 common lodging-houses, which are described as insanitary, containing 5,831 inhabitants.

Niven, 6324.

108. Again, Dr. Young, President of the Association of Certifying Factory Surgeons, presented the Committee with a body of reports collected from a large number of his colleagues confirmatory, as a whole, of the same view. Dr. Young is himself connected with Liverpool, and testifies very favourably to the work done by the municipal authorities in that city. Reports from Preston, Wolverhampton, and Sheffield tell the same tale in varying degrees, though in regard to the last named, evidence, to be mentioned later, shows that the awakening has been somewhat tardy. In Glasgow, where a generation ago the conditions of existence were perhaps harder and more depressing than in any other town in Great Britain, there is great improvement to record. In the opinion of Dr. Scott, Certifying Factory Surgeon in that city, the Corporation have done their very best. Rickets, which had reached terrible proportions twenty years ago, has been reduced, owing to the improvement effected in the conditions under which people now live. Dr. Chalmers, Medical Officer of Health in the same city, attributed to this improvement an increase in the expectation of life and, by implication, in the standard of vitality, and added that without the one-roomed house difficulty the death rate would be something like 18 or 19 per 1,000. “One talks” he said “of insanitary areas at the present moment, but although it is the same phrase, it means something different from what it did thirty years ago.” What was wanted, he believed, was a concentration of attention on the population which has fallen below all reasonable standard of living. In regard to the pollution of the air by smoke and noxious vapours, he declared that a vigorous application of the Acts was systematically made.

Young, *passim*.

Scott, 1675.

Chalmers, 5986.

Chalmers, 6019.

Chalmers, 5947.

Chalmers, 6134.

Chalmers, 6215.

109. Mr. Shirley Murphy explained the steps taken in London to ensure the enforcement of the bye-law, which under Section 94 of the Public Health (London) Act prescribes the number of cubic feet which each individual should have, but as the enforcement of this bye-law is primarily in the hands of the Borough Councils, its application is varying and irregular. The standard of 300 feet for a room occupied at night only, and 400 for a room occupied by night and day, is so low that in Mr. Murphy's opinion it ought to be enforced rigidly throughout London, and

Murphy, 9383-9398.

to that end he stated that the County Council had been making very considerable efforts for a number of years, as it was a point to which they attached great importance. They have also done something towards the provision of dwellings and the clearance of insanitary areas, while their control of the common lodging houses has resulted in a marked improvement in the standard of living noticeable in those establishments, as the Committee can testify from a personal inspection of a considerable number.

110. On the other hand, Tyneside, Dundee, Edinburgh, the Staffordshire Potteries, and to some extent Sheffield, were mentioned as districts which in whole or in part had suffered from the neglect of the local authorities to deal with glaring evils. Dr. Neston, of Newcastle, says—

Young, 2082.

“There is undoubtedly great deterioration in the physique of our City population, and this is attributable to two chief causes, first a decadence in home life, which entails improper food and clothing, irregular habits (drinking and gambling), absence of order and thrift; second, the miserable housing and high rents which prevail; overcrowding, with its consequences, is an important factor in physical and mental degeneration. The fathers and mothers of the rising generation do not recognise, in their gravity, the obligations of paternity, which are left to the authorities, educational or parochial. There is an undoubted falling off in the physical condition of the infants vaccinated, and young persons presented for employment during the last quarter of a century, and this is due to the fact that they are the offspring of town-bred parents, who produce *sui generis*.”

111. Mr. Harry Wilson, an Inspector of Factories, says—

Wilson, 1935.

“Personally the poorest specimens of humanity I have ever seen, both men and women, are working in the preparing and spinning departments of certain Dundee jute mills.”

In reply to a question as to the sort of tenements these people occupy, he says—

Wilson, 1940-1.

“There are a great number of single-room and two-room tenements in Dundee, and big blocks having no privy accommodation at all except a common one in the yard.”

Wilson, 1942-4.

Next to no effort had been made to improve this state of things.

Mackenzie, 6923.

112. In certain districts of Edinburgh no less than 45 per cent. of the population, according to the information given by Dr. Leslie Mackenzie, Medical Inspector to the Local Government Board for Scotland, live in one-roomed or two-roomed dwellings, a fact which largely accounts for the sinister results attending the examination of the 600 children conducted by Dr. Mackenzie, under the direction of the Royal Commission on Physical Training (Scotland). In the district from which many of these children were drawn—the North Canongate—Mrs. Mackenzie, who assisted her husband at the aforesaid survey, told the Committee that 76 per cent. of the population lived under these conditions, and in these one or two-roomed dwellings there are often seven, eight, or nine children, besides the father and mother. To the question whether the City Council of Edinburgh has taken action, the witness replied, “Individual cases do not come within their purview until some one complains;” and to the further question, whether they took any steps to inform themselves of such abuses, the answer was “I do not know.” If this is at all a correct representation of the case, the statement of Dr. Mackenzie, that “Where the neglect of duty is a specific thing having relation to specific conditions, such as overcrowding or special nuisances,” the powers of the Local Government Board are complete, is eloquent of a double neglect.

Mrs. Mackenzie,
7030-7

Mrs. Mackenzie,
7038, 7049.

Mackenzie, 6342.

113. As to Sheffield, Mrs. Greenwood, one of the Sanitary Inspectors in that place, described the drainage as bad, many rubble sewers being still in existence, and the sanitary conditions shocking in respect of a large number of unpaved courts which receive the contents of the middens, and are therefore saturated with filth. There are also a large number of unwholesome dwellings, no fewer than 15,000 on the back-to-back system, most of them with no more than three rooms, and sometimes occupied by eight, ten, or even twelve persons. Therefore, it is not surprising to hear that “the number of deformed people is something terrible,” and that infant mortality goes up in one district to 234 per 1,000. Referring to the action of the municipality, Mrs. Greenwood said, “They are very much behind the times,” and she thought they had only been awakened to activity by serious outbreaks of infectious disease. As an instance of dilatoriness, she mentioned

Greenwood, 8106-9.

LONDON COUNTY COUNCIL,

Public Health Department,

8, St. Martin's Place, S.W.,

20th October, 1904.

No. 23.

REPORT by the Medical Officer on the report of the
Inter-departmental Committee on physical
deterioration.

The Committee are aware that the Inter-departmental
Committee has now reported on the subject of physical deteriora-
tion. They state that -

"there are no sufficient data at present obtainable for a
"comparative estimate of the health and physique of the
"people".

They make a number of recommendations with a view to mitigating
evils the existence of which is admitted "while awaiting the
"necessary steps being taken to secure that body of well sifted
"and accurate information without which it is impossible to
"arrive at any conclusion of value as to the general problem."

Among these recommendations are the following to which
the Committee may like to have their attention specially directed.

"(2) Register of sickness.

"It appears to the Committee in the highest degree
desirable that a Register of Sickness, not confined to in-
fectious diseases, should be established and maintained.
For this purpose the official returns of Poor Law Medical
Officers could, with very little trouble and expense, be
modified so as to secure a record of all diseases treated
by them. And, further, it ought not to be difficult to
procure the co-operation of hospitals and other charitable
institutions throughout the country, so as to utilize for
the same purpose the records of sickness kept for such
institutions".

"(4) Overcrowding.

"The Committee believe that the time has come for dealing drastically with this problem. They advocate an experimental effort by the Local Authority in certain of the worst districts in the direction of fixing a standard and notifying that after a given date no crowding in excess of such standard would be permitted. It is believed that, if the thing were carried through without hesitation or sentimentality, means would be found through the ordinary channels of supply and demand, or within the sphere of municipal activity, for housing all but the irreclaimably bad".

"(8) Register of owners of houses.

"It should be the duty of the Local Authority in all towns above a certain size to establish and maintain an accurate register of owners; this is one of the first desiderata towards dealing with slum property".

"(21) Cooking Grates.

"It should be provided by law that every dwelling let for the occupation of a family, should include a grate suitable for cooking".

"(23) Milk supply.

"With a view to ensuring the purity of the supply of milk to the community, the Committee think that the measures indicated in paragraph 273 of the report should be taken; in default of the Local Sanitary Authority taking proper precautions, the County Council should in all cases be authorised to act, and it should be the duty of the Local Government Board to intervene in the ultimate resort".

"Paragraph 273.

"The remedies for this state of things are, first, the general application of the permissive provisions of the existing law under the Contagious Diseases (Animals) Act, 1878. The Local Government Board may make orders for:-

- (i) Registration of cowkeepers, dairymen, etc.
- (ii) Inspection of cattle in dairies, and for prescribing and regulating the lighting, ventilation, cleansing, drainage and water supply of dairies and cowsheds.
- (iii) Securing the cleanliness of milk stores, milk-shops, and vessels.
- (iv) Prescribing precautions to be taken for protecting milk against infection or contamination.
- (v) Authorising a Local Authority to make such orders.

The Committee think that in the event of the Local Authority not making such orders the Local Government Board, who, it is understood, have already issued model bylaws for urban and rural districts respectively, should make the orders themselves: or if it was deemed preferable to bring indirect pressure to bear, the power now enjoyed by a Local Authority under the Infectious diseases (Prevention) Act, 1890, for prohibiting the supply of milk from an infected dairy might be extended so as to cover exclusion of supply

from areas where provisions of the Contagious Diseases Animals Act are not in operation. Under either alternative the County Council should be empowered to act in default of the Local Authority, and in either case it should be the duty of the Local Government Board to intervene in the ultimate resort."

"(32) Midwives.

"The Committee desire to call the attention of Local Authorities to the provisions of the Midwives Act, 1902, which may be made an instrument of the greatest utility for the dissemination among mothers of proper knowledge and practical advice".

Upon these I would beg to make the following observations.

Register of Sickness.

The institution of a system of registration of cases of sickness in public institutions, poor law and other, has often been proposed. If it were decided that an administration should be designed for this purpose it would be necessary for some central authority to collect and collate the material.

At the present time the County Council receives returns as to all cases of infectious disease notified each week in London. With the sanction of the Committee these returns are tabulated in the Public Health Department and the tabular statement is sent to the Registrar General and published by him in his weekly, quarterly and annual reports.

It would not be difficult to adopt the same system with respect to cases of illness at public institutions except that where as the Council only receives its information as to infectious disease through the Metropolitan Asylums Board there would be obvious advantage in the information being received direct from the institutions concerned.

Overcrowding.

In London, Authorities are presumed not to permit more persons to occupy a room than a definite recognised standard would permit based upon the cubic space per person. It is however much the practice to serve notices when such overcrowding

is found. When tenement houses are registered under Section 94 of the Public Health (London) Act the authority can proceed at once for penalty. Effect could thus be given to the recommendation of the Inter-departmental Committee by the registration of Houses let in Lodgings and the application for a penalty whenever overcrowding is found.

Register of owners of houses.

This is a proposal which would require legislation. I think it would serve a useful purpose and, if accompanied by an obligation on superior landlords to enforce the repairing clauses of the leases, would have a far reaching effect in maintaining the sanitary condition of many houses.

Cooking Grates.

This subject has already been before the Committee. In a report I presented to the Committee in the present year, I stated that in a third of the tenements visited by the Council's inspectors the grates provided were not better adapted for cooking food than an ordinary bedroom grate. These tenements were in houses which had not been specially constructed for use as tenement houses.

Milk Supply.

These recommendations relate to administration outside London and are I think sound except that I do not believe that there will be efficient regulation of cowsheds in rural districts until the powers of control are vested in County Councils instead of rural district sanitary authorities.

Midwives.

This might well be made part of the curriculum of the training of midwives but beyond this it may be found possible to do something in this direction with existing midwives through the Council's newly appointed inspector. The matter will no doubt engage the attention of the Council's Midwives Act Committee.

To the
Public Health Committee.

(Sgd.) SHIRLEY F. MURPHY,
Medical Officer of Health.

London County Council.

PHYSICAL DETERIORATION.

REPORT by the Clerk of the Council on the report of the Inter-Departmental Committee on Physical Deterioration.

(Printed by order of the Public Health Committee, 20th October, 1904.)

On 2nd September, 1903, the Lord President of the Privy Council appointed an Inter-Departmental Committee, consisting of Mr. Almeric W. Fitzroy, C.V.O., Clerk of the Council, *Chairman*; Colonel G. M. Fox, H.M. Inspector of Physical Training under the Board of Education; Mr. J. G. Legge, Inspector of Reformatory and Industrial Schools; Mr. H. M. Lindsell, C.B., Principal Assistant H.M. Secretary to the Board of Education; Colonel G. T. Onslow, C.B., R.M.L.I., Inspector of Marine Recruiting; Mr. John Struthers, C.B., Assistant Secretary to the Scotch Education Department; and Dr. J. F. W. Tatham, M.D., F.R.C.P., of the General Register Office, with instructions to make a preliminary inquiry into the allegations concerning the deterioration of certain classes of the population as shown by the large percentage of rejections for physical causes of recruits for the Army, and by other evidence, especially the Report of the Royal Commission on Physical Training (Scotland), and to consider in what manner the medical profession can best be consulted on the subject, with a view to the appointment of a Royal Commission, and the terms of reference to such a Commission, if appointed.

These terms of reference were subsequently explained and enlarged as follows:—

(1) To determine, with the aid of such counsel as the medical profession are able to give, the steps that should be taken to furnish the Government and the nation at large with periodical data for an accurate comparative estimate of the health and physique of the people; (2) to indicate generally the causes of such physical deterioration as does exist in certain classes; and (3) to point out the means by which it can be most effectually diminished.

The Committee sat on 26 days for the purpose of hearing evidence, and examined 68 witnesses from England, Scotland and Ireland, of whom 54 were men and 14 women. Of this number, 20 men and 3 women held official positions either under His Majesty's Government or under local authorities in connection with local administration, schools and factories; 13 of the official witnesses were members of the medical profession, which was also represented by 21 other witnesses, seven of whom were specially nominated to give evidence by the Royal Colleges of Physicians and Surgeons and by the British Dental Association; two witnesses were noted anthropologists; two were members of Parliament, and the remainder were either independent authorities or representatives of well-known organisations and charitable institutions.

The report which has now been presented by the Inter-Departmental Committee has, for sake of convenience, been divided into three parts, the first consisting of an examination into the evidence deducible from the War Office figures and a statement of the steps required to obtain adequate data for determining questions of national physique; the second and largest part dealing with the causes and indications of degeneracy in certain classes of the community, and the means by which it may be arrested; and the third part containing a summary of the principal recommendations which the Committee desire to make.

In dealing with Part I. of their Report (an examination into the evidence deducible from the War Office figures and a statement of the steps required to obtain adequate data for determining questions of national physique), the Committee decided, before proceeding to take personal evidence, to consider what information of a documentary character was available which would throw any light upon the questions they were directed to investigate, and in this connection they had before them the memoranda on the subject of the number and causes of rejection of recruits issued by the War Office upon the responsibility of the Director-General of the Army Medical Service and the Inspector-General of Recruiting; and, as shortly after the publication of these memoranda, the Secretary of State for the Home Department had addressed a communication to the Royal Colleges of Physicians and Surgeons respectively, asking for observations on a proposed inquiry into the causes which have, in recent years, led to the rejection of so many recruits for the Army on account of physical disability, and the possible measures by which this condition of things might be remedied, he placed at the disposal of the Committee copies of the replies from both Colleges, and in the opinion of the Committee these replies appeared to point to the conclusions that (1) the evidence adduced in the Director-General's memorandum was inadequate to prove that physical deterioration had affected the classes referred to; (2) no sufficient material (statistical or other) was at present available to warrant any definite conclusions on the question of the physique of the people by comparison with data obtained in past times; and (3) a partial investigation, as for instance, into the condition of the classes from which recruits are at present drawn, might be very misleading, however carefully conducted, and might give rise to erroneous conclusions on the general question unless checked by expert knowledge.

The Royal College of Physicians were, however, disposed to think that an inquiry into the physical condition of the nation would be of great value, but the Royal College of Surgeons did not see any particular need for such investigation on a large scale as the well-known facts relating to public health were sufficient to dispel anxiety.

In the evidence given respecting army recruiting it was pointed out that the personnel of recruits for the British Army was largely influenced by the state of the labour market and that consequently the records of the recruiting department did not deal with persons taken from one distinct class of society, also that the increased stringency in the requirements as to teeth has materially swelled the percentage of rejections during the past two years. It was, moreover, noticed that one man had presented himself at four different recruiting stations with the same result, a circumstance which suggested a possible explanation for a considerable proportion of rejections generally. The Committee expressed their conviction that the examination of the official representatives of the recruiting system, confirmed as it was by the evidence of other witnesses, proved conclusively that it would be as reasonable to argue from criminal statistics to the morals of the great mass of the people as it would be to argue to their physical conditions from the feeble specimens that come under the notice of recruiting officers.

The Committee, in considering the question of the number of rejections in Army recruits, also came to the conclusion that the machinery of the ordinary type of Royal Commission was both unsuitable and inadequate for the purpose of furnishing both the Government as well as the nation at large with periodical data for an accurate estimate of the health and physique of the people, and were of opinion that particulars on these points could best be obtained by the establishment of some permanent organisation such as a Central Anthropometrical Bureau, acting under the advice of a Consultative Committee of noted Anthropologists. The importance of obtaining a register of cases of sickness (not confined to infectious diseases) is also emphasised, and the formation of an Advisory Committee on Public Health is suggested.

With regard to part 2 of their report (the causes and indications of degeneracy in certain classes of the community and the means by which it may be arrested) the Committee at once point out that the opinions gathered from the great majority of the witnesses examined do not support the belief that there is any general progressive physical deterioration in the nation, physical infirmity being, as one witness puts it "practically confined to the poorest and lowest strata of the population, whose children are improperly and insufficiently fed and inadequately housed, and where parents are improvident, idle, and intemperate." If this statement be correct the Committee feel that remedial measures are comparatively easy of application as "the task of dealing with a concentrated rather than a scattered evil manifestly presents fewer difficulties." The collection of people in the large towns is doubtless one of the general causes which tend to arrest and depress development, and the evil effects of this urbanisation may be classified under three heads—over-crowding, pollution of the atmosphere, and conditions of employment.

In order to deal with over-crowding the Committee suggest that the local authority should notify that after a certain date no one-roomed, two-roomed, or three-roomed tenements will be permitted to contain more than two, four, or six persons respectively, the change being brought into operation gradually. The Committee, in this connection, specially refer to the marked improvement in the standard of living in common lodging houses in London since they came under the control of the Council. They also suggest as a last resource the detention of habitual vagrants in labour colonies, and the temporary lodging of the children of such persons in public nurseries until their parents have been rendered fit to take charge of them. The Committee see no reason why every town above a certain size should not be compelled to keep a register of owners of all slum property, and it is also suggested that the local medical officers of health should be granted security of tenure of office. The report further states that the chain of responsibility should be made more complete so that minor authorities if negligent might be superseded by some superior body, as is the case in London. To this end every County Council should be required to appoint a Medical Officer of Health, who should devote his whole time to the duties of his office, and the local sanitary authority should furnish reports containing certain specified particulars.

The pollution of the air is next dealt with, and the report states that the chief causes of this pollution are alleged to be the non-enforcement of the law for the prevention of smoke from factories, the imposition of inadequate penalties, the neglect to limit works which produce noxious vapours to special areas where they can be closely supervised and so do the least possible amount of harm; and lastly the absence of any provision in the law compelling the occupants of dwellings to produce the least possible quantity of smoke.

With regard to the conditions of employment it appears that there is, if anything, rather a general improvement in the physique of the factory class, but the system of half-time employment of children is not conducive to their health. An extension of the powers of certifying factory surgeons is suggested so as to enable these officers to examine employees for purposes of qualification at a later age than 16, and to re-examine, when necessary, at definite intervals; the medical examination of young persons should be extended to cover their entry into coal pits; and attention is drawn to the apparent lack of regulation and control over small workshops, and to the absence of almost any medical examination of young persons and children employed in workshops generally.

In dealing with the question of alcoholism, attention is drawn to the close connection between bad housing and a craving for drink. The Committee are unable to decide whether drunkenness is on the increase, but state that there is an admitted increase in the drinking habits of women of the working classes. The report, however, goes on to point out that intemperance in working women seems to be confined to towns, and is rare in rural districts. The Committee state that they are convinced as a result of the evidence laid before them that the abuse of alcoholic stimulants is a most potent and deadly agent of physical deterioration, and they suggest that some general educative impulse is needed to bring home to the community at large the gravity of the evil and the extent to which it is within the power of the individual to remedy the present state of affairs.

The Committee also considered the depletion of rural districts by the exodus of the best types caused by the most capable of the population being allured to the towns, partly owing to the difficulty in obtaining cottages in the country and partly to the system of country education being

such as does not induce in the children an interest in their immediate surroundings. As a remedy the Committee hope that the scheme of the Garden City Association will prove successful, and hint at State help for such schemes if they are found to fulfil the expectations of their promoters.

Attention is drawn to the alleged tendency of superior stocks in all classes towards a diminished rate of reproduction, but the Committee are of opinion that this question can only be settled when tested by definite figures, and think it might be well to obtain accurate information thereon by means of a proper census.

The question of food is brought under review, with the result that the excessive use of bread and tea by the workers to the exclusion of more nutritive articles of diet is condemned, and in this connection the love of pleasure and gambling are said to be fruitful causes of the withdrawal from the working class budget of money which should be spent on food, whilst a judicious enforcement of compulsory attendance by girls at classes on cookery and other branches of domestic hygiene is suggested in the near future. The Committee also express the view that every tenement let for the occupation of a family should include a grate suitable for cooking, and they suggest that the Local Government Board should fix standards for all foods and drinks for the purposes of the law relating to adulteration.

The conditions attending the life of the juvenile population are next taken into consideration, and the first point dealt with under this heading is Infant Mortality, in connection with which suggestions were made to the Committee that all still-births should be required to be registered, and that the system of infant insurance should be restricted so as to cover actual expenses of burial only, but the Committee came to no conclusion in regard to the question of insurance, although they recommended the registration of still-births.

Hereditary Taint is the next point touched upon under this division, and it is suggested that the depressing effects of the life struggle on parents may be, in some measure, transmitted to their offspring. The employment of mothers late in pregnancy and too soon after childbirth is taken into consideration. The Committee are of opinion that the application of the existing law on this subject might be made more regular and elastic, and suggest the formation of voluntary agencies for helping mothers before, during, and after confinement to take care of infant life, even where such agencies already exist.

Another subject dealt with at this stage is the decrease in the breast feeding of infants, a condition which it is stated is common to all highly civilised people, and of reasons for which the medical profession are in ignorance. The use of modified cow's milk as a substitute is advocated instead of tinned milk.

The Committee also considered the question of defective milk supply, and suggested in order to guard against the consumption of tainted and filthy milk the general application of the permissive provision of the Contagious Diseases (Animals) Act, 1878. Since, however, the dangers of contamination are by no means passed when the milk has left the farm on which it has been produced, it being liable to contamination through the length of time taken in transmission, in the milk shops and in the homes of the consumers (particularly in the latter case, owing to the use of the feeding bottle with a long indiarubber tube which cannot be cleansed), the Committee can only suggest that the real remedy is to be found in a better social education of the community at large. The formation of milk depots, the machinery of registration and the employment of a number of health visitors are also mentioned as well as the submission to a body of experts of the question of the advantages of sterilization or prompt refrigeration of milk.

Dealing with parental ignorance and neglect, the report calls attention to the overlaying of infants caused by neglect or drunkenness (most of the cases occurring between Friday night and Monday morning), the leaving of children in a room with an unprotected fire, the lack of ventilation in dwelling houses, the noxious practice of giving infants indiarubber nipples to suck, the habit of allowing children to stay up very late in the evening, thereby causing them to obtain an insufficient amount of sleep, the indifference of mothers to the slighter ailments of their children, the improvidence of the poor, and the improper feeding of infants. These evils the Committee submit can only be overcome by the adoption of some great scheme of social education. They, however, lay stress upon the beneficial effects of a proper administration of the Midwives Act, 1902, the value of crèches, and the establishment of a body of health visitors, and suggest the issue of a circular on the whole subject to local authorities by the Local Government Board.

The School System also came under the review of the Committee, and attention was drawn to the keeping of children at desks which were not suited to their height, causing curvature, and to the use of a blackboard which, if the class be a large one, may be placed in such a position as to cause a strain upon the vision of some of the scholars; whilst with regard to infant schools the opinion of the Committee was that school attendance in *rural* districts should not be compulsory until a child had reached 6, or possibly 7, years of age, and should be discouraged, if not prohibited, until the child was 5 years old. The Committee also thought that physical recreation and exercise should be provided for, and that a greater elasticity should be allowed in the conditions upon which recognition as a certificated teacher was granted, in order to provide for a more thorough instruction of the young in cookery, hygiene and domestic economy. The view was also expressed that special magistrates should be appointed to deal with juvenile delinquents, and a medical inspection of school children was suggested.

Evidence was taken on the extent of underfeeding of school children, and on the extent of existing voluntary methods of providing food, and in regard to this problem, the Committee agree with the opinion of the Royal Commission on Physical Training (Scotland) "that the preparation and cooking of these meals (*i.e.*, meals for children who attend school habitually underfed), where it is found necessary to provide them, ought to be regarded as one of the charges incident to school management." The treatment of many of these children whose antecedents place them in the category of "retarded" is best managed, in the opinion of the Committee, by means of special

schools of the Day Industrial Schools type, but stress is laid upon the fact that it is the duty of parents to provide personal necessities such as food, clothing and lodging for their children, and the first aim in dealing with such matters should be to restore self-respect, and to bring home to the parents the duty of providing for their offspring.

Dealing with risks of contamination during adolescence, it was noted that girls are not so prone to tight-lacing as was formerly the case; also that there appears to be a general opinion that young women are growing larger in stature; the desirableness of obligatory attendance at evening classes in hygiene, domestic economy and physical exercise was touched upon; suggestion was made that if municipal crèches be established, girls over 14 years of age might be made to attend occasionally in order to obtain instruction in infant management.

With regard to boys, the Committee are of opinion that shelters, fitted with gymnastic appliances, should be provided by municipalities in all or some of their open spaces; that some grant should be made from the national exchequer in aid of all clubs and cadet corps conducted on approved lines; that all boys should be obliged to attend continuation classes in which drill and physical exercises take a prominent place; and that a central body should be established in each town to supervise voluntary agencies of all kinds, and to collect information and to give advice on the various kinds of employment open to young people upon leaving school. Juvenile smoking is shown to be on the increase, and is said to have a very deleterious effect upon its votaries, although no actual testimony is forthcoming to prove that early smoking diminishes growth. The Committee recommend the introduction of a Bill in Parliament prohibiting the sale of tobacco and cigarettes to children under the age of at least 16 years, and providing that licenses for the sale of tobacco and cigarettes should not be granted to shops frequented by children (*e.g.*, sweet-shops).

The concluding portion of the second part of the report deals with certain special subjects bearing on the general purpose of the inquiry, to which the attention of the Committee has been called.

Syphilis is first taken into consideration, and the general trend of the evidence is to show that this disease is an active agent in the production of congenital weakness and its accompanying degeneracy; it cannot, however, be said to be one of the causes of progressive deterioration, as most of the expert witnesses agreed that the malady was not on the increase in this country. The Committee draw special attention, however, to two points raised in the discussion of this subject:—

(i.) A suggestion that notification of the disease should be made compulsory, and (ii.) the inadequacy of hospital accommodation, especially for the poorer classes, for the treatment of venereal disease. It was pointed out that medical practitioners are reluctant to enter syphilis on a medical certificate as a cause of death, and the Committee would therefore desire to see all reference to "cause of death" eliminated from the death register, and express the conviction that the medical opinion as to the cause of death should be regarded as confidential. They also feel that a Commission of Inquiry into the whole matter should be appointed.

The next special subject dealt with is Insanity, of which syphilis and alcoholism are said to be the chief causes, and next to these, density of population appears to be conducive to mental disease. The Committee came to no decision in regard to the alleged increase in lunacy in Great Britain, but were of opinion that it is on the increase in Ireland, and recommend that an inquiry should be held at an early date as to the extent and character of the growth of lunacy in that country.

In considering the question of eyesight and hearing, no proofs of degeneracy were forthcoming, but the report states that there can be no doubt that the condition of the teeth of the people has become much worse of late years. There is, however, no reason to associate dental degeneracy with progressive physical deterioration, and the Committee decided to make to the Board of Education certain recommendations as to the teaching in schools of the care of the teeth, the enforcement of their daily cleansing, and systematic inspection and treatment of scholars by qualified dentists. In dealing with this subject it is curious to note that one witness points out that as a general rule the higher the social scale of the child the worse are its teeth.

Evidence was also given before the Committee on the subject of vagrancy and the condition of defective children, but the Committee have not thought it necessary to consider them in the report, as it is understood that they are to be the subject of separate inquiries.

The third portion of the report contains a summary of the principal recommendations, 53 in number, which the Committee desire to make. These recommendations are reproduced at full length at the end of this summary.

The Committee, in conclusion, express the hope that the facts and opinions they have collected will have some effect in allaying the apprehensions of those who, as it appears on insufficient grounds, have made up their minds that progressive deterioration is to be found among the people generally, and state that in the carrying out of their recommendations for the rectification of acknowledged evils, they do not rely so much upon any large measure of legislative assistance as in the overcoming of complacent optimism and administrative indifference, and feel that a large-hearted sentiment of public interest must take the place of timorous counsels and sectional prejudice.

Upon examination, the principal recommendations of the Inter-Departmental Committee can be arranged, from the standpoint of the Council, into three groups:—

- (a) Matters affecting existing services of the Council.
- (b) Recommendations which affect matters akin to existing services of the Council; and
- (c) Matters which the Council might consider with a view to obtaining legislation.

Under the first heading may be classed:—

(a) MATTERS AFFECTING EXISTING SERVICES OF THE COUNCIL.

(1) *Anthropometric Survey.*

With a view to the collection of definite data bearing upon the physical condition of the population, the Committee think that a permanent Anthropometric Survey should be organised as speedily as possible upon the lines indicated in Part I. of the Report. In the

first instance, this Survey should have for its object the periodic taking of measurements of children and young persons in schools and factories, enlisting for this purpose the assistance, among others, of School Teachers and Factory Surgeons, supplemented by a small staff of professional Surveyors. Besides this, a more comprehensive and specialist survey, spread over a longer period, of the population of the country at large, might be undertaken.

This might be carried out in a modified degree by a voluntary examination of pupils in the Council's schools and educational establishments.

(6) *Building and Open Spaces.*

Local Authorities in contiguous areas which are in process of urbanisation should co-operate with a view to securing proper building regulations, in furtherance of which end the making of Building Bye-laws to be approved by the Local Government Board should be made compulsory on both urban and rural authorities; attention should also be given to the preservation of open spaces with abundance of light and air. By the use of judicious foresight and prudence the growth of squalid slums may be arrested, and districts which hereafter become urbanised may have at least some of the attributes of an ideal garden city.

The attention of the Building Act Committee and Parks Committee might be directed to this recommendation.

(8) *Register of owners of houses.*

It should be the duty of the Local Authority in all towns above a certain size to establish and maintain an accurate register of owners; this is one of the first *desiderata* towards dealing with slum property.

This recommendation should be brought to the notice of the Improvements Committee which is already dealing with the preparation of a ground plan of London.

(9) *Medical Officers of Health.*

A Medical Officer of Health in all areas above a certain population should be required to give his whole time to the work, and in no case, unless convicted of misconduct, should a Medical Officer of Health so engaged be removed without the consent of the Local Government Board.

This is practically in operation in London, there being only one medical officer of health who does not devote his whole time to the duties of his office. Medical officers of health in London cannot be removed without the consent of the Local Government Board.

(11) *Reports from Local Authorities.*

The Local Sanitary Authority in each district should be required to furnish to the Local Government Board, through the County Authority, reports according to certain specified requirements, which would show accurately what was being done, or left undone, in matters of sanitation and administration generally, and would thus form a basis of comparison between different districts. Armed with this information it should be the duty of the Central Authority to watch closely local administration, and to endeavour constantly to level up backward districts to the standard attained in the best administered areas.

The reports of the medical officers of the metropolitan boroughs are already sent to the Council, and the suggestion that they should be so prepared as to form a basis of comparison between different districts is well deserving of consideration.

(4) *Overcrowding.*

The Committee believe that the time has come for dealing drastically with this problem. They advocate an experimental effort by the Local Authority in certain of the worst districts, in the direction of fixing a standard and notifying that after a given date no crowding in excess of such standard would be permitted. It is believed that, if the thing were carried through without hesitation or sentimentality, means would be found, through the ordinary channels of supply and demand, or within the sphere of municipal activity, for housing all but the irreclaimably bad.

(12) *Law as to Insanitary and Overcrowded House Property.*

Nothing has been brought more prominently to the notice of the Committee than the ignorance that prevails, even in quarters which ought to be well informed, as to what the law and the powers it confers are. A statement on this subject was prepared for the Committee with the assistance of the Local Government Board; and it appears to them that the Board could not do better than issue it, with such additions as they think proper, to all Local Authorities.

The question of a circular to local authorities on the existing law and its enforcement might be considered by the Public Health Committee.

(14) *Over-fatigue.*

As a preliminary to any further legislation on the subject of hours of employment, particularly employment of women and children, it is, in the view of the Committee, highly desirable that there should be a strictly scientific enquiry into the physiological causation and effects of over-fatigue, as recommended by the Brussels Congress.

The Public Control Committee might consider this recommendation in relation to the Shop Hours and Seats for Shop Assistants Acts. The Council has power to spend money on investigations under the London County Council (General Powers) Act, 1893.

(17) *Alcoholism.*

The Committee believe that more may be done to check the degeneration resulting from "drink" by bringing home to men and women the fatal effects of alcohol on physical efficiency than by expatiating on the moral wickedness of drinking. To this end they advocate the systematic, practical training of teachers to enable them to give rational instruction in schools on the laws of health, including the demonstration of the physical evils caused by drinking. At the same time, the Committee cannot lose sight of the enormous improvement which has been effected in some countries, and might be effected in this country, by wise legislation.

(20) *Food and Cookery.*

For the purpose of bringing home to the people the importance of properly selected and carefully prepared food, there is much room for training of a socially educative character among girls and young women. To this end the teaching of cookery in schools should be guided by the principles laid down in Paragraph 232 of the Report. Even more may be done by mothers' meetings and lectures, and the distribution of leaflets on the subject. Continuation classes for girls beyond school age should be organised, attendance at which should be compulsory, subject to the exercise of a judicious discretion on the part of the School Authority.

These recommendations might be brought to the notice of the Education Committee.

(29) *Feeding of Infants.*

The Committee are impressed with the enormous sacrifice of infant life due to insufficient or improper feeding. The ultimate remedy lies in that social education already described, and the Committee advocate the systematic instruction in continuation classes of girls in the processes of infant feeding and management. They also recommend the issue to mothers in every district of leaflets on the rearing of babies, similar to those used in Sheffield and Wakefield; this could be done by the municipality, by voluntary associations, or by the Registrar on the registration of every infant.

The attention of the Education Committee might be directed to the suggestions for continuation classes, and as to issuing leaflets for the use of registrars and others.

(31) *Sterilisation and Refrigeration.*

Having regard to the acute difference of medical opinion as to the effects of sterilisation, the Committee recommend an investigation into the whole subject by a small body of experts. Milk, when drawn from the cow, should at once be refrigerated to a temperature of 40 degrees Fahrenheit.

The Public Health Committee may think this a proper subject for inquiry. The expenditure could be defrayed under the London County Council (General Powers) Act, 1893.

(32) *Midwives.*

The Committee desire to call the attention of the Local Authorities to the provisions of the Midwives Act, 1902, which may be made an instrument of the greatest utility for the dissemination among mothers of proper knowledge and practical advice.

The Special Committee recently appointed should have their attention directed to this recommendation.

(33) *Training of Mothers--Health Associations.*

While laying special stress on the need for education of the young in matters of hygiene and domestic economy, the Committee believe even more may be done in the direction of training the mothers of the present generation in these matters. To this end, Health Societies on the lines of the Manchester and Salford Ladies' Health Society should be formed all over the country. Enough has been said of the value of the system by competent judges to justify the Committee in urging upon every locality the adoption of similar methods. They would further suggest to the Local Government Board the expediency of issuing to Local Authorities a circular explaining the objects to be sought and the means by which they can best be attained.

This is also a matter for the consideration of the Education Committee.

(36) *Games and exercises for school children.*

It is desirable that more attention should be given, with the assistance, where possible, of voluntary agencies, to organising games for school children, and for that purpose much greater use should be made both of school and public playgrounds than at present. But the Committee are of opinion that no scheme of games alone can ever be made general enough to supply the place of methodical physical training, and they hope that the course of physical exercises referred to in paragraph 308 will find general acceptance with Local Authorities. While they consider that such exercises should, when possible, be taken in the open air, they would urge upon Local Authorities the expediency of providing play-sheds or rooms other than the ordinary class-rooms in which the exercises may be conducted regularly without interruption from the weather.

(37) *Cookery, hygiene, and domestic economy.*

Instruction in these matters should, as far as possible, be made compulsory on the elder girls at school, and care should be taken that it is placed in the hands of properly qualified

teachers, to which end it is expedient that some State aid should be given under proper conditions to schools of cookery at which teachers are trained, and that hygiene in its various branches should be made an essential element in the course of training for all teachers.

(38) *Partial exemption from school.*

It should be considered whether the present law might not be modified so as to make it possible for a child under fourteen years to obtain partial exemption from the obligation to attend school, on no other condition than that of continuing to attend school up to a later age for certain specified periods and for special subjects of instruction.

(39) *Special schools for "retarded" children.*

The Committee think that special schools of the Day Industrial School type might, with advantage, be established for the temporary treatment of children who are not up to normal school standard and are yet not so defective as to warrant treatment as "mentally deficient."

(41) *Medical inspection of school children.*

The Committee are emphatic in recommending that a systematised medical inspection of children at school should be imposed as a public duty on every school authority, and they agree with the Royal Commission on Physical Training (Scotland) that a contribution towards the cost should be made out of the Parliamentary Vote. With the assistance of teachers properly trained in the various branches of hygiene, the system could be so far based on their observations and records that no large and expensive medical staff would be necessary. The lines on which the inspection should be conducted are laid down in paragraphs 323-326 of the Report.

(42) *Feeding of elementary school children.*

The Committee recommend that definite provision should be made by the various Local Authorities for dealing with the question of underfed children in accordance with the methods indicated in paragraphs 358-365 of the report. The Committee, it will be seen, do not contemplate any one uniform method of procedure, but think that regard should be had to the varying circumstances of different localities. They also suggest safeguards against economic abuse.

(43) *Physical exercise for growing girls.*

If physical exercise of a recreative character were included in the curriculum in the obligatory evening continuation classes for girls, the establishment of which has already been recommended, it would be likely to add greatly to the value and ultimately, it may be, to the popularity of such classes.

(47) *Physical exercise for growing boys.*

Lads should be made to attend evening continuation classes, in which drill and physical exercises should take a prominent place; and, with a view to the encouragement of clubs and cadet corps, exemption from the obligation might be granted to all enrolled and efficient members of such organisations as submitted to inspection and conformed to the regulations qualifying them for public aid.

(52) *Teeth, Eyes, and Ears.*

The Committee are of opinion that the care of the teeth should receive special attention in the teaching of the elements of hygiene in schools, that daily cleansing of the teeth should be enforced by both parents and teachers, and that systematic inspection of the teeth, eyes, and ears of school children should be undertaken as part of that general medical inspection which has already been recommended.

The recommendations on these subjects should all be considered by the Education Committee.

(45) *Open Spaces and Gymnastic Apparatus.*

It should be the duty of Local Authorities to provide and maintain open spaces in some proportion to the density of the population, and such spaces, or some of them, should include shelters fitted with gymnastic apparatus. Every effort should also be made to put such apparatus to the best possible use by placing it in charge of a competent instructor.

The attention of the Parks and Open Spaces Committee should be drawn to this recommendation.

(50) *Syphilis.*

The Committee recommend the appointment of a Commission of Inquiry into the prevalence and effects of syphilis, having special regard to the possibility of making the disease notifiable and to the adequacy of hospital accommodation for its treatment.

This question is one for the consideration of the Public Health Committee. The Council has power to make the disease notifiable in London, with the consent of the Local Government Board.

Under the second heading are the following:—

(b) RECOMMENDATIONS WHICH AFFECT MATTERS AKIN TO EXISTING SERVICES OF THE COUNCIL.

(2) *Register of Sickness.*

It appears to the Committee in the highest degree desirable that a Register of Sickness, not confined to infectious diseases, should be established and maintained. For this purpose the official returns of Poor Law Medical Officers could, with very little trouble and expense,

be modified so as to secure a record of all diseases treated by them. And, further, it ought not to be difficult to procure the co-operation of hospitals and other charitable institutions throughout the country, so as to utilise for the same purpose the records of sickness kept by such institutions.

(10) *County and District Councils.*

With a view to strengthening the chain of responsibility in matters of local administration, County Councils should be empowered when necessary, after a reference to the Local Government Board, to act in default of urban (other than municipal boroughs) and rural sanitary authorities within the area of their administration, for all purposes of the Public Health and Housing Acts, to which end the appointment of Medical Officers of Health who would give their whole time should be made obligatory on County Councils.

This would have the general effect of extending to the country the law in force in London.

(15) *Coal Mines.*

The medical examination of young persons should be extended so as to cover those employed in coal mines.

(18) *Education in Rural Schools.*

With a view to combating the evils resulting from the constant influx from country to town, the Committee recommend that every effort should be made by those charged with the conduct and control of rural schools to open the minds of the children to the resources and opportunities of rural existence.

(19) *Rural Housing and Allotments.*

Local Authorities in Rural Districts should apply themselves to remedying the dearth of cottages which exists in many parts of the country, by the exercise of their powers under Part III. of the Housing Act, 1890, as amended by the Act of 1900. If necessary, these powers might be supplemented by the introduction of some such machinery for putting them in motion as is contained in the Labourers' (Ireland) Acts, 1883-1903. It should also be seriously considered whether the experiment, for which there are legislative facilities, of dividing land into small holdings, might not be tried more frequently.

(22) *Adulteration.*

It would be highly expedient that the Local Government Board should be authorised to fix a standard of purity for all foods and drinks, in the same manner as standards for milk and butter have been fixed by the Board of Agriculture.

A resolution on this subject, passed at the recent conference of representatives of Metropolitan Borough Councils convened by the Council, has been communicated to the Local Government Board and the Board of Agriculture.

(34) *Elementary Schools in Ireland.*

It appears that the elementary school system prevailing in Ireland urgently requires amendment in regard to warming of schools and hygienic conditions generally.

(35) *School attendance in Rural Districts.*

The Committee think that school attendance in rural districts should not be compulsory till the age of six or possibly seven, and should be discouraged, if not absolutely prohibited under five.

(51) *Insanity in Ireland.*

The Committee recommend that investigation should be undertaken at an early date into the extent and character of the increase of lunacy in Ireland.

Under the heading third may be classified :—

(c) MATTERS WHICH THE COUNCIL MIGHT CONSIDER WITH A VIEW TO OBTAINING LEGISLATION.

(3) *Advisory Council.*

The Committee are emphatic in recommending the creation of an Advisory Council, representing the Departments of State within whose province questions touching the physical well-being of the people fall, with the addition of members nominated by the medical corporations and others, whose duty it should be, not only to receive and apply the information derived from the Anthropometric Survey and the Register of Sickness, but also to advise the Government on all legislative and administrative points concerning public health in respect of which State interference might be expedient; and to them might be remitted for consideration and report all the problems affecting public health which the requirements of a complex social organisation are constantly bringing to the front. Such a Council, the composition of which might be modelled to some extent on *Le Comité Consultatif d'hygiène publique de France*, would be, the Committee believe, of great assistance, especially to the Local Government Board, and would be calculated to supply the knowledge and stimulus which are necessary in order to give to the Public Health side of the Board's administration a prominence which the multiplicity of its other functions may have tended to obscure, and to attract to its work that measure of public interest and support which has perhaps been lacking hitherto.

(5) *Labour Colonies and Public Nurseries.*

It may be necessary, in order to complete the work of clearing overcrowded slums, for the State, acting in conjunction with the Local Authority, to take charge of the lives of those who, from whatever cause, are incapable of independent existence up to the standard of decency which it imposes. In the last resort, this might take the form of labour colonies on the lines of the Salvation Army colony at Hadleigh, with powers, however, of compulsory detention. The children of persons so treated might be lodged temporarily in public nurseries or boarded out. With a view to the enforcement of parental responsibility, the object would be to make the parent a debtor to society on account of the child, with the liability, in default of his providing the cost of a suitable maintenance, of being placed in a labour establishment under State supervision until the debt is worked off.

This question will probably be raised at the forthcoming conference of Sanitary Authorities of England and Wales convened by the Council as to the spread of disease by vagrants.

(7) *Smoke Pollution.*

The Committee strongly advocate that cases of pollution of the air by smoke and noxious vapours in manufacturing districts should be heard by a stipendiary magistrate. A stricter enforcement of the law, and a change in legislation, giving higher penalties, would produce a great improvement without imposing any serious burden on manufacturers. It should also be considered whether the responsibilities of the ordinary householder in regard to domestic smoke pollution might not be brought home to him.

This recommendation might be brought to the notice of the Public Control Committee.

(13) *Medical Inspection of Factories.*

The existing powers of Certifying Factory Surgeons should be extended (1) so as to enable them to examine employees for purposes of qualification at a later age than sixteen, (2) so as to enable them to re-examine, when necessary, at definite intervals. Further, even if it be necessary that Inspectors of Factories and Medical Officers of Health should have, to some extent, co-ordinate powers with regard to insanitary conditions in factories, an arrangement should be made whereby each authority should notify to the other any defects that may be apparent, although coming within the other's province. Similarly it should be the Certifying Surgeon's duty to notify to the Factory Inspector or the Medical Officer of Health, as the case may be, such defects as may come under his notice.

Factories in London, with certain exceptions, do not come within the jurisdiction of the Sanitary authorities as regards sanitary conditions, although workshops do. Legislation, therefore, would be required to bring factories within such jurisdiction.

(16) *Workshops.*

The inspection and supervision of these, as distinguished from factories, should be strengthened. On the question whether this work should be undertaken by the Local Authority or the Home Office, the Committee are not in a position to make a definite recommendation. But one point in particular that calls for consideration is the propriety of making employment of children and young persons in workshops, dependent, as it is in factories, on a medical certificate.

In London, the inspection and supervision of workshops and homes of outworkers, as regards their sanitary condition, come within the province of the Sanitary Authorities. The suggestion as to medical certificate is one that apparently would involve further legislation.

(21) *Cooking Grates.*

It should be provided by law that every dwelling let for the occupation of a family, should include a grate suitable for cooking.

This point might well be considered in connection with proposed legislation as to tenement houses.

(23) *Infant Mortality and Employment of Women.*

In order to arrive at some conclusion as to the connection between these two, (1) the infant mortality rates should be localised for particular areas in industrial towns, (2) general infant mortality rates for selected industries throughout the country should be taken, (3) the occupations, (if any) of all mothers (married or unmarried) should be shown in the Registrar-General's records.

Possibly this may involve further legislation.

(24) *Still-births.*

Still-births should be registered.

(25) *Medical certificates as to Cause of Death.*

A medical certificate as to the cause of death should invariably be required before the death of any child, or indeed of any other person, is registered. Moreover, the medical certificate should be regarded as confidential, and its contents should never be divulged by the Registrar, as is permissible at present, to the friends of the deceased. It should be sent by the local Registrar direct to the Registrar-General.

This question has been under the consideration of the Public Control Committee and the Council has pressed the advisability of legislation on the subject.

(26) *Employment of Women in Factories.*

The Committee do not think that the period during which employment after confinement is prohibited could be extended without counterbalancing disadvantages. But the law should certainly be strengthened, so as to place upon the employer the burden of obtaining proof that the required period has elapsed since the confinement of the women he employs, or, in the alternative, so as to prohibit future employment in the absence of (1) a medical certificate that it will not be prejudicial to their physical well-being, and (2) proof that reasonable provision is made for the care of their infants. This might take the form of a crèche, or be secured by the recognition for the purpose of a duly licensed body of women.

(28) *Milk Supply.*

With a view to ensuring the purity of the supply of milk to the community, the Committee think that the measures indicated in paragraph 273 of the Report should be taken; in default of the Local Sanitary Authority taking proper precautions the County Council should in all cases be authorised to act, and it should be the duty of the Local Government Board to intervene in the ultimate resort.

This would require further legislation and would tend to protect London from impure and infected milk being sent from the country.

(30) *Milk Depôts.*

It is of great importance that the milk supply should pass through as few hands as possible, and that milk vendors should not be general dealers whose sale of milk is confined to a few quarts. In order to effect these objects, milk depôts should be formed in every town, obtaining their supply direct from the farms. The Committee believe this could be done without recourse to direct municipal action, but they think that in all improvement Bills promoted by Local Authorities, the insertion of provisions dealing with the milk supply within their area should be insisted on.

This question is now under the consideration of the Public Health Committee.

(41) *Medical Inspection of School Children.*

The Committee are emphatic in recommending that a systematised medical inspection of children at school should be imposed as a public duty on every school authority, and they agree with the Royal Commission on Physical Training (Scotland) that a contribution towards the cost should be made out of the Parliamentary Vote. With the assistance of teachers properly trained in the various branches of hygiene, the system could be so far based on their observations and records that no large and expensive medical staff would be necessary. The lines on which the inspection should be conducted are laid down in paragraphs 323-326 of the Report.

(42) *Feeding of elementary school children.*

The Committee recommend that definite provision should be made by the various Local Authorities for dealing with the question of underfed children in accordance with the methods indicated in paragraphs 358-365 of the Report. The Committee, it will be seen, do not contemplate any one uniform method of procedure, but think regard should be had to the varying circumstances of different localities. They also suggest safeguards against economic abuse.

These are matters for the consideration of the Education Committee.

(44) *Crèches.*

Wherever it was thought desirable, owing to the employment of married women in factories, or for other reasons, to establish municipal crèches, girls over fourteen might be made to attend occasionally, and the teaching of infant management to such girls should be eligible for aid from the grant for public education.

This question is under the consideration of the Public Health Committee in connection with a resolution passed at the recent conference of representatives of metropolitan borough councils on the Public Health (London) Act.

(49) *Juvenile Smoking.*

The Committee recommend that a Bill should be brought before Parliament at an early date, having for its object, (1) to prohibit the sale of tobacco and cigarettes to children below a certain age; (2) to prohibit the sale of tobacco and cigarettes in sweet shops frequented by children.

There remain a few miscellaneous recommendations, as follows:—

MISCELLANEOUS.

(27) *Provident Societies and Maternity Funds.*

Charitable efforts in manufacturing towns might well be directed towards endowing and maintaining insurance organisations to which employees, assisted by voluntary subscriptions, could contribute while at work, and from which they might receive assistance during the period of confinement and afterwards.

(40) *Special Magistrate for juvenile cases.*

In all cases touching the young where the assistance of a magistrate is invoked, he should, where possible, be a specially selected person sitting for the purpose.

(46) *Clubs and Cadet Corps.*

Having regard to the enormous value to the physique of growing lads of these institutions, and to the possible saving of expenditure in other directions resulting therefrom, the Committee are of opinion that some grant should be made from the National Exchequer in aid of all clubs and cadet corps in which physical or quasi-military training, on an approved scheme, is conducted, subject to public inspection.

(48) *Organisation of existing institutions for the welfare of lads and girls.*

In order to organise existing efforts on a comprehensive and effective basis, the Committee would like to see a central body, in touch with municipal activity, established in every large town, and charged with the duty of supervising and directing voluntary agencies with a view to bringing them up to a minimum standard of efficiency.

(53) *Vagrancy : Defective Children.*

The Committee wish to record their belief that the proposed inquiries into these subjects will be of great value.

Spring Gardens, S.W.

20th October, 1904.

G. L. GOMME,*

Clerk of the Council.

one insanitary area for which a provisional order was obtained fifteen years ago, and which is not cleared yet. There is certainly an improvement, sh added, during the last five years, but even now the building bye-laws are not as stringent as they ought to be, and, in the opinion of a great many, the Corporation are not pushing on things as they ought. Greenwood, 8131.
Greenwood, 8154,
8129.

114. The severest exposure of neglect was given by Miss Garnett, the head of a settlement of philanthropic ladies in the Staffordshire Potteries. According to her evidence, more than two bedrooms in a house are rarely to be found in that district, and these houses are sometimes occupied by eight adults. "I should think," she said, "the local authority in the Potteries was as inefficient as you could find anywhere." Most of the bad houses are owned by members of the local bodies, and the sanitary inspectors are too much in awe of their employers to carry out their duty. The only hope of a change, short of a drastic interference from headquarters, lay, in her opinion, in a registration of the owners of slum property and the rendering the Medical Officer of Health independent of the local authority. The normal type of municipal organization was, as has been stated, criticised by one witness as deficient in the elements of good government, owing to the fact that the principal officer was the creation of annual election, whereas in Germany local administration was treated as a profession; but looking to the excellent results that are obtained in certain places, it would seem that it is not so much the instrument that is in fault as the impulse behind it. Garnett, 9087-8.
Garnett, 9096.
Garnett, 9136,
9147.
Horsfall, 5629.

115. It is, moreover, often forgotten that police control, which in Germany is the saving factor of the position, is there much stronger than in this country: a fact which is largely attributable to compulsory military service, the disciplinary effect of which touches every point of administration.

116. The reluctance to incur necessary expenditure, insensibility to the pressing nature of the evils themselves, and the difficulties inseparable from any serious effort towards their removal, are the main causes of the neglect which the Committee have noticed. In some cases the interests of manufacturers and property owners have been alleged to interfere with the proper exercise of the functions of local administration, and behind the whole system there is no sufficient driving power to secure that adequate pressure shall be brought to bear on the careless or indifferent.

117. It has been represented to the Committee that one of the first *desiderata* towards dealing with slum property is an accurate register of owners, and there seems no reason why in all towns above a certain size it should not be the duty of the local authority to make and preserve such a register. Garnett, 9142-7.

118. Another change which might effectually reinforce the cry for improvement in many places would be to grant security of tenure to the Medical Officers of Health, who as a rule hold office at the goodwill of the Local Authority. Such security is enjoyed in Scotland and in London, and the Committee, who had the advantage of hearing the evidence of Mr. Lithiby, Assistant Secretary of the Local Government Board, on the point, think that in no case, unless convicted of misconduct, should a Medical Officer of Health, not engaged in private practice, be removed without the consent of the Local Government Board, and that in all areas above a certain population he should be required to give his whole time to the work. Rowntree, 5237-5241,
Horsfall, 5630-3.
Niven, 6465-6474,
6485-6493.
Fosbroke, 6721-4.

9136-9141, 9176-9,
9310-3.
Lithiby, 13489-
13527.

119. It appears, moreover, that the chain of responsibility should be made more complete, so that minor authorities, if notoriously negligent, might be superseded by some superior body with a wider outlook and a more sensitive sanitary conscience. In London a power resides with the County Council to step in upon neglect of the Metropolitan Borough Councils to discharge their duties under any part of Part II. of the Housing Act, 1890, and the Committee think it would be expedient if in certain circumstances County Councils were empowered, after a reference to the Local Government Board, to act in default of any urban (other than a municipal borough) or rural sanitary authority within the area of their Ashby, 8823-6.
Loch, 10285-8.

administration, for all purposes of this Act and the Public Health Acts. To this end it would be necessary to amend the Act of 1888, by rendering it obligatory on every County Council to appoint a Medical Officer of Health, who should be required to give his whole time to the work.

120. It remains to be considered whether, apart from direct representations on the subject which might call for special examination, any general criterion of neglect ought to be laid down, the fact of which should make it the duty of the higher authority, either local or central, to intervene.

121. On the establishment of an anthropometric survey, the disclosure of any marked declension in physical characters might be one such criterion, an abnormal death rate continued for two or three years or the recurrence of serious epidemics might be another; but the Committee are inclined to view with particular favour a suggestion of Mr. C. S. Loch, that the local sanitary authority should be made to furnish information according to specified requirements, which would show what was being done or left undone in the matter of sanitation, and the administration of the law relating to overcrowding and so on. Mr. Lithiby, it is true, stated that, according to the present practice, returns were made by the Medical Officer of Health, which often led to enquiry and the rectification of gross abuses, but the Committee think that the responsibility of the local administration in this regard ought to be emphasized, and consider Mr. Loch's proposal a useful one from that point of view.

Loch, 10258.

Lithiby, 13530-13541.

122. The particulars required for the purpose of such a return might include the infant death rate, the number of cellar and back-to-back houses, an enumeration of one-roomed, two-roomed and three-roomed dwellings, with the tale of occupants in each dwelling, and the minimum amount of cubic feet allowed for each person, the character of the water supply and sewerage arrangements, and the means for the disposal of refuse, and any cognate matters, information on which would afford a clue to the character of the administration.

123. No reasonable objection could be taken if on a comparison of the returns a gradual effort was made to screw up the efficiency of local government to the standards of its best exponents in town and country. As Mr. Loch said elsewhere—

Loch, 10171.

“There are many conditions for the prevention of which a local authority is working and in regard to which a central authority could do a great deal to assist. It can inspect and it can work on the natural method of promoting good conditions by the process of imitation.”

And he went on to urge—

Loch, 10174-5

“That possibly by a more systematic application of the law on definite lines, in conjunction with the support of the central authority, the staff work could go very much further”;

and in certain directions he would look for valuable volunteer help, as for instance in the form of sanitary visitors.

124. The public health is obviously a question of the highest general concern, and, to the extent that local independence militates against its security, the principle of local self-government must be subordinated to more important interests. The motive governing domestic legislation of recent years has been a devolution on the Local Authority of powers as extensive as possible. The Committee have a firm belief in the soundness of this principle, but they hold no less strongly that an important function remains for the Central Government as representing the nation at large, viz: to watch the play of local administration throughout the country, and to bring influence to bear on backward districts, with a view to levelling them up to the standards attained in what are by general consent the best administered areas. They venture to doubt whether this latter consideration has received due prominence. The mass of routine work in which the Local Government Board is immersed, affords it little time for the consideration of questions of public policy in the sphere of health, and may render it slow to assume the responsibility of applying new principles of administration; but it is in these

directions that opportunities for improvement lie, and the Committee think the Board would find in the knowledge and stimulus of such an Advisory Council as has been suggested a most useful auxiliary.

125. The Committee are strongly of opinion that recourse should be had to the methods they have described, and as a first step they think that the making of Building Bye-laws to be approved by the Local Government Board should be made compulsory on the several authorities, urban and rural.

126. The recent French Law on Public Health (*Loi du 15 Ferrier, 1902*) has already been mentioned, but it rests on such logical and intelligible principles that some further account of it at this stage may not be out of place.

Henri Monod :
"La Santé Pub-
lique."

127. In the view of its framers it was held to be axiomatic (1) that the whole of any administrative area is threatened by the insalubrity of any of its parts, and (2) that the inhabitants of any *commune* have a right to be protected against the negligence of its municipality.

128. In applying these principles, the framework of the local organization provided by the law presents some obvious advantages. While looking to the local authority to be the executant of those changes which are demanded in the interests of public health, it recognises that that authority is often without the competence or independence to decide upon their nature or extent, and that these questions must be determined by a freer body of expert opinion. There is thus established a hierarchy of powers for the purpose in close connection with, but independent of, the local administration, terminating in "*Le Comité consultatif d'hygiène publique*," which has its seat in the capital and is the supreme adviser of the Minister of the Interior in matters of this character.

129. In immediate connection with this Committee in each department is the "*Conseil d'hygiène départemental*," composed of from ten to fifteen persons, of whom two must be "*Conseillers Généraux*," three doctors of medicine, one a pharmacist, one an engineer, one an architect, and one a veterinary surgeon; by and with the advice of this body it is the duty of the *Conseil Général* to map out the whole department in "*circonscriptions sanitaires*," and provide each *circonscription* with a "*commission sanitaire*," from five to seven in number, of whom one must be a "*Conseiller Général*" elected by his colleagues, and the others experts appointed for a term of years by the *préfet* in the same way as the expert members of each *Conseil d'hygiène départemental*.

130. These *Commissions Sanitaires* form the inspecting and advising body, by whose influence pressure is brought to bear upon negligent municipalities; they can either act (1) on the report of the *maire* of the *commune*, moved thereto by the complaint of occupiers, neighbours, the *bureau d'hygiène* of any town that has one, or the police; (if the *maire* refuses to forward the complaint, the persons interested may address themselves to the *préfet*, who proceeds to charge the commission with the duty of making inquest); or (2) upon the direct instruction of the *préfet*. In the last case, the occasion of his intervention is prescribed by the law.

131. By the terms of Art 9—

"Lorsque pendant trois années consecutives le nombre de décès dans une commune a dépassé le chiffre de la mortalité moyenne de la France, le préfet est tenu de charger le conseil départemental d'hygiène de procéder, soit par lui-même, soit par la commission sanitaire de la circonscription, à une enquête sur les conditions sanitaires de la commune."

132. If as the result of this enquiry certain works are said to be necessary they must be carried out, though further resistance on the part of the municipality may necessitate recourse being had to the *Comité consultatif d'hygiène publique*, and, finally, to a decree of the President *en Conseil d'Etat*.

133. All towns of over 20,000 inhabitants are obliged to have a *bureau d'hygiène*, and also most of the communes that possess a thermal establishment.

134. The general effect of these provisions is to combine the various administrative units of the country into one homogeneous organization, inspired by similar ideals and recognizing a common obligation. A sense of sanitary responsibility is awakened and a solidarity of interests established between all classes of the community in furtherance of better conditions of public health.

135. The completeness of the system established under this law, its homogeneity and flexibility, bring into relief the gaps in the chain of responsibility permitted by the happy-go-lucky methods popular in this country. Nowhere, however, is pressure from outside or from above more constantly necessary owing to the multiplicity of independent administrative units.

Appendix IV.

136. Nothing has been brought more prominently to the notice of the Committee than the ignorance that prevails even in quarters that ought to be well informed as to what the law and the powers it confers are. A statement on this subject was prepared for the information of the Committee, with the assistance of the Local Government Board; and it appears to them that the Board could not do better than issue it, with such additions as they think proper, to all Local Authorities.

Lithiby, 13670.

137. The Committee are given to understand that the pressure from above, which in many cases they consider so necessary, is very intermittently employed; indeed, in some spheres of the Board's possible activity, it was allowed by Mr. Lithiby that the powers conferred are held in permanent suspense. Thus in no case, with a view to compelling the enforcement by the local authority of "any provisions of the Act which it is their duty to enforce," has the Board ever made an order under s. 299 of the Public Health Act, 1875, limiting the time for the performance of their duty by the local authority; nor has an order, so the Committee believe, ever been issued under s. 31 of the Housing Act, 1890, (Part II.), even if, as seems doubtful, any such order is enforceable.

138. It is not for the Committee to say that the Board is in no circumstances justified in dispensing with the exercise of functions to the discharge of which it is called by the Legislature, but they are concerned to learn that in matters so closely touching Public Health as are covered by the parts of the statutes mentioned, there appear to be insurmountable obstacles to the use of the powers of the Board.

iii. *Conditions of Employment.*

(a). *Character of Employment in relation to physique.*

139. With the changes in occupation attending the rapid urbanization of the people, it is obvious that the conditions of employment must enter largely into the causes that determine physique.

140. No one will deny that coincident with the large increase in the number of factory workers great amelioration has taken place in the circumstances of labour, but causes prejudicial to health cannot be altogether eliminated, and under the most favourable conditions degenerative agencies will continue at work. Moreover, it seems to be the case that the advance has been more in the direction of combating the effects of dangerous trades, which, after all, only affect a comparatively small section of the working population. Describing the life of a boy of fourteen in a textile district, who has probably been bred in unwholesome environment and nourished on unnatural food, Mr. Wilson, H.M. Inspector of Factories, said:—

Wilson, 1927, 1930.

"The hours will be long, fifty-five per week, and the atmosphere he breathes very confined, perchance also dusty. Employment of this character, especially if carried on in high temperatures, rarely fosters growth or development; the stunted child elongates slightly in time, but remains very thin, loses colour, the muscles remain small, especially those of the upper limbs, the legs are inclined to become bowed, more particularly if heavy weights have to be habitually carried, the arch of the foot flattens and the teeth decay rapidly."

141. He continues :—

“The girls exhibit the same shortness of stature, the same miserable development, and they possess the same sallow cheeks and carious teeth. I have also observed that at an age when girls brought up under wholesome conditions usually possess a luxuriant growth of hair, these factory girls have a scanty crop which, when tied back, is simply a wisp or ‘rat’s tail.’”

But he added the impression that, generally speaking, females withstand the evil effects of adverse environment slightly better than males from birth to at least maturity, a circumstance which may to some extent be counted among the causes that arrest the transmission of these effects to the next generation.

Wilson, 1931.

142. It was noted by the same witness that occupations had a profoundly selective effect, the strongest following the calling where their physical powers will have the maximum advantage in wage earning, and the weakest drifting to those where their lack of vigour will tell least against them. By this pressure the weaker vessels are constantly recruiting those fields of employment least capable of fostering development, and the poorest in physique are those met with in the lowest paid and unskilled textile operations. Another witness put this clearly, and stated that there was a regular gradation through the factories of the more or less inefficient boys, who could not get better employment by reason of their poor physique, and this has been more apparent since the operation of the Factory Act of 1901, because employers are more careful than formerly to weed out unsuitable candidates.

Wilson, 1934-5.

Young, 2054-7, 2069.

(b). General Conditions of Factory Employment.

143. It must not be assumed, however, that factory life is necessarily injurious to persons of normal health; indeed, Miss Anderson, H.M. Principal Lady Inspector of Factories, went so far as to say that within proper limits as to hours and periods, and with such hygienic surroundings as are attainable, it may be a means of improving the health of women and girls of the poorer classes.

Anderson, 1466-8, 1580-4.

144. Dr. Young, whose evidence has been already mentioned, furnished the Committee with opinions collected from various factory surgeons throughout the country as to the comparative physique of the factory class: the general direction of those opinions (with exceptions) was to the effect that there was no general deterioration at the present time, but rather a gradual improvement; and such was Dr. Young’s personal impression.

Young, 2076-2091, 2117.

145. Dr. Young also thought that the system of factory surgeons had been productive of beneficial results, not only in the rejection of cases not fit for employment, but also in the moral influence exercised by the surgeons in the way of cleanliness and decency; it was further stated that the latitude granted under the last Factory Act to assign candidates for employment in factories to certain industries, or certain departments of an industry, was working very well and likely to be fruitful of good.

Young, 2122.

Anderson, 1523-8.

146. Miss Anderson indicated very clearly the difference in the functions of factory inspectors and certifying surgeons, pointing out that the former are better able to speak of the “conditions affecting health in the factories than of the results in the workers’ state of health.” The duty of the certifying surgeon is to certify as to the qualification of children and young persons for employment, to inquire into accidents and certain cases of notifiable disease, to re-examine persons under sixteen (if required by the inspector), and to report to the Secretary of State as to health generally.

Anderson, 1444-6.

Anderson, 1480-
1509, 1544-1554.
Appendix XV.

147. Miss Anderson gave a classification of the sources of injury to health, life and limb, from factory employment, as follows :—

1. Accidents.
2. Poisoning and damage from toxic agents, or excessive dust, fumes, &c.
3. Over-fatigue.
4. Defective ordinary hygiene.

Scott, 1781, 1860.

As regards the first two, men suffer most; as regards the third, women. And on this head Miss Anderson, as well as Dr. Scott, thought there had not been a sufficient amount of scientific study. At the Brussels Congress it was recommended that Governments should do all in their power to further an enquiry into over-fatigue. In many cases hours are too long for women, and in some industries, especially the clothing trade and dressmaking, there are not sufficient pauses for food. Laundries and food-preserving industries give an example of too long hours; and excessive strain by carrying heavy weights takes place in food-preserving works, bleach and dye works, earthenware and china works, and various metal trades. Besides this the worker must often contend with extremes of temperature and often with the humid atmosphere which is inseparable from some forms of industry.

148. Generally, however, Miss Anderson pointed out that remedies were being applied by law, and year by year better applied, to remove these defects; and she suggested that we had by no means had time yet to see the full effects which might be expected from the Factory and Workshop Act, 1901.

Garnett, 9065-8,
9129-9133.

Wilson, 1964-6,
2035-8.

Legge, 5829-5837.

149. Miss Garnett approved of the provisions of this Act, but did not think they were properly applied in the Staffordshire Potteries; the worst offenders were the small manufacturers who had risen quickly. Mr. Wilson did not think legislative interference had reached its maximum; and he, too, pointed to the terrible strain of long hours; in some cases, even for children, the hours of work being twelve, with two hours off for meals. He also instanced the lack of ventilation in work-rooms where people are engaged in sedentary occupations. Dr. Legge thought exposure to injurious dust the worst feature of factory life, and that employment in a humid atmosphere gradually undermined the health, but he admitted that we were working on the right lines towards reform in these matters.

150. In regard to the important point of ventilation, Section 7 of the Act of 1901 provides that—

“In every room in any factory or workshop sufficient means of ventilation shall be provided and sufficient ventilation shall be maintained.”

There is no definition of the word *sufficient*, but the Secretary of State has power by Order to prescribe a standard of sufficiency for any class of factories or workshops. Since the passing of the Act of 1901, only one such order has been made, and this merely fills up a gap created by the repeal of previous enactments. By this Order, dated February 4th, 1902, a minimum of 600 cubic feet of fresh air per hour is prescribed for each person employed in every textile factory, not being a cotton-cloth factory, in which atmospheric humidity is artificially produced by steaming or otherwise, and in which no special rules in regard to humidity are in force. Besides the fact that the above Order is limited in its application, no standard of ventilation in terms of gaseous impurity has hitherto been prescribed, partly in consequence of a difference of opinion between the Ventilation Committee and various bodies, such as the Society of Medical Officers of Health; so that bad ventilation in many cases still cries for a remedy. Instances of such cases were given by Mr. Rowntree, in whose own works there are large rooms where 500 girls are employed and the air is changed every seven minutes, and is passed through water screens.

Rowntree, 5191.

151. The question of employment of women in relation to child-bearing was much discussed, but can be better considered in relation to child life.

Other effects of the employment of women are the tendency it sometimes has to encourage men to loaf while their wives earn the wages, and actually to cut men out of work; also the tendency to encourage neglect of home and children. The number of women employed in factories is not diminishing relatively to the population, but, except in the laundry industry, there is no significant increase. Miss Anderson thought that in some districts the general tendency of factory life was to discline young persons for home responsibilities.

Garnett 9345-9367.

Anderson, 1617, 8, 1619-1624.

152. Dr. Scott deprecated the system of half-time employment under the Factory Acts as not conducive to the health of the children. The amount of half-time is, however, reduced at the present day; for instance, in Dundee which, along with Paisley, is practically the only town in Scotland where this form of employment prevails, it does not affect more than 1,200, whereas, in 1896, 2,800 children were so employed. Mr. Wilson gave some measurements of children employed in factories compared with average measurements, greatly to the disadvantage of the former.

Scott, 1667, 8, 1786-1797.

Wilson, 1921-5, 1936.

153. While admitting for the most part that the provisions of the Factory Act are on the right lines, various witnesses had an important improvement to suggest, namely, an organised Medical Inspection of Factories; that is to say, an extension of the existing powers of certifying factory surgeons (1) so as to enable them to examine employees for purposes of qualification at a later age than sixteen (this Miss Anderson would limit for the present to eighteen or twenty-one), (2) so as to enable them to re-examine, when necessary, at definite intervals, and (3) so as to include the general powers of medical officers of health in regard to insanitary conditions. In this connection the danger of phthisis and other forms of tuberculosis in factories was emphasised by Dr. Scott and Dr. Young; and Dr. Young would make notification of these diseases in factories compulsory.

Young, 2165-8.

Anderson, 1523-1530, 1446-1451.

Scott, 1762-5, 1829-1831.

Scott, 1715-1721.
Young, 2146-7.

154. Dr. T. M. Legge, Medical Inspector of Factories, intimated that the greater part of his time was taken up in dealing with trades specially scheduled as dangerous; and the fact seems to be that, while the risks in these trades have been greatly reduced, it is now time to devote more attention to the working of the general provisions of the Factory Act, and to getting those provisions supplemented where necessary.

Legge, 5810-1.

155. The appointment of women inspectors in greater abundance than at present was also advocated; and Dr. Young mentioned that in Hudson's Soap Works and the Diamond Match Works the appointment by the employers of special lady superintendents has had great influence for good on the health of the employees.

Young, 2103.

Garnett, 9314-9527.

156. Dr. Scott was strongly of opinion that the medical examination of young persons should be extended so as to cover their entry into coal pits. The only present condition is that they must be a certain age, and according to his evidence, "It does not matter to the managers whether they are scrofulous, rickety, phthisical or anything else—they get them into the pit." Dr. Young also instanced coal miners as a class liable to degeneration.

Scott, 1721.

Young, 2116.

157. The Committee desire to endorse generally these recommendations.

(e) *Small Workshops and Home Work.*

158. There appears to be a lack of regulation and control over small workshops; though they come to some extent under the provisions of the Factory Act, they contrive to escape notice, and are often not visited at all. Dr. Scott called attention to the fact that the certifying surgeon examines children and young persons in factories but not in workshops, whereas these last are not, in his experience, as healthy as factories. It appears that there are practically no examinations by certifying surgeons of children and young persons in any kind of workshop. In factories such an examination is com-

Legge 5911, 2.

Scott, 1653-5.

pulsory (section 63 of the Factory Act, 1901). In workshops it is only undertaken at the request of the occupier (section 65 of the same Act), save in particular cases where the Secretary of State makes a special order under section 66. As a matter of fact, no such order, the Committee understand, has been made. The result is that, as shown by the statistics published in the report of the Chief Inspector of Factories, for 1901, while 376,278 children and young persons were examined in factories, only 413 were examined in workshops. As the case stands, there is practically nothing to prevent a child rejected for factory work from at once finding employment in a workshop. No doubt one of the reasons for this is the multiplicity of workshops, of which the Committee understand there were under inspection in 1901 143,065, as against 97,845 factories. Obviously the extension of the certifying surgeon's inspection of children and young persons to cover employment in workshops, would be a formidable undertaking, but the Committee are of opinion that the matter is one which calls for the earnest consideration of the department concerned.

159. Local authorities have now the power to deal with places where "homework" is being carried on, in a systematic way, and it appears that in some places this is being done. But in regard to small workshops Mr. Booth pointed out that they are not included within the purview of Sec. 108 of the Act of 1901, and with a view to counteracting the neglect under which, as has been said above, these establishments suffer, he advocated a double system of licence by which both the owner of the premises and the employer might be made responsible.

Booth, 1020-3,
1110-4.

III. ALCOHOLISM.

160. Next to the urbanization of the people and intimately associated with it, as the outcome of many of the conditions it creates, the question of "drink" occupies a prominent place among the causes of degeneration. The close connection between a craving for drink and bad housing, bad feeding, a polluted and depressing atmosphere, long hours of work in overheated and often ill-ventilated rooms, only relieved by the excitements of town life, is too self-evident to need demonstration, nor unfortunately is the extent of the evil more open to dispute.

161. The evidence laid before the Committee teems with testimony as to the disastrous operation of these causes. Dr. Scott puts alcohol first among the influences that retard improvement.

Scott, 1777, 8.

"They are living on it, some of them, and the lower you go the worse it is."

And Mrs. Mackenzie expressed the general view when she said—

Mrs. Mackenzie,
7068.

"I think that if the drink question were removed, three-fourths of the difficulty and the poverty and degradation altogether would go along with it."

162. Not only is poverty the result of drink, but it becomes an active agent in promoting it.

Niven, 6297.

"People who have not enough food turn to drink to satisfy their cravings, and also to support their enfeebled hearts by alcohol";

or, as another witness said—

Jones, 10814.

"The poor often drink to get the effects of a good meal. They mistake the feeling of stimulation after alcohol for the feeling of nutrition."

Ormsby, 12732.

They turn to it to blunt their sensibility to squalor, and it reacts in deadening all desire for improvement. On the other hand, Sir L. Ormsby noticed more drunkenness among the artizan population in Dublin owing to the fact that being in receipt of good wages they had a larger margin to spend in drink.

Eichholz, 436.

163. As to whether drunkenness is on the increase it is not perhaps easy to speak. Dr. Eichholz, in his investigation into the condition of the children in a poor school in Lambeth, was informed that there were not more

than twelve parents out of two hundred who did not "fortify themselves by the irregular use of alcoholic stimulants." Dr. Niven gave a list of occupations with which intemperance was more particularly associated; but Manchester witnesses seemed to think that, on the whole, there was less general drunkenness. Mr. Fosbroke, Medical Officer of Health to the Worcester County Council, believed there was less among agricultural labourers, and, with exceptions in certain districts, this is probably true of England as a whole; both Scotch and Irish witnesses declined to testify to any considerable improvement within their experience, though the worst conditions are probably limited to the towns small and great.

Fosbroke, 6550.

Scott, 1777-1780.
Cameron, 10989.
Kelly, 11316-11320.

164. In one respect, however, and that in a direction pregnant with evil, there is an admitted increase. The tendency of the evidence was to show that drinking habits among the women of the working classes are certainly growing, with consequences extremely prejudicial to the care of the offspring, not to speak of the possibility of children being born permanently disabled. Factory labour is mentioned as a predisposing cause, and Miss Garnett noted the pernicious effects of drink clubs on the young girls employed in the Potteries. Dr. Wigglesworth instanced the depressing influence of pregnancy as a cause with many, and the general effect of town life in creating a demand for excitement and lessening the force of public opinion was mentioned by others. Sir Charles Cameron, Medical Officer of Health for the City of Dublin, attributed to similar causes a marked increase in general intemperance in that city. On the other hand, intemperance among young women in rural districts is believed to be rare.

165. Besides the large mass of general evidence tendered on the subject, the Committee had the advantage of hearing two special witnesses who presented themselves as the result of concerted action on the part of a group of medical men who have been particularly interested in the effects of alcohol.

166. Of these gentlemen—fourteen in number—five represented the alienist side, four were hospital physicians, two hospital surgeons, one a medical officer of health, one a workhouse medical officer, and one the medical officer of a medical mission: with them were associated four laymen, Mr. J. Henderson, representing the National Temperance League, Mr. Stafford Howard, Director of the United Kingdom Temperance and General Provident Institution, and the Secretaries of the Central Temperance Legislation Board and the National Temperance League. Following upon the deliberations of a Conference so constituted, certain authoritative statements were submitted to the Committee, upon which it was proposed to base evidence on the relationship of alcohol to physical deterioration, and Mr. McAdam Eccles and Dr. Robert Jones were selected as witnesses.

Appendix XVI.

167. The first point on which Mr. Eccles laid stress was the physical action of alcohol on tissues. Illustrating this by the results of experiments on vegetable growths, animal protoplasm, and the development of certain eggs, he argued that the action upon the cells of the entire body is similar in character and operative in the same adverse manner. These facts are held to be of special importance, when the great increase of drinking among women already described is realised. It is true, as was pointed out, that history affords instances of drunken nations whose vitality does not seem to have been greatly interfered with, but this is assumed to have been the case because the mothers of the race were sober, and the conclusion is stated that,

Eccles, 10656,
Appendix XV

"If the mother as well as the father is given to drink, the progeny will deteriorate in every way and the future of the race is imperilled." Appendix XVI., 12.

168. Mr. Eccles submitted some striking figures (1) from Dr. Tatham's letter to the Registrar General, (2) from certain Insurance Tables, to prove the effect of alcohol in shortening life. According to the first it has been ascertained that of 61,215 men between 25 and 65, 1,000 die in one year, but of

Appendix XVI.,
2, 3.

61,215 publicans no less than 1,642 die in one year, while of Rechabites (abstainers) only 560 die. Under the second head the higher vitality of temperance lives is shown by the fact that, whereas out of 100,000 persons aged 30, some 44,000 would, according to the average rates of mortality, survive to the age of 70, over 55,000 abstainers might be expected to reach that age, or 25 per cent. more.

Jones, *passim*.
Appendix XVI., 4

169. The lunacy figures, which were dealt with by Dr. Jones, show a large and, in some cases, an increasing number of admissions of both sexes which are due to drink, and an increase of general paralysis among lunacy patients tells the same tale.

170. Special causes appear at work in particular places: thus in Nottingham, where so many women are employed in lace factories, twice as many women as men are received into the asylum whose insanity is ascribed to drink. In Sunderland, on the other hand, where the prosperity of the mechanic and the miner is evidenced by higher wages and abundant work, the proportion reaches 38·6 per cent. for men as compared to 20 per cent. for women. But even these figures are surpassed in Scotland. From the report of the Gartloch Asylum for the City of Glasgow the percentage of males was 45 and of females 26·8.

171. The influence of climate has, of course, to be considered in connection with these figures. In marked contrast to the foregoing, we find the case of Cornwall, which for men and women gives a combined average of under 2 per cent., and of rural Kent, which gives a combined average of 3·8 per cent.

172. In summing up the influences of alcoholism Dr. Jones states—

Appendix XVI., 4.

“Alcohol perverts the moral nature, affects the judgment, and impairs the memory; it moreover especially affects the motor system and creates an enormous loss to the community through destroying the productiveness of the skilled craftsman.”

He goes on—

“In regard to the effects of alcohol upon the descendants, anything which devitalizes the parent unfavourably affects the offspring, *and clinical experience supports this in the lowered height, weight, and impaired general physique of the issue of intemperate parents.* It also records the fact that no less than 42 per cent. of all periodic inebriates relate a history of either drink, insanity or epilepsy in their ancestors.”

Appendix XVI., 8.

171. In further illustration of this point it is stated as the result of observation of the offspring of female chronic drunkards in Liverpool prison, (1) that the death rate among the infants of inebriate mothers was nearly two-and-a-half times that among the infants of sober mothers of the same stock; (2) that in the alcoholic family there was a decrease of vitality in successive children, *e.g.*, in one family the earlier born children were healthy, the fourth was of defective intelligence, the fifth an epileptic idiot, the sixth still-born, nature at last providing its own remedy; (3) that taking women of the same class, with 125 children of 21 drunken mothers, 69 died under two years = 55 per cent., while of 138 children of 28 sober mothers, 33 died under two years = 23·9 per cent.

172. Both Mr. Eccles and Dr. Jones testified to the vulnerability of alcoholic persons to syphilis and tuberculosis, and to their general liability to all forms of what in common parlance are called inflammatory disorders; such persons also suffer much longer from the effects of any malady, thus involving their dependents in prolonged privation.

173. As the result of the evidence laid before them, the Committee are convinced that the abuse of alcoholic stimulants is a most potent and deadly agent of physical deterioration.

174. The mere statement of the contributory causes indicates some, at any rate, of the lines along which remedial effort may work effectually.

Every step gained towards the solution of the housing problem is something won for sobriety. Direct proof was forthcoming of men, who had been addicted to alcohol, passing into better surroundings, with the result that they realized the fact and found it a help to them in struggling against their weakness. The provision of properly selected and carefully prepared food ranks next in value, and to this end, as will be shown later, there is much room for training of a socially educative character among girls and the younger generation of women.

175. Large classes must, however, from one cause or another, be compelled to obtain their food ready cooked, and in this connection it is eminently desirable that increased facilities should be furnished. It may take time to bring into existence many restaurants of the type required, but there seems no reason why something should not be done at once to transform the nature of the ordinary public-house and render it a place where food of a suitable kind should be as readily procurable as beer. The Committee look to the operations of such Associations as Lord Grey's to promote these objects. The want of easily accessible and attractive means of recreation makes the public-house the only centre of social relaxation. English towns are usually ill-supplied with planted footways where, in genial weather, the working man and his family can resort for the enjoyment of the open air and intercourse with neighbours. The opportunities offered to the young to find pleasure and stimulus in physical exertion are inadequate and ill-chosen. Evidence will be referred to in another place, showing that the effects of physical training on young men are to convince them that in abstinence is to be sought the source of muscular vigour and dexterity; but means of obtaining this training on a comprehensive and systematic scale are sadly lacking.

176. Beyond all expedients of this sort, which can only operate in mitigation of the evils they are designed to meet, the Committee are impressed with the conviction that some general educative impulse is in request which will bring home to the community at large the gravity of the issue and the extent to which it is within individual effort to promote and make effective the conclusions of expert opinion.

177. In view of similar dangers on the other side of the Channel, the French Government have adopted the plan of circulating throughout the schools, barracks, and post offices, etc., of the country a document (quoted in full in Dr. Eichholz' evidence) setting forth in a few well-written and cogent sentences the evils of indulgence in alcoholic stimulants.

Eichholz, 537-542.

178. In this country, no doubt, much has been accomplished in this direction by the efforts of the various Temperance and Total Abstinence Societies whose organisation is more widespread and longer established than in France; but it is nevertheless worthy of consideration whether the efforts of such societies might not usefully be supplemented by State action in furtherance of the dissemination of temperance literature.

179. The systematic training of teachers in the laws of health, and rational instruction in schools, embracing, but not confined to, an explanation of the effects of alcohol on the system, would do much to prepare the way for the comprehension and appreciation of more direct temperance instruction, which to be effective must be given at a later age. This more direct instruction might be imparted in various ways, *e.g.*, by lectures on public health organized by the municipality or by the different health and temperance societies. Associations like the Manchester and Salford Ladies' Health Society, which the Committee would gladly see in every large city, could give special attention to saving young mothers from the temptation to drink, and health visitors of all kinds should be charged with the duty of combating the evil by every means in their power.

180. It is outside the scope of the Committee's responsibility to recommend any large changes in the laws for the regulation of the liquor

traffic, but it will not be presumptuous for them to call attention to what has been done in other countries by legislation.

Appendix XVI, 11

181. The statements submitted by the Conference above referred to (paragraph 166) include some remarkable diagrams prepared by Dr. Legrain, Superintendent of the Asylum at Ville Evrard, Paris, showing the increase of consumption of spirits in France and Belgium since 1830, and coincidentally therewith an upward trend of the consequences of drink, such as accidental deaths and suicides, lunacy and common crimes, and notably, as to France, a definite increase of the percentage of conscripts refused as unfit for service. Thus, in France, the consumption of proof spirits containing 50 per cent. alcohol in 1830 was 2·2 litres per head; in 1898 it had risen to 10·16 litres; the rejection of conscripts was 21 per cent. in 1830, and in 1895 it had risen to 32 per cent.

182. Diagrams are also given illustrating a totally different state of things in the countries where the consumption of drink, owing to wise legislation, has been steadily decreasing, viz., Norway and Sweden. In the last named, the reverse of the picture presented by France is complete, seeing that besides a diminution in crimes, suicides and deaths from alcoholism and syphilitic diseases, the percentage of conscripts refused has been steadily reduced, showing an elevation in the standard constitution of the people. Thus in Sweden the consumption of spirits containing 50 per cent. alcohol in 1830 was 46 litres, and in 1890, 6 litres per head. The percentage of rejection of conscripts in 1845 was 34·46, and in 1885, 19·61.

183. The Committee cannot but commend these facts to the most serious attention of the Government.

IV. DEPLETION OF RURAL DISTRICTS BY THE EXODUS OF THE BEST TYPES.

184. Another factor in the alleged deterioration of the people, connected like the last with their aggregation in towns, is said to be the withdrawal from the rural districts of the most capable of the population, leaving the inferior types to supply their place and continue the stock, the evil being often aggravated, in the opinion of some, by the drifting into the country of the debilitated town population, which is crowded out by the inrush of more vigorous elements.

185. There appears on the face of it to be considerable probability that both these movements are in operation. The effect of certain conditions of town life on the weaker members of the community, and the selective tendency of certain classes of employment which creates a demand for men of greater physical efficiency than is to be found as a rule in a town-bred population, are constantly drawing upon the resources of the rural districts, and it is presumably the men of most energy and possibly of finer physique that respond to the allurements offered them.

186. Thus after describing the splendid men to be found working as navvies, pig-iron carriers in blast furnaces, bleaching powder packers, cement workers, labourers in steel plate mills, and steel smelters, occupations which are not only exceedingly arduous, but throw a severe strain on the powers of endurance and speedily sift out the inefficient, Mr. Wilson says:—

“The vast majority of these workers are country bred and have grown to maturity in farm or outdoor work.”

Wilson, 1934.

187. Mr. Fosbroke, Medical Officer of Health to the Worcestershire County Council, whose evidence was exclusively concerned with the conditions of health in the rural district with which he is familiar, had no doubt that notwithstanding better wages, better housing, and better feeding, the physique of the agricultural labourer had deteriorated owing to the

depletion of the rural population by the exodus of the best types into the towns. In practical proof of this allegation he stated :—

“That thirty years ago it was the commonest thing for a labourer to carry two and a quarter cwt. of corn up a ladder ; now you very seldom see it. Farmers tell me the same.” Fosbroke, 6539-6543.

And again :—

“Generally the farmers say that the men are of a weaker type altogether. The more robust men go into the towns.”

188. He admitted that drunkenness and specific diseases menacing to human life and vitality were diminishing, and believed this falling off in physique solely due to the fact that the stronger types move out of the country and leave reproductivity to the poorer. He had, however, to own that he knew of no investigation into physical characters that bore out his opinion ; indeed, such facts of the kind as were obtainable pointed in the other direction. There is no difficulty in keeping up the standard of the police, and an experienced medical officer of a post office at Worcester, who had been under the impression that there was deterioration, found on going into the whole of his records that this was not so, when he took the average heights and weights and chest measurements, and so on. Fosbroke, 6536-6558.

189. This admission coming from a witness whose own beliefs it belied, seems to the Committee to furnish very cogent reasons for the institution of the Anthropometric survey which they recommend ; the condition of the rural population as a reservoir of national strength is of first-rate importance, and yet on a point so crucial the opinions of an intelligent and candid observer are liable to be upset by a fragment of scientific evidence.

190. It is with a view to correct impressions, however acquired, and to get at the bedrock of fact, that the Committee so earnestly look to the results of methodical enquiry on the lines suggested. In the confidence that by no other means can these questions be satisfactorily determined the Committee are supported by the testimony of every competent witness.

191. There cannot, however, be any controversy as to the expediency of arresting, where possible, the exodus to which such baneful results are attributed. Nothing, perhaps, would be so likely to force upon the urban communities the necessity of healing their own sores, and bringing up a healthy population within their own limits, as the cessation of the influx of vigorous bodies to take the place of the crushed and broken by the wheels of city life.

192. No great body of evidence was submitted as to how this might be done, but Mr. Fosbroke himself mentioned one most successful experiment of the Worcestershire County Council, under the Small Holdings Act, by which 147 acres of land had been purchased and resold to small holders in plots varying from two to eight acres, loans being made to them at the same time for building houses. Mr. Fosbroke also testified to the value of allotments in the same direction, in diminishing mendicancy, interesting the rural population in the cultivation of the soil, and increasing their appreciation of country life. Fosbroke, 6565-6576.

193. The Committee may here record their opinion that the school might be made a most valuable agent towards the attainment of these objects, and they are not without hope that the recent Education Act, by bringing all forms of secular instruction under a popularly elected local authority, may greatly contribute to that end.

194. It must not be supposed that they contemplate any change by which the rural school should become a less efficient agent for the equipment of the promising scholar whose manifest destiny is to seek elsewhere a more fitting field for his activities. But for one such, numbers are tempted to incur the competition of town life with no better prospect than to swell the ranks of

unskilled labour, owing to lack of interest in their home surroundings and to no effort being made to open their minds to the resources and opportunities of rural existence, and to the saner and more wholesome atmosphere that pervades it.

195. The Committee accordingly have great sympathy with the view expressed by the late M. Felix Pécaut :—

“First of all, teach the children to take an interest, not only in books, but in the life of the fields. Teach them gardening, and how to keep bees, the making of cheese, and the management of a dairy. Show them the reason of these things, their cause, and the possible improvements. Above all, in educating your little rustics do not impose an ideal from without; work your reform from within. Make your scheme of education deliberately rural; be sober, just; teach them courage, and the contempt of mere ease and well being; give them a wholesome, ample way of looking at things; instil the taste for an active life, the delight in physical energy.”

The Committee would commend this passage to the special consideration of those charged with the conduct and control of rural schools.

196. Another cause which, it is stated, tends to swell the stream of emigration towards the town, is the difficulty of obtaining cottages. Mrs. Arthur Lyttelton said, “The people cannot get cottages; they leave the country because they cannot get cottages.” The very activity of the Sanitary Authority in removing sources of mischief contributes to this result. There are many houses, according to Mr. Fosbroke, really unfit for habitation which, if you were to try to bring them up to a proper standard, you would only succeed in closing, and there would be nothing else to take their place. He went on to say he could name one district where a whole series of houses had been closed because the landlord would not do anything, and these formed part of a large estate.

Lyttelton, 5386.

Fosbroke, 6577-6589.

197. The Committee think that in such circumstances means should be found for bringing pressure to bear on the Rural Sanitary Authority for the adoption of Part III. of the Housing Act, 1890, to which end provisions would seem necessary similar to those contained in the Labourers (Ireland) Acts, 1883-1903. The Committee understand that since 1900, when the powers of Rural Authorities under the Act of 1890 were extended, only two District Councils have actually built cottages.

Thompson's
“Housing
Handbook.”

198. A statement of Mr. Rowntree's may here be given with advantage.

Rowntree, 5099.

“I am associated with a little scheme in York conducted by private enterprise where we are trying to get people to move out. We are building cottages about a mile from the boundary of the city, each cottage having a garden, and we find that we can build an artistic cottage thoroughly well built of the best materials with a large living room and scullery, bath, three good bedrooms, and a garden, to let at 4s. 6d. a week, the tenant paying rates, to show 4 per cent. on capital.”

199. There is one movement that may properly be mentioned in this connection, which, though it has not for its object the arrest of emigration townward, may have such effect.

200. The Garden City Association is designed to induce manufacturers to remove their plant and their workpeople into newly developed areas in the country where every hygienic safeguard will be applied to the aggregation of an industrial population, and that aggregation so controlled within due limits that rural conditions may be permanently associated with urban life.

201. The Committee had the advantage of hearing evidence on this subject from Mr. Ralph Neville, K.C., the chairman of the Company formed for the object, who described in detail the intentions of the Association in laying out an estate of 3,800 acres which has been bought for the purpose in the neighbourhood of Hitchin. These are briefly :—

Neville, 4771.

(a) “The provision of a minimum space, say one-tenth an acre for each family; (b) covenants against overcrowding; (c) provision of an agricultural belt around the town; (d) reasonable measures to prevent smoke—Mond gas to generate electricity, etc.; (e) in a town surrounded by

its own agricultural estate, on which intensive culture would prevail, fresh fruit, vegetables, and milk would be cheap and abundant."

202. Mr. Neville claimed for this scheme the promise of considerable support from London manufacturers, and explained its advantages in these terms :-

"1. Conditions of life for the artisan and townsman, consistent with sound health for himself, his wife, and his children. 2. Cheapness, efficiency, and sightliness resulting from the scientific laying out of the town as a whole from the outset. In connection with this head may be grouped: (a) the supply of light, water power, and heat; (b) facility of transit and communication; (c) disposal of sewage. 3. The reduction of rates by the application of the increment in the value of the lands so far as it can be secured for the benefit of the inhabitants. 4. Bringing a market to the farmers of the agricultural land, and incidentally (a) increasing the amount of labour employed upon the land by the extension of small culture. May I pause there to say that I attach an enormous deal of importance to that. It seems to me that this is the only scheme that I have come across, if it were carried out, which does offer a prospect of largely increasing the amount of labour employed upon the land. Of course, we all know the enormous amount of small produce imported into the country at the present time, and that is largely in consequence of the railway rates, the cost of handling, and the difficulty of getting the produce to the market. If you could distribute the population you would very largely increase small culture, and that means more hands on the land than there are at present. (b) Affording the agricultural labourer the advantages of town life."

Neville, 4758.

203. Mr. Neville considered that this scheme might ultimately be made the model for State enterprise, as in the event of its development prices might become prohibitive and recourse to the Lands Clauses Consolidation Act might prove the only alternative. He did not propose to call upon the State to incur any risk on its own account, but merely to legalise the action of private Companies; in fact it was nothing more than benevolent assistance to which he looked.

Neville, 4775-8.

204. The Committee wish every prosperity to the effort, and think that if the experiment is successful any such help from the State would be more than repaid by the solution the scheme offers for so many of the problems that at present perplex and hamper its action.

205. Evidence given before the Royal Commission on Physical Training (Scotland) seemed to suggest that the physique of the population in certain of the Home Counties had suffered by the outflow of debilitated types from the metropolitan area. No very conclusive confirmation of this theory was laid before the Committee, but Mr. Tweedy, in the course of what he had to say on the migration of the stronger types into the towns, expressed the opinion that a reverse process was going on.

"There is a current of the better and more adventurous people into the towns, and also a smaller reverse current of the feebler and less strong and fit, who are driven back to the land again,"

Tweedy, 3762-3.

the rural districts becoming thus both the recruiting ground and the asylum of the towns.

206. The aspect of the question discussed in this section has special features in Ireland, which require separate consideration. The witnesses from that country were emphatic in ascribing to emigration fatal effects upon the physique of the people by the withdrawal of the strongest and best types, thus leaving it to the less able-bodied to reproduce their kind and carry on the race. Dr. C. R. Browne, whose name has already been quoted as associated with that of Prof. Cunningham in certain anthropometric investigations in the West of Ireland, stated:—

"The sound and the healthy—the young men and young women—from the rural districts emigrate to America in tremendous numbers, and it is only the more enterprising and the more active that go as a rule."

Browne, 9660.

207. Dr. Kelly, the Roman Catholic Bishop of Ross, carried the point further, in describing how the conditions attending emigration at the present time had aggravated the circumstances of the case. He says:—

"There are some features of the emigration that I wish to emphasise. Emigration began a very strong flow out of Ireland in the famine times and immediately after the famine,

Kelly, 1127

but at that period it was the emigration of whole families. I know in various parts of Ireland there were whole families which went to a foreign country during the famine or immediately after the famine. That had no effect on the physique of those who remained behind—it left things *in statu quo*. Then for several years afterwards a considerable number of families did go. When the younger and more vigorous members went to America or Australia, after some years they were not satisfied until they finally took out the old father and mother and the young members of the family. So that although the numbers emigrating were larger it did not affect the physique of those remaining behind. But for a considerable number of years it has been only the strong and vigorous that go—the old people and the weaklings remain behind in Ireland. That has arisen from several causes. One of the causes is that the authorities in the United States have become particularly strict about the physical condition of the immigrants into the States; they have a stricter medical examination when the immigrants land, and if they are not found physically fit they are sent back again. Then the shipping companies, finding that they had to carry back *gratis* those emigrants, have become very particular, so that before a shipping company in Ireland will take an emigrant, the emigrant has to make a solemn declaration that he is not suffering from tuberculosis or scrofulous glands or insanity or diseases of the eyes. The emigrants very largely have to get themselves medically examined before they leave home at all. So that the present flow of emigration, though smaller in volume, has a much more serious and deleterious effect on the physical condition of the population of the country. Now as to the number of emigrants: from 1851 to 1901, 3,846,393 people emigrated in those fifty years, an average of 77,000 in the year. For the last twenty years the average would hardly reach 50,000. I could give you the particular figures, but they will not interest you. The taking away of 50,000 strong, vigorous men and women every year from the country has a very serious effect. According to the Registrar-General, of those 50,000 on an average who emigrate, 81·5 per cent. of the total emigrants are between fifteen and thirty-five years of age. Therefore of the 50,000 over 40,000 were between the ages of fifteen and thirty-five.”

Browne, 9660-9673,
9836-8.
Kelly, 11197-11201,
11211-11216.

208. By the operation of these causes the flower of the rural population is depleted, and an undue proportion of weaklings constitutes the stock from which the population of Ireland is recruited. To the effect of this both witnesses attributed a large measure of the increase in lunacy, a subject to which return will be made later under a special heading of the report.

V. ALLEGED TENDENCY OF SUPERIOR STOCKS IN ALL CLASSES TOWARDS A DIMINISHED RATE OF REPRODUCTION.

209. The alleged tendency of the superior stocks in all classes towards a diminished rate of reproduction deserves some notice as one of the possible causes of physical deterioration.

210. So far as this allegation is based upon a diminished birth-rate, a fact general in varying degrees over the whole of Western Europe, there appear in this country at all events to be certain compensating considerations, inasmuch as the Registrar-General's Returns show that among the factors in the reduced birth-rate are: (1) the raising of the age at which marriages are contracted, and (2) a diminution in the number of illegitimate births, both, it will be readily agreed, circumstances tending to the improvement rather than the deterioration of the race.

211. But a more serious view has been taken and put forward by high scientific authority, which, if correct, points to a condition of things which cannot in the long run fail to react adversely on the physical characters of the people.

212. In the Huxley lecture for 1903, Professor Karl Pearson made this announcement:—

“Looking round impassionately from the calm atmosphere of anthropology, I fear there really does exist a lack of leaders of the highest intelligence, in science, in the arts, in trade, even in politics. I do seem to see a want of intelligence in the British merchant, in the British professional man and in the British workman. I believe we have a paucity, just now, of the better intelligences to guide us, and of the moderate intelligences to be successfully guided. The only account we can give of this is that we are ceasing as a nation to breed intelligence as we did fifty to a hundred years ago. The mentally better stock in the nation is not reproducing itself at the same rate as it did of old; the less able, and the less energetic, are more fertile than the better stocks. The only remedy, if one be possible at all, is to alter the relative fertility of the good and the bad stocks in the community. Let us have a census of the effective size of families among the intellectual classes now and a comparison with the effective size of families

in the like classes in the first half of last century. You will, I feel certain, find, as in the case of recent like censuses in America, that the intellectual classes are now scarcely reproducing their own numbers, and are very far from keeping pace with the total growth of the nation. Compare in another such census the fertility of the more intelligent working man with that of the uneducated hand labourer. You will, I again feel certain, find that grave changes have taken place in relative fertility during the last forty years. We stand, I venture to think, at the commencement of an epoch which will be marked by a great dearth of ability.

* * * * *

The remedy lies first in getting the intellectual section of our nation to realize that intelligence can be aided and be trained, but no training or education can *create* it. You must breed it: that is the broad result for statecraft which flows from the equality in inheritance of the psychical and the physical characters in man."

213. The Committee have not been able to obtain decided confirmation of this view. Professor Cunningham, to whom the point was referred, said:—

"I think that the statement is a pure assumption. I do not know how we can possibly measure this supposed loss of inherited intelligence—we are dealing with inherited intelligence because all his remarks refer to inherited intelligence—and I do not think there is a single solid fact in support of such a view. I am astonished that one for whom I entertain so high an admiration as Professor Pearson should have put forward such a statement, and more especially claim for it, as he does, that it emerges from the 'calm atmosphere' which is supposed to surround the anthropologist."

Cunningham, 2270.

Adding, in reply to a further question:—

"It should be borne in mind that it is stocks and not classes which breed men of intellect. These intellectual stocks are found in all classes, high and low. No class can claim intellect as its special perquisite. This is a fortunate circumstance, seeing that the conditions which affect the degree of fertility in the higher classes are not as a rule present in the lower classes. The conditions under which genius or outstanding ability appears are peculiar and very little understood. It likewise has a residence, I believe, in no special class and very probably in no special stock. It is not improbable that the physical conditions upon which genius depends may not, in certain cases, be far removed from the domain of pathology."

Cunningham, 2271.

214. Dr. Arthur Shadwell did not think that, beyond the general fact mentioned at the outset, there was ground for the belief that the more capable among the working classes are not reproducing themselves at least in the same proportion as those less capable of putting into existence persons who are physically fit; indeed, vigour seemed to him to imply reproduction—meaning a proper fulfilment of the natural functions of which reproduction is one. On the other hand Mr. Gray, a competent witness, said:—

Shadwell, 12230-2.

"Anything which decreases the difference between the birth-rate and the death-rate among the superior classes and increases this difference among the lower classes tends to produce a progressive deterioration of the average national physique. The tendency of the population in modern industrial communities to concentrate itself in large towns and the increase of wealth appear to have the effect of reducing the birth-rate of the superior classes and of decreasing the death-rate of the inferior classes. It has been established by taking a census of the size of the families of the professional classes in the United States of America, that there has been a great decrease in the size of their families within recent times, and that these intellectual classes are now barely reproducing their numbers."

Gray, 3267.

And Sir John Gorst was impressed by the idea that the race is propagated in the greatest proportion by the least fit part of it, the restraints on marriage disappearing as you reached the most unfit.

215. The question is one which can be settled only when brought to the test of definite figures, and in view of the statements made by Professor Pearson, it might be as well if here, as in America, steps were taken to obtain, by means of a proper census, accurate information on the point.

VI. Food.

216. A striking consensus of opinion was elicited as to the effects of improper or insufficient food in determining physique, and this factor was acknowledged by every witness to be prominent among the causes to which degenerative tendencies might be assigned, though in one or two cases its relative importance was thought liable to exaggeration. It is in connection with the young and the conditions affecting their growth and development that the matter must be studied under its most serious aspect, and this will be dealt with in the succeeding section of the report, but in the meantime the Committee desire

Rees, 4283-8.

to consider the question in its general relation to the health of the people at large.

Close, 2556-2560,
2636-9, 2774-2780,
2796-2829.
Collie, 4041-4055.

Wilson, 2005-6.
Malins, 3149.
Dowding, 4884.
Ashby, 8686-9.
Garnett, 9265-9274.

217. Into the circumstances affecting this aspect of the subject, the habits of the community enter largely, and these it is obvious are open to a great variety of influences, moral, industrial, and economic. If, as one witness emphatically stated, with the support more or less marked of others, a large proportion of British housewives are tainted with incurable laziness and distaste for the obligations of domestic life, they will naturally have recourse to such expedients in providing food for their families as involve them in least trouble; if, as many contended, the effect of female labour in factory and workshop is to form bad wives and mothers, any changes in the industrial conditions of the people that increase the demand for this class of labour react upon the comfort of the home, and the economic causes that have contributed of recent years to the production of tinned foods in enormous quantities have had the effect of reducing the amount of home-cooking. Changes, moreover, in the relative cost of certain articles of food, whether brought about by economic or fiscal causes, give a direction to popular taste, which it may take generations of educative influence to correct.

218. If competent witnesses are to be believed, the progressive decrease in the price of certain articles of common consumption, such as tea, has not been without consequences of a prejudicial character. Dr. Purdon, of Belfast, is quoted by Dr. Young with entire approval in saying—

Young, 2093.

“People are living so much on tea and white bread and jam, instead of oatmeal and milk. They are using these cheap jams, and there is the white bread which is supplied so cheaply, which does not contain all the elements of nutrition. In former times the children used to live on oatmeal and butter-milk and potatoes, and the country children still live on that, but the town children live more on tea, and this white bread and jam. Dr. Purdon considers—and I quite agree with him—that that has a very decidedly deteriorating influence.”

Hutchison, 10082-6.
Cameron, 10095-7.

Evidence was, however, given that white bread properly made was as rich in nutritive properties as any form of brown bread, and the Committee must not be understood to express any opinion on the relative merits of either.

Hutchison, 9991.

219. Dr. Robert Hutchison, whose authority on this point is unquestioned, said—

“If I were asked to state the chief fault in the diet of the working classes of this country, I should say it is the excessive use of tea and bread.”

Young, 2093-4.
Cunningham, 2298.
Kelly, 11284,
11374-9.
Lyttelton, 5531.
Bostock, 7484-8.

Hutchison, 9995.

It is not so much the actual deleterious effect of tea, though on that point much evidence was given to show that in the form in which it is generally consumed it produces anaemia and neurosis, as that the money spent upon it might with much greater profit be spent on other things. Dr. Hutchison went on to say he would like to see porridge and milk substituted for bread and jam. The Bishop of Ross had the same story to tell of the Irish peasantry who have come to regard bread and tea as a higher and better class of food than potatoes and milk, or porridge and milk; a sentiment which he describes as growing more obdurate every day.

Mackenzie,
6814-6827.
Hutchison,
9957-9978.

220. Both Drs. Mackenzie and Hutchison laid great stress on balance in the formation of a scientific dietary, as well as on quantity. Dr. Hutchison explained that whereas the physiological standard for a man of average weight demands 3,500 units of energy, and for the upkeep of his body 125 grammes of the chemical substance called proteid, that is to say, nitrogenous material found in certain foods, observation showed the diet of the Edinburgh labourer deficient by 280 units of energy and by 13 grammes of proteid; while in York the average diet, according to Mr. Rowntree, was 17 per cent. below standard in energy and 29 per cent. too low in proteids. The consequence of the deficient supply of energy is to lower physical efficiency and reduce the amount of work of which the man is capable. Where the amount available for expenditure upon food is limited, it is of special importance to get the proper materials, and it is in selection that the defects of English habits come out most prominently. As one witness said—

Eccles, 10726.

“They do not understand how to provide themselves with proper food. They may have plenty of food, but it is not proper food; it is tinned food, easily got, and badly prepared.”

221. The question of tea as an article of general consumption requires a little further notice. In a statement furnished to the Committee, relating to the physical condition of the working class children in Ancoats, one of the poorest districts of Manchester, these words are used—

“Another fruitful and one of the most unsuspected causes of deterioration lies in the long ingrained habit of tea drinking at breakfast and other times in the factories and foundries of the City. Tea drinking, if it really were so, might not be harmful, but unfortunately the mixture drunk can hardly be called tea at all. More frequently than not boiling water is poured on to too large an amount of poor tea leaves and is left to stand until the tea has become almost a stew, and this dark and nasty mixture is drunk, sometimes three and four times a day, by hundreds of young lads, setting up frequently various forms of varicocoe, and is responsible for several kindred evils (excessive costiveness, etc.) We were informed by the late Chief Recruiting Officer in Manchester some time ago that a very large proportion of young men rejected for the Army had been refused on account of ailments brought about by this practice.” Appendix XXII.

222. Mr. Atkins also referred to the observations of Colonel Leetham on this point. He found that a large proportion of those rejected for enlistment were heavy tea drinkers who suffered from one form or another of varicocoe, and were, in consequence, unfitted for long marches. Atkins, 2954.

223. Dr. Hawkes' experience of female workers employed in factories and workshops in Finsbury pointed to the same abuse of tea. In the case of many of these, tea is the only thing consumed before starting to their work from places in remote parts of the suburbs. During some years' work at a large Metropolitan Dispensary, he found that 80 per cent. of women and girls who came under his notice never touched solid food till the middle of the day: pickles and vinegar were then often the staple of the “solid” meal with tea, and tea again in the afternoon; three or four pints of “tea poison” being thus absorbed in the course of the day. An enormous amount of dyspepsia is thus set up, which rapidly assumes acute forms, with the result that alcohol, at first taken to allay pain, is frequently the final refuge. Hawkes, 13110-13125.

224. With indifference as to the proper distribution of meals and gross ignorance of the right selection of foods required for them, a very general disinclination prevails to spend sufficient money upon food, even among those with ample resources. It is no doubt the case that with greater knowledge the poor might live much more cheaply than they do, but with all classes the tendency appears to be to spend as little as possible on food. Young men are said to take better care of themselves in this respect than the other sex, as they are not under the temptation to spend money in personal adornment, an object for which women will, it is said, stint themselves in food to a terrible degree, and sacrifice many other necessities of life. Hawkes, 13109, 13126-9.

225. The desire for pleasure is stated to be another fruitful cause of the withdrawal from working class budgets of money that should be devoted to the purchase of food. Mr. Eccles said—

“There is a vast deal more pleasure amongst the working classes now than there was—I mean pleasure which requires money wasted on it.” Eccles, 10725.

Other witnesses spoke of the taint with which the love of amusement was infecting large sections of the population, especially amusement in the form of cheap excitement, the desire for some sort of sensation, comparable to the aforesaid dietary of pickles and vinegar. Close, 2569.

226. Betting figures prominently among pleasures of this kind, and much privation in the homes of workmen is due to losses so incurred, while on the other hand, if they win, the family dietary is not improved, but the proceeds of the successful gamble go in drink. The taste for betting is unhappily not confined to men; women, and even children, according to Dr. Hawkes, being very ready to partake of this form of excitement. Loch, 10187-9. Hawkes, 13091-13100.

227. In estimating the causes which contribute to render the poor careless of, or indifferent to, the conditions of proper feeding, it is only fair to remember the extreme narrowness and squalor of their surroundings. Under any aspect of this multiform problem, it is difficult to keep away for long from the housing difficulty, and it enters very largely into the matter immediately under discussion; houses that were originally built for one family have, by the operation of pressure upon limited space and high rents, become occupied by several, but often only one room in the whole house contains a grate of proper service for cooking, with the result that a large number of tenements do not contain the requisite apparatus for the preparation of food, and the culinary art, if practised at all, is reduced to its crudest form of expression. Looking to the large rents that accrue to the proprietors of these premises by their sub-division into so many separate tenements, it does not seem too much to require that every tenement let for the occupation of a family should include a grate suitable for cooking.

Close, 2569.

228. The extent to which tinned food has superseded other kinds was the subject of some emphatic comment by a lady who claimed to know much of the habits of the people at home and abroad. In one farmhouse, notwithstanding the existence of a well-stocked garden, there was nothing but tinned vegetables and tinned fruits besides tinned food for breakfast and dinner. This she attributed partly to laziness and partly to ignorance. The nearer you come to London the more infamous, in her opinion, the food and cookery, young women caring for nothing but pleasure and amusement; their failure to make the home attractive was, she believed, one of the causes of the rural exodus, and while on this subject she described the conditions of squalor and discomfort with which she was familiar.

Lyttelton,
5375-5382.

229. It has already been indicated in an earlier section of this report that for the purpose of bringing home to the people the importance of properly selected and carefully prepared food there is much room for training of a socially educative character among girls and young women. Both Mrs. Close, the witness just quoted, and Mrs. Arthur Lyttelton agreed that the teaching at present imparted in schools was of little value, partly because of the unpractical character given to it by some managers, but mainly because of the early age at which children leave school. The evidence, however, on this point is somewhat conflicting. Mrs. Lyttelton was of opinion that something of a different nature was perhaps more wanted, and instanced the tenement classes that have been established in New York with some success. She would like to see the people instructed in cookery in their own houses or in kitchens fitted up like those within their experience, and employing the simplest utensils; by these means she believed they could be familiarised with processes for using up vegetable and garden stuff, which would tend to economical and wholesome living. Both she and Dr. Hutchison thought much might be done by mothers' meetings and lectures conducted on simple and practical lines, which might be supplemented, after interest had been awakened, by the distribution of leaflets, undertaken by health visitors in the employment of the local authority or acting in co-operation with it.

Lyttelton,
5391-5402,
Hutchison,
9937-9941,
9979-9981.

230. The Committee believe that all these methods are valuable: nor would the question of cost form an obstacle. In the first place it would be small, and secondly after the lapse of a few years unnecessary, as once a generation of competent mothers and housewives had been brought into being, a family tradition would be created which would contribute to preserve higher ideals of domestic comfort and better standards of life. To these ends the Committee think that a further step might be taken within the near future, and continuation classes for domestic instruction organized, at which the attendance of girls who have left school should be made obligatory twice a week during certain months of the year. The courses of instruction at such

classes should cover every branch of domestic hygiene, including the preparation of food, the practice of household cleanliness, the tendance and feeding of young children, the proper requirements of a family as to elothing, everything in short that would equip a young girl for the duties of a housewife.

231. There is no reason why a judieious discretion should not be permitted in the enforcement of compulsory attendance at such classes: girls in domestic service, for example, might properly be exempt, as the Committee were informed that comfortable homes are as a rule to be found among the working classes where the wives have had the advantage of this training; factory operatives are, on the other hand, said to make the worst wives, and to facilitate their attendance at such classes some modification of their hours of work might be introduced.

232. Further reference to the teaching of Cookery in Schools will be made in the next section, but it may be as well to lay down here the principles by which it should be guided so as to form a preparation for Continuation Classes. The teaching of cookery should be directed to the selection, economy, and preparation of the material best suited to the needs of the poorer elasses, including the requirements of young children. It should have for its object the constant repetition of those proecesses most in request in cottage households, with a view to impressing them as firmly as possible on the minds of the scholars, and care should be taken to use such apparatus and utensils as under favourable conditions are likely to be found in the houses of the poor. The syllabus of instruction should be drawn up by some one with immediate knowledge of the wants of the elass from which the children under instruction are drawn; it should vary for urban and rural schools; it should be modest in scope but thorough in application, attentive to detail, but yet based on some broad principle of domestic effectiveness; and, above all, it should provide as much praetieal work as possible, to the exclusion of mere exeursions into theory and demonstrations which tire without exciting interest. Wherever practicable the material eoked should be served and eaten in the presenee of those that have prepared it, and in all eircumstances the greatest prominence should be given to the utility of the task upon which the scholars have been engaged. For this reason no seientific terminology should be introduced into lessons on the chemistry of food, but the praetical value of the different articles of diet should be stated in the simplest and homeliest language.

233. No evidence was taken on Adulteration, but there is no donbt that the opportunities offered to the adulterator by the echange from the home production of many articles of food to supply through the channels of trade has had a deleterious effect on publie health. The Committee's attention has been ealled to the fact that the Board of Agrieulture, under the powers conferred on it by the Aet of 1899, has fixed standards of purity for milk and butter, and they cannot but think it highly expedient that the Local Government Board should, with proper expert assistance, be authorised to fix some standard, which should of eourse be a reasonably high one, for all foods and drinks. This has now to be done by the Public Analyst, subject very often to prolonged and eostly police proeeedings, and the standard arrived at necessarily differs aeeording to the views of individuals and the strength of evidence in a particular prosecution.

234. It appears to the Committee that in regard to food, as in other matters, there is something wanting to the ideal of the Local Government Board as a department of publie health, and that it is desirable that this aspect of the Board's administrative functions should receive greater attention.

235. The Committee are aware that there is nothing heroic about these remedies, but they believe that by combined pressure in the directions in-

dicated, and the enlistment of an active public sentiment in their favour, much might be done in a few years to reduce evils which are not only a standing reproach to certain classes of the nation, but constitute a serious menace to its general well-being.

VII. CONDITIONS ATTENDING LIFE OF JUVENILE POPULATION.

i. *Introductory.—Infant Mortality.*

236. Enough has already been said in the course of this Report to demonstrate the nature and extent of the waste that goes on under the name of "infant mortality," but before discussing the subject matter of the present section under certain particular aspects, the broad facts of this annual sacrifice, and some conclusions to which they point, require a little separate notice.

237. Among the more highly organised nations, where the tendency to a decrease in the birth-rate becomes more or less noticeable, the means by which infant mortality can be averted present a social problem of the first importance. Unfortunately in the volume of vital statistics, from which so many consolatory reflections are drawn, infant mortality remains a dark page. The Registrar-General in his last report lays down that "the mortality among infants and very young children has always been regarded as a valuable test of salubrity." Since the date of that report, Dr. Tatham has caused to be prepared, at the Committee's request, certain interesting statistics respecting infantile mortality in England and Wales, at two quinquennial periods a quarter of a century apart. The tables, six in number, show the mortality among male and female infants separately—(a) in town as distinguished from country; (b) among legitimate as distinguished from illegitimate infants. He has also furnished the Committee with a careful analysis of the tabular returns, and as this analysis is very full, it is only necessary to refer to the appendix, where will be found the six tables referred to, and also Dr. Tatham's remarks upon them.

Appendix V A.

238. Three facts stand out prominently as the result of this investigation: first, that infantile mortality in this country has not decreased materially during the last twenty-five years, notwithstanding that the general death-rate has fallen considerably; secondly, that the mortality among illegitimate children is enormously greater than among children born in wedlock; thirdly, that about one-half the mortality occurs in the first three months of life.

239. The evidence furnished by a variety of witnesses is confirmatory of the conclusions to which these figures point. According to Dr. Chalmers, of Glasgow, where the infant death-rate varies in different districts from 63 to 217 per 1,000 births (that for the whole city being 141), "Quite one-third of the infant deaths occur in the first four weeks of life." In certain parts of London, where the proportion of persons living in one or two-roomed tenements exceeds 35 per cent., it has already been seen that this death-rate reaches 223. Preston, with nearly half its female population occupied (30 per cent. being married), has an average rate for the ten years to 1900 of 236, Burnley of 210, and Blackburn, with a still higher percentage of married women employed, of 200. In Sheffield, where the general rate in 1901 was 201, it went up in one district to 234, and there is no doubt that, in parts of the country, during certain seasons of the year, such rates are vastly exceeded.

Chalmers, 5958.

Appendix XIII., 4.

Appendix V., 26.

Greenwood, 8233.

240. Coming to particulars illustrative of these conditions, Mr. Wilson speaking of Dundee, said: "It was quite a common thing to find a woman had had as many as thirteen children, and had lost eleven or twelve out of that number, in some cases the whole of them." Mrs. Greenwood, in a paper submitted relating to Sheffield, says: "One woman I know has buried seventeen out of eighteen children, another has had sixteen sons, of whom only six are living," though neither of them had worked out of their homes since

Wilson, 1952.

Appendix XX.

marriage. Nor, in her opinion, is such waste necessarily connected with poverty; deaths from diseases of the respiratory organs constantly occur owing to the practice of even well-to-do mothers exposing imperfectly-clad children to cold while gossiping with neighbours. Among a certain number of mothers questioned in Hanley and Longton, it appeared that 38 per cent. of the children born to them had died in infancy, and the state of the case in many Lancashire towns is certainly no better; thus in Burnley one woman is said to have had twenty children and buried sixteen, all having died between one and eleven months of age; in this case the father was a collier in good wages and the mother stayed at home. At Accrington things have become so bad as to lead to vigorous action on the part of a conference convened by the Mayor, as the result of which exhaustive enquiry into the conditions under which children are brought up has been demanded.

Appendix V., 35.

Appendix V., 49.

241. In a detailed discussion on the subject of extreme value to those who may undertake further investigation, Miss Anderson was good enough to supplement her original evidence, and the Committee fully endorse the conclusions at which she arrives. The connexion between infant mortality and (i) bad or insufficient feeding, and (ii) the overcrowding of one or two-roomed tenements, is no doubt established, but though the facts seem to point to a strong presumption that it is also connected with the employment of mothers, the information is not so complete as might be desired. Miss Anderson indicates two directions in which this information should be sought: (i) localisation of the infant mortality rates in a systematic way for particular areas in industrial towns where the workers of selected industries live; and (ii) general infant mortality rates for selected industries throughout the country.

Appendix V.

Appendix V, 25-7.

242. The Registrar-General's records, which she points out might be available in throwing light on this important question, are confined to showing the occupations of mothers of illegitimate infants, and the Committee think that it would be well if they could be expanded to show the occupations (if any) of married mothers. In this connexion the Committee desire to call attention to a point of considerable importance. At the Brussels Congress on Hygiene in 1903, the absence of any registration of still-births in Great Britain was noticed, and the consequent difficulty of obtaining the complete figures as to infant mortality. Every witness who was questioned on the subject agreed in deploring the present neglect, and the Committee are emphatically of opinion that still-births should be registered, as apart from the advantages a system of registration would have in making it easier to bring home instances of mal-practice, a knowledge of the facts as to the frequency of still-births would be of great value towards elucidating the causes of infant mortality by throwing light on the ante-natal conditions prejudicial to the survival of the foetus.

Cunningham, 2293, 4

Malins, 3142-4.

Chalmers, 5957-8.

Niven, 6422-3.

Greenwood, 8173.

243. With a view to the protection of infant life, another point arises on which it would be expedient to amend the Registration Laws. By the system under which deaths are registered, a medical certificate as to the cause of death is not absolutely essential to the registration of a death, or the burial of a dead body, although the certificate is always asked for by the Registrar. Having regard to the heavy mortality affecting children of tender years, the Committee are of opinion that the death of no child should be registered in the absence of a medical certificate as to the cause of death. Every witness who touched the subject was strongly in favour of this amendment of the law as the best means of bringing home to the careless parent the consequences of culpable neglect.

Malins, 3142-6.

Collie, 3918-3923.

Dowding, 4915-9.

Greenwood, 8171, 2.

244. In this connexion the subject of infant insurance was also considered. As to the propriety of interfering with this practice different opinions were expressed, though it was the general view that it contributed to parental negligence. On the whole it was thought that if restricted so as to cover the actual expenses of burial its principal abuses would disappear. The evidence of Sir Lambert Ormsby, President of the Royal College of

Surgeons in Ireland, upon Irish practice in this regard pointed to the prevalence of a very low view on the part of many medical men in respect of their obligations toward the security of infant life under the conditions touching insurance in that country.

245. The Committee do not think that upon the evidence they are in a position to make any definite recommendation on this point, but they consider that the operation of the practice should be carefully watched.

ii.—*Hereditary Taint.*

246. So far as the Committee are in a position to judge, the influence of heredity in the form of the transmission of any direct taint is not a considerable factor in the production of degenerates.

247. Prof. Cunningham's views, that inferior bodily characters, the result of poverty and not of vice are not transmissible, were confirmed by Dr. Mackenzie, who at the outset of his interesting evidence elaborated a distinction between inheritable characters and their environmental modifications, the result of these last being imposed on the individual by his life history and not therefore transmissible to the offspring. Dr. Eichholz was disposed to go further and sought to explain how some mysterious law of transmitted impulse made for the recuperation of each generation, the unborn child fighting strenuously for its own health at the expense of the mother and arriving in the world with a full chance of living a normal physical existence. This view he supported by the assertion that the number of children born healthy in the worst districts was very great, he himself putting it at not less than 90 per cent. Dr. Ashby thought this was only partially true, as nature too often failed in its effort, and Dr. Mackenzie would not even concede so much, as investigations into the effect of food on guinea-pigs during pregnancy had, he said, shown that the embryo suffers in greater proportion than the mother. He quoted the opinion of Dr. Noel Paton that "the nourishment of the maternal tissues seems to take precedence over the nutrition of the fœtus."

248. The Committee deemed it advisable to hear on this point Dr. Edward Malins, President of the Obstetrical Society of London, and Professor of Midwifery in the University of Birmingham, who thought the testimony of experienced persons was on the whole in accordance with the views expressed by Dr. Eichholz. He would say that from 80 to 85 per cent. of children were born physically healthy, whatever the condition of the mother might be antecedently, so far confirming the opinion that nature intends all to have a fair start. Dr. Malins kindly undertook on behalf of the Obstetrical Society to institute an enquiry among the Lying-in-Charities and Hospitals in London which should furnish information on these facts; this enquiry is unfortunately not complete. The Committee were, however, supplied by the courtesy of Dr. Eichholz with evidence which did tend to establish this conclusion from the Medical Officers working for the Royal Maternity Charity, and from the Paddington and Kensington Workhouse Infirmarys.

249. The Committee cannot ignore these opinions though it may well be that the depressing effects of the life-struggle on parents are, nevertheless, in some measure transmitted to the offspring. At any rate some vulnerability towards disease may co-exist with a superficially healthy appearance, and granted unfavourable environment the seeds of degeneration are not long in producing a rank harvest. The consolation of the doctrine lies in the encouragement it gives to working for the removal of the causes which are prejudicial to the health of each successive generation, an encouragement which is immensely strengthened by the concurrent testimony of all concerned as to the immediate effect upon growth and development brought about by the withdrawal of even the most unpromising material from noxious surroundings.

Mackenzie, 6742-6781, 6900-2.

Eichholz, 556-560.

Ashby, 8671-7

Malins, 3123-9, 3203-5.

250. It must be remembered that even Professor Cunningham, while denying the influence of heredity in most cases, expressed the firm belief that diseases such as syphilis and alcoholism transmit their effects to the third and fourth generation—and in this opinion the Committee fully concur. Cunningham, 2210.

iii.—*Employment of Mothers late in Pregnancy and too soon after Childbirth.*

251. A very general agreement was expressed that the factory employment of mothers had a bad effect on the offspring, both direct and indirect, but opinions differed as to the extent of the evil and the practical steps that could be taken to remedy it. It is to be found in the most acute form in the Pottery districts and in textile mills. Speaking from an extensive experience of the Potteries, Miss Garnett declared that married women's labour was really the root of all the mischief; the children are born very weakly they are improperly fed, and placed in the charge of incapable people. She admitted the impossibility of interference by any general prohibition, but thought the period during which women are not permitted to return to work after their confinement should be extended. Drs. Scott and Young, certifying factory surgeons of long standing, took the same view. Miss Anderson acknowledged the evil in evidence, but her appreciation of all the conditions of the problem led her to pause before subscribing to the prudence of any legislative change. As the result of further consideration the Committee were favoured with the Memorandum already described, in which the whole subject is discussed with a fulness of detail and wealth of information that have rendered it unnecessary to go further for the basis of the following paragraphs. Garnett, 9015-9034, 9116-9122, 9345-9367.

Anderson 1590-1613
Appendix V.

252. The existing law requires that no occupier of a factory shall knowingly allow a woman to be employed within four weeks after she has given birth to a child. Thus no legal offence arises unless the occupier, with a full knowledge of the facts, is yet responsible for the employment, a situation which, in the ordinary conditions attending factory labour, it is almost impossible to prove. It is needless to say that in these circumstances prosecutions are infrequent or abortive, and though there may be a pretty uniform observation of the law, cases in which it is broken are numerous in some districts, amounting it is thought to general evasion. Appendix V., 3.

253. It has already been indicated that the extent to which the mothers of young children are employed in factories can only be roughly determined, nor are the means forthcoming for an accurate judgment of its effects on infant mortality, but the enquiries of three members of Miss Anderson's staff—in Dundee (jute), Preston, Burnley, and Blackburn (cotton), Hanley and Longton (potteries)—did lead to their noting in those towns "A very striking degree and amount of ignorance of maternal duties, especially of feeding and cleanliness." In Blackburn, Preston, and Burnley it is estimated that of women employed, 37·9 per cent., 30·5 per cent., and 33·5 per cent. respectively are married or widowed. In the several towns of the Pottery district the proportion varies from 10 to 20 per cent. The three ladies quoted by Miss Anderson were unanimous as to the stress and strain involved in the "employment of women from girlhood, all through married life, and through child-bearing"; the decreasing physical capacity of the child-bearing woman brings her at last some relief at the hands of the manager of the mill, and she is sent away, often to take up the equally unsuitable occupation of charwoman or house-scrubber. In this connection Miss Paterson says— Appendix V., 14.
Appendix V., 16.

"Great harm is done and suffering occasioned to the women by their remaining at work too long before confinement as well as by their returning too soon after it. Factory managers, doctors, health visitors, and workers themselves are agreed that the four weeks absence is often shortened to three or even less." Appendix V., 31.

254. As an instance of the lack of sufficient care for the children that follows, a subject on which she was able to form very definite ideas, she gave particulars of 144 cases where the health visitors found two, three

Appendix V., 32.

or more very young children left alone in the house (in some cases locked in) while the mother was at the mill, with only such food as the mother could prepare over night or in the early morning before leaving. Definite arrangements with another woman to take charge of the children seem less common in Dundee than in Lancashire and the Potteries. It was stated

Appendix V., 34.

by two doctors in Preston that a large number of premature births were attributable to continued work in the mill during pregnancy, and members of the profession in Blackburn held that the evil of the employment of women during that period was aggravated by their desire to earn as much as possible before they are forced to give up work. In Preston it is found that factory operatives are in the habit of nursing their babies at meal times, and before and after the day's work at the mill; but in Burnley this is exceptional, while greater ignorance and unintentional cruelty in the giving of unsuitable food seem to be common. In the Potteries Miss Martindale notes the effects on infant life of improper feeding and the "appalling ignorance and objections to being taught."

Appendix V., 35.

255. Coming to the causes that render the labour of mothers necessary, Miss Anderson enumerated them thus:

Appendix V., 37.

- (i.) Death of father, or lack of employment, or inadequacy of father's wage.
- (ii.) Desertion of father.
- (iii.) Fear on mother's part of loss of future work in factory.
- (iv.) Preference for factory over domestic work.

Miss Anderson points out that some of these causes may be traced to the concentration of women's industries in districts where there is absence of men's occupations, and, so far as these are due to economic and social circumstances not immediately alterable, she considers that more may be effected, and the operation attended with fewer counterbalancing disadvantages, by working towards the mitigation of the results of the employment of mothers than by any attempted diversion thereof on a large scale. The great majority of cases may be said to fall under one or other of the three sub-divisions in class (i.).

256. Dundee and Preston resemble each other in scarcity of employment for men.

Appendix V. 40.

Miss Squire, speaking of Preston, says,

"The men are said to look out for a wife who is a four loom weaver, and they have the reputation of being lazy."

It was also found that the husbands of cotton operatives were chiefly employed as labourers in intermittent work, while

"in all cases when the husband was in regular employment as weaver, platelayer, painter, bricklayer, etc., the one wage was insufficient to keep the family at the standard of life they expect."

It must be admitted that the standard is somewhat exacting, as the husband insists on having his spending money whatever the household needs may be, and, therefore, the mother's wage, over which she has control herself, proves a valuable accessory.

Appendix V., 45.

257. Miss Squire proceeds,

"The general opinion, among those best qualified to judge, seems to be that the working classes are well off, and that if it was not for the proverbial improvidence of the cotton operatives there would be no poverty. Still, it seems to be the practice for the women to continue their work in the mill as near to the time of confinement as the manager will allow; always the same complaint being made that he had to keep watch and tell the woman that she must cease work."

Appendix V., 47.

258. In Blackburn, Miss Squire finds a high standard of life among textile operatives; comfortable homes, and money to spend on excursions,

holidays and amusements, are considered essential. Of Burnley, it is said that

“The infants are of a miserable, debased type in a large number of cases. Whereas, in Preston, the important point seems to be that the infants should be properly fed, in Burnley it seems as if no amount of nourishment could build up a healthy child.” Appendix V., 48.

Poverty and desertion are there the causes of the mother's early return.

259. In the Potteries the lack of regular employment for men is a serious element in the situation. According to Miss Martindale, the early return to work is in very many cases prompted by necessity, but she goes on to say, Appendix V., 50.

“It is impossible not to be impressed by the universal preference amongst the women for factory over domestic life, and how depressed and out of health they became if they were obliged to remain at home.”

Analysing the causes of this preference for factory life, Miss Martindale adds :

“Surprising as this appears at first, it becomes less so on consideration. At 13 years of age the majority of these women would have begun to work in a factory, to handle their own earnings, to mix with a large number of people with all the excitement and gossip of factory life. They would thus in most cases grow up entirely ignorant of everything pertaining to domesticity. After marriage, therefore, it is hardly probable that they would willingly relinquish this life to undertake work of which they are in so large measure ignorant, and which is robbed of all that is to them pleasant and exciting. Until as girls they have been taught to find a pleasure in domestic work, and until there is a greater supply of healthy and suitable recreations and amusements in the reach of all women, to counteract the prevailing squalor and gloom of these Pottery towns, it is useless to expect them to relinquish factory life.”

260. The Committee have no doubt that the employment of mothers in factories is attended by evil consequences both to themselves and their children, and they would gladly see it diminished if not altogether discontinued ; but in approaching a discussion of the remedies that have been suggested, they are convinced of the necessity of extreme caution. They have been reminded of (1) the enormous practical difficulties that would accompany any sort of legal prohibition : (2) the existence of a considerable number of unmarried mothers without means of support, whose main chance of rescue from degradation lies in the fact that they desire to labour and know they ought to labour in support of their infants ; and (3) the presence in certain populous industrial districts of a large proportion of married mothers who are necessarily the chief breadwinners of their families, and the danger that, if deprived of the opportunity of earning a wage, means will be taken to prevent these families coming into existence ; they also feel that the right of married women to the fruits of their own labour, secured to them under the Married Women's Property Act, ought not to be lightly interfered with. Appendix V, 52.

261. Even Miss Garnett, who was most strenuous in condemning the whole practice, admitted that the time was not ripe for prohibition. Among other witnesses, Dr. Scott would prohibit all employment of married women in factories, unless the children are absolutely dependent on their wages. In that case he thought the municipality must make provision for the care of the children while the mother is at work. Mr. Wilson and Dr. Malins agreed that there would then be good cause for such assistance. Dr. Young would extend the period of exemption to two months before confinement (or three in some cases) and three months afterwards. (In Switzerland the period is two months both before and after confinement.) Dr. Ashby would extend it as far as possible, but saw the practical difficulty in regard to pregnancy that the exact date of the child's birth is not easy to predict, and that this would be a loophole of evasion for both employer and employed. He instanced illegitimate children as suffering most, because the mother so often has to go to work. He also discussed the question of licensed women for the care of infants when mothers went to work, but preferred the crèche. Garnett, 9118.
Scott, 1834-8,
1888-1901.
Wilson, 2039-2042.
Malins, 3210-2.
Young 2169-2172.
Ashby 8678-8689,
8785-6,
8800-9.

262. The Committee are not able to recommend prohibition, nor do they advocate any uniform extension of the period, but it does seem to them that the application of the law, as it stands, might be made more regular and elastic.

The extension of the period at present prescribed, which is less than that in many European countries, would probably be made the occasion for more wholesale evasion, and the Committee think the alternative lies between (a) maintaining a hard and fast line and placing upon the employer the burden of obtaining proof that the required period has elapsed since the confinement of the woman he employs, and (b) exacting in all cases of pregnant or recently delivered woman (1) a medical certificate from an appointed person, say the Certifying Surgeon of the district, that they can be employed without serious prejudice to their physical well-being, and (2) proof that in their absence reasonable provision is made for the care of their infants, which might take the form of a crèche established under municipal or private management, or be secured by the recognition for the purpose of a duly licensed body of women. The latter plan seems open to the least objection, provided a proper licence is assured, but the two might subsist side by side.

Appendix V, 55.

263. Another source of amelioration is suggested by Miss Anderson, who notes the general neglect of voluntary agencies for helping mothers before, during and after confinement, to take care of infant life, even where such agencies exist. In Lancashire, where, it is said, insurances of all kinds abound, no form of provident society exists to which women could contribute while still able to earn wages, nor has any attempt been made to organize a maternity fund, towards which both employer and employed might contribute. The existence of such a fund at Mulhausen is said to have resulted in the reduction of infant mortality by half. The Committee would strongly urge the adoption of such methods of voluntary assistance, and think it not improbable that endowments may be found in many places which could be utilised as the nucleus for a considerable amount of charitable effort in this direction.

iv.—*Decrease in Breast Feeding—Defective Milk Supply.*

264. A decrease at the present time in breast feeding is generally admitted to be the case in all classes of society, at any rate in the urban districts. With the poor, it seems fair to say that their failure in this respect is due to inability rather than unwillingness, especially in view of the fact that as long as it can be properly continued breast feeding is much the most economical way of nourishing an infant. It is, however, no doubt, the case that women are often unwilling to nurse their own children, because it interferes with their going to work, and witnesses were found to say that in the absence of such excuse mothers were often neglectful of their duty from sheer indifference or weariness.

Hutchison, 9909,
10018.

Malins, 3131-4.
Smyth, 1239.
Collie, 3909.

Cunningham, 2198-9

265. The heavy rate of infant mortality is said to be in large part due to the fact that infants are now-a-days seldom fed from the breast, in which connection Mrs. Watt Smyth gave some figures for the sixteen months ending January 1st, 1902, derived from one of the institutions for the *Surveillance de Nourissons*, maintained by the *Conseil-Général de la Seine* and administered by the *Assistance Publique* of Paris, wherein it appears that among the children breast fed, being 45·4 per cent. of the whole number, the death rate was 2·6 per cent.; among 35 per cent. artificially fed the proportion was 10 per cent.; and among 19·6 per cent. with mixed feeding, 6 per cent.

266. It was also stated by the same witness that in Liverpool, Dr. Hope, the Medical Officer of Health, made an inquiry a few years ago and found that for every death from diarrhoea which occurred among breast-fed infants under 6 months old there were 15 among those fed partly at the breast and partly on artificial food, and 22 among infants fed entirely on artificial food.

267. It must not, however, be understood that the neglect is universal; on the contrary, Mrs. Lyttelton said that country women usually suckled their

Lyttelton, 5366.

own children, with which statement Mr. Fosbroke and Mrs. Watt Smyth appeared to agree; though with country women the process is often continued too long in the mistaken belief that it keeps off pregnancy. Mrs. Greenwood gave some figures showing that out of 725 infants visited in Sheffield nearly 79 per cent. were being fed from the breast alone; but these infants were visited within a week of registration, and it is therefore doubtful for how long they were so fed. Moreover, a medical officer in that town quoted in a lecture by Dr. Jones and referred to in his evidence, has stated that only one in eight of infants born in Sheffield is brought up at the breast. Dr. Eustace Smith, to whom this difference of opinion was submitted, said, "Sometimes they nurse their children for a month or two," and was quite definite that a very small proportion of babies brought to the East London Children's Hospital are suckled. In Dr. Hutchison's opinion it hardly counts unless a child is suckled for at least six months. Dr. Ashby said the women try to suckle their children; but if they are going to work they soon stop. It was on this account that Mrs. Watt Smyth strongly advocated the extension of the period within which a woman was allowed to return to work, as in her view a limit of three months would give a woman time to take an interest in the development of the child, whereas if she feels she must go back in a month she does not deem it worth while.

Fosbroke, 6623.

Greenwood 8177.

Jones, 10889.

Smith, 8435.

Hutchison, 9912,
10019.
Ashby, 8708.

Smyth, 1225.

268. But whatever may be the case in certain districts, or whatever may be the cause, it is quite certain that there is a great decrease in breast feeding, notably in towns, testified to by a number of the most competent witnesses. The evidence of Dr. Hutchison in this regard is of special interest. He says that the fact is common to all highly civilised people, but the medical profession are in ignorance as to reasons for this disability of mothers. He notes a better state of things among the Jews, which may be connected with the abstinence from labour of Jewish mothers. Sir Charles Cameron appeared to think the Irish better off in this respect, but he admitted that the milk was not of good quality and that many of the women were taking a great deal of whiskey. On the other hand, Dr. Kelly, Bishop of Ross, declares, "The practice (of suckling) is fast dying out," and Dr. Browne testifies to its disappearance in manufacturing towns.

Kelly, 11247.

Browne, 9690.

269. It is obvious that in these circumstances the question of the possible alternatives to breast feeding becomes of the greatest importance. The Committee are informed by the highest authority that modified cow's milk is by far the best. The patent foods so largely in use are stated by Dr. Hutchison to present certain marked inferiorities to milk as a means of nourishing children: most of these are deficient in fat, and a considerable number contain unaltered starch, which, being incapable of digestion, produces diarrhoea and irritation of the bowels, a condition which naturally leads to impairment of growth and consequently defective physique.

Hutchison, 9920-3.

270. It must not, however, be supposed that these foods enter into competition with cow's milk among the poor, as, in fact, they are more expensive and beyond their reach except in a very diluted form. The substitutes they employ are still more deficient in nutritious properties, and much more favourable to the production of every variety of intestinal disorder. In most cases tinned milk is the only expedient. This in a proper state and of a good kind is not deleterious, and there are obvious reasons of convenience why it should be preferred; but at its best, judged by its value as food, it is three times as expensive as cow's milk and is often of inferior quality and always liable to pollution. The vessel once opened is exposed to every kind of bacterial contamination, and by the time it is exhausted all sorts of foul ingredients have been conveyed into the child's system. When tinned milk is not in use, highly diluted and probably sour cow's milk, in which groats or bread have been soaked, is employed instead. It is needless to say that in such circumstances the worst effects of mal-nutrition make themselves manifest very soon, and the condition of the unfortunate child is not improved by the practice begun very early in its career of encouraging it to eat whatever may be included in its parents' dietary.

Defective Milk Supply.

271. The importance of being able to obtain a sufficient supply of good cow's milk being thus emphasised, the Committee are confronted with a great deal of evidence to the effect that it is next to impossible to ensure such a supply, at any rate to the poorer classes. It is not a little curious that, while people in the rural districts have a growing difficulty in obtaining milk because it pays better to send it into the towns, the great mass of the dwellers in towns are in no better case than formerly. There is in fact a great lack of organisation in the distribution of this prime necessity, a great want of knowledge as to its value, and very inadequate means for its preservation from the most obvious sources of pollution. Mrs. Watt Smyth called special attention to this subject, and her evidence was full of the strongest allegations against the cleanliness of the persons from whom the milk comes and of the processes by which it is treated. Thus—

Smyth, 1247.

"It is a fact that the milk when it arrives in large towns has been proved to be putrescent. I mean it goes through so many stages, from the country farm to the towns, that it is badly contaminated. But that is not the worst of it. The farms are in such a filthy condition that the milk when it leaves the farm is already poisonous. I have been over many farms, and the conclusion one must come to is that at the bottom of the whole question is the filth of the farms."

And again—

Smyth, 1347.

"The cows are in the most filthy condition, standing in manure, and the cow-sheds, the stalls, are covered with manure; and outside the yards are heaped up with it. There is no proper ventilation, the milkers are filthy, their hands and clothes are dirty, and their vessels very often are dirty."

Smyth, 1350.

Smyth, 1348.

Malins, 3220, 3235.

Fosbroke, 6731-9.

Vincent, 12070.

272. In another case Mrs. Smyth detected hair and fæces in the milk, which the boy in charge took quite as a matter of course because it came off the cow. These allegations Mrs. Smyth declined to admit were only applicable to a few farms. On the contrary she believed that the great majority of farms from which the milk supply was obtained were of this character. It is only fair to say that from his experience at Birmingham Dr. Malins was not prepared to support Mrs. Smyth's indictment, but he could not state whether any precautions were systematically taken to see that the dairies from which the city received its supply were under proper supervision; Mr. Fosbroke's evidence that the County Council of Worcestershire had been urging this duty on the District Councils implied the presence of much neglect, and Dr. Ralph Vincent's description of the steps taken in the model farm connected with the Infants' Hospital at Hampstead indicated with much clearness the deficiencies of most farms in this respect. These conclusions were borne out by a report on the milk supply of Finsbury in the course of an inquiry conducted by Dr. Newman, the Medical Officer of Health.

The report runs,

"There is evidence to prove that as a general rule the country cowsheds from which the milk is derived are ill-lit, over-crowded, badly ventilated, and badly drained. There is little or no guarantee that the milk is derived from healthy cows."

273. The remedies for this state of things are, first, the general application of the permissive provisions of the existing law under the Contagious Diseases (Animals) Act, 1878. The Local Government Board may make orders for:—

(i) Registration of cowkeepers, dairymen, etc.

(ii) Inspection of cattle in dairies, and for prescribing and regulating the lighting, ventilation, cleansing, drainage and water supply of dairies and cowsheds.

(iii.) Securing the cleanliness of milk stores, milk shops, and vessels.

(iv.) Prescribing precautions to be taken for protecting milk against infection or contamination.

(v.) Authorizing a Local Authority to make such orders.

The Committee think that in the event of the Local Authority not making such orders the Local Government Board, who, it is understood, have already issued model bye-laws for urban and rural districts respectively, should make the orders themselves ; or if it was deemed preferable to bring indirect pressure to bear, the power now enjoyed by a local authority under the Infectious Diseases (Prevention) Act, 1890, for prohibiting the supply of milk from an infected dairy might be extended so as to cover exclusion of supply from areas where provisions of the Contagious Diseases (Animals) Act are not in operation. Under either alternative the County Council should be empowered to act in default of the Local Authority, and in either case it should be the duty of the Local Government Board to intervene in the ultimate resort.

274. Nor are the risks of contamination at an end when the milk has left the farm. Owing to the distance from which the supply is drawn and the number of hands through which it passes, these are numerous ; to quote Mrs. Smyth again :

“Dr. Priestly, medical officer of health for Lambeth, has stated that much of the milk consumed in the poorer quarters is three or four days old, and probably Lambeth is not the only district in which this state of affairs exists. The milk has passed through the hands of three or four dealers by each of whom a dose of some preservative has been added in order to prevent the actual onset of decomposition. The mischief is caused by the many hands through which it passes. If there were some system of collecting milk in the country and sending it straight to milk depots it would be better.” Smyth, 1267.

In Dr. Newman's report it is stated under this head :

“52 per cent. of the milk shops in the Borough were found to have one or more sanitary defects, and 73 per cent. of the milk vendors fail to keep their milk covered or protected from dust. Further, 48 per cent. of the shops where milk is sold are small general dealers, doing a daily milk trade of only a few quarts or pints.”

And again,

“There is reason to believe that Finsbury milk and milk generally in London contains great bacterial contamination. Four unpreserved samples of milk, selected from two good class and two poor class milk shops, gave an average of 2,370,000 bacteria per cubic centimetre, which is about 2,000,000 bacteria in excess of what should be present in good fresh milk. Of 25 milks examined in Finsbury in 1903, 32 per cent. contained *pus* and 40 per cent. contained dirt.”

275. Things may be better or worse in selected localities, but the Committee have no reason to think this is an overstated account of the general condition. In proof of the extreme ignorance that prevails even among the better class of dealers as to the precautions that should be taken to preserve the purity of milk, Dr. Vincent instanced the practice of a prominent dairy company in keeping a wide bowl of milk standing on the counter of a shop in the West End within a few yards of a continuous and dense traffic. This they label “Pure Milk,” whereas from the wide surface exposed to contamination it is imbibing the maximum of bacterial poison, and in Dr. Vincent's emphatic words “should be pitched down the drain.” “It is perfectly incredible,” he adds, “how milk companies could act in this way.” Vincent, 12066

276. The evil is not at an end when the milk reaches the home of the consumer. A pure supply may be rendered injurious by dirt in the house, the proximity of contaminating articles, the general ignorance, in fact, that prevails as to how milk should be stored and the conditions under which it is fit for use. One fertile source of contamination was said to be the use of the feeding-bottle with a long indiarubber tube, which it was impossible to keep clean. Dr. Hutchison would like to see the use of this tube made illegal, as he believes it is in France, and is certainly in some of the States of America. Hutchison, 9984-9.

277. The real remedy, however, is to be sought in that social education already described, by means of which, at first in the school and afterwards in continuation classes, and finally by the fostering care of philanthropic and municipal agencies, the foundations of maternal competence may be laid. The Committee had their attention called to a document issued by the Health Department of the Corporation of Sheffield, entitled “Advice on the Feeding and Rearing of Infants,” and to another emanating from the Wakefield and Appendix XVIII.

District Sanitary Aid Society, "How to Rear a Healthy Baby," either of which might be made the model of similar admonition elsewhere. Dr. Hutchison thought systematic instruction of mothers in the methods of feeding and rearing of the first importance; he believed they were in most cases willing to learn, and recommended the issue in all towns of leaflets by the Registrar on the registration of every infant, as was said to be the practice in France, and as had been done for twenty years in Glasgow.

Smith, 8458-8463.

Hutchison, 9925-9.

278. The crux of the question lies in the steps that should be taken to bring an adequate supply of pure milk within the reach of the poorer classes. The Committee have had before them schemes for the organisation of this supply by municipal action, the agency of hospitals or charitable societies, or some better adaptation of trade methods. A good account of the system adopted at Battersea was given by Mr. Atkins. It is claimed for it that it has already had an effect in reducing infant mortality, and will be self-supporting when its area of operation is sufficiently extended. The securities taken against contamination seem adequate. Mrs. Smyth described the methods pursued in Paris, both commercially, by an organization under the direction of Dr. H. de Rothschild, and municipally by the *Assistance Publique*. Both these work under medical supervision, and their operations include the periodical weighing of the children fed thereby. In Liverpool the scheme is directed towards "the supply of sterilised milk to poor people at a nominal price," and it was deemed by Dr. Young that the municipality had thus reduced very largely infantile mortality from diarrhoea in the summer. Dr. Collie was an advocate of such a system and thought it could be made self-supporting, and Dr. Chalmers explained the steps that were being taken to organize it in Glasgow. On the other hand Dr. Niven was rather inclined to deprecate municipal activity in such a field, and Dr. Ashby held that the municipality weakened their position as censor if they assumed the functions of trader, and thought much could be done by helping the people to help themselves and by improving the commercial channels of supply. Dr. Eustace Smith informed the Committee that an attempt was about to be made by the East London Children's Hospital to organise a proper milk supply. The milk will be brought from farms kept under strict supervision and it will be kept under supervision the whole time it is in the hands of the Hospital authorities, and will be sold as cheaply as possible. Dr. Smith believes that the scheme will be self-supporting, and anticipates a large sale owing to the willingness of parents to take advantage of the instruction given by the hospital in the shape of leaflets. Dr. Hutchison, however, saw a good deal of difficulty in the general adoption of such a system. Hospitals were for the most part non-local, and he would rather look to improvement in the ordinary commercial supply. On the whole it seemed to him that concerted action might be brought about in which municipalities, hospitals, and charitable agencies might all bear a part and prepare the way for the introduction of better commercial methods.

279. It is of great importance, with a view to enforcing responsibility and guarding against contamination, that the milk supply should pass through as few hands as possible. It has already been shown that milk vendors are often general dealers whose sale of milk is confined to a few quarts, and in the interests of public health this practice should cease. With the formation of a sufficient number of milk depôts, the machinery of registration and of municipal health visitors could be utilised to bring to the knowledge of mothers of young children where supplies of milk could be obtained, and to the spread of this knowledge hospitals and infirmaries in the district could contribute their share. By these means the Committee believe the difficulty of milk supply could be got over without recourse to direct municipal action, but they think that in all improvement Bills promoted by Local Authorities, the insertion of provisions dealing with the milk supply within their area should be insisted on.

280. The problem of providing *ab initio* for the purity of the milk is not so easy: most of the witnesses appeared to think that sterilisation did secure this object; but Dr. Vincent, who gave evidence late in the enquiry,

Vincent 12061-4,
12137-12143.

condemned the practice *in toto* on the ground that it reduced the nutritive value of milk to a minimum, and was calculated to cause a scorbutic condition. The Committee do not feel themselves qualified to determine a point on which professional opinion is so acutely divided, but having regard to its importance and the very general belief that by means of sterilisation the best conditions under which a supply can be organised are secured, they think that it should be made the subject of a special investigation by a small body of experts. They have no doubt, however, that Dr. Ashby and Dr. Vincent are right in holding that the first step to be taken with milk on its leaving the cow is prompt refrigeration to a temperature of 40° Fahrenheit.

Ashby, 8874.
Vincent, 12073.

281. It is obvious that the enforcement of this practice would stand in the way of the small cow-keeper sending his milk to the agents of the great collectors who serve the urban market, but looking to the alleged scarcity of milk for the consumption of the poor in rural districts, it might be a good thing if these persons were confined to the sale of what they produce among their own neighbours, where it would be rapidly consumed, and the supply of the urban market thus left in the hands of producers with sufficient capital to take a precaution which the Committee believe to be an essential preliminary to the protection of milk from pollution.

v. *Parental Ignorance and Neglect.*

282. These failings have not escaped illustration in the preceding subdivisions of this section; unfortunately they are not confined to the subject-matter therein treated, but touch every aspect of child-life. The fact of ignorance and neglect on the part of parents is undisputed, and is testified to by a crowd of witnesses. It is not, perhaps, easy to determine how much of this neglect springs from ignorance and how much from callousness; observers are indisposed to take a view that would appear to press hardly on persons the conditions of whose lives are unfavourable to the development of the domestic virtues, and many testify to the willingness of the poor to learn and to a tractable disposition in contact with judiciously tendered advice; but, at the same time, there is no lack of evidence of increasing carelessness and deficient sense of responsibility among the younger women of the present day, which is a discouraging sign, especially as these features are said to exhibit themselves in the country as well as in the towns. Apart from the effects of extreme poverty, alcoholism and love of ease are contributory causes on which many witnesses laid stress. Mr. Booth admitted a growing disinclination to attend to domestic duties, and Mrs. Mackenzie's description of certain classes in the Canongate, Edinburgh, pointed to a degree of indifference which amounted to positive inhumanity.

Booth, 1087-8.

Mrs. Mackenzie,
7034.

283. In certain overt directions, the disastrous consequences of this neglect are very palpable. Thus overlaying is described as frequent, and is the result of carelessness or drunkenness, the cases generally occurring between Friday night and Monday morning. The practice of placing a small child in bed with older people is, perhaps, sometimes defensible on the score of warmth, but it should be discouraged, and health visitors might properly point out its dangers, while, at the same time, indicating that next to no cost would be incurred by providing a suitable box in which a child could sleep with safety.

(a) *Overlaying.*

Atkins, 3002-5.
Malins, 3147.
Greenwood, 8165-7.
Smith, 8507-8

284. The instances in which children are left alone in a room with a fire unprotected by any guard are said to be very numerous. During the years 1899 and 1900 inquests were held on the bodies of 1,684 young children whose deaths had resulted from burning, and in 1,425 of these cases, the fire which caused the accident was unprotected by a guard. Mrs. Greenwood stated that in the leaflets distributed in Sheffield, "On the Care of Infants and Children," warning was given on this point, showing the picture of a fire-guard, but she had never known one bought as the result of the warning, and thought they could only be brought into use by the inclusion of provisions in the building bye-laws.

(b) *Fire.*

Booth, 1008.

Greenwood, 8163-4.

(c) *Ventilation.*Lyttelton, 5454-6,
5480-5.Ashby, 8700;
8723-5.(d) *Want of Cleanliness.*(e) *Insufficient Clothing.*

Deverell, 7998-9.

285. The lack of ventilation and ignorance of the value of keeping windows open—not only in schools but at home—has been mentioned as having a very deleterious effect on child-life. Thus Mrs. Lyttelton said that “not one person in a thousand understands the value of fresh air,” and she thinks cottagers get less air than they used because the cottages are less draughty. Dr. Ashby alluded to bad ventilation in the houses as a particular in which mothering was deficient, and classed it with want of cleanliness and badly fitting and insufficient clothing. In this last connection Miss Deverell, Inspector of Schools, confirmed the remark of Mr. Booth that the poor did very little mending, by stating that in many households there is no such thing as a needle and cotton, and mothers made no attempt to mend their children’s clothes. Weight, in their opinion, is the only criterion of warmth: children are often without underclothing at all, and their outside garments are both ragged and filthy.

(f) *“Comforters.”*Young, 2117.
Greenwood, 8197-
8200.
Ashby, 8907-8911;
8918.
Garnett, 9211-4.

286. One of the most noxious practices described is the habit of giving infants india-rubber nipples to suck; this habit appears to be very common, and was most strongly deprecated. It has the effect of causing contraction of the roof of the mouth and the air passages at the back of the nose, which is prejudicial to proper breathing, and is also instrumental in introducing foul germs into the system by virtue of the dirt accumulated. The first of these evils was illustrated by Dr. Young, the second by a number of witnesses.

(g) *Sleeplessness.*

Rees, 4418.

Mackenzie, 6835-8.

287. Much evil arises from the chronic sleeplessness fostered by the conditions of life so largely prevalent. The lack of sleep from which town children suffer was mentioned by several witnesses as a cause of degeneration. “One of the great contributory causes of physical deterioration,” says Mr. Edwards Rees, “is the fact that the children do not get enough sleep.” Children in the slums are habitually up till very late at night. This is attributed by Mr. Edwards Rees more to parental carelessness than to the fact that the children would not go to sleep, even if they were put to bed, by reason of the noise and overcrowding, and so on; “for,” he says, “children easily get accustomed to such surroundings;” but the conditions under which many of them are compelled to exist must render sleep very troubled and broken. Dr. Mackenzie attributes to sleeplessness the prevalence of irritability and nervous exhaustion.

(h) *Indifference to slight ailments.*

Deverell, 8006.

(i) *Improvvidence.*

Loch, 10185-9.

Chalmers, 6051.

288. Very little knowledge is moreover found among mothers of the slighter ailments to which children are prone, and precautionary measures are rarely taken until they have reached an aggravated stage. The improvidence of the poor is another circumstance responsible for much juvenile suffering. Money, when plentiful, is spent on luxuries or absorbed in the pursuit of pleasure, and when the pinch comes the children are the first to feel it. Mr. Loch drew attention to the higher rate of wages and also to the decrease of child pauperism; but he said that “when the higher wage has not been combined with a better power of using the wage the children have not come off better,” and Dr. Chalmers stated “that there is no relation between the total earnings of the individual householder and the quantity or the quality of the food going into the household.”

vi.—*Feeding wrong in time, in kind, and proportion.*

Eichholz, 436, 7.

289. The general aspect of the feeding problem is discussed under a previous heading of the report, and the questions of milk for infants and feeding of children at schools under sub-sections of this heading, but looking to the extreme importance of nutrition in relation to the young, the subject requires some special notice among the factors that make for juvenile degeneracy. With the single exception of Mr. Edwards Rees, whose panacea is fresh air, all the witnesses concurred in claiming the first place for food. “Food,” says Dr. Eichholz, “is the point about which turns the whole problem of degeneracy.” There is, first, the want of food, secondly, the irregularity in the way in which children get their meals, and, thirdly, the non-suitability of the food when they

get it; and these three circumstances, want of food, irregularity and unsuitability of food, taken together, are, in his opinion, the determining cause of degeneracy in children. Describing their dietary, he says:

"Their breakfasts are nominally bread and tea, and the dinner nothing but what a copper can purchase at the local fried fish shops, where the most inferior kinds of fish are fried in reeking cotton-seed oil, and this often supplemented by rotten fruit collected beneath coster's barrows."

290. Meat may be had in small quantity and of a poor sort on Sunday, but according to this witness the absence of milk and meat is most important in determining degeneracy in the poorer areas. The tea it must be added is probably in the dangerous form already mentioned, having been brewed in the morning and been allowed to stew throughout the day. Dr. Scott instanced a child in Arran who died the victim of his parents' special kindness in this respect. Mrs. Close thought children would be better brought up on beer than the tea they get. Dr. Collie considered it most deleterious, and evidence to the same effect was given by other witnesses. The growing consumption of tinned foods and its coincidence with the decrease of cookery at home press with exceptional severity on the young. Sir Frederick Maurice laid stress on this as a serious factor in the situation. Few of the mothers in the poorer districts, according to Mrs. Bagot, do much cooking; tinned foods or bad fried fish are the alternatives, and if the mother does do any cooking it is only for the father, and the children have to eat what he does. Thus Miss Garnett cited a case where a baby, who was very ill, had been fed on tinned salmon and orange juice, and Mrs. Lyttelton described the regrets of a country holiday child for its "tasty" supper, which on enquiry proved to vary between bloaters and a halfpenny saucer of pickles.

Scott, 1744.

Close, 2592.

Collie, 3931-3.

Maurice, 331, 2.

Bagot, 4554.

Garnett, 9110.

Lyttelton, 5388.

291. In the course of Sir Frederick Maurice's investigations, he gathered "universal testimony" that it was the habit of parents to feed children off their own plates, and this would ordinarily include raw herrings, pickles, fried fish, and the like. "They live as we do," was quoted by Mr. Fosbrooke as a common saying.

Maurice 275.

Fosbrooke 6624.

292. With the prevalence of such ignorance, it is needless to say, no balance or proportion enters into the calculations of those who cater for the wants of the young. The greater cheapness of many articles of consumption—meat, for instance—has brought them much more largely within reach of the poor but there has been no corresponding increase of knowledge as to the economic expenditure of money on wholesome food; indeed, the general consensus of opinion collected from every variety of witness points to the conclusion that in no branch of domestic life is the English housewife so deplorably destitute of the necessary equipment.

REMEDIAL MEASURES FOR THE ABOVE ADVERSE CONDITIONS.

293. It is clear that the evils, which it has been the object of the preceding sub-sections to summarize, can only be dealt with as part of some great scheme of social education, to which many agencies must contribute, legislative, administrative and philanthropic, and by which the people themselves must be induced to cast off the paralysing traditions of helplessness and despair.

294. Later sub-sections will deal with what, in the Committee's opinion, may be done in school and during the period between the close of school life and adolescence to raise the standard of domestic competence and ideals of home life, and in this they believe lies the principal hope for future generations; but it is not too late to do something to rescue the present generation from the consequences of past neglect, and to that end the subjoined observations and recommendations are directed.

295. An enactment placed on the Statute Book so recently as 1902 offers an opportunity to the Local Authority that should not be missed. Under the Midwives Act of that year, which places in the hands of County Councils, or any District Council to which they may delegate their powers, the general supervision of all midwives practising within their area in accordance with rules to be laid down under the Act, rules have been made and approved

by the Privy Council by which every midwife is made responsible for the cleanliness and is enjoined to give full directions for securing the comfort and *proper dieting* of the mother and child during the lying-in period, which, for the purposes of the regulations, is held to include a period of ten days after delivery. It is obvious that as women trained under the Act take the place of the illiterate, incompetent persons that very generally look after the poor at this critical point of their lives, a great opportunity is offered for giving mothers the information wanted and providing the newly-born infant with a fair start. If the Local Authority make use of this agency, which is entirely under their control, for the dissemination of proper knowledge and practical advice, a considerable step in advance will have been achieved. Models for maintaining and improving upon this step already exist, and only require careful study and a genuine faith in the value of social education, to be brought into general use.

Eves, *passim*.

296. Direct evidence on the value of crèches as places of instruction for mothers was given by Miss Eves. She thought education of young women in the care of infants in the strictest sense technical education, and advocated the establishment of centres for the purpose under the Local Education Authorities.

Worthington, *passim*
Bostock, *passim*

297. A large body of evidence was tendered as to the organisation and operations of the Manchester and Salford Ladies' Public Health Society, and the Committee had the advantage of examining on the subject Mrs. Worthington, one of its principal members, and Mrs. Bostock, one of the Health Visitors it employs. The Society, which has been in existence for more than twenty-five years, has for its object the discovery of all those conditions that are adverse to public health, and especially the bringing within the knowledge of the mothers among the poor such information as will enable them to do their duty by their children. The poorer parts of both towns are divided into districts, each under the supervision of one or more of the ladies who constitute the Society, and, subject to their directions, a number of Health Visitors, who are in part paid by the Corporation, undertake the duty of visiting every house in which the birth of a child is reported, with the object of educating mothers in the best methods of bringing up young children. By these means, Mrs. Worthington stated that a good deal of influence has been brought to bear upon them to adopt regular hours and not be quite so miscellaneous in their feeding operations, and it is said that they have now acquired some settled notion of what is the best type of food to give children. Incidentally and very largely the labours of the Health Visitors in this connection bring to their knowledge all sorts of insanitary conditions, arising from overcrowding, stopped drains, and structural defects, which they proceed to report to the municipality on a form provided for the purpose. In the result, an inspector is at once sent and the evil is put right before very long. In a recent report of the Society's work, it is said that the Health Visitors have made 30,364 inspections of houses, and have reported 1,500 cases of insanitary conditions, and the Medical Officer of Manchester testifies that the effect is marked in the poorer districts of the city, and that "an improvement on former conditions can now be generally discerned." The Report goes on to quote from one of the superintendents that the poor "look upon the Health Visitor as their best friend, and there are few homes where she is not made welcome."

298. The Report proceeds:—

"In addition to teaching personal and household cleanliness and giving advice and sympathy, much practical help is given in ways such as giving food and clothing to specially needy families, finding work for men and women, getting recommendations for different hospitals and institutions, sending children into the country or to the seaside, making the beds of sick patients and cleaning their houses."

On the whole, however, the work is preventive rather than remedial.

"The women in the district are shown the evils of dirt and the dangers of living in unhealthy dwellings; they are taught to prevent the spread of disease, and the laws generally which will enable them and their families to lead moral and healthy lives."

Miss Squire, one of the Factory Inspectors employed by Miss Anderson for the purposes of the Memorandum which has been extensively

referred to, visited some houses with one of the Health Visitors and was

“favourably impressed with the effect she seemed to produce upon the mother or nurse, as the case might be. The serious proportion of infant deaths is a matter of common knowledge in the town, and the mothers and nurses seemed to take it as quite reasonable that the Medical Officer of Health should prescribe to them what they might and might not do, and to be impressed with the fact that what their mothers did before them would no longer be allowed to be their guide in the treatment of their children.” Appendix, V. 60.

These visits are supplemented and the lessons they give enforced by the distribution of short leaflets (as concise and pointed as possible) in order to keep the advice given constantly before the mother's mind, and it is found that these leaflets, following upon personal visits, are read and treasured.

299. Fuller testimony is borne to the value of the system by the extent to which it has already been adopted in other places. Mr. Rowntree advocated municipal leaflets associated with visiting; he described the work of the Health Society in York and also the standard of knowledge and training to which visiting ladies ought in his opinion to attain. Mr. Fosbrooke testified to the good results of the lady visitors employed by the Worcestershire County Council. Dr. Smith said that the distribution of leaflets by the East London Children's Hospital had had great effect, and he thought that direct work among parents was more valuable than the training of children and young people with a view to their becoming parents, a view also taken by Dr. Hutchison, because in his opinion these things do not come home to girls until they have a baby of their own.

Rowntree, 4994-5028
5158-5168
5252-5263
Fosbrooke, 6613-6621
Smith, 8464-7.
Hutchison, 9937-
9953, 9980-9990.

300. The Committee believe that enough has been said of the value of the system, and the testimony paid to its success by competent judges, to justify them in urging upon every locality the adoption of similar methods. The system has the advantage of linking individual and philanthropic effort with municipal responsibility, in a way that regularises the one while energising the other, and appears to give to each its proper influence in dealing with social wrongs, at the same time tending to check the overlapping and misdirection so often characteristic of purely charitable impulse.

301. Other agencies to the same end, such as lectures and mothers' meetings are not excluded; indeed, they can very well be worked into the system and be utilised to expand and develop its scope. There is no step, in short, towards training mothers in personal, domestic and infant hygiene, with which it cannot be associated, and towards the effect of which it cannot be made to contribute.

302. The Committee desire to press these considerations with all the earnestness at their command upon the most serious attention of the community, and they would further suggest to the Local Government Board the desirability of issuing to local authorities a circular explaining the objects to be sought and the means by which they can best be attained. It is in connection with steps of this sort that the Committee believe an Advisory Council formed on the lines recommended in the earlier part of the Report might prove of great use to the Department usually charged with the interests of Public Health.

vii. *School System—Medical Inspection of School Children—Feeding of School Children.*

303. In a country without compulsory military service the period of school life offers the State its only opportunity for taking stock of the physique of the whole population and securing to its profit the conditions most favourable to healthy development. It has been shown in the first part of this report how the occasion may be utilised in furtherance of the objects of an anthropometric survey, and it remains to be considered what are the conditions of school life adverse to physical well-being, and how the opportunities which it presents can be made to realise the best results for the rising generation, at, perhaps, the most sensitive period of its growth.

304. It may be said at once that the general effects of school life are not prejudicial to health. The civilising influence exercised by the school during

Kelly, 11366-8.

the last thirty years was noticed by both Drs. Eichholz and Niven. The untamed savagery characteristic of certain types has disappeared, and Dr. Eichholz further thought that there was nothing in the conditions of school life which it was not in the power of existing authorities to improve; but popular opinion required educating on such elementary though important points as the seating of children, the arrangement of light, and the supply of fresh air. Evidence was given of children being kept too long at desks which do not fit them, in an attitude of strained attention, either writing or with their eyes concentrated on a blackboard, which, if the class happens to be a large one, perforce occupies a position in which some have a difficulty in seeing it. Very young children are sometimes observed sleeping in postures calculated to develop curvature, and infant occupations are criticised as often much too fine for their eyesight. It was also alleged that the eyes of scholars often suffered from the effects of a strong cross light, and that defective ventilation counted for a great deal among the unfavourable circumstances with which children had to cope.

305. While with the last-named exception schools on the whole seem to be in a good state, Mrs. Greenwood drew a sad picture of the dirt and darkness in some of the Sheffield schools, and Dr. Kelly, Bishop of Ross, taxed the National Board with indifference to the warming of schools, from which children suffered acutely. It appears that whatever fuel is used in schools in Ireland has to be procured by voluntary contributions or brought there by the children themselves, and it is not an uncommon thing for children to take a sod or two of turf to school on a winter's morning. Dr. Kelly goes on:—

"I might set it down as one of the causes of the poor physical development in Ireland that the school children are unfairly, in fact I might say cruelly, treated in the schools themselves. I see now many of these little children going to school all the winter barefooted, and in some instances they go to a school where there is no fire. The country children have to travel a couple of miles to school; a great many of them have no cloak or shawl, or anything to cover them. Ireland is rather a rainy country, and they go wet into the school and sit down there shivering all day."

The Committee think that a system under which the infliction of such suffering on poor children is possible requires amendment.

306. On the point of ventilation, there was some difference of opinion between the advocates of open windows on the one hand and mechanical appliances on the other, but as in the case of the latter the inlets are usually under the control of the teacher, it is of the first importance that he should be alive to the value of fresh air, and in this respect among others there appears to be something wanting to the education of teachers in the principles of practical hygiene. Sir Lauder Brunton was perhaps the most emphatic critic of the school system, and believed that both in regard to breaks in school work and the substitution of physical exercises for prolonged mental application the Swiss practice was preferable, but his actual knowledge of what goes on in English schools did not appear to be very close, and the Committee are convinced that the regulations in force, if properly observed, are sufficient to cover both points of attack.

Lyttelton 5415-5428.
Fosbroke 6598-6608.

307. Infant schools as conducted in urban districts can no doubt be worked to the great physical advantage of the children attending them, but there is evidence that a handful of small children in a rural school necessarily suffer a good deal from neglect or are taught under conditions from which no advantage can be derived. So impressed were Mrs. Lyttelton and Mr. Fosbroke with the unsatisfactory results that may be expected from keeping tiny children at school that they would not permit attendance under five at all. Mr. Fosbroke made this one of his chief points and had evidently given it a great deal of attention. He thought the effect of a later attendance at school on the children themselves, both physically and mentally, would be most salutary, and it would have the indirect result of keeping mothers at home and compelling them to attend to domestic duties. Sir J. Gorst went even further, and would be glad to see country children excluded from school up to seven years of age.

Gorst, 11816.

"That is the practice in Switzerland, which is perhaps almost the best educated country in the world. They do not let their children come to school till they are seven. They run about in the villages and mountain sides, and they are often employed in looking after cattle, goats, and so on. They do not go into school at all till they are seven years old, and therefore when they do go to school they are sturdy and strong, and their observation is awakened."

While the Committee are unable to accept this statement as entirely correct, they think that school attendance in the *rural* districts should not be compulsory till six or possibly till seven, and should be discouraged, if not absolutely prohibited, under five.

See Appendix III to the Report of the Committee on Employment of School Children (1901, Cd. 849).

308. The organisation of games and the provision of accommodation for outdoor exercises were strongly pressed by some witnesses, but no scheme of games alone can ever be made general enough to supply the place of methodical physical training. A model course of physical exercises, more thorough, systematic, and complete than any previously in use, has just been produced by the labours of another inter-Departmental Committee, and in connection therewith this Committee desire to express their opinion that wherever practicable, the prescribed exercises should be performed in the open air, and the interval utilised to obtain a thorough ventilation of the school premises, and particularly the class-rooms, which as a rule suffer most in this respect. Inasmuch, however, as the effect of physical exercises depends in no small degree on their regularity, and the climate of this country is such that exercises in the open air are necessarily interrupted for days at a stretch, the provision of play-sheds or rooms for physical exercises, other than the ordinary class-room, should be insisted on in ordinary circumstances as an almost indispensable part of the school equipment.

309. Mr. Atkins avowed himself a great advocate of games as an educative as well as a health-giving factor, and he thought there might be a much more systematic effort towards their proper organisation, both for children of school age and young people. Mr. Rowntree called attention to the same want, more especially in towns, and cited Boston as an example of the American practice in this respect, where there is no open space without some one to organize the children's play. Mr. Horsfall and others emphasised the need for physical recreation and exercise, through the lack of opportunities for which Mr. Edwards Rees said the children of Salford were losing the instinct of play. To this end playgrounds should be utilised, not only during the mid-day recess but after school hours. The Committee heard a good deal from Sir Lauder Brunton of an organization now in process of formation, under the name of a National League for Physical Education and Improvement, and they cannot do better than commend to its attention the expediency of placing itself in communication with the educational authorities throughout the country, with a view to their intelligent co-operation in a scheme of so much importance and utility. The Committee have read with great interest the observations of the Royal Commission on Physical Training (Scotland) on this subject, and think that paragraphs 85 and 86 of that Report deserve the special study of the organizers of the League. In the Committee's judgment a full consideration of the subject requires that due prominence should be given to the part that ought to be played by skilled physical instructors, and the need of securing a constant supply of such. In this regard, the suggestion in paragraph 314, as to the training and recognition of teachers and instructors, may be useful.

310. The teaching of cookery and household management assumed particular importance as bearing directly on the subject of this enquiry. The principles that should govern the teaching of cookery have already been laid down in paragraph 232 of this Report. These principles are to all intents and purposes embodied in the directions of the English and Scotch Central Education Authorities for the conduct of Cookery Classes, but there is a considerable body of evidence to show that, for various reasons, in practice the teaching of cookery has not had all the beneficial results that might have been expected.

311. Dr. Eichholz summed up the fruits of his experience in these words:—

Eichholz, 499.

"Many reforms are necessary in the teaching of cooking before it will become sufficiently useful in the home. The children begin to learn it too early to retain much by the time they leave school. They do not follow the work up sufficiently at home or at school to become conversant with the process taught them. It is the exception to find a girl repeat a lesson on the cooking of meat at home. The knowledge which the child gains is too insecure to tempt the parent to run any risks with the modest domestic allowance of meat. So it comes about that the girls become great adepts at making cakes. I think the work would be all the better for being concentrated upon the last six or twelve months of school life."

Lewis, 8579-8581,
8624, 8631.

Bostock, 7516-7523.
Stanley, 13448.

This testimony is confirmed by other witnesses such as Mr. Lewis, teacher in the West Green School, Tottenham, who pointed out that teachers were apt to substitute a standard limit for the age condition very properly inserted in the Code, and that one cause of the disposition to devote too much attention to the making of cakes and other attractive dishes is the difficulty of getting rid by sale—as the teachers are expected to do—of the plainer and more useful dishes. On the other hand, Mrs. Bostock and Miss Maude Stanley bore testimony to the beneficial effect in the homes of the teaching at present given in cookery classes in school.

312. It seems to the Committee that certain prevalent defects in the teaching of cookery are, in part at all events, due to the absence of an efficient system of inspection, but on a consideration of the evidence they are disposed to doubt whether any system of teaching cookery, however well organised, is likely to be effective or practical, which is confined to the period of school life and is not continued and supplemented by instruction of the girls at a more mature age, when they are more appreciative of the need of such instruction and more likely to have opportunities for the practical application of what they have learned. It is for this among other reasons that the Committee have elsewhere (paragraph 230) recorded their opinion in favour of compulsory Continuation Classes.

313. As regards the instruction of girls of school age, however, the Committee are disposed to agree with those witnesses who urged that instruction in Cookery, Hygiene and Domestic Economy, should, as far as possible, be made compulsory on the older girls, that such instruction should be concentrated in the last year or so of school life, and that room for it should be made by the omission at this stage of certain other subjects from the school curriculum. In this connection, they would direct attention to the scheme of supplementary courses for girls under the Scotch Code, which virtually carries out these suggestions. Girls are admitted to these courses at or after 12 years of age, on giving proof of reasonable proficiency in the three R's, and thereafter devote most of their school time to *practical* instruction in cookery and laundry work, and all that appertains to the management of a home. As girls must remain at school till 14, unless specially exempted, there is thus opportunity for concentrating the attention of the girls upon domestic subjects for a period of a year or eighteen months immediately prior to their leaving school.

314. It is obvious that if instruction of this kind is to form part of the normal school course, questions of school and personal hygiene and of the proper conduct of a home must receive much greater prominence than appears to have been the case hitherto in the normal curriculum of Training College students, and that further, in the large centres of population, there will be opportunity for the employment of a special class of teachers, of more moderate attainments, perhaps, as regards the ordinary subjects of a general education, but who have a thoroughly expert knowledge of the class of subjects in question. It follows from this that, in the opinion of the Committee, there should be greater diversity of type in Training Colleges and greater elasticity in the conditions upon which recognition as a Certificated Teacher is granted. This status, subject, of course, to sufficient safeguards as regards general education, should be conferred not only upon the teachers of book subjects but also upon those who have received a comprehensive and thoroughly satisfactory training as teachers of housewifery, or, to take another example, teachers of physical exercises, and the training of such teachers should be equally an object of State support.

315. Moreover, the Committee think it worth considering whether the present law as to school attendance could not be so modified as to render the partial exemption from attendance at school, which in England and Wales is at present granted only on a certificate of proficiency or of previous due attendance, obtainable without further condition than that the obligation to attend school, which at present ceases altogether at the age of fourteen, shall in that case be extended to a later age. By this means the knowledge acquired during

6526-8.

attendance at elementary schools, which is too often forgotten on leaving school, might, it is hoped, be retained and extended. Legislation would, of course, be required to effect this, but the principle has already been to some extent recognised by the agricultural provisions of Robson's Act, and the Education (Scotland) Act, 1901, and it seems capable of extension in other directions; it might, for example, be made a valuable means of fostering that sense of domesticity in girls, the decay of which several witnesses deplored. In this, as in many other respects, the co-ordination of education which is now being effected by means of the new Local Education Authorities should be of great service in rendering a scheme of the sort feasible.

316. The problem presents features of too great minuteness and intricacy to be adequately discussed within the limits of this Report, but enough has been said to indicate the lines of advance upon which the Committee think that something may be done in order to equip the daughters of the people for domestic life.

317. Evidence was also forthcoming as to the unsuitableness of a stereotyped school system for children who are not up to normal school standard and are yet not so defective as to warrant treatment as "mentally deficient." Dr. Eichholz advocated the establishment of special schools, to which he gave the name of "Schools of Industry," something on the lines of day industrial schools for "retarded" children; that is, all children other than those actually defective who, by reason of insufficient feeding or whatever cause, are backward and not able to profit by the ordinary school curriculum. The condition of many of these children is the result of parental neglect, so that there are two sets of associated circumstances, educational and domestic, which, in his opinion, make it desirable to extend the industrial school system under Section 16 of the Education Act, 1876, with the same liability on the part of the parent to contribute. In his own words—

Eichholz, 486-494,
680-708.

"I should like to see schools, either urban or rural, schools of industry, not punitive industrial schools, which shall recognise the uselessness of much of our present curriculum for retarded children, which will, in the first instance, create self-respect through cleanliness and decency, and aim at re-establishing an enfeebled constitution through suitable regular feeding. As these are secured, physical education becomes possible, and the final aim comes into the foreground, which is to provide a curriculum based largely on manual occupations and manual instruction, and which shall endeavour to implant in the minds of the children a respect for the dignity of work—a fact which their homes have never impressed upon them, and which the elementary schools likewise fail too often to accomplish."

Eichholz, 486.

Dr. Eichholz would like to see the thing done through the magistrate rather than by a simple drafting of children to and from such schools by means of the School Attendance Officers and the ordinary authorities concerned.

Eichholz, 486-494,
680-708.

318. The Committee may take this opportunity of expressing their opinion that, wherever possible, in cases touching the young where the assistance of a magistrate is invoked, he should be a person specially selected, sitting for the purpose.

319. Dr. Kerr was also in favour of a system of special schools for retarded children, though he had not considered the matter in relation to the food problem. He considered that as many—

Kerr, 783-794, 846-9,
869-880, 888-902,
918-941.

"as ten per cent. of the ordinary school populations all over the country, at any rate in the first half of school life, require some consideration on account of debility and backwardness from various causes—some simpler education than the ordinary Board School attempts to give them."

In his view the method of selection for such schools would depend on the results of medical and educational inspection, the great point to be kept in view being "to suit the curriculum to the child instead of the child to the curriculum." It would, of course, be an essential feature of the scheme that children who under special treatment became fit for the normal type of school should be transferred there for the remainder of their school life. Besides these "retarded" children, Dr. Kerr thought there was a group of semi-invalids for whom something between a school and a hospital in the country should be started.

Medical Inspection of School Children.

320. It is obvious that underlying all these schemes there is need of a much more complete system of Medical Inspection in schools than has yet been attempted, and it is not therefore surprising to find that all the medical witnesses and others laid great stress upon its introduction on some recognised basis.

321. Dr. Eichholz thought it was the greatest need in school organisation. On the ground of expense he would confine a general examination to the poorest schools, and considered that in London the work could be done by ten young men at £250 each. The School Board had nothing like a big enough staff and confined their attention to cases of defective eyesight, feeble-minded children, and the medical examination of pupil and assistant teachers. Dr. Eichholz explained to the Committee the conditions observable in the children attending these poorer schools, and described the means by which medical inspection might be utilised to note and check degenerative tendencies. Children who were thought to need medical examination in better class schools would be examined on special notification by the teacher, but in the schools classified as poor the inspection would cover all new admissions and the re-examination of old cases where necessary. What follows on such a system is thus described:—

“The business of the school doctor is to examine children at admission when necessary, and periodically later; to make recommendations to the school authority which shall reach the parent without delay. It is for the school authority to determine how to make those recommendations effective. It is impossible that the doctor can enforce anything that he says. The way I suggest this should be done is as it is done in Frankfurt and in German schools generally. They issue a slip of paper, which I suggest should be in duplicate, which says, ‘Your child is suffering from so-and-so, kindly exclude him until he is fit to attend.’ In England this would not suffice, as it would give the parent an excuse for not sending the child to school. We want the certificate in duplicate so that the school attendance officer may keep its contents before the parent. The authority would issue one to the officer and the other to the parent, and the parent in this way might be dealt with according to the measure of his culpability or his powerlessness, if he did not or could not act upon it. Many cases would still need charitable aid and whatever help managers could procure. I do not anticipate that the need for punitive expedients would often arise. A few wholesome examples would effect a very rapid cure of culpable neglect.”

Among the further duties of the medical inspector would be:

“recommendations to the local authority on general and special points of school curriculum, length of lessons, apportionment of intervals for recreation, organisation of recreation, ventilation, lighting, artificial and natural, the use and abuse of needlework, desking for children of various ages, use of slates, towels, local variations in curriculum to meet special needs.”

322 Dr. Kerr thought that with the assistance of intelligent teachers trained in hygiene, there need not be a very great augmentation of the existing medical staff. Dr. Collie went into the matter in some detail and thought that in the first instance it would be sufficient to entrust to the teacher the duty of reporting to the medical inspector the case of any child who on admission appeared to him to be suffering from any physical or mental defect; and the medical inspector would attend occasionally to receive such reports from the teacher and examine any child who required it. He advocated the employment of doctors of experience rather than young ones, and said the late School Board staff was quite inadequate, but well qualified general practitioners might be entrusted with the inspection of eyes and teeth (and presumably ears) without having recourse to specialists. No very large staff would, in his opinion, be required. Dr. Chalmers quoted the Report of the Royal Commission on Physical Training (Scotland), and declared a medical inspection the necessary accompaniment to any system of general physical training in schools. He thought medical inspectors might be useful in matters of ventilation and health conditions generally. Dr. Niven, like Dr. Collie, would utilize the teachers in the first instance and would require them to have special training. This last indeed appears a necessary corollary to the introduction of any system of the sort. Dr. Mackenzie considered “the systematic medical inspection of schools as one of the things that is most called for at the present time,” and explained with some fulness the methods he advocated. He thought the

superintendence of the system might be entrusted to the Medical Officer of Health, and the inspection made on admission and periodically afterwards. The assistance of specialists on certain points would probably be required, but he agreed with other witnesses that properly trained teachers could render most useful assistance. Mr. Loch would not neglect the medical inspection of the home, "the fulfilment of an already recognised public sanitary duty," and he would have the two go together. Mr. Murphy was also among those who emphasized the need of a general medical inspection of schools.

Loch, 10328-10333.

Murphy, 10403.

323. For the reasons, then, that appear in the discussion that has occupied the preceding paragraphs of this sub-section, the Committee consider that a systematized Medical Inspection of School Children should be imposed as a public duty on every school authority, and they agree with the recommendation of the Royal Commission on Physical Training (Scotland) that a contribution towards the cost should be made out of the Parliamentary Vote. The value of such an inspection is well illustrated by the particulars given in a recent report by Mr. George Andrew, of the Scotch Education Department, on the *Gemeindeschulen* of Berlin and Charlottenburg. From that report it appears that of 2,547 children examined on admission to the schools of Charlottenburg, 321 or 12·3 per cent. were rejected as being unfit for the work of ordinary schools, and of all the children examined, 63 per cent. were described as not completely normal (*nicht völlig normal*).

324. The Committee believe that, with teachers properly trained in the various branches of hygiene, the system could be so far based on their observation and record, that no large and expensive medical staff would be necessary. The general inspection may safely be limited to that class of school which from its character and surroundings affords clear evidence of the type of which its scholars are composed, and it should be repeated as often as the medical officer thinks necessary. In other cases it will be enough for him to examine such children as may be submitted to him by the teachers, and it would be for him to determine whether circumstances called for expert assistance. In no instance should the inspector do more than state the facts that require the attention of the parent, cases of poverty or neglect being left to the proper authorities to deal with.

325. The Committee further think that the services of the medical inspector should be at the disposal of the school authority in respect of all matters where the advice of a person skilled in the hygiene of child life may be wanted, and they look in the result to a much more intelligent handling of many of the problems with which that authority is charged.

326. Owing to the healthier conditions commonly prevailing in regard to the nurture and growth of the country population, the Committee do not think that these recommendations will have any appreciable effect in augmenting the charge for education that now devolves upon the rural ratepayers: on the contrary they are of opinion that bringing the sanitary administration of the county into touch with the schools may lead to the anticipation and prevention of many of those epidemics which are now such a fertile source of local expense.

Feeding of School Children.

327. The Committee have reserved to the end of this subsection the discussion of the question of feeding elementary school children (1) because it lies outside any direct obligation that has hitherto been recognised and (2) because some of the matter that precedes has a bearing upon its consideration.

328. Besides seeking to elicit the opinion of a large number of general witnesses on the point, the Committee sought to equip themselves for the task of formulating some conclusion by the examination of certain persons who were either called or tendered themselves to give special evidence thereon. These included Mr. W. H. Libby, Secretary to the East Lambeth Teachers' Schools Dinner Association, Sir John Gorst and Dr. Macnamara, Members

of Parliament, and Dr. Osmond Airy, one of H.M. Inspectors of Schools, who for many years was chairman of the organisation for providing dinners to poor children in Birmingham.

329. Before, however, proceeding to examine the evidence on the point, it may be as well to state that the general trend of opinion was to the effect that the ultimate means of dealing with the difficulty lay in the development of those forces of social education which have been described above, and in the operation of the great body of ameliorative tendencies which would raise the general condition of the poor, and foster a sense of parental responsibility, spreading knowledge and enlightenment in their train.

330. It was nevertheless acknowledged that the evils arising from underfeeding were so widespread, and in certain localities so pressing, that some authoritative intervention is called for at the earliest possible moment to secure that the education of the children who are obliged to attend school shall not be hampered and retarded by the physical conditions thereby engendered.

331. The evidence on the specific question of the feeding of children compelled by law to attend a Public Elementary School can conveniently be treated under the following heads:—

- (a). The extent to which underfeeding prevails at present.
- (b). Existing voluntary methods of providing food.
- (c). Proposals in regard to the more systematic feeding of school children.

(a). The Extent of Underfeeding.

332. On this point Dr. Eichholz, one of H.M. Inspectors of Schools, gave very interesting evidence. In pursuance of his view, already noted, that the whole question of bad physique practically centres round feeding, he made a special investigation into the conditions of the Johanna Street Board School, Lambeth, as a type of school in a very bad district, and he considers that 90 per cent. of the children are unable, by reason of their physical condition, to attend to their work in a proper way, while 33 per cent. during six months of the year, from October to March, require feeding. He gave the Committee an estimate, based on the figures of the voluntary feeding agencies, of the number of underfed children in London. Some time ago he furnished the Board of Education with a similar estimate, in which he set down the number as 60,000; but he has since gone into the question in more detail and now estimates the number as approximately 122,000, or 16 per cent. of the elementary school population of London.

333. The London School Board expressed the opinion that there were not more than 10,000 children suffering from malnutrition; but, in Dr. Eichholz's view, this estimate is belied by the actual figures given in the report of the Joint Committee on Underfed Children, which gives the average number of children fed per week during the weeks the feeding centres were open in 1902-3 as 22,206. His argument is that in the first place this figure only refers to children attending Board Schools; and secondly it is very fallacious as an index of the total number of children who are underfed, because the same children are not being fed all through the season; the result of investigation shows that on an average the centres feed three times as many children during the season as they feed on any one day, and that the number furnished as the weekly average of children fed may be taken as an index of the daily average of meals provided; and therefore we get 66,000 as the rough total of underfed children attending the London Board Schools. Besides this there are the children attending voluntary schools. And, as the amount spent per annum in London by voluntary feeding agencies is £6,100, and £100 spent is said to represent 2,000 necessitous children fed per season, the total estimate of underfed children in London is, roughly speaking, 122,000, or 16 per cent. of the whole.

334. This calculation obviously proceeds on the assumption that all the children fed at schools and centres would otherwise be underfed, but such observations as those of Miss M. Horn, manager under the late London School Board, in a paper recently read to the International Home Relief Congress, threw considerable doubt on the validity of the assumption.

Eichholz 435-7.

Eichholz 471, 476.

Eichholz 472, 475.

335. Dr. Eichholz also made enquiries about Manchester, and was assured that 15 per cent. of the Manchester children are underfed. As to this, Dr. James Niven, the Medical Officer of Health for Manchester, did not give any figures, but expressed the opinion that there was a very large number of underfed children, that the child must be fed at any cost, and that no voluntary agencies could possibly cope successfully with the evil. On the other hand, Mr. Edwards-Rees, Vicar of Pendleton, Salford, and a member of the Salford Education Committee, stated distinctly that not more than 2 per cent. of the children in Salford and Manchester come to school underfed; and in his opinion the question of malnutrition is not nearly so urgent as that of lack of proper physical training and pure air. Dr. Henry Ashby, of Manchester, nominated by the Royal College of Physicians to give evidence on the subject of nutrition, was inclined to think that most children go to school having had sufficient breakfast; so that there is some apparent conflict of evidence as to the conditions in Manchester.

Eichholz, 476, 478.

Niven, 6290-1,
6372-8.Rees, 4285, 4286,
4384-9.Ashby, 8740-1,
8748-9.

336. To revert to London, Dr. James Kerr, Medical Officer to the London School Board, "does not feel as strongly on the point of nutrition, or rather want of nutrition, as most people"; but he admitted not having considered the matter as fully as Dr. Eichholz. Dr. R. J. Collie also, a Medical Inspector to the late London School Board, stated that there is "not a very large proportion of children who are actually half-starved; it is only in some districts"; but he did not give any statistics.

Kerr, 942-5.

Collie, 3947.

337. Of other witnesses who spoke on the extent of underfeeding, Mrs. Close, a lady who considers herself familiar with rural England, said that children are constantly half-starved when they get to school owing to the laziness and neglect of the parents. Dr. Chalmers, Medical Officer of Health for Glasgow, is now making enquiry into the proportion of underfed children in Glasgow, but had no figures at the date of giving evidence.

Close, 2636-2642.

Chalmers, 6171-2.

338. Dr. W. L. Mackenzie, Medical Officer to the Local Government Board for Scotland, said that in the slums of Edinburgh a large proportion of children were half-starved, and he agreed that to subject a half-starved child to the routine of school would be the height of cruelty, and the educational result would be poor. Mrs. Mackenzie, the wife of Dr. Mackenzie, gave the same sort of opinion: "the child must be fed." Mr. W. H. Libby said that a feeding agency in Lambeth coped with from 12 to 15 per cent. of the elementary school population, and in the poorest districts with from 25 to 30 per cent., which, so far as that locality is concerned, bears out Dr. Eichholz's figures. Miss Garnett, the head of the Diocesan Women's Settlement in the extremely bad district of the Potteries, attributed the faulty nourishment of the children to the neglect of the mother who goes to work in the factories; the teachers in the various schools notice that children from such homes are less able to do their morning's work; but they do not admit that the proportion of such cases is very large. Mr. C. S. Loch, Secretary to the Charity Organisation Society, did not think a large number of children were sent to school half-starved, but gave no figures. Mr. Shirley Murphy, Medical Officer of Health of the Administrative County of London, regarded the question as by far the most important before the Committee, and said "the child has got to be fed." Finally, Dr. Kelly, Roman Catholic Bishop of Ross, said that in the South of Ireland it was commonly the case that children came to school underfed.

Mackenzie, 6977-
6980.Mrs. Mackenzie,
7030.

Loch, 10191.

Murphy, 10402-5.

Kelly, 11380.

(b). *Existing Voluntary Methods of Providing Food.*

339. There has not been a great amount of definite evidence on the voluntary agencies in existence. As regards London, Dr. Eichholz mentioned the following agencies which spend about £6,100 per annum collectively:—

Eichholz, 473, 475
476.

London Schools Dinner Association.

Mr. G. R. Sims *Referee* Fund.

Destitute Children's Dinner Society.

East Lambeth Teachers' Schools Dinner Association.

Southwark Children's Free Meals Fund.

The work of these agencies has been coordinated, so far as the Board Schools

are concerned, by the Joint Committee on Underfed Children, which was worked under the aegis of the School Board and existed to prevent overlapping.

Eichholz, 482.

340. In regard to the sum contributed by the parents, Dr. Eichholz said that it amounted to 5 per cent. in the case of the London Schools Dinner Association, and 25 per cent. in the case of the Destitute Children's Dinner Society.

Libby, *passim*.

341. Mr. Libby, who is Secretary to the East Lambeth Teachers' Schools Dinner Association, gave a description of the working of the Free Meal Fund in connection with the Association. The fund has been running about twelve years, and is conducted on business lines; it is worked by the teachers through the attendance officers, and careful enquiries are made as to the circumstances of each family before a child is given a meal. There are breakfast centres and dinner centres. A child can be given a pint of vegetable soup and a piece of brown bread and a piece of cake at the cost of 1d. About 2 per cent. of the children pay the full 1d., some pay part of the cost, and the rest nothing; not more than 7 or 8 per cent. pay anything at all, but Mr. Libby thought this small percentage was due to the thing not being sufficiently worked. In spite of the fund there are still many underfed children, because there is not sufficient organisation; it is difficult to get sufficient organisation by voluntary methods.

Atkins, 2967-2974-2981.

342. Mr. J. B. Atkins, the London Editor of the *Manchester Guardian*, gave a description of the Free Feeding System in Manchester. There the funds are derived entirely from voluntary sources, but the School Board recognised the charity and the teachers helped in distributing the food, &c. The movement has grown steadily, and in 1902, 139,000 free dinners were given, at the cost of a little over £400. In this case also the circumstances of the family are carefully investigated by the attendance officers, but no attempt is made to recover payment from the parents.

Chalmers, 6173-7.

343. In Glasgow Dr. Chalmers said there is an institution called the "Poor Children's Dinner Table," by means of which the condition of every child is enquired into, and meals are given to the underfed; the system is very comprehensive apparently, so that "no child in Glasgow ought ever to go to school starving," but no detailed account was given to the Committee. Sir Frederick Maurice, however, referred to the Glasgow system and stated that the difficulty as to parental responsibility had there been solved by means of a very thorough system of investigation, and that the applications for gratuitous food have diminished rather than increased.

Mackenzie, 6977.
Mrs. Mackenzie,
7005-7013.

344. Free meals are given in Edinburgh to about 2,000 children, but the evidence given by Dr. and Mrs. Mackenzie makes it doubtful whether this number by any means exhausts the number of children who are underfed.

Airy, *passim*.

345. The most complete scheme described was started by the late Mr. George Dixon, and has now been in operation for 20 years in Birmingham with Dr. Airy, H.M.I., as chairman of the organisation. In considering the principles on which they would act it was decided in the first place that only those should be helped who could expect practically nothing if it was not given to them, and secondly that only such a meal should be given as would not compete in any way with the meal which could be provided even in a very poor home. It was next decided that cases for help should be selected with the greatest care. This is done by three different people—by the head teacher of the school, by the class teacher in whose class the boy or girl is, and by the visiting officer. The co-operation of these three, Dr. Airy states, has been so successful that he does not believe there has been 5 per cent. or anything like it of abuse. The number of children fed in normal times is 2,500 and the plan pursued is thus described:—

Airy, 13253.

"We began with ten centres. We had large coppers for soup at ten centres, to which the children came from all outlying schools. The School Board allowed us in each of those centres to canvas off some twenty or thirty yards of playground, perhaps five yards wide, and the cooking was done at one end. There the soup, a good lentil soup with some animal stock, and the bread and jam, were prepared. The process was simply this: we had to do everything to simplify matters. It had to be a rough business, but it was an effective one. The children come, and form file, and then they walk up, and as they walk up they take a spoon out of a basket and go up to where the voluntary helpers are distributing the soup. They take their bowl of soup and go on to benches on the other side of the canvassed shed and sit down and eat their soup. The moment they have done they put their basin and spoon into another basket, and as they go out they take a large slab of bread and jam, and eat that

in the street. The School Board allowed us to do this without any rent, and they gave us the gas. Then the cooking of those meals is done by paid labour, but the distribution is done by the voluntary help of ladies at each centre. There is a rota at each centre and there are two ladies who attend each day. Our manager I will refer to directly—he is a most capable, suggestive man. We were very much distressed at the fact that the children would come a mile or a mile-and-a-half to eat this poor dinner, and they would come through slush and snow and wet, and we wanted to prevent that. A system of baskets was invented. There is a system of baskets at present in use by which the soup can be kept absolutely hot for more than an hour. I have tried it at both ends, and I find it is almost as hot as when it comes out of the copper. We reduced the number of centres to four or five, and now all the outlying schools send their baskets with a paper saying how many dinners they want. Those dinners are put into the baskets at a quarter to twelve or twelve o'clock, and then the staff of the school help in distributing the meals at that school."

346. The Committee have thought it worth while to print this part of Dr. Airy's evidence in the body of the report because of the remarkable economic fact with which he concludes:—

"We give that dinner, a large bowl of soup—in fact, they have two or three bowls if they like—and a large slab of bread and jam, for less than a half-penny, and in that expense is included £150 or £100 a year to the manager." Airy, 13258.

347. He attributed this result (1) to the concentration of the population that has to be helped, (2) to the good will and assistance of the local authority, and (3) to the organizing skill of "a heaven-born manager," a retired naval officer, and to the co-operation of volunteers. In addition to those dinners, which provide for some 2½ per cent. of the children of school age, breakfasts, consisting of cocoa, milk and bread, are supplied by the bounty of a private individual to the necessitous children in about twenty schools in Birmingham, as Dr. Airy believed, under similar conditions. The testimony of the teachers is unanimous, that the system pursued enables the children to do the ordinary school work, and they report that the difference is perfectly extraordinary. Airy, 13272.

(c) *Proposals in regard to the more systematic feeding of school children.*

348. With scarcely an exception, there was a general consensus of opinion that the time has come when the State should realize the necessity of ensuring adequate nourishment to children in attendance at school; it was said to be the height of cruelty to subject half-starved children to the processes of education, besides being a short-sighted policy, in that the progress of such children is inadequate and disappointing; and it was, further, the subject of general agreement that, as a rule, no purely voluntary association could successfully cope with the full extent of the evil. Even those witnesses who were inclined to think that its magnitude had been much exaggerated, did not question the advisability of feeding, by some means or other, those children who are underfed, provided it could be done quietly and without impairing parental responsibility. The only witness who appeared absolutely to dissent from that view was the Bishop of Ross, who, while admitting an enormous number of underfed children in Ireland, deprecated any steps being taken to remedy the evil, on the ground that it would weaken the sense of self-respect and self-reliance both of parent and child. Kelly, 1130-88.

349. The purely medical view was well put forward by Dr. Robert Hutchison, a well-known authority on nutrition, nominated to give evidence by the Royal College of Physicians. He said, "looking at it purely scientifically, it would be an extremely important thing to ensure to every child at school a sufficient and proper sort of meal"; and again, "I feel certain that the provision of meals would do a great deal to improve the health and growth and development of the children of the poorer classes." It is worth noting, also, that he considers the ages of ten to fifteen as the most critical period, rather in opposition to the view expressed by some witnesses that the period of infant life is the most important. This witness further gave the Committee to understand, that a child ought to have a certain amount of nourishment during the twenty-four hours, but that it does not very much matter how you divide it up; except that it is more important to have a meal before physical exercise than before mental; and, therefore, mid-day dinner is more important than breakfast. This view is interesting, as differing from a very general opinion that no child should be allowed to come to school without sufficient breakfast. Dr. Hutchison further Hutchison, 9973 8,
10061-10015,
10067, 8.

thought that most children require a certain amount of animal food, and pure vegetarianism is not sufficient. He spoke entirely from the medical point of view, and refused to discuss the economic question.

Booth, 992-6,
1128-1133.

350. The general trend of opinion is in favour of some sort of regularised feeding in school, or at centres, exacting payment from the parents where they are in a position to pay, but giving the meal free where they are not. Thus, Mr. Charles Booth is in favour of some sort of school restaurant in every school, or connected with every school, where food could be obtained at a minimum cost, but with no intention of giving it away; though he admitted that "in some cases it might be a mere charitable assistance." He is also in favour of some special industrial schools, where children, whose parents culpably neglect them, could be fed and boarded, the cost to be charged upon the parents.

Brunton, 2428,
2450-2.

351. Sir Lauder Brunton thought it might be necessary to provide food at schools, and "in cases where the parents are absolutely unable to pay, food might be provided out of the poor rates;" but "every effort must be made to force the parents to pay properly for the food."

352. Mr. Atkins said,

Atkins, 3000,
3006-3018.

"We have got to the point where we must face the question whether the logical culmination of free education is not free meals in some form or other, it being cruelty to force a child to go and learn what it has not strength to learn."

But he agreed that the parents should be made to pay, if possible.

Collie, 3955-9.

353. Dr. Collie thought that underfed children should be fed by means of school kitchens, and that the parents should be prosecuted for neglect; a few prosecutions would have a salutary effect. Mr. Seeborn Rowntree advocated the judicious feeding of school children, so as not to pauperise the parents. Mrs. Mackenzie thought the child must be fed, but there ought to be power to "arrest the wages of the parents." Miss Garnett thought the children must be fed, and there were other opinions to the same effect.

Rowntree, 5039-
5041.

Mrs. Mackenzie,
7030-4.
Garnett, 9215-9.

Loch, 10192-9,
10242-6,
10271-6.

354. The opinion of Mr. C. S. Loch is worthy of consideration, as being presumably the official view of the Charity Organisation Society. He found fault with the existing systems of voluntary feeding, as "purely a movement against destitution without regard to education;" he stated his belief that no child should ever be fed without thorough investigation into the circumstances of its family, and no free meal given except in special cases, and then only as secretly as possible; but he admitted the necessity in special cases. The feeding should not be at the school, though it does not appear from his evidence where it ought to be. He instanced the difficulty in former days, before the Free Education Act of 1891, of getting educational fees out of parents, and argued there would be similar difficulty in getting feeding fees. Both Mr. Loch and Mr. Shirley Murphy thought that in cases of real destitution the Poor Law Administration should always be brought into play, and not kept out by any system of free feeding.

Murphy, 10402-
10411.

Niven, 6349-6378,
6508-6510.

355. Dr. Niven propounded a definite scheme for ascertaining the fact of malnutrition, for feeding the child, and enforcing parental responsibility. The teacher would be taught to note all children obviously suffering or under-sized, and to report them, if diseased, to a medical officer; if underfed, to the educational authority. The director would then instruct the attendance officer to ascertain the circumstances of the family; and the subsequent feeding of the child would depend upon the facts thereby elicited. It is worth noting that any such system would in the first instance be rendered easier by an organised medical inspection of schools, a proposal, as it has been seen, very widely and generally advocated.

Gorst, 11834.

356. The most uncompromising advocacy of public responsibility came from Sir John Gorst and Dr. Macnamara, and as the first-named appealed to the authority of the other, it is fair to treat his proposals as put forward

in the name of the two. Dr. Macnamara has based his recommendations on the following proposals of a Committee of the London School Board in 1898, which, however, do not appear to have commended themselves to the School Board of the day :—

Children attending School unfit for School Work.

(i.) It should be deemed to be part of the duty of any authority by law responsible for the compulsory attendance of children at school to ascertain what children, if any, come to school in a state unfit to get normal profit by the school work—whether by reason of underfeeding, physical disability, or otherwise—and that there should be the necessary inspection for that purpose.

Provision for Children sent to School "Underfed."

(ii.) That where it is ascertained that children are sent to school "underfed" (in the sense defined above), it should be part of the duty of the authority to see that they are provided, under proper conditions, with the necessary food, subject to the provision contained in Clause (vi).

Supervision of Voluntary Organisations by Authority.

(iii.) That existing or future voluntary efforts to that end should be supervised by the authority.

Voluntary Effort to be Supplemented if inadequate.

(iv.) That in so far as such voluntary efforts fail to cover the ground, the authority should have the power and the duty to supplement them.

School Dinners available for all Children, and Method of Payment.

(v.) That where dinners are provided it is desirable that they should be open to all children, and should be paid for by tickets previously obtained, which parents should pay for, unless they are reported by the Board's officers to be unable by misfortune to find the money; but in no case should any visible distinction be made between paying and non-paying children.

Prosecution of Parent for culpable Neglect.

(vi.) That where the Board's officers report that the underfed condition of any child is due to the culpable neglect of a parent (whether by reason of drunkenness or other gross misconduct) the Board should have the power and the duty to prosecute the parent for cruelty, and that, in case the offence is persisted in, there should be power to deal with the child under the Industrial Schools Act.

357. Dr. Macnamara was good enough to explain to the Committee how a scheme on these lines could be brought into practical application, and gave interesting evidence as to the success claimed for similar schemes in Brussels, Vienna and Paris. Upon the plan followed in the last-named city he estimated the outside cost of its application to London to amount to £120,000. He did not believe that any serious difficulty would arise in determining what children should be fed without paying, as "the attendance officer and the teacher together could bring you very near to the actual state of facts," and he was prepared to press the case against the parents who neglected their children with all the force at the disposal of the law. He advocated dealing with them by an extension of the Prevention of Cruelty to Children Act, or under the Education Acts by enabling the school authority to recover the cost of food in the same way as fines for non-attendance are recovered. The permission to parents to have their children fed at school, if they desired it, would, it was believed, greatly facilitate the operation of such a scheme, and Dr. Macnamara agreed that where parents made use of it as a convenience it would be fair to make them pay something in excess of cost price, which would to some extent diminish the charge that would in the last resort fall upon the community. The weak point in the system was admitted to be the difficulty of maintaining voluntary effort and providing public help at the same moment. Sir John Gorst, it is true, said the British public is very fond of doing some part of the work of the Government for them, instancing the lifeboat service, and thought private benevolence would still come in, though the school authority should be responsible for its efficient working; but Dr. Macnamara was obliged to acknowledge that in those towns abroad where the municipality had stepped in, the flow of charity had been arrested, and he was not prepared to think his scheme could be adopted without a substantial public charge. This he would allow, subject to increased powers of dealing with a parent who could and would not pay, which he regarded as an essential part of the scheme.

358. On a general survey of the evidence, and bearing in mind the considerations which form the subject of Paragraphs 329 and 330, the Committee think that a large number of children habitually attend school ill-fed, but this

number varies locally with the time of year and with the conditions of employment, and is not likely to increase —indeed they look, as they have said, with confidence to the operation of many causes towards its diminution.

359. It seems, further, that in a large number of cases voluntary organisations with the support and oversight of the Local Authority are sufficient for the purpose, and as long as this is so the Committee would strongly deprecate recourse being had to direct municipal assistance.

360. Circumstances, however, do arise which call for more immediate aid, and in which the School Authority, taking into account the difficulty in the way of home provision of suitable food, and the number of children who attend school habitually underfed, are willing to provide regular and sufficient meals, and in such cases the Committee agree with the opinion of the Royal Commission on Physical Training (Scotland), that "the preparation and cooking of these meals, where it is found necessary to provide them, ought to be regarded as one of the charges incident to school management."

361. By a differentiation of function on these terms — the School Authority to supply and organise the machinery, the benevolent to furnish the material—a working adjustment between the privileges of charity and the obligations of the community might be reached.

362. In some districts it still may be the case that such an arrangement would prove inadequate, the extent or the concentration of poverty might be too great for the resources of local charity, and in these, subject to the consent of the Board of Education, it might be expedient to permit the application of municipal aid on a larger scale. As a corollary to the exercise of such powers—which should be by scheme sanctioned by the Board—the law would have to be altered so as to furnish means, as was suggested in evidence, to compel the neglectful parent to take his full share of responsibility, and the Committee are sanguine that a few prosecutions to this end would have a most salutary and stimulating effect.

363. It seems probable that the best way of dealing with many of these children, whose antecedents place them definitely in the category of "retarded," is by means of special schools of the Day Industrial Schools type, in which feeding would form an essential feature, and the choice between establishing such schools or merely treating children as underfed must be largely left to the Local Authority, after considering all the circumstances, to determine.

364. The Committee, moreover, do not think that children should be made the subject of either experiment without the concurrence of the Poor Law Authorities, and the funds should be found through the machinery of the Poor Law, with all due precaution against affixing any unnecessary stigma upon the deserving parent.

365. The Committee deem that by these means the community may be protected from the consequences of the somewhat dangerous doctrine that free meals are the necessary concomitant of free education. Education is a great social need, which individual citizens are, as a rule, not able to provide for their children on a sufficient scale, but food, like clothing and lodging, is a personal necessity, which in a well-ordered society it is not inherently impossible for parents to provide; and the effort to supplement their deficiencies, and to correct the effects of their neglect, should aim, in the first instance, at the restoration of self respect and the enforcement of parental duty.

viii. Risks of Contamination during Adolescence.

366. The Committee are impressed with the conviction that the period of adolescence is responsible for much waste of human material and for the entrance upon maturity of permanently damaged and ineffective persons of both sexes. The plasticity of the physical organization, the power it possesses of yielding rapidly towards degenerative or recuperative influences, appears

to terminate at eighteen, and the records of the years preceding that age are in the great majority of cases decisive for self-improvement or the reverse. Unfortunately, it is a period of which too little account is taken. With the classes under consideration education in the ordinary sense of the word is over just when in its full significance it becomes most necessary. Parental direction is almost entirely absent, and in lieu of it very little supervision is exercised in any other quarter over physical or moral development.

367. The Committee are not prepared with any comprehensive scheme of social regeneration, but there are agencies at work whose efforts deserve recognition and support, and there are ways in which the State might still exert some restraining and guiding influence in the interests of the adolescent of either sex.

(a) *Girls.*

368. Taking girls first, it is said, "the conditions under which they work, rest and feed doubtless account for the rapid falling off in physique which so frequently accompanies the transition from school to work." The secretaries of Girls' Clubs were quoted "that as soon as a girl leaves school she does not fall off immediately, but between fifteen and eighteen she begins to suffer, and if her work is too hard she does not recover." Hot rooms, unhealthy surroundings at work, bad food, late hours, excitement and stress of work, superadded to functional anæmia, are described as most detrimental during these years. The extension of the mid-day restaurant to meet the needs of adolescent girls was recommended, but the difficulty, in the opinion of one witness, was to get girls to feed themselves properly, however much restaurants might abound.

Eichholz, 435.

Eichholz, 566.

Hawkes, 13113.

369. Testimony, however, was forthcoming that girls, as a whole, during these years showed improvement. Prof. Cunningham noted a conspicuous diminution in the number of young women whose figures were distorted by tight lacing. Whether due to "improved æsthetic taste" or the greater prevalence of outdoor exercises, the important effect of the change is recognised by all familiar with the anatomy of the thoracic and abdominal cavities. Moreover, it was remarked as a common impression that girls were actually bigger than they used to be, a statement which, in the absence of anthropometric observations, it is of course impossible to prove.

Cunningham, 2220-5.

Eichholz, 551.

370. The opinion of the Hon. Maude Stanley is valuable on this point. From an experience of thirty-four years in connection with Girls' Clubs in Soho, a district which Mr. Charles Booth marks as one of the blackest on the map, this lady was able to assure the Committee that the physical conditions of girls had improved. Though 50 per cent. of those that come under her review are working as tailoresses under circumstances which cannot be particularly favourable, she is satisfied that they are better grown and likely to do better towards their children than were their mothers. Even in a poor district in Walworth, where a club was recently started for the benefit of a most demoralised class, the girls who joined it were not physically deteriorated. Miss Stanley attaches great value to the contact with helpful and sympathetic women of a superior class which these clubs establish, and to the ten days or a fortnight in the country which most of the members enjoy through the medium of their organization. Miss Stanley was able to add, owing to maintenance of relations with members after they married, that they proved competent housewives and were greatly in request upon that ground.

Stanley, 13381-8.

Stanley, 13408.

Stanley, 13465.

371. Unfortunately, the number of these clubs is small and the sphere of their operations far too limited to produce any general effect. Mr. Douglas Eyre, who spoke with authority on this point, confirmed the evidence of Miss Stanley that much less was done for girls than boys in this respect. Mr. Eyre enumerated the principal organisations that have for their object the strengthening and development of the work of institutions for the welfare of girls, but, so far as it was possible to collect reliable returns on the subject, he did not believe there were more than 5 per cent. of the youthful portion of the industrial population who were materially touched or assisted by

Eyre, 3555-3563.

anything in the shape of a well organised recreation agency out of school or working hours.

372. The Committee have already (paragraph 230) touched upon the subject of obligatory evening continuation classes for girls beyond school age, which should have for their aim the instruction of girls in the objects of personal and domestic hygiene, and a large body of opinion was in favour of the experiment being made; and if physical exercises of a recreative character were included in the curriculum, the Committee believe it would add to the value and ultimately, it may be, to the popularity of such classes.

373. Wherever it was thought desirable, owing to the employment of married women in factories, or for other reasons, to establish municipal crèches, girls over 14 might be made to attend occasionally, and the teaching of infant management should rank with other forms of technical instruction in the way advocated by Miss Eves.

Eves, 7708-7719.

(b) *Boys.*

374. Turning to boys of the age under discussion, it is not too much to say that in their case physical training contains the most fruitful germ of moral and material well-being. The evidence of Mr. Douglas Eyre, who has been for years connected with the organisation of boys' clubs and other associations which rest on a basis of physical exercise, affords striking testimony to their value, but indicates at the same time how small a field is covered by existing effort owing to lack of funds, scarcity of personal service, and want of systematised co-ordination.

Eyre, *passim*.

375. The work of a cognate character described by Mrs. Josceline Bagot, who for many years has maintained a Boys' Club in Lisson Grove, shows what may be effected by the single-handed exertions of an intelligent and sympathetic individuality towards giving lads of a very poor class that motive for self-preservation from contaminating influences which is the very bed-rock of self-respect, and it is not a little singular that so obvious an outlet for philanthropic energy should have received such scanty support, either personal or pecuniary. One reason appears to be the reluctance of some of the clergy to associate themselves with anything that is not primarily religious; as Mr. Booth puts it, "Obligatory attendance at a Bible class being administered medicinally, with cricket and football to take the taste away." Boys entering the club physically feeble are greatly improved by a few months' systematic training, and Mrs. Bagot's experience shows that the interest a lad acquires in physical fitness instinctively weans him from idleness and temptation to drink, while teaching the roughest to box gives them a chivalrous sense of obligation to the weak. Material improvement thus becomes the natural ground-work upon which moral and religious impressions are afterwards built up; but all these results are too apt to be lost by prematurely forcing religious interests upon the attention.

Bagot, *passim*.

Eyre, 3574-8.

Bagot, 4693-9.

Bagot, 4564-7.

376. The evidence on this subject was not confined to London; the Rev. W. Edwards Rees and Mr. Horsfall testified most forcibly to the need of similar efforts in Lancashire. Mr. Rees considered the lack of physical training to be one of the two main causes of degeneration, and would make such training universal for boys and girls of all ages; both gentlemen deemed the provision of facilities for physical exercise and enjoyment as the most pressing question of the hour, and Mr. Rees in common with Mrs. Bagot and others was emphatic in attaching great importance to swimming. Mr. Douglas Eyre commented on the lack of encouragement given to physical education in continuation schools, and the difficulty, in the absence of some State system of training, of finding competent instructors. He also described the organisation and objects of the Twentieth Century League, which he hoped in due course would provide the machinery for intelligent co-operation among the various voluntary agencies in the field, and thus give the State a firmer foothold for direct intervention and support.

Rees, 4318-4341.

Eyre, 3642-3652,
3692-5, 3710-9.

Eyre, 3532-5,
3548-3564,
3578-3584.

377. It is not a little curious, however, that a league with these objects should not have come to the knowledge of the persons engaged in the formation

of the National League for Physical Education and Improvement, which is apparently being promoted by Sir Lauder Brunton and others, with similar aims. That two leagues should be in the field for the same ends appears to the Committee a signal instance of that waste of energy and overlapping which the existence of each league is presumably designed to counteract.

Brunton, 2430,
2454-7, 2537-9.

378. Mr. Murphy was impressed with the number of boys employed on errands and as messengers (by which means they begin to earn money younger) who have no technical training and therefore subsequently drift into the ranks of unskilled labour. He threw out suggestions as to making them join cadet corps, with a view to their being fitted for military service, and at the same time teaching them a trade upon which they could engage after leaving the Army, if they enter it. In this connection it is interesting to note that, in Mr. Edwards Rees' opinion, the Lancashire working men at all events would not be afraid of some form of general military service which did not imply absence from home.

Murphy, 10440, 1.

Rees, 4336-4341,
4503-8.

379. With a view to giving the people every possible opportunity for physical recreation, the Committee think it should be the duty of municipalities to provide and maintain open spaces in some proportion to the density of the population, and that such spaces, or some of them, should include shelters fitted with gymnastic apparatus, these last being put in the charge of competent instructors; and having regard to the paramount importance of the national physique to the community at large, they are also of opinion that some grant should be made from the National Exchequer in aid of all clubs and cadet corps in which physical or quasi-military training, on an approved scheme, is conducted, subject to public inspection, which grant might be provided without any additional charge to the Treasury, by insisting that a certain proportion of the sums already paid to the local authority under the Local Taxation (Custom and Excise) Act, 1890, should be devoted to physical education.

380. The Committee also think that the obligation should be laid on boys to attend continuation classes, in which drill and physical exercises should take a prominent place; and with a view to the encouragement of clubs and cadet corps, exemption from the obligation might be granted to all enrolled and efficient members of such organisations as submitted to inspection and conformed to the regulations qualifying them for public aid. By these means, without recourse being had to any suggestion of compulsory military service, the male adolescent population might undergo a species of training that would befit them to bear arms with very little supplementary discipline. The older lads could actually be familiarised with the use of the rifle, an exercise of no inconsiderable value from the point of view of general education, and a great deal might thus be done which would not only provide partly prepared material for absorption into the army or reserved forces, but would give a tone and a carriage to all that came under the influence of the system.

381. Direct information on the working of a cadet corps was furnished by Mr. Bennett, Captain of the 1st Cadet Battalion "The Queen's" Royal West Surrey Regiment. His letter on the subject, and some figures illustrative of his experience are printed in the Appendix. Their general effect, so far as it goes, is to negative the presumption of progressive deterioration in the class concerned.

Appendix XXIII.

382. In order to organize existing efforts on a comprehensive and effective basis, the Committee would like to see a central body (whether a branch of the Twentieth Century League or another), in touch with municipal activity, established in every large town, and charged with the duty of supervising and directing voluntary agencies of all kinds and bringing them up to a minimum standard of efficiency. One extremely important field of operation for such an organisation in each town would be the collection of information as to the various kinds of employment open to young people on leaving school—the conditions of employment, rates of remuneration, and relative permanence—with a view to advising them in their choice of an occupation, and thus minimising the evil effects of the kind of temporary and casual employment referred to in paragraph 378.

(c) Juvenile Smoking.

383. The question of Juvenile Smoking at the period of life dealt with in this and the preceding sub-section has been given some prominence in evidence, and the Committee have received communications on the subject from the late London School Board and one or two Anti-smoking Leagues. The evidence submitted on the point represents a practically unanimous opinion that the habit of cigarette smoking among boys is a growing one, and that its consequences are extremely deleterious. No actual testimony was forthcoming to prove that early smoking diminishes growth, but Prof. Cunningham mentioned it as one of the causes of physical deterioration, and Dr. Scott was of opinion that scarcely two per cent. of cases of undergrowth had not been habitual cigarette smokers: the experience of a schoolmaster at Longton was quoted to show a distinct inferiority of physique in the case of boy-smokers as against non-smokers, and Mr. Atkins adduced evidence from Colonel Leatham, the late Chief Inspector of Recruiting in Manchester, who has said that "perhaps a third of the rejects from the Army in Lancashire might be attributed to smokers' heart." This is, no doubt, an excessive estimate, but it shows one bad consequence of early smoking, and it is common knowledge that smoking affects the wind and general physical capacity.

Cunningham, 2346-9, 2369-2372.

Scott, 1766-9.

Garnett, 9261-4.

Atkins, 2954-9.

384. There appear to be two ways of dealing with the matter which might be of good effect and could be made the subject of a very simple Act of Parliament.

(1.) To prohibit the sale of tobacco and cigarettes to children below a certain age.

Eyre, 3603.

Fosbrooke, 6642-6.

Chalmers, 6202-4.

Garnett, 9134-5.

All the witnesses were agreed in advocating this step, but there was some difference of opinion as to the age which should be selected. The Committee think that it should at least be sixteen.

(2.) To prohibit the sale of tobacco and cigarettes in sweet shops and other shops frequented by children.

This appears to be a growing practice, though it is impossible to discover the number of such shops licensed for the sale of tobacco. The Committee communicated with the Inland Revenue Office on the subject, and their reply was to the effect that "a licence to deal in tobacco is granted to anyone who asks for it, and no record is kept of whether the holder of such a licence is solely a tobacconist or whether he combines with that business any other trade." Mr. Eyre was of opinion that sweet-stuff shops should not be so licensed, and called attention also to the gambling propensities encouraged by such shops. The Committee agree with the weight of the evidence that licenses for the sale of tobacco should not be given to these shops.

Eyre, 3605-8, 3678-

3687.

Rees, 4410-2.

Lamb, 11754-6.

VIII.—SPECIAL SUBJECTS.

385. The Committee now proceed to notice certain special subjects bearing on the general purpose of the inquiry, to which their attention has been called.

i. *Syphilis.*

386. It will be remembered that Professor Cunningham in declaring certain inferior bodily characters to be not transmissible from one generation to another, carefully excluded syphilis from the agencies so indulgently estimated. The general effect of the evidence is to show that syphilis is an active agent in the production of congenital weakness and the degeneracy that accompanies it. "It is the great element" says Dr. Kerr "in congenital blindness and deafness, and in the cases that go blind and deaf—children who have gone to the age of ten or eleven gradually getting blind and deaf." In his opinion all these combined cases were practically due to this cause, presenting the other characteristics of syphilis—interstitial iritis and internal ear deafness, and generally the brain deterioration that goes with it. It can hardly, however, be included among the factors making for progressive deterioration, for Sir Alfred Cooper and the other

Cunningham, 2210-2350.

Kerr, 851-2.

Cooper, 3815-7.

experts examined on the point, Sir Victor Horsley and Dr. F. W. Mott, all agreed that there was no increase of syphilis; indeed Sir A. Cooper thought there was less, and it was also thought that it had now assumed a less virulent form. This last circumstance was largely attributed by Sir W. Taylor to the precautions taken in India and other tropical stations, by which means the worst taint was kept out of this country. Mr. Tweedy, whose experience of its effects is principally connected with the eye, is under a strong impression that there is nothing like the same amount of secondary and tertiary disease, or disease transmitted to the children, and quoted as a proof the diminution of a disease of the eye, called interstitial keratitis, which is essentially a disease of inherited syphilis. He could not say whether it was due to the existence of less primary syphilis or to the more efficient treatment and care that syphilitic patients now receive.

Horsley, 10627.
Mott, 10502-4.

Taylor, 33-5.

Tweedy, 3776.

387. In describing the consequences of syphilis Sir A. Cooper gives the following sinister category of disease :

Cooper, 3818.

"Insanity; idiocy; diseases of bones, producing deformity and disfigurement; diseases of the eyes producing blindness; disease of the ear producing deafness; disease of the internal organs, causing defective nutrition and deficient development; disease of the nervous system, producing insidious forms of paralysis, locomotor ataxy."

And Sir Victor Horsley described with minute care its effects on successive generations :

Horsley, 10564.

"The infection at one end of the family or the other may be slight, but you cannot say that any child of such a family, whom you can trace, escapes during its whole life and is really a healthy individual."

It appears in the second generation in the form of what is called disseminated sclerosis and degeneration of the nervous system, an organic disease and a progressive deterioration of a paralytic type which ends fatally after perhaps fifteen or twenty years. Without having any scientific proof of syphilis in the third generation, this witness would be quite prepared to find it, having regard to the severity of the disease in the second generation, and he was certain that a syphilitic condition of the tongue rendered the member more liable to cancer. Numbers of children moreover die within the first six months of life from what is called bronchitis, but a number of those are cases of congenital syphilis of the lungs. It is admitted that syphilis in the female is still more prejudicial to the child than the transmission of the taint through the male, and Sir Victor Horsley considered this a source of general physical deterioration.

Horsley, 10570-1.

Horsley, 10578
10581.

Horsley, 10564-6

388. Two specific points were mentioned in connection with the treatment of the disease, and to these the Committee desire to draw particular attention. It was alleged that, owing to the comparatively small practical inconvenience attending the first visitation of the malady, curative measures were frequently postponed and the tainted persons left to infect others. As a remedy for this Sir A. Cooper and Sir V. Horsley strongly advocated compulsory notification; they were aware of the difficulties and objections on which both Dr. Mott and Dr. Jones laid stress, but having regard to the terrible nature of the disease and its far-reaching effects they thought these should be disregarded and every effort made to arrest its progress. The argument that it might lead people to refuse treatment was, Sir Victor Horsley said, used in connection with simple zymoties at the time of the Notification Act and has been shown to have no validity. Dr. Mott mentioned it as one of the evils of syphilis that at present it so often escapes treatment, and notification would thus be the means of bringing many cases under observation.

Cooper, 3869-3872.
Horsley, 10539-
10543, 10600-1,
10631-2.
Mott, 10469-10471,
10493-5.
Jones, 10891-6,
10912-4.

389. The second point was the inadequacy of hospital accommodation, especially for the poorer classes, and on this all the witnesses were agreed. "Taking the case of London," said Sir Alfred Cooper, "it may be said without fear of contradiction that the accommodation for the treatment of venereal disease is lamentably inadequate." And he went on to indicate how it should be remedied by the addition of special departments to general hospitals for this class of disease. Dr. Mott and Sir V. Horsley both complained of general hospitals not taking cases of syphilis, and Dr. Jones thought treatment in general hospitals preferable on every ground to the lock hospitals system.

Cooper 3849.

Mott 10468, 10486-9.
Horsley 10534-5.
Jones 10892-5.

Horsley 10525-9,
10602-10616.

390. A third point in connection with the disease, to which all these gentlemen attached the greatest importance, was the necessity of inquiry into its nature and prevalence. Sir A. Cooper and Sir V. Horsley put this into the forefront of their recommendations. Owing to the insidious forms that the later stages of the malady assume, the official returns are far from representing the true extent of mortality from syphilis, and death certification is fallacious because, it is said, medical practitioners are reluctant, for fear of possible consequences, to put syphilis on a certificate.

391. In these circumstances, the Committee would desire to see all reference to the "cause of death" eliminated from the statutory death register. The medical opinion as to cause of death should be regarded as confidential, and should never be divulged, as is permissible at present, by the Registrar to the friends of the deceased. The medical certificate should be sent by the local Registrar direct to the Registrar-General, who would use it for the elaboration of his national mortality statistics. In this way the Committee believe that the accuracy of the records would be greatly increased.

Appendix XXIV.

392. The Committee hardly feel qualified at this stage to express a definite opinion on so thorny a subject as notification, although they think the considerations in its favour have great weight, but this point and the question of hospital accommodation may safely be relegated to the Commission of inquiry into the prevalence of the disease which the Committee feel ought to be appointed. A voluntary association, of which Sir J. Crichton Browne and Sir V. Horsley are prominent members, has been in existence for some time, and would be of great service in presenting evidence to any such Commission in a compendious form. The good that has been done by the Tuberculosis Inquiry has stimulated interest on the subject, the recent resolutions of the Brussels Congress point to the urgency of the case, and the Committee are satisfied that the moment is ripe for a searching and exhaustive investigation into the extent of the malady, and for a definite pronouncement on the steps that should be taken, while arresting its progress, to trace and counteract its effects.

ii.—*Insanity.*

393. Syphilis is, as has been seen, one of the principal elements in the manufacture of the insane, and alcoholism has also been shown to contribute its share, but the prevalence of insanity has certain special features which call for separate notice.

394. Besides the evidence on the subject under the above-mentioned heads, the Committee had the advantage of examining Dr. Joseph Wiglesworth, who was selected for the purpose by the Royal College of Physicians, and certain witnesses from Ireland who gave valuable information on the aspect which the question assumes in that country.

Appendix XXVII.

395. Documentary evidence was also put in of some interest to the special objects of the inquiry. The Lunacy Commissioners sent a circular letter in December last to the Medical Superintendents of all the County and Borough Asylums in England and Wales, asking for physical statistics, information or suggestions as to the lines on which steps should be taken to collect such statistics and information. Most of the replies gave information of an inconclusive character, but those which appeared to be useful were, by the courtesy of the Home Office, forwarded for the consideration of the Committee, who have printed a summary of them in the Appendix.

396. In regard to the preliminary, but most important point, as to whether insanity is increasing, it is extremely difficult to give a decided opinion so far as Great Britain is concerned. There is no doubt about the gross increase; the number of persons under treatment relative to population is much greater, but the question is whether this is due to accumulation, or how far it is due to that, and how far to increased incidence of insanity in the people at large.

Wiglesworth, 8927.

397. On this point Dr. Wiglesworth admitted that statistical information was incomplete, and that the conclusions to be drawn from it varied according as it was read and looked at, but on the whole, though he would like to express

himself with reserve, he was inclined to think that the incidence is increasing. He had arrived at this conclusion from careful study of the Lancashire statistics, which, as covering one-eighth of the population of England and Wales, were likely, in his opinion, to afford a reliable indication.

398. Analysing the increase to be accounted for on the theory of accumulation, he acknowledged that there was a large increase in the number of cases sent to the Unions, owing to the growing unwillingness or inability of their relations to charge themselves with their maintenance, and stated further that the poor-law authorities showed a much greater tendency to send on to asylums cases of idiocy, imbecility, and senile weak-mindedness. The diminution of the death-rate is another factor in the process of accumulation.

Wiglesworth 8930-8952.

399. Examining two decennial periods, 1882-1891, and 1892-1901, Dr. Wiglesworth found that the annual average number of lunatics in Lancashire in the first period was 8,247, which is equivalent to a rate of 2.221 per thousand on the average population; in the following decennium that rate had risen to 2.562; if the previous average had not been exceeded, the number of lunatics would have been 9,301, whereas it actually amounted to 10,733, an average increase of 1,432 for the decennium, over and above what might have been anticipated from the increase of population. In trying to ascertain how much of this increase might be accounted for on the theory of accumulation, *i.e.*, the diminution of the discharge rate by deaths or recoveries, he was met by the difficulty that no returns from the workhouses were available. Proceeding to deal with asylums alone, he found that the percentage of deaths in the second decennium stood at 8.89 as against 10.27 in the first, which represented an accumulation of 1,149 persons. The rate of recoveries, however, showed a reversed condition of things. Calculated on admissions (and here it may be as well to observe that the practice of the Lunacy Commissioners is not the same as that of the Registrar General, who is said to have made his calculations on the numbers resident) the rate of recovery had improved in the second decennium to the extent of 4.13 per cent. Had the recovery rate been maintained at the low level of the first decennium, 735 fewer cases would have been discharged than was actually the case, but the more favourable aspect that these figures wear, is to some extent discounted by two indeterminate factors, (1) the number of recoveries that are counted more than once, and (2) the restriction that was placed during this second period on the reception of incurable cases, owing to the lack of accommodation in the various asylums. On the whole, Dr. Wiglesworth calculates that 900 remain thus unaccounted for on the theory of accumulation in the two decenniums he has compared.

400. Among the circumstances conducive to insanity, next to alcoholic and syphilitic conditions, Dr. Wiglesworth gave a high place to density of population and the environment it connotes. This view is conveniently illustrated by certain tables he prepared showing the different unions of Lancashire classified according to the relative incidence of insanity, and the same unions arranged according to the density of the populations as aggregated in towns of different size. Two unions, which are both mainly country districts containing comparatively small aggregates of population, but with a high lunacy rate, Ulverston and Lunesdale, appear as exceptions to this argument, but in each there is a significant decline in population since 1891, for, speaking generally, Dr. Wiglesworth affirms that there appears also to be some relation between a declining population and a high lunacy rate. If this is so, the fact assumes considerable importance in relation to the state of Ireland, and may account for an increase of lunacy in some of the rural districts of England, combined as it probably is with a greater tendency to intermarriage among a reduced population. The observations collected from various asylums, which have been mentioned above, give some colour to the belief.

Appendix XXVI.

Wiglesworth, 8955.

Appendix XXVII.

401. Discussing the connection between insanity and progressive deterioration, Dr. Wiglesworth is at one with other witnesses as to the frightful havoc wrought by alcohol on the nervous system, adding—

“There is reason to believe also, from the great frequency with which a history of gross parental intemperance is found in the antecedents of persons who become insane, that a habit of

Wiglesworth, 83.

excessive drinking tends in some cases to a poisoning of the germ cells of the parent by means of the alcohol circulating in the blood, and a consequent tendency on the part of these germ cells to develop into an organism with an unstable or badly developed brain. This may probably result even if the sperm cells of the father are alone affected."

402. In regard to the effects of syphilis in producing insanity, Dr. Wigglesworth considered it the most important factor in causing the development of general paralysis, and he went on to say—

Wigglesworth, 8999,
and see Appendix
XXV.

"The importance of this disease in connection with the incidence of insanity is emphasised by the fact that general paralysis cannot be considered as a disease of degeneration. A large number of our cases are purely examples of degeneration, and if they did not get insanity they would be very useless to the community. General paralysis cannot, however, be considered as a disease of degeneration. On the contrary, it attacks very frequently persons of exceptional mental and physical energy, who are valuable members of the community, and though an inherited predisposition to insanity has an influence in causing the development of the disease, it is, nevertheless, less hereditary than other forms of insanity. The causes of general paralysis act more readily if there is a tendency by heredity, but at the same time it is a more strictly acquired disease than any other form of insanity."

403. On the whole, while expecting to find an increase of insanity coincident with a growing tendency towards physical deterioration, Dr. Wigglesworth did not appear equally confident that if an increase of lunacy were proved it could necessarily be accepted as evidence of progressive deterioration.

Wigglesworth,
8970-8.

404. There can, it is feared, be no question but that insanity is on the increase in Ireland: according to the published returns the number of lunatics under care in 1880 was 250 per 100,000, or 1 in 400, and in 1902, 499, or 1 in 200, and if the number of idiots and lunatics at large is added, the whole represents 587 per 100,000 or 1 in 170: moreover, fifty years ago the number is said not to have exceeded 1 in 730. Sir L. Ormsby, who was closely questioned on the subject, was of opinion that considerable allowance must be made for the fact that people are put into asylums now who were never so treated formerly, and the number is swelled by the unwillingness of their relations to take care of old people who get softening of the brain and become slightly demented; Sir Lambert also referred to the effects of accumulation in raising the rate, as both the death rate and the recovery rate are lower than in England; but giving full effect to all these considerations, enough remains to excite very serious disquiet. The Bishop of Ross made some notable statements in confirmation of the impression produced by the returns. "Lunacy," he said, "has become so common that it is practically no longer a disgrace," and to this he attributed the loss of any disinclination to make the fact public by the removal of the affected person to an asylum. The number of families affected is so great that apprehension based on the risk of inter-marriage ceases to operate, and the Bishop went on to say—

Ormsby, 12684-
12702.

Kelly, 11216.

"I have a very serious difficulty in that way, because, according to the Canon Law, I am bound, as a bishop, not to admit amongst the clergy any person whose relations within certain degrees are affected with insanity, and if I draw a line very strictly I would exclude practically all the applicants, so that I cannot draw the line too strictly"

Kelly, 11217.

405. In estimating the causes of this state of things, syphilis, at any rate, must be excluded. Except in Dublin, there is said to be very little syphilis in Ireland. Sir L. Ormsby, in gathering information from Sir George O'Farrell and Dr. Courtenay, the two inspectors of Lunacy, and from Dr. Woods, the medical inspector of the Cork Asylum (the largest outside Dublin), was told that it is very seldom that they put down syphilis as a cause of insanity. General paralysis of the insane is also less common, and although the taste for drink is still, in many parts of Ireland, regrettably strong, there is no evidence of increased drunkenness that could account for the increase of lunacy.

Ormsby, 12691.

406. The cause that the inspectors are disposed to lay principal stress upon is heredity, and here the same agency appears that has already been held responsible for the depletion of the population in the rural districts, viz: emigration. The effects of this extensive emigration have been thus noted by a competent authority:—

(1) Depletion of the population; (2) a lowering of the marriage-rate; (3) alteration of the age distribution of the population; (4) lowering of the birth-rate; and (5) depending upon the lowered birth-rate a diminished natural increase of the population.

"Insanity in relation to Fertility," by Dr. John Macpherson.

These five factors acting in sequence and conjunction disturb the normal stability of the population, and induce conditions which are favourable to the production of insanity.

The depletion of the population, as has been seen, chiefly affects its sexually efficient units, and by so doing tends to lower the marriage-rate among the remaining sexually potent units in the population. The growing disinclination to marriage is one of the most observable features in the vital statistics of the country.

407. On the whole, it appears to the Committee that there are more grounds in Ireland than can be discovered in England for connecting increase of lunacy with conditions of physique which show signs of progressive deterioration. In regard to certain classes in Dublin, Sir L. Ormsby was convinced that there was evidence of progressive deterioration, and Sir Charles Cameron seemed to share the same belief. It is not only that the effect of migration into the towns is to make the next generation of a weaker type, but in Sir L. Ormsby's opinion the people who come into the towns from the rural districts are of a weaker type to start with and therefore more vulnerable to the noxious influences of urban existence. From the facts that came under his knowledge, the Bishop of Ross was likewise of opinion that there was physical deterioration amongst the people, and seemed to look upon the increase of lunacy, particularly among girls between 18 and 20, as the strongest evidence of its existence. The Committee think that, having regard to the special conditions that appear to prevail in Ireland, investigation should be undertaken at an early date into the extent and character of the increase of lunacy in that country, and a serious effort made to trace it to causes which might be the subject of some ameliorative interference.

Ormsby, 12640

Cameron, 10917.

Ormsby, 12641.

Kelly, 11163,
11202-7.

iii. *Eyes and Ears.*

408. The evidence on the subject of defective eyesight does not point to the conclusion that blindness, or tendencies towards it, is on the increase, still less that the actual conditions of the eye afford any index of deterioration. Speaking from the experience of a very large hospital and private practice, Mr. Tweedy said:—

(a) *Eyes.*

"I do not see there is any evidence, so far as the eyesight of the population is concerned, of any physical deterioration of the people; there is no evidence in the eyes that degenerative diseases are more common than they were."

Tweedy, 3746.

And he went on to attribute any apparent increase in optical defects to the greater knowledge and care with which they are treated, the connection between optical defect and headache being much more understood and noted than formerly. Mr. Tweedy, however, mentioned one rather curious fact, viz., the frequency with which really degenerative types of disease occur in people from the rural districts, and gave as an example the greater degree in which *retinitis pigmentosa*, an essentially degenerative malady, is met with in such persons. This he was inclined to attribute to the intermarriage of blood relations, among the offspring of whom the disease is often found.

Tweedy, 3757-9.

409. Dr. Eichholz appealed to the evidence of the Census and of the London School Board Schedule to show that there is a distinct decrease in blindness and deafness among adults and children.

"In the last ten years—in 1891 the blind adults numbered 3,573 (one in 1,186), and in 1901 the number was 3,556 (one in 1,275). Deaf mute adults were 5,023 (one in 930), in 1901; and in 1891 they were 4,787 (one in 883). Then coming to the children of school age, in 1891 in the case of the blind it was one in 1,844, and now they are one in 2,233. In the case of the deaf, in 1891 it was one in 744, and it is now one in 866."

Eichholz, 552.

It is noteworthy that the recruiting returns do not show a similar improvement in respect of those rejected during the last ten years for defective vision.

Appendix VI., VII

410. Carelessness at birth is a fertile source of infantile eye disease. "Half the cases," said Dr. Kerr, "of blind children in the blind-schools are due to ophthalmia caused by infection at birth." The Committee believe

Kerr, 825-9.

that the provisions of the Midwives Act, if properly enforced, will have a signal effect in reducing blindness from this cause.

Kerr, 812-6

411. Dr. Kerr further considered that the methods pursued in many infant schools were responsible for the development of visual defects; 95 per cent. of over 1,000 infants examined for the purpose between the ages of 6 and 6½ managed to reach the standard of normal visual acuity in London, but among older children it was found that 10 per cent. had exceedingly defective vision. "The conditions," he says, "are bad for infants' eyesight in every way; the work is too fine." This subject has been mentioned in an earlier section of this Report, but these facts point to the want of some general provision for testing visual acuity in all schools under proper medical supervision. Mr. Tweedy laid great stress upon this and noted the good that that had already been done by the experimental application of the system to Board Schools and High Schools. The testing of eyesight, whether for colours or objects, should, he thought, take place in childhood, before time has been wasted in acquiring technical knowledge, which defective vision may render useless.

Tweedy, 3771-5,
3778-3781.

Tweedy, 3767-3770.

412. In the judgment of the same authority, the prevalence of short-sightedness must not be associated with ophthalmic degeneracy; the long-sighted eye of primitive man has hitherto been the normal eye in England, but it appears as if it were gradually being replaced by the short-sighted eye of civilised man, to whom, as he mostly works within a yard of his eyes, short sight, so long as it is healthy, is a positive advantage. The evidence already mentioned as to a marked diminution in those forms of eye disease which are connected with congenital syphilis confirms the belief that no proofs of degeneration are to be found in the conditions touching the eyesight of the people.

(e) Ears

413. In regard to the condition of the ears, the Committee had the evidence of Mr. Arthur Cheatle, who recently conducted an investigation into the hearing of 1,000 school children between the ages of 3 and 16 in the Hanwell District School (including the Ophthalmic School), which receives the children of the poorest class from Southwark and the City of London, and, so far as the Ophthalmic School is concerned, from the Metropolitan Poor Law Schools, all being thus of a type exposed to degenerative influences from birth. Of the children examined, 341, or 34 per cent., had normal ears and hearing, and 449, or 45 per cent., were suffering from adenoids in some form or other.

Cheatle, 12833-
12844.

414. It is from the prevalence of this ailment that most of the deafness observable arises, but Mr. Cheatle was unable to associate it with degenerative tendencies, as it was found in all classes, being, as he admitted, quite as common where children are in healthy surroundings as among the poor. Further, Mr. Cheatle was not prepared to say that it is more prevalent now than it was some years ago, as the indications given by pictures seem to show that at any rate among the upper classes it has always been common. The effects of it, on the other hand, are distinctly degenerative; it produces mouth breathing with all its attendant evils, imperfect expansion of the lungs, want of proper oxygenation of the blood, contracted chest and stunted growth; it tends to increase vulnerability to all zymotic diseases, produces defective dentition by the contraction of the upper jaw which it favours, and leads to broken sleep by inducing the habit of snoring. The only remedy is the removal of the adenoids, and with a view to that remedy being adopted at the earliest possible moment, Mr. Cheatle advocated the medical inspection of schools, or, at least, the reference to a doctor of any case in which, by the application of proper tests, the teacher discovered signs of defective hearing. Looking to the permanent disablement and marked dulness which are associated with deafness in the young, the Committee think that the case for the medical inspection of schools is greatly strengthened by the means it offers for dealing promptly and adequately with this class of "retarded" child. A timely interference may not only prevent their becoming later a serious charge upon the community, but may supply a necessary check to tendencies which, if unheeded, would render the victims useless to society.

Cheatle, 12851,
et seq.

415. Mr. Cheatle was not able to say that deafness due to congenital syphilis had diminished, but he did not think it had increased. Cheatle, 12381-2.

iv. Teeth.

416. In the first part of this Report, Professor Cunningham's testimony to the anatomical fact tending to favour dental deterioration was quoted. There is no question that the teeth of the people have become much worse of late years, and in many parts of the country may now be described as very bad. On this point there is no difference of opinion, though the acuteness of the evil is said to vary much, and may in some cases be affected by local causes. While affirming the indirect consequences that may flow from the gradual contraction of the jaw, Professor Cunningham had no difficulty in assigning the real cause of dental degeneration to the change that had taken place in the character of the food in common use. Sir Lauder Brunton laid great stress on the fact that dental caries is due to the cessation of the use of food which requires good mastication, and added that the soft foods are more apt to leave particles behind which cause decay. This view, and the aggravation that lack of cleanliness lends to the conditions of the mouth so produced, were emphasized by a succession of witnesses, lay and professional. Cunningham, 2219.
Legge, 5919.
Cunningham, 2225-9, 2363-8.
Brunton, 2461-9.
Taylor, 43.
Smyth, 1216-8.
Collie, 3987.
Fosbroke, 6638-6641.
Murphy, 9464-5.

417. Mr. W. H. Dolamore, who attended on behalf of the British Dental Association, and laid before the Committee (i.) a statement of the results obtained by a Committee of the Association appointed to investigate the condition of the teeth of school children, and (ii.) a Report of the Hygienic Committee of the Association on the alleged increase of dental caries, both of which will be found in the Appendix, confirmed these opinions. He had no doubt that bad teeth were a condition of the feeding that accompanies high civilization. The ruder and coarser sorts of food at one time in use not only kept the jaw in action during the plastic period of its development, but had the effect of a tooth brush in keeping the teeth free from the settlement of toxic agents. Appendix XXVIII
Dolamore, 7073-7082.

418. On the vexed point of the presence of sufficient lime in teeth, Mr. Dolamore agreed that, as a matter of fact, caries is just as often found in teeth with their proper elements of lime as in teeth which are defective in lime, and stated that, so far as chemical analysis went, there was not much difference between what are called soft and hard teeth, but he seemed to think that investigations into the character of the enamel might produce different results. Dolamore, 7088-7092.

419. Though no doubt bad teeth generally accompany deterioration of physique, and are often the result of bad conditions in childhood, there are happily no grounds for associating dental degeneracy with progressive physical deterioration. On this point Sir L. Brunton is as emphatic as any other witness, including Mr. Dolamore. It is not a little curious in this connexion, that it was found upon examination of two schools in Edinburgh that the ratio of defective permanent teeth per 1,000 children was 158·2 in the school for children of well-to-do working people, and 273·9 in that for the children of a better class, professional men and merchants. According to Mr. Dolamore, "It is undoubtedly the better class schools, in my experience, where the teeth are the worst—the higher the class the worse the teeth." And this appears to be the general opinion. Brunton, 2469-1, 2524-8.
Dolamore, 7123-7131.

420. In the result of a recent Admiralty and War Office Interdepartmental Conference on the subject, it was held that deterioration of teeth is intimately connected with a variety of intricate causes affecting the general health of the nation, but that mal-nutrition plays but a very small part in the production of dental caries, as compared with the more common Appendix XXVIII

use of articles of food which readily undergo acid fermentation, and that it is neglect to keep the mouth clean that is chiefly responsible for the decay of teeth.

421. In this opinion the Committee concur, and they also agree with the recommendations which the Conference decided to make to the Board of Education on the subject—

1. That the teaching of the elements of hygiene should be made compulsory in schools, and in this teaching the care of the teeth should receive special attention.

2. That daily cleansing of the teeth should be enforced by parents and teachers.

3. That systematic examination of the teeth of children by competent dentists, employed by school authorities, should be practised where possible, to prevent caries extending, to stop carious teeth, and to remedy defects of the teeth.

The Committee believe that if to these precautions are added systematic instruction to mothers, through the medium of health visitors, as to the proper food for infants, so that dentition may not be delayed or imperfect, much will be done towards removing a condition of things which, though it is not an indication of degeneration, contributes to the causes that produce it by the poison dental caries introduces into the system and the gastric disorders that follow therefrom.

v. *Vagrancy and Defective Children.*

422. Two other matters have been mentioned, viz. : vagrancy and the condition of defective children, and some evidence was given on the first named by Mr. Loch and "Colonel" Lamb; but the Committee have not thought it necessary to consider them in this Report, as it is understood they are to be the subject of separate enquiries.

Loch, 10336-10367.
Lamb, 11528-11553.

PART III.

SUMMARY OF RECOMMENDATIONS.

423. The following is a summary of the principal recommendations which the Committee desire to make :—

(1) *Anthropometric Survey.*

With a view to the collection of definite data bearing upon the physical condition of the population, the Committee think that a permanent Anthropometric Survey should be organised as speedily as possible upon the lines indicated in Part I. of the Report. In the first instance, this Survey should have for its object the periodic taking of measurements of children and young persons in schools and factories, enlisting for this purpose the assistance, among others, of School Teachers and Factory Surgeons, supplemented by a small staff of professional Surveyors. Besides this, a more comprehensive and specialist survey, spread over a longer period, of the population of the country at large, might be undertaken.

Pars. 55-61, 189-190.

(2) *Register of Sickness.*

It appears to the Committee in the highest degree desirable that a Register of Sickness, not confined to infectious diseases, should be established and maintained. For this purpose the official returns of Poor Law Medical Officers could, with very little trouble and expense, be modified so as to secure a record of all diseases treated by them. And, further, it ought not to be difficult to procure the co-operation of hospitals and other charitable institutions throughout the country, so as to utilise for the same purpose the records of sickness kept by such institutions.

Par. 62-3.

(3) *Advisory Council.*

Par. 64-6, 124, 302.

The Committee are emphatic in recommending the creation of an Advisory Council, representing the Departments of State, within whose province questions touching the physical well-being of the people fall, with the addition of members nominated by the medical corporations and others, whose duty it should be, not only to receive and apply the information derived from the Anthropometric Survey and the Register of Sickness, but also to advise the Government on all legislative and administrative points concerning public health in respect of which State interference might be expedient; and to them might be remitted for consideration and report all the problems affecting public health which the requirements of a complex social organisation are constantly bringing to the front. Such a Council, the composition of which might be modelled to some extent on *Le Comité Consultatif d'hygiène publique de France*, would be, the Committee believe, of great assistance, especially to the Local Government Board, and would be calculated to supply the knowledge and stimulus which are necessary in order to give to the Public Health side of the Board's administration a prominence which the multiplicity of its other functions may have tended to obscure, and to attract to its work that measure of public interest and support which has perhaps been lacking hitherto.

(4) *Overcrowding.*

Par. 87-9.

The Committee believe that the time has come for dealing drastically with this problem. They advocate an experimental effort by the Local Authority in certain of the worst districts, in the direction of fixing a standard and notifying that after a given date no crowding in excess of such standard would be permitted. It is believed that, if the thing were carried through without hesitation or sentimentality, means would be found, through the ordinary channels of supply and demand, or within the sphere of municipal activity, for housing all but the irreclaimably bad.

(5) *Labour Colonies and Public Nurseries.*

Par. 90-2.

It may be necessary, in order to complete the work of clearing overcrowded slums, for the State, acting in conjunction with the Local Authority, to take charge of the lives of those who, from whatever cause, are incapable of independent existence up to the standard of decency which it imposes. In the last resort, this might take the form of labour colonies on the lines of the Salvation Army Colony at Hadleigh, with powers, however, of compulsory detention. The children of persons so treated might be lodged temporarily in public nurseries or boarded out. With a view to the enforcement of parental responsibility, the object would be to make the parent a debtor to society on account of the child, with the liability, in default of his providing the cost of a suitable maintenance, of being placed in a labour establishment under State supervision until the debt is worked off.

(6) *Building and Open Spaces.*

Par. 97-9, 125.

Local Authorities in contiguous areas which are in process of urbanisation should co-operate with a view to securing proper building regulations, in furtherance of which end the making of Building Bye-laws to be approved by the Local Government Board should be made compulsory on both urban and rural authorities; attention should also be given to the preservation of open spaces with abundance of light and air. By the use of judicious foresight and prudence the growth of squalid slums may be arrested, and districts which hereafter become urbanised may have at least some of the attributes of an ideal garden city.

Par. 105.

(7) *Smoke Pollution.*

The Committee strongly advocate that cases of pollution of the air by smoke and noxious vapours in manufacturing districts should be heard by a stipendiary magistrate. A stricter enforcement of the law, and a change in legislation, giving higher penalties, would produce a great improvement without imposing any serious burden on manufacturers. It should also be considered whether the responsibilities of the ordinary householder in regard to domestic smoke pollution might not be brought home to him.

Par. 117.

(8) *Register of owners of houses.*

It should be the duty of the Local Authority in all towns above a certain size to establish and maintain an accurate register of owners; this is one of the first *desiderata* towards dealing with slum property.

Par. 118.

(9) *Medical Officers of Health.*

A Medical Officer of Health in all areas above a certain population should be required to give his whole time to the work, and in no case, unless convicted of misconduct, should a Medical Officer of Health so engaged be removed without the consent of the Local Government Board.

Par. 119.

(10) *County and District Councils.*

With a view to strengthening the chain of responsibility in matters of local administration, County Councils should be empowered when necessary, after a reference to the Local Government Board, to act in default of urban (other than municipal boroughs) and rural sanitary authorities within the area of their administration, for all purposes of the Public Health and Housing Acts, to which end the appointment of Medical Officers of Health who would give their whole time should be made obligatory on County Councils.

Par. 120-4.

(11) *Reports from Local Authorities.*

The Local Sanitary Authority in each district should be required to furnish to the Local Government Board, through the County Authority, reports according to certain specified requirements, which would show accurately what was being done, or left undone, in matters of sanitation and administration generally, and would thus form a basis of comparison between different districts. Armed with this information it should be the duty of the Central Authority to watch closely local administration, and to endeavour constantly to level up backward districts to the standard attained in the best administered areas.

Par. 135-C.

(12) *Law as to Insanitary and Overcrowded House Property.*

Nothing has been brought more prominently to the notice of the Committee than the ignorance that prevails, even in quarters which ought to be well informed, as to what the law and the powers it confers are. A statement on this subject was prepared for the Committee, with the assistance of the Local Government Board; and it appears to them that the Board could not do better than issue it, with such additions as they think proper, to all Local Authorities.

Par. 153.

(13) *Medical Inspection of Factories.*

The existing powers of Certifying Factory Surgeons should be extended, (1) so as to enable them to examine employees for purposes of qualification at a later age than sixteen, (2) so as to enable them to

re-examine, when necessary, at definite intervals. Further, even if it be necessary that Inspectors of Factories and Medical Officers of Health should have, to some extent, co-ordinate powers with regard to insanitary conditions in factories, an arrangement should be made whereby each authority should notify to the other any defects that may be apparent, although coming within the other's province. Similarly it should be the Certifying Surgeon's duty to notify to the Factory Inspector or the Medical Officer of Health, as the case may be, such defects as may come under his notice.

(14) *Over-fatigue.*

Par. 147.

As a preliminary to any further legislation on the subject of hours of employment, particularly employment of women and children, it is, in the view of the Committee, highly desirable that there should be a strictly scientific enquiry into the physiological causation and effects of over-fatigue, as recommended by the Brussels Congress.

(15) *Coal Mines.*

Par. 156.

The medical examination of young persons should be extended so as to cover those employed in coal mines.

(16) *Workshops.*

Par. 158.

The inspection and supervision of these, as distinguished from factories, should be strengthened. On the question whether this work should be undertaken by the Local Authority or the Home Office, the Committee are not in a position to make a definite recommendation. But one point in particular that calls for consideration is the propriety of making employment of children and young persons in workshops, dependent, as it is in factories, on a medical certificate.

(17) *Alcoholism.*

Par. 173-183.

The Committee believe that more may be done to check the degeneration resulting from "drink" by bringing home to men and women the fatal effects of alcohol on physical efficiency than by expatiating on the moral wickedness of drinking. To this end they advocate the systematic, practical training of teachers to enable them to give rational instruction in schools on the laws of health, including the demonstration of the physical evils caused by drinking. At the same time, the Committee cannot lose sight of the enormous improvement which has been effected in some countries, and might be effected in this country, by wise legislation.

(18) *Education in Rural Schools.*

Par. 193-5.

With a view to combating the evils resulting from the constant influx from country to town, the Committee recommend that every effort should be made by those charged with the conduct and control of rural schools to open the minds of the children to the resources and opportunities of rural existence.

(19) *Rural Housing and Allotments.*

Par. 192, 197.

Local Authorities in Rural Districts should apply themselves to remedying the dearth of cottages which exists in many parts of the country, by the exercise of their powers under Part III. of the Housing Act, 1890, as amended by the Act of 1900. If necessary, these powers might be supplemented by the introduction of some such machinery for putting them in motion as is contained in the Labourers' (Ireland) Acts, 1883-1903. It should also be seriously considered whether the experiment, for which there are legislative facilities, of dividing land into small holdings, might not be tried more frequently.

Par. 229-232.

(20) *Food and Cookery.*

For the purpose of bringing home to the people the importance of properly selected and carefully prepared food, there is much room for training of a socially educative character among girls and young women. To this end the teaching of cookery in schools should be guided by the principles laid down in Paragraph 232 of the Report. Even more may be done by mothers' meetings and lectures, and the distribution of leaflets on the subject. Continuation classes for girls beyond school age should be organized, attendance at which should be compulsory, subject to the exercise of a judicious discretion on the part of the School Authority.

Par. 227.

(21) *Cooking Grates.*

It should be provided by law that every dwelling let for the occupation of a family, should include a grate suitable for cooking.

Par. 233.

(22) *Adulteration.*

It would be highly expedient that the Local Government Board should be authorised to fix a standard of purity for all foods and drinks, in the same manner as standards for milk and butter have been fixed by the Board of Agriculture.

Par. 241-2.

(23) *Infant Mortality and Employment of Women.*

In order to arrive at some conclusion as to the connection between these two, (1) the infant mortality rates should be localised for particular areas in industrial towns, (2) general infant mortality rates for selected industries throughout the country should be taken, (3) the occupations (if any) of all mothers (married or unmarried) should be shown in the Registrar-General's records.

Par. 242.

(24) *Still-births.*

Still-births should be registered.

Par. 243, 391.

(25) *Medical Certificates as to Cause of Death.*

A medical certificate as to the cause of death should invariably be required before the death of any child, or indeed of any other person, is registered. Moreover, the medical certificate should be regarded as confidential, and its contents should never be divulged by the Registrar, as is permissible at present, to the friends of the deceased. It should be sent by the local Registrar direct to the Registrar-General.

Par. 262.

(26) *Employment of Women in Factories.*

The Committee do not think that the period during which employment after confinement is prohibited could be extended without counterbalancing disadvantages. But the law should certainly be strengthened, so as to place upon the employer the burden of obtaining proof that the required period has elapsed since the confinement of the women he employs, or, in the alternative, so as to prohibit future employment in the absence of (1) a medical certificate that it will not be prejudicial to their physical well-being, and (2) proof that reasonable provision is made for the care of their infants. This might take the form of a crèche, or be secured by the recognition for the purpose of a duly licensed body of women.

(27) *Provident Societies and Maternity Funds.*

Par. 263.

Charitable efforts in manufacturing towns might well be directed towards endowing and maintaining insurance organisations to which employees, assisted by voluntary subscriptions, could contribute while in work, and from which they might receive assistance during the period of confinement and afterwards.

(28) *Milk Supply.*

Par. 273.

With a view to ensuring the purity of the supply of milk to the community, the Committee think that the measures indicated in Paragraph 273 of the Report should be taken; in default of the Local Sanitary Authority taking proper precautions, the County Council should in all cases be authorised to act, and it should be the duty of the Local Government Board to intervene in the ultimate resort.

(29) *Feeding of Infants.*

Par. 277.

The Committee are impressed with the enormous sacrifice of infant life due to insufficient or improper feeding. The ultimate remedy lies in that social education already described, and the Committee advocate the systematic instruction in continuation classes of girls in the processes of infant feeding and management. They also recommend the issue to mothers in every district of leaflets on the rearing of babies similar to those used in Sheffield and Wakefield; this could be done by the municipality, by voluntary associations, or by the Registrar on the registration of every infant.

(30) *Milk Depôts.*

Par. 279.

It is of great importance that the milk supply should pass through as few hands as possible, and that milk vendors should not be general dealers whose sale of milk is confined to a few quarts. In order to effect these objects, milk depôts should be formed in every town, obtaining their supply direct from the farms. The Committee believe this could be done without recourse to direct municipal action, but they think that in all improvement Bills promoted by Local Authorities, the insertion of provisions dealing with the milk supply within their area should be insisted on.

(31) *Sterilisation and Refrigeration.*

Par. 280-1.

Having regard to the acute difference of medical opinion as to the effects of sterilisation, the Committee recommend an investigation into the whole subject by a small body of experts. Milk, when drawn from the cow, should at once be refrigerated to a temperature of 40 degrees Fahrenheit.

(32) *Midwives.*

Par. 295, 410.

The Committee desire to call the attention of Local Authorities to the provisions of the Midwives Act, 1902, which may be made an instrument of the greatest utility for the dissemination among mothers of proper knowledge and practical advice.

(33) *Training of Mothers—Health Associations.*

Par. 297-302.

While laying special stress on the need for education of the young in matters of hygiene and domestic economy, the Committee believe even more may be done in the direction of training the mothers of the present generation

in these matters. To this end, Health Societies on the lines of the Manchester and Salford Ladies' Health Society should be formed all over the country. Enough has been said of the value of the system by competent judges to justify the Committee in urging upon every locality the adoption of similar methods. They would further suggest to the Local Government Board the expediency of issuing to Local Authorities a circular explaining the objects to be sought and the means by which they can best be attained.

Par. 305.

(34) *Elementary Schools in Ireland.*

It appears that the elementary school system prevailing in Ireland urgently requires amendment in regard to warming of schools and hygienic conditions generally.

Par. 307.

(35) *School attendance in rural districts.*

The Committee think that school attendance in rural districts should not be compulsory till the age of six or possibly seven, and should be discouraged, if not absolutely prohibited, under five.

Par. 308-9.

(36) *Games and exercises for school children.*

It is desirable that more attention should be given, with the assistance, where possible, of voluntary agencies, to organizing games for school children, and for that purpose much greater use should be made both of school and public playgrounds than at present. But the Committee are of opinion that no scheme of games alone can ever be made general enough to supply the place of methodical physical training, and they hope that the course of physical exercises referred to in Paragraph 308 will find general acceptance with Local Authorities. While they consider that such exercises should, when possible, be taken in the open air, they would urge upon Local Authorities the expediency of providing play-sheds or rooms other than the ordinary class-rooms in which the exercises may be conducted regularly without interruption from the weather.

Par. 310-314.

(37) *Cookery, hygiene, and domestic economy.*

Instruction in these matters should, as far as possible, be made compulsory on the elder girls at school, and care should be taken that it is placed in the hands of properly qualified teachers, to which end it is expedient that some State aid should be given under proper conditions to schools of cookery at which teachers are trained, and that hygiene in its various branches should be made an essential element in the course of training for all teachers.

Par. 315.

(38) *Partial exemption from school.*

It should be considered whether the present law might not be modified so as to make it possible for a child under fourteen years of age to obtain partial exemption from the obligation to attend school, on no other condition than that of continuing to attend school up to a later age for certain specified periods and for special subjects of instruction.

Par. 317.

(39) *Special schools for "retarded" children.*

The Committee think that special schools of the Day Industrial School type might with advantage be established for the temporary treatment of children who are not up to normal school standard and are yet not so defective as to warrant treatment as "mentally deficient."

Par. 318.

(40) *Special magistrate for juvenile cases.*

In all cases touching the young where the assistance of a magistrate is invoked, he should, where possible, be a specially selected person sitting for the purpose.

(41) *Medical inspection of school children.*Par. 320-6, 411,
414, 421.

The Committee are emphatic in recommending that a systematised medical inspection of children at school should be imposed as a public duty on every school authority, and they agree with the Royal Commission on Physical Training (Scotland) that a contribution towards the cost should be made out of the Parliamentary Vote. With the assistance of teachers properly trained in the various branches of hygiene, the system could be so far based on their observations and records that no large and expensive medical staff would be necessary. The lines on which the inspection should be conducted are laid down in paragraphs 323-326 of the Report.

(42) *Feeding of elementary school children.*

Par. 358-365.

The Committee recommend that definite provision should be made by the various Local Authorities for dealing with the question of underfed children in accordance with the methods indicated in paragraphs 358-365 of the Report. The Committee, it will be seen, do not contemplate any one uniform method of procedure, but think that regard should be had to the varying circumstances of different localities. They also suggest safeguards against economic abuse.

(43) *Physical exercise for growing girls.*

Par. 372.

If physical exercise of a recreative character were included in the curriculum in the obligatory evening continuation classes for girls, the establishment of which has already been recommended, it would be likely to add greatly to the value and ultimately, it may be, to the popularity of such classes.

(44) *Crèches.*

Par. 373.

Wherever it was thought desirable, owing to the employment of married women in factories, or for other reasons, to establish municipal crèches, girls over fourteen might be made to attend occasionally, and the teaching of infant management to such girls should be eligible for aid from the grant for public education.

(45) *Open spaces and gymnastic apparatus.*

Par. 379.

It should be the duty of Local Authorities to provide and maintain open spaces in some proportion to the density of the population, and such spaces, or some of them, should include shelters fitted with gymnastic apparatus. Every effort should also be made to put such apparatus to the best possible use by placing it in charge of a competent instructor.

(46) *Clubs and cadet corps.*

Par. 379.

Having regard to the enormous value to the physique of growing lads of these institutions, and to the possible saving of expenditure in other directions resulting therefrom, the Committee are of opinion that some grant should be made from the National Exchequer in aid of all clubs and cadet corps in which physical or quasi-military training, on an approved scheme, is conducted, subject to public inspection.

(47) *Physical exercise for growing boys.*

Par. 380.

Lads should be made to attend evening continuation classes, in which drill and physical exercises should take a prominent place; and, with a view to the encouragement of clubs and cadet corps, exemption from

the obligation might be granted to all enrolled and efficient members of such organizations as submitted to inspection and conformed to the regulations qualifying them for public aid.

Para. 382.

(48) *Organization of existing institutions for the welfare of lads and girls.*

In order to organize existing efforts on a comprehensive and effective basis, the Committee would like to see a central body, in touch with municipal activity, established in every large town, and charged with the duty of supervising and directing voluntary agencies with a view to bringing them up to a minimum standard of efficiency.

Par. 384.

(49) *Juvenile Smoking.*

The Committee recommend that a Bill should be brought before Parliament at an early date, having for its object, (1) to prohibit the sale of tobacco and cigarettes to children below a certain age, (2) to prohibit the sale of tobacco and cigarettes in sweet shops and other shops frequented by children.

Par. 392.

(50) *Syphilis.*

The Committee recommend the appointment of a Commission of Inquiry into the prevalence and effects of syphilis, having special regard to the possibility of making the disease notifiable and to the adequacy of hospital accommodation for its treatment.

Par. 407.

(51) *Insanity in Ireland.*

The Committee recommend that investigation should be undertaken at an early date into the extent and character of the increase of lunacy in Ireland.

Par. 411, 414, 421

(52) *Teeth, Eyes, and Ears.*

The Committee are of opinion that the care of the teeth should receive special attention in the teaching of the elements of hygiene in schools, that daily cleansing of the teeth should be enforced by both parents and teachers, and that systematic inspection of the teeth, eyes, and ears of school children should be undertaken as part of that general medical inspection which has already been recommended.

Par. 422.

(53) *Vagrancy; Defective Children.*

The Committee wish to record their belief that the proposed inquiries into these subjects will be of great value.

CONCLUSION.

424. The Committee hope that the facts and opinions they have collected will have some effect in allaying the apprehensions of those who, as it appears on insufficient grounds, have made up their minds that progressive deterioration is to be found among the people generally. At any rate the Committee believe that their labours will result in giving matter for reflection to those who realize the importance of evidence towards the determination of issues of such uncertainty and complexity, and that these persons, who they would fain hope are the larger portion of the thinking community,

will await the necessary steps being taken to secure that body of well-sifted and accurate information, without which it is impossible to arrive at any conclusion of value as to the general problem.

425. It may be argued that there is here no immediate remedy, and that years must elapse before the lack of knowledge is supplied; but in regard to those evils, the existence of which is admitted, the Committee have recognised what can be done in the interval, and are confident that if their recommendations are adopted a considerable distance will have been traversed towards an amendment of the conditions they have described.

426. In the carrying out of their recommendations for the rectification of acknowledged evils, the Committee do not rely upon any large measure of legislative assistance; the law may with advantage be altered and elaborated in certain respects, but the pathway to improvement lies in another direction. Complacent optimism and administrative indifference must be attacked and overcome, and a large-hearted sentiment of public interest take the place of timorous counsels and sectional prejudice.

427. The Committee cannot conclude their Report without a cordial acknowledgment of the debt they owe to the zeal, diligence and ability of their Secretary, Mr. E. H. Pooley, who has been of the greatest service to them throughout the inquiry; and they also desire to recognise their obligations to the Royal Colleges of Surgeons and Physicians for the assistance rendered by those bodies, in expressing their opinion on points submitted to them and in the selection of witnesses.

We have the honour to be,

Your Lordship's obedient Servants,

ALMERIC W. FITZ ROY.

G. M. FOX.

JAMES G. LEGGE.

ERNEST H. POOLEY, SECRETARY.

July 20th, 1904.

APPENDICES.

APPENDIX I.

(a) ORIGINAL MEMORANDUM PREPARED BY SURGEON-GENERAL SIR WILLIAM TAYLOR, K.C.B.,
DIRECTOR-GENERAL, ARMY MEDICAL SERVICE.

1. A deep interest has been aroused, both in the lay and medical press, by the writings of Sir Frederick Maurice and others, who have brought into prominence certain observations pointing to the fact that there is an alarming proportion of the young men of this country, more especially among the urban population, who are unfit for military service on account of defective physique.

The questions naturally arise as to whether this impeachment of the national health has a solid foundation in fact, and as to whether the condition is true of the population as a whole, or only of a certain section of it. The teaching of public health statistics would appear to show that progressive improvement of the national health has steadily followed the improved conditions of life which have been brought about by the advance of sanitary knowledge and its practical application. It has also been pointed out that athletic records are constantly being broken for all sorts of feats of strength, agility, and endurance, facts which would seem to indicate that the physique of the well-to-do classes, at least, is improving rather than deteriorating. It is nevertheless true, and the fact is a disturbing and disquieting one, that a very large proportion of the men who offer themselves for enlistment in the Army are found to be physically unfit for military service.

2. In an article on the National Health, which appeared in a recent number of the *Contemporary Review*, Sir Frederick Maurice states that, according to the best estimate he had been able to arrive at, it has been for many years the case that out of every five men who wished to enlist, and primarily offer themselves for enlistment, you will find that by the end of two years' service there are only two men remaining in the Army as effective soldiers. Of the men who offer themselves, some are rejected by the recruiting sergeant or recruiting officer, some by the examining medical officer, and some, though enlisted, are found after three months to be unlikely to develop into effective soldiers and are summarily discharged. According to General Maurice's experience, at the end of two years not more than 40 per cent. of the men who wished to become soldiers will be found serving; or, in other words, 60 per cent. of the men offering themselves are physically unfit to serve as soldiers. He points out that it is no good talking of conscription or of any form of compulsory service if we already have five men offering themselves for every two men who are fit for the work; no one has suggested that we should increase our Army in the proportion of two to five, *i.e.*, make it two and a-half times as large as it is now. He then goes on to say that no nation was ever yet for any long time great and free, when the army it put in the field no longer represented its own virility and manhood.

3. But the want of physique, thus shown to exist with regard to a large section of the community, is not only

serious from its military aspect, it is serious also from its civil standpoint, for if these men are unfit for military service, what are they good for? As Sir Lauder Brunton says—"Poor in physique as they all are, and poor in mental capacity and power of application as many of them must be, what becomes of them? Many of them probably marry girls as weak as themselves, and have children, some of whom go to swell the lists of infant mortality, some to join the criminal classes, while others grow up more weak and incompetent than their parents." Inquiry is wanted, and it is vital for us to know the truth. Whether part of the physical deterioration is the result of unskilled labour flocking to the towns and there failing to find means for properly rearing a family, or whether it be on account of causes which are attackable, such as early marriages and the ignorance of mothers; the result is that the rising generation of all below the artisan class includes a vast number of men of a very low standard of health and physique.

4. Regarding the condition of the poorer classes, Mr. B. S. Rowntree read a paper at the British Medical Association Meeting, last August, on Poverty and Disease (*British Medical Journal*, 16th August, 1902). His observations refer to York, which has a population of about 75,000. In discussing the question he speaks of poverty under two heads, primary and secondary poverty. He defines "primary poverty" as the condition when the total earnings are insufficient to obtain the minimum necessities for the maintenance of physical efficiency in the family. "Secondary poverty" is when the earnings would be sufficient if some part of them were not wasted. He found that in York 10 per cent. of the total population were living in "primary poverty," and that of this 10 per cent. just one-half (52 per cent.) is due to the fact that the chief wage earner, though in regular employment, has wages which are insufficient to maintain a family of moderate size in a state of physical efficiency. 18 per cent. of the population were living in a state of "secondary poverty," so that, adding the two classes together, 28 per cent. of the population in York are living in poverty. Some years ago Mr. Charles Booth estimated that in London 30 per cent. of the people were living in poverty. If then the same conditions prevail in other large towns, it would appear that more than a quarter of our town populations are living at, or below, the poverty line. Now in England and Wales, at last year's census, 77 per cent. of the population was urban; namely, 25 millions out of 32½ millions; the town population having increased 15 per cent. during the last decade.

5. Every year a table is published, in the Army Medical Department Report, which classifies the recruits examined according to their previous occupations. The following is the table for 1900. It has not been selected for any special reason, but is given as an average example of our recruiting experience:—

Occupation of recruits.	Number inspected.	Number rejected.	Ratio rejected per 1,000 inspected.	Proportion of each group in 1,000 recruits inspected.
1. Labourers, servants, husbandmen, etc. -	52,022	15,025	288.82	616
2. Manufacturing artizans (cloth-workers, weavers, lace makers, etc.) - - -	11,971	3,478	290.54	142

6. Boys under 17 years of age - - -	2,431	273	112.30	29
TOTAL - - - - -	84,402	23,745	281.33	1,000

6. Examination of a series of these annual tables shows that the proportion of the different classes remains remarkably constant from year to year, and the figures indicate that the bulk of our soldiers are drawn from the unskilled labour class, and consequently from the stratum of the population living in actual poverty or close to the poverty line. As might be expected, the highest ratio of rejection is shown for men who have been following indoor occupations.

7. The impairment of vigour and physique among the urban poor is easy to understand when we reflect that, in addition to their only being able to provide themselves with food insufficient in quantity and probably poor in quality, their poverty also usually entails unhealthy environment, *e.g.*, defective housing, overcrowding and insanitary surroundings. Add to this the distress resulting from such causes as want of thrift, illness or death of the breadwinner, and alcoholic excess. Further, the physical deterioration caused by inherited or acquired disease must not be forgotten, and in illustration we need only instance the part played in this way by tubercle and syphilis.

8. In his Annual Report for 1902, just issued, the Inspector-General for Recruiting remarks that the one subject

which causes anxiety in the future as regards recruiting is the gradual deterioration of the physique of the working classes from whom the bulk of the recruits must always be drawn, and, when it is remembered that recruiters are instructed not to submit for medical examination candidates for enlistment unless they are reasonably expected to be passed as fit, we cannot but be struck by the percentage considered by the medical officers as unfit for the service. In the reports from all the manufacturing districts, stress is invariably laid upon the number of men medically rejected for bad teeth, flat feet, and inferior physique.

9. Examining next the Army recruiting statistics in relation to the assertion that practically 60 per cent. of the men offering themselves for enlistment are unfit for military service, the following table has been compiled from information given in the Army Medical Department Reports, supplemented in some particulars by data obtained from the reports of the Inspector-General of Recruiting. A period of 10 years (1893-1902) has been selected, as of course, the greater the number of observations dealt with, the nearer will be our approximation to the truth.

Year-	1.	2.	3.	4.	5.	6.	7.
	Number of recruits inspected (A.M.D. Report.)	Number rejected on inspection. (A.M.D. Report.)	Number re- jected within 3 months after enlistment. (A.M.D. Report.)	Invalids discharged during the year under 2 years' ser- vice. (I.G.R. Report.)	Ratio per cent., column 2.	Ratio per cent., column 3.	Ratio per cent., column 4.
1893 - - - - -	64,110	25,999	342	962	40.6	0.5	1.5
1894 - - - - -	61,985	24,705	369	770	39.9	0.6	1.2
1895 - - - - -	55,698	22,548	368	952	40.5	0.7	1.7
1896 - - - - -	54,574	22,698	413	999	41.6	0.8	1.8
1897 - - - - -	59,986	22,370	575	997	37.3	1.0	1.7
1898 - - - - -	66,502	22,983*	387	983	34.6	0.6	1.5
1899 - - - - -	63,087	22,071	433	1,003	32.4	0.6	1.5
1900 - - - - -	84,402	23,105	640	1,514	27.4	0.8	1.8
1901 - - - - -	76,750	21,522*	1,014	3,825	28.0	1.3	4.9
1902 - - - - -	87,609	26,913*	1,308*	2,254	30.7	1.5	2.5
1893-1902 - - - - -	679,703	234,914	5,849	14,259	34.6	0.9	2.1

* Does not include men enlisted in 1902 and discharged under 3 months' service in 1903.

10. It will be observed that during this decennial period the number of men medically examined for enlistment was 679,703, and of those 234,914 were rejected as medically unfit for service, giving a rejection ratio of 34.6 per cent.; of the men passed fit, 5,849 broke down within three months after enlistment, being at the rate of .9 per cent. for this class; while 14,259, or 2.1 per cent. more, were discharged as invalids under two years' service. The smallness of the rate of the rejections within three months of enlistment, varying as will be observed, between .5 and 1.5 per cent. speaks well, I think, for the thoroughness of the primary medical examination of recruits. But the rejection of one out of every three men examined by the recruiting medical officer points clearly to the poorness of the human material available for army purposes, as a writer in the *Lancet* puts it. Adding together the rates for the three classes of rejections referred to in the table, we find that 37.6 per cent. of the 679,703 men examined during the decennial period proved to be unfit for military service. This percentage of rejections does not, however, represent the whole extent of the physical unfitness existing among men wishing to become soldiers, and offering themselves for enlistment. The Inspector-General of Recruiting states in his report for 1902, that it must be borne in mind, when examining these totals, that they do not represent anything like the total number of the rejections of candidates for enlistment into the Army. A large

number of men are rejected by recruiting sergeants and recruiting officers and such men in consequence are never medically inspected and do not appear in any returns. In the decennial period under consideration we have only been able to account for 37.6 per cent. of rejections from official statistics; but according to Sir Frederick Maurice's estimate, 60 per cent. of the men who offer themselves are unfit for service. This indicates that the number of men turned away by the recruiters themselves as unlikely to have any reasonable chance of passing the medical examination is an appallingly large one. As already stated no official record is kept of the number of men turned away; but there is reason to believe that the number is a large one, though whether it is sufficiently large to bring up the figures of the rejected to 60 per cent. we have no means of saying.

11. Examination of the statistics dealing with the causes of rejection by the examining medical officers of men seeking enlistment, brings into prominence the fact that the majority are rejected on account of causes indicating poor physical development, namely, under chest measurement, under height, and under weight. Defective vision may also be regarded in many cases as resulting from developmental defect. The following table gives the statistics relating to the principal causes of rejection for the twelve years 1891-1902:—

CAUSES of Rejection of Recruits on Inspection, with ratio per 1000.

1891-1902.

Cause of rejection.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Under chest measurement -	92.03	95.90	108.55	110.27	126.38	139.64	89.44	73.88	65.84	59.84	49.88	56.72
Defective vision- - -	40.35	42.35	41.51	42.90	39.88	40.72	41.15	42.64	41.99	36.42	35.84	39.23
Under weight - - -	32.47	27.62	39.99	39.61	36.58	35.95	45.58	34.82	33.84	28.52	25.15	21.72
Under height - - -	26.76	32.71	33.24	28.67	28.72	28.77	24.86	21.79	20.21	15.18	13.56	11.59
Imperfect constitution and debility	18.40	9.87	9.47	5.00	3.57	4.44	4.45	5.49	5.82	4.94	3.36	3.91
Disease of veins- - -	16.39	16.24	17.11	15.84	15.85	15.72	15.42	15.74	14.22	11.69	13.98	12.30
Disease of heart- - -	16.06	13.87	17.74	19.62	20.71	18.76	17.67	17.26	15.69	13.15	16.74	17.33
Defects of lower extremities	15.57	17.09	14.40	17.44	18.16	18.14	18.12	17.72	13.98	10.53	10.35	12.27
Varicocele - - -	12.93	11.85	12.85	14.25	12.28	13.07	13.07	12.29	12.16	11.21	13.89	12.59
Flat feet - - -	11.04	9.83	12.45	14.71	13.16	17.81	16.79	12.24	12.31	9.02	11.66	12.44
Loss or decay of teeth -	10.88	14.56	15.33	16.26	17.95	19.75	24.16	26.34	25.29	20.02	26.70	49.26

It will be observed that bad teeth and flat feet, causes of rejection to which considerable importance was attached in General Maurice's paper in the *Contemporary Review*, occupy a comparatively low place in the list. But with regard to loss or decay of teeth, it must be pointed out that the numbers rejected on this account during the past four or five years have shown steady increase, until this cause of rejection has come to regularly occupy a high place on the list. Whether the increase in the rejections for bad teeth is an indication of increasing prevalence of physical unfitness is open to question, the increase may partly, at least, be due to the more common use of articles of food which readily undergo acid fermentation, and partly also to examining medical officers having gradually come to place a high value on soundness of teeth as a matter of the greatest importance in its relation to the maintenance of the physical efficiency of the soldier on service. The main inference to be drawn from a consideration of the figures in the table is that the bulk of the rejections arise from causes indicating the operation of agencies antagonistic to healthy physical development.

12. It has already been stated that a large proportion of the population live in towns, and this has been estimated at 77 per cent., or 25,000,000. Of this town population about 25 per cent. (probably at least 6,000,000), appear from trustworthy investigations, to be not only poor, but living in actual poverty, so as to be unable to rear their children under conditions favourable to health and physical fitness. The bulk of the men who seek enlistment belong to this section of the population, and a very large proportion (but probably not quite three out of five as stated by General Maurice) of the men who wish to join the Army prove physically unfit for military service. It is not claimed that the same proportion of poor material will be found generally distributed amongst all classes of the community. In an earlier paper in the *Contemporary Review*, on "Where to get men," General Maurice remarks regarding this point, "Of course, as yet, that stern and brutal fact of the two in five does not mean that of the whole male population of the kingdom there are only two out of five who are fit to bear arms."

In the concluding paragraphs of his paper on "National Health: A Soldier's Study," Sir Frederick Maurice states:

"My object is to call upon the great profession, whose immediate concern is health, to give us the guidance and leading we need, and primarily it seems to me that we ought to call upon the Councils of the Colleges of Physicians and Surgeons, as *ex officio* the great national boards of health to help and guide us." I should suppose that they have not at this moment, despite the census, sufficiently comprehensive data on which to pronounce, but if that be so, no Government could or would wish to resist an appeal from them for assistance in getting at the truth on the tremendous question which has been raised by the investigations of Mr. Rowntree: "Is it or is it not true that the whole labouring population of the land are at present living under conditions which make it impossible that they should rear the next generation to be sufficiently virile to supply more than two out of five men effective for the purposes of either peace or war."

The question at issue constitutes a problem by no means easy to solve. Were all classes of the community able to provide their offspring with ample food and air space, a healthy race would be produced, and the proper material to fill the ranks of the Army would probably soon be obtained.

13. Information is wanted as to the causes of physical deficiency and as to the best available methods of remedying defects and improving the national health. Such an inquiry might fitly be undertaken by a commission as to the composition of which the advice of the Colleges of Physicians and Surgeons might be asked. As the matter is one of the utmost importance from the recruiting point of view, it is suggested that the Secretary of State might take the initiative in the matter of getting the opinion of the Councils of the Colleges with regard to—

(a.) The necessity for such an inquiry.

(b.) The ground to be covered by a commission if appointed.

(c.) Composition of commission.

W. TAYLOR, Director-General,
Army Medical Service.

War Office,
2nd April, 1903.

(b) REPORTS TO THE HOME OFFICE BY THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS.

ROYAL COLLEGE OF PHYSICIANS.

REPORT OF THE COMMITTEE ON THE PHYSICAL DISABILITY OF ARMY RECRUITS.

14. Committee appointed by the College, July 2nd, 1903, to consider a communication from the Home Secretary, asking for observations on a proposed enquiry into the causes which have led to the rejection in recent years of so many recruits for the Army, on the ground of physical disability, and the possible measures by which this state of affairs may be remedied.

Members of the Committee.—The President, Dr. Poore, Dr. Longstaff, Dr. Pringle, Dr. Newsholme, Dr. J. F. W. Tatham.

In the original Memorandum, signed by Sir William Taylor, Director General of the Army Medical Department, sent to the College under cover of a letter from the Home Office, dated June 11th, 1903, the College was asked to express an opinion as to the necessity for an enquiry into the causes of the physical disability of so large a proportion of men offering themselves as recruits, and as to the available methods of remedying defects and improving the national health.

The general tenour of the report appeared to favour the opinion that an increasing deterioration in physique is taking place in the classes of the population from whom military recruits are chiefly drawn. An examination, however, of the figures given in the tables in the Memorandum itself does not support this view, as we find that the rejections of those offering themselves as recruits have fallen from 42 per cent. in 1891, to 34 per cent. in 1902. If we consider the causes of rejection, the table on page 4 of the Memorandum shows that chest measurements, weight, and height have all improved in recent years; whilst at the same time the rejections from other causes—with the exception of decayed teeth—have all decreased in number. Application was therefore made by the College to the Home Office for further information which might explain the apparent contradiction between the general tone of the report and the figures given. Information was especially asked for on such points as alterations in standard, if any, and more detailed statements as to the occupations of the heterogeneous class No. 1 ("labourers, servants, husbandmen, etc.") from whom nearly two-thirds of the number inspected were drawn, and who, therefore, furnish by far the largest number of rejections.

In reply to this application we were informed through Mr. Cunynghame, C.B., that the College was not asked to enter into an investigation of any alleged deterioration. What was wanted of the College, at this stage, was the expression of an opinion whether, from their point of view, an inquiry was necessary or not; and that they should confine themselves to answering the questions *a*, *b* and *c* at the end of the Director General's Report—

(a) The necessity for such an enquiry.

(b) The ground to be covered by a Commission if appointed.

(c) Composition of Commission.

15. The College is therefore placed in a position of expressing an opinion as to the necessity of an inquiry without any adequate data upon which an opinion can be founded.

Your Committee hold that it is extremely improbable that any general deterioration of the physique of the population is taking place, when they consider (without laying undue stress on the greatly lowered death-rate) how much the food, clothing and housing of the people have improved, together with the diminution of general pauperism. Class 1 (No. 1 of the Director General's statement) must include the *residuum* of the labour market; and, whilst your Committee duly recognise the effect which the increase of urban as compared with rural population may have on the population at large, it must be remembered that there has been a marked increase in the wage of agricultural labourers (a diminishing class) of late years, and that the attractions offered to this class by the Army in the shape of pay are proportionately much less than formerly, and consequently a larger proportion of men offering themselves for recruits may be expected to belong to the class of casual labourers in our large towns.

The Committee desire to draw attention to the fact that a greater change has taken place in the conditions of life in this country during the last fifty years than in any similar period of our history. Could an enquiry be made into the present physical condition of the nation, it is self-evident that it would be of great value, but one dealing with a portion only would be likely to lead to error.

The Committee would, therefore, suggest to the College that its answer to the Home Secretary's letter be as follows:—

Draft of reply to the Home Office.

16. The College has carefully considered the statement of the Director General of the Army Medical Service, forwarded through the Home Office, and would point out that the information furnished by it is not of such a character as to enable the College to express a decided opinion upon the question of whether there is, or is not, a necessity for an enquiry into the causes of the physical deficiency of those offering themselves as recruits for the Army.

The College is in possession of no means for comparing the condition of the population from whom recruits are drawn at the present time with that which obtained in former years. The figures given in the Director General's statement show that there has been no increase in the proportion of rejections, and although the numbers of those discharged from the Service in 1901-1902 are proportionately larger than those in former years, no details are given as to the circumstances under which the increase has taken place; and, indeed, the figures may not be strictly comparable.

17. Any investigation which does not take into account the condition of the labouring classes in the great industries of the country must necessarily give a very erroneous impression of the physique of these classes. The increase in the rate of wages in all forms of labour to that extent diminishes the attractions of a military career for those engaged in regular labour, and leads to a proportionately larger number of the "unemployed" offering themselves for service in the Army.

18. It is obvious that the casual labourers of the large towns represent the poorest portion of the population, among whom the lowest standard of physique would be found; but the College is not in possession of any evidence which satisfies it that there is any physical degeneration of the urban population generally. Moreover, the fact that the urban death-rate has declined between 5 and 6 per thousand, and now more closely approximates that of the rural population makes it unlikely that such deterioration is taking place.

19. The question of what *means* are available for remedying existing defects in and improving the national health may, perhaps, be briefly summed up as those which tend to diminish poverty. At the same time, the College desires to point out that very great changes in the conditions of life have taken place during the last fifty years, the effects of some of which are not yet determined. Among these should be considered the alterations in character of the food, the compulsory education and confinement in schools of young children, and the very great increase of female labour in towns. Could an enquiry be made into the present physical condition of the nation it is self-evident that it would be of great value; but one dealing with a portion only of the population would be likely to lead to error. Such an enquiry would naturally include the above subjects, the experiences of the Royal Navy, and other services of the State.

20. It hardly comes within the province of the College to state its views with regard to the composition of such a Commission as is suggested. If decided upon by the Government, it would be prepared, in conjunction with the Royal College of Surgeons of England, to suggest names, should it be thought desirable to place members of the medical profession on the Commission.

W. S. CHURCH,
President.

27th July, 1903.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

21. The Council of the Royal College of Surgeons of England have carefully considered the Circular drawn up by Sir William Taylor, Director General of the Army Medical Service, on the physical deficiencies of the men who offer themselves for enlistment in the Army; and now beg to submit, for the information of the Secretary of State, the following observations in reference to those matters upon which their opinion is invited, viz.:—(a) the necessity of a proposed enquiry into the causes of physical deficiency and as to the best available means of remedying defects and improving the national health; (b) the ground to be covered by the Commission if appointed; and (c) the composition of the Commission.

It is premised in the Circular of the Director General that, while there is reason to believe the physique of the well-to-do classes is improving, "a very large proportion of the men who offer themselves for enlistment in the Army are found to be physically unfit for military service;" and there seems to be a presumption that the proportion is increasing. But the statistics set forth in the Circular do not support this view; and there is no indication that the figures are affected by any change in the standard of physical requirements in recruits during the period under consideration. Nor does it appear that there has been any noticeable change in the personnel of the candidates for enlistment during this period. In the opinion of the Council, however, there are reasons for believing that, compared with former times, most of the men who now offer themselves as recruits are drawn from a class physically inferior, and that a general statistical statement may be, therefore, misleading.

22. Many influences have been at work during recent years to affect the status of the working classes. Increased competition in trade, keener industrial rivalries, the growing responsibilities of employers, the "labour movement," trades-unions, and other social and economic factors have altered the conditions of labour, and raised at once the comparative standard of efficiency of the workman, the standard of living, and the rate of wages. In the struggle for employment the better educated, the more intelligent, and the more active and industrious are attracted to the better paid and more coveted occupations. The result is a large, and probably growing, remainder of those who, more or less unfit, fail to obtain regular employment. And it is apparently from this residue that the Army has to obtain the larger proportion of its recruits.

23. Disquieting though this reflection may be, there is no evidence before the Council that the physical disabilities of this class, taken by itself, has increased or are increasing. Indeed, the data supplied by the Circular itself seem to show that they have not increased, but rather that they may tend to diminish.

From Table I, p. 2, it would appear that when recruits belong to a class which may be regarded as first-hand material, namely, "boys under seventeen years of age," the proportion of rejections is only 11·2 per cent. Considering the probable parentage and the early surroundings of these youths, and considering also the numerous possible physical disqualifications, this cannot be regarded as a high rate of rejection. Moreover, this class of recruit affords a fair criterion of the average physique of the lower stratum of society. And it is also this class of recruit which should manifest most improvement under the favouring conditions of better food, better housing, and better surroundings and associations after enlistment.

Again, Table II, p. 3 shows a steadily declining rate of primary rejections from 40·6 per cent. in 1893 and 41·6 per cent. in 1896 to 27·4, 28·0, and 30·7 respectively in the three years 1900-2. Against this is to be set a sharp rise in the years 1901 and 1902 in secondary rejections, that is, rejections within three months of enlistment and after two years' service. The causes of these secondary rejections are not stated; but it may not unreasonably be assumed that many of them were due to preventable causes, physical or moral.

As bearing generally on the larger question of National Health, and more particularly on the physique of those who offer themselves as recruits, Table III, p. 4 is not

without some hopeful indications as to the future. The Table shows a diminishing proportion of rejections in each of the assigned grounds of disqualification, excepting that of "loss or decay of teeth." In such a critical test of physique as "chest measurement," the rejections which were 139·64 per thousand in 1896, were only 49·88 and 56·72 respectively in the years 1901-2. "Imperfect constitution and debility" caused 18·40 per thousand rejection in 1891, and only 3·36 and 3·91 respectively in the years 1901-2. On the other hand, the rejections due to loss or decay of teeth which were 10·88 per thousand in 1891, had risen to 49·26 per thousand in 1902.

The Circular does not state whether or not there has been increased stringency of late in the matter of the teeth, or relaxation with respect to the other physical and vital requirements. In the absence of any statement to the contrary, the Council assume that no material alteration has been made. In any case the Council believe that many of the causes of disability will tend to grow less. Greater attention is now paid in schools to the general health of children, to physical training, to the care of the sight, the hearing, and the cleanliness of the mouth and teeth. And the spreading influence of the various social, municipal, and philanthropic agencies for the promotion of the public health, and the strengthening of the character of the individual, cannot fail to beneficially affect the health and well-being of all classes of the people, including the lowest.

24. It may, perhaps, not be altogether irrelevant to remark that many of the grounds of physical disqualification for the English Army, such as defects in vision, weight, height, and teeth, would in countries where conscription obtains be much less important factors in judging of the fitness of men for military service.

The Council desire to state that while they have thought it right to scrutinize the data supplied in the Circular prepared by the Director General, they have not done so in a captious spirit, but rather to illustrate the difficulty they have experienced in forming an opinion or in making any definite recommendation. They cordially recognize the immense importance of the matters to which the Director General has called attention, and the skill and clearness with which he has collated the facts upon which his opinion and recommendations are based.

25. On the evidence before them, and in view of the testimony of the public health statistics, the Council do not think there is need for a large enquiry into the National Health, and they are doubtful whether trustworthy results would be obtained by instituting a special enquiry with respect to the class from which most of the recruits are obtained. The Council are, however, of opinion that much might be done in a less formal manner by emphasizing the necessity of still stricter attention to the health, feeding, and training of school children, and more especially the care of the teeth and the arrest of threatened or early decay.

26. The Council also are of opinion—upon which opinion they would lay great stress—that as much as possible should be done to promote the health, growth, and general physical development of the young soldier by improving his environment and by the exercise of special care in the selection of the kind and quality of his food and in its preparation and preservation.

Should the Government decide to institute the larger enquiry into the National Health, or the more limited one dealing chiefly or solely with the class supplying the majority of recruits, the Committee would suggest that in addition to military men, the Commission should contain employers of labour, representatives of the working-classes, persons who have specially studied matters relating to public health, and members of the medical profession. With respect to the last named, the Council would be pleased in conjunction with the Royal College of Physicians to nominate representatives specially acquainted with the subject-matter of the enquiry.

JOHN TWEEDY,
President.

4th August, 1903.

(c) LETTER TO THE WAR OFFICE FROM THE PHYSICAL DETERIORATION COMMITTEE.

October 26th, 1903.

SIR,—

Physical Deterioration Committee.

27. The Committee which was appointed on September 2nd, by the Duke of Devonshire at that date Lord President of the Council, to enquire into the allegations concerning the physical deterioration of certain classes of the population, held its first meeting on the 21st inst., when the Memorandum of the Director General, Army Medical Service, dated April 2nd, 1903, was under consideration.

If reference is made to the Table on page 6 of the Memorandum, it appears that chest measurement, weight and height have all improved in recent years, whilst at the same time the rejections from other causes—with the exception of decayed teeth—have for the most part decreased in number, and the Committee would therefore be glad of any further information that would tend to explain the disquieting tone of the Memorandum, as a whole. It was also decided to ask you to be so good as to furnish the Committee with any information in the

possession of the Department that throws light upon the figures included in head No. 1 of the Table on page 4 of the Memorandum. That head comprises “labourers, servants, husbandmen, etc.,” and from these classes by far the largest number of recruits are drawn. The Committee would be glad to know what sub-divisions, with the figures attaching to each, are included, and, if possible, what classes of men are employed and what occupations are meant by the terms “labourers, servants, husbandmen, etc.,” and it would be of great additional assistance if the tables so expanded could be arranged with the object of showing the local distribution of the conclusions deducible from them.

The Committee are desirous of obtaining as many statistics and records as possible bearing upon the existing state of facts, and will feel obliged for any help you could give in the matter.—I am, Sir, your obedient servant,

ALMERIC W. FITZ ROY.

The Under Secretary of State,
War Office.

(d.) FURTHER MEMORANDUM OF THE DIRECTOR-GENERAL, ARMY MEDICAL SERVICE.

28. IN reference to a letter dated 26th October, 1903, from the Chairman of the Committee appointed by the Lord President of the Council to inquire into the question regarding the defective physique of certain classes of the population of the United Kingdom, I think I ought to explain that an earlier statement could not be sent on account of the time taken up in obtaining the necessary information from different recruiting centres and the large amount of work involved in the preparation of the accompanying statistical tables.

Before touching on these tables, there are one or two points of great importance in relation to this inquiry about which I would like to say a few words with a view to bring to notice what I conceive to be a grave misunderstanding as to the main question at issue. In the first place, I think that the idea of “progressive physical deterioration” has occupied a much too prominent position in the minds of those who have had to consider and report as to the advisability of inquiry being necessary, and I also regret that the words “physical deterioration” have been adopted in the designation which has been given to the Committee. I consider that it is impossible to obtain reliable statistical or other data regarding the conditions that have existed in the past, and consequently, as no reliable data are obtainable for purposes of comparison, I don’t see how the question can be dealt with from the progressive deterioration point of view. Whether or not there has been, or is, progressive physical deterioration among the classes now in question is a matter of very great importance, no doubt, but, in my opinion, it is not the chief question from a practical standpoint. To my mind the principal question for the Committee is to inquire into the causes and present extent of the physical *unfitness* that undoubtedly exists in large degree among certain classes of the population. The question dealt with in my original Memorandum was not that there was evidence of progressive physical deterioration of the race, either in whole or in part, but that it is a most disturbing fact that from 40 to 60 per cent. of the men who present themselves for enlistment are found to be physically unfit for military service. Even if the proportion is no greater than in the past, surely it is a state of matters worthy of the closest investigation, and one which no thinking man can wish to see continue. Moreover, it would be out of keeping with the progressive spirit of the times we live in for us to be content with the consolation that we are no worse off than we were fifty or even twenty years ago. I trust that the inquiry may end in suggestions that will lead to the institution of measures which will result in bringing about a marked improvement of the physique of the classes from which our recruits are at present drawn. I would again take this opportunity of pointing out that the smallness of the rate of the rejections within three months of enlistment, varying, as will be observed from the table on page 3 of my first Memorandum between .5 and 1.5 per cent. speaks well, I think, for the

carefulness of the primary medical examination of recruits; while the rejection of one out of even every three men examined by the recruiting medical officer points clearly to the poorness of the human material available for Army purposes.

Secondly, I would like that the objects with which the tables given on pages 3 and 4 of the Memorandum were prepared should be clearly understood. The table on page 3 was compiled for the purpose of comparing the evidence given by Army Recruiting Statistics with Sir Frederick Maurice’s assertion that 60 per cent. of the men offering themselves for enlistment are unfit for military service. The table on page 4 was prepared in order to show the principal causes of rejection, and it is stated in the Memorandum that the main inference to be drawn from a consideration of the figures in the table is that the bulk of the rejections arise from causes indicating the operation of agencies antagonistic to healthy physical development. These explanations are given, as there appears to be an impression abroad that these tables were inserted in order to in some way lend support to the view that an increasing deterioration in physique is taking place in the classes of the population from whom military recruits are chiefly drawn.

The figures in the tables referred to in the preceding paragraph cannot be taken as either telling for or against increasing deterioration. The apparent improvement which the figures show since 1896, as regards chest measurement, weight, and height, and also as regards some of the other causes of rejection, must be considered in conjunction with the statement made near the bottom of page 3 of the Memorandum: “That it must be borne in mind, when examining these totals, that they do not represent anything like the *total* number of the rejections of candidates for enlistment into the Army. A large number of men are rejected by recruiting sergeants and recruiting officers, and such men in consequence are never medically inspected and do not appear in and returns.” The Inspector-General of Recruiting issued these instructions in order to lessen the work of medical officers engaged on recruiting duties. Recruiters had strict orders not to send any recruit before an examining medical officer unless they considered that the man had a reasonable chance of passing. The Inspector-General of Recruiting has stated to me in regard to this point: “My recruiters not being medical men. I cannot check rejections for ‘various ailments,’ but I can for ‘want of physical development,’ by having all weeds immediately thrown out and not sent up for medical examination.” This radical change in procedure was made on account of the large number of rejections for “under chest measurement,” observed up to 1896, and as the change dates from that time, I regret to say that the improvement in the figures since observed cannot be regarded as indicating an all-round improvement in physique on the part of the men presenting themselves for enlistment.

The following statistical tables, which bear on the existing state of facts, are herewith forwarded:—

Appendix
VI.

Table 1.—Return of recruits rejected on inspection at St. George's Barracks, London, Hounslow, Woolwich, Newcastle on-Tyne, Manchester, Liverpool, Birmingham, Lichfield, Edinburgh, Glasgow, Dublin, and Belfast, during 1901 and 1902, showing causes of rejection according to previous occupations.

Table 2.—Return of recruits rejected on inspection during 1901, at the same recruiting stations, showing causes of rejection according to previous occupations, arranged by stations.

Table 3.—Return of recruits rejected on inspection during 1902, at the same recruiting stations, showing causes of rejection according to previous occupations arranged by stations.

Table 4.—Principal causes of rejection, tabulated according to previous occupations.

The heading "Want of Physical Development," includes the following, which are shown separately in the other tables.

Impaired constitution and debility.
Under height.
Under chest measurement.
Under weight.
Not likely to become an efficient soldier.

W. TAYLOR,
Director-General.

War Office,
November, 1903.

(e) LETTERS TO THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS FROM THE
PHYSICAL DETERIORATION COMMITTEE.

December 1st, 1903.

December 1st, 1903.

SIR,—

Physical Deterioration Committee.

29. The above Committee have had under consideration the Memorandum of the Director-General, Army Medical Service, dated April the 2nd, 1903, and the Reports of the Royal Colleges of Physicians and Surgeons consequent thereon. They have communicated with the War Office on the difficulty of reconciling the general views expressed in the Memorandum with the actual results that appear from the figures contained therein, and have received in answer a further memorandum from the Director-General together with four tables of figures giving more detailed statistics as to the percentage of recruits rejected and the causes of rejection. Copies of this Memorandum and tables are enclosed herewith.

The Committee will be glad if the Royal College of Physicians will take these documents into consideration and while favouring the Committee with any observations it is desired to make, will be careful to state whether the perusal of the supplementary matter now furnished suggests the modification in any degree of the opinions previously expressed on the subject.—I am, Sir,

Your obedient Servant,

A. W. FITZ ROY.

The President,

The Royal College of Physicians,
Pall Mall East, S.W.

SIR,—

Physical Deterioration Committee.

30. The above Committee have had under consideration the Memorandum of the Director-General, Army Medical Service, dated April the 2nd, 1903, and the Reports of the Royal Colleges of Physicians and Surgeons consequent thereon. They have communicated with the War Office on the difficulty of reconciling the general views expressed in the Memorandum with the actual results that appear from the figures contained therein, and have received in answer a further Memorandum from the Director-General together with four tables of figures giving more detailed statistics as to the percentage of recruits rejected and the causes of rejection. Copies of this Memorandum and tables are enclosed herewith.

The Committee will be glad if the Royal College of Surgeons will take these documents into consideration, and while favouring the Committee with any observations it is desired to make, will be careful to state whether the perusal of the supplementary matter now furnished suggests the modification in any degree of the opinions previously expressed on the subject.—I am, Sir,

Your obedient Servant,

A. W. FITZROY.

The President,

The Royal College of Surgeons,
40, Lincoln's Inn Fields, W.C.

(f) REPLIES FROM THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS.

Royal College of Physicians,
London, S.W.
30th January, 1904.

SIR,—

Physical Deterioration of Army Recruits.

31. I am at length able to reply on behalf of this college to your letter of December 1st, 1903, enclosing a further Memorandum from the Director-General and four additional statistical tables on the above subject, and asking to be informed if the opinions previously expressed by the college are in any way modified by a perusal of this supplementary matter.

The communication was submitted in December to the same Select Committee as the previous one on this subject, received through the Home Secretary in June last, had been, and their Report was received and considered at a general meeting of the college on the 28th instant.

From the new memorandum, it appears that the college somewhat misunderstood the question which it was intended to place before them on the first occasion. The general tenor of the first Memorandum suggested that the existence of a progressive physical deterioration was the most important portion of that question, and their answer was framed under this impression.

32. Having now carefully considered the further document supplied to them, the College are of opinion that an enquiry into the present extent and causes of the alleged physical disability for military service of certain classes of the population is desirable.

In their former reply the College considered that sufficient data were not available for forming a judgment on the extremely complex question of the occurrence or not of progressive degeneration in the classes from which recruits are mainly drawn, and the supplementary matter now brought before them does not suggest any modification of their former opinion.—I am, Sir,

Your obedient Servant,

EDWARD LIVEING, M.D.,
Registrar.

A. W. Fitz Roy, Esq.

Royal College of Surgeons of England,
Lincoln's Inn Fields, London, W.C.

22nd December, 1903.

33. SIR,—With reference to your letter of the 1st instant, forwarding a copy of a further Memorandum prepared by the Director-General of the Army Medical Service, together with four tables of figures giving more detailed statistics as to the percentage of rejection of those who have offered themselves as recruits, and as to the causes of the rejections, the Council of the Royal College of Surgeons beg to make the following observations:—

The Council note that the Director-General thinks "that the idea of 'progressive physical deterioration' has occupied a much too prominent position in the minds of those who have had to consider and report as to the advisability of inquiry being necessary," and they also note the statement that the intention of his original Memorandum

was to call attention to "the most disturbing fact that from 40 to 60 per cent. of the men who present themselves for enlistment are found to be physically unfit for military service," and not to suggest there was evidence of a "progressive physical deterioration of the race," concerning which there are no trustworthy "statistical or other data."

With reference to these remarks of the Director-General, the Council desire to point out that in their Report to the Home Office they did not use the phrase "progressive physical deterioration," though some of their criticisms did assume that the first Memorandum of the Director-General seemed to suggest the idea of progressive physical deterioration among certain classes of the community.

While, therefore, the Council may not in every respect have interpreted quite accurately all the meaning and import of the Director-General's first Memorandum, their opinion was in no sense based upon a misunderstanding as to the main question at issue; and they are entirely in accord with the Director-General in believing that the two principal matters now to be considered are, first, an inquiry into the causes and present extent of the physical unfitness for military service that exists in

a large degree among certain classes of the population; and, second, the institution of measures which may bring about an improvement of the physique of the classes from which most of the recruits are at present drawn.

The Council believe that, in addition to any other means which may commend themselves to your Committee, the adoption of the precautions and supervisions indicated in the Council's previous Report would contribute not a little to the physical and moral improvement and well-being of the classes concerned.

In conclusion, the Council beg to state that, after a careful perusal of the supplementary information now supplied, they see no ground to modify the opinions which they have previously expressed upon the subject of the physical disability of many who offer themselves as recruits.—I am, Sir,

Your obedient Servant,

JOHN TWEEDY,
President.

A. W. Fitz Roy, Esq.,
Privy Council Office,
London, S.W.

APPENDIX II.

SCHEME FOR ANTHROPOMETRIC SURVEY OF UNITED KINGDOM.

1. The following table shows the statistics of population, schools and scholars :—

	Population (1901).	No. of Schools (primary).	No. on Register.	Scholars per cent. of Population.
England - - -	32,527,843	20,153	5,881,278	18
Scotland - - -	4,472,103	3,145	768,598	17.2
Ireland - - -	4,458,775	8,712	737,086	16.5
	41,458,721	32,010	7,386,962	M 17.2

The United Kingdom would be divided into 400 districts each containing on an average 100,000 persons. In thinly populated rural districts the number may be smaller, and in large towns the number may be greater.

In each of these districts 18,500 persons are in the primary schools, and 81,500 are adults or very young children. Let us say 80,000 adults are available for measurement in each district.

Let us suppose that a sample of 2,000 adults is measured in each district; the total number of adults to be measured will be $400 \times 2,000 = 800,000$.

In the case of school children we must measure a sample of 1,000–2,000 for each age interval of twelve months.

The total number of school children in each district is $\frac{7,386,962}{400} = 18,467$. Dividing this number into twelve age groups each of one year, each group will contain 1,539. This number is only just a sufficient sample. Hence, it follows that it will be necessary to measure the whole of the children in the primary schools. There are also a number of children in addition to this in the secondary schools.

Approximately it will be necessary to measure 800,000 adults, and 8,000,000 school children.

Each district should be measured once in ten years. In order to keep the staff constantly employed the measuring of the whole population may be spread over the whole ten year period. It will be necessary, therefore, to measure per annum, 80,000 adults and 800,000 school children, i.e., forty districts.

Taking 250 working days per annum, it will be necessary to measure 320 adults per day, and 3,200 school children per day.

If we have a staff of twenty surveyors it will be necessary that each surveyor measures 16 adults and 160 school children per day.

This, we think, allowing for unavoidable delays in getting at the persons to be measured, is a reasonable amount of work to expect from one surveyor per day.

QUALIFICATIONS AND DUTIES OF THE OFFICIALS OF THE PERMANENT STAFF.

2. The formation of a National Bureau would involve the establishment of:—

I. A Consultative Committee.

II. A Central Bureau.

III. Surveyors or Measurers.

The CONSULTATIVE COMMITTEE to consist of three leading Anthropologists who have devoted special attention to Anthropometry; one residing in England, one in Scotland, and one in Ireland. The appointments to be honorary, without salary.

THE BUREAU to be under the direction of a DIRECTOR and a DEPUTY-DIRECTOR. A statistical department would also require to be organised.

The SURVEYORS must be accurate and reliable manipulators, capable of being taught by the instructors to make the necessary anthropometric measurements. Their duties will be to go to districts as directed by the chief surveyor, and to carry out measurements as he directs. A certain number of the surveyors should be ladies, to measure school girls and female adults.

ESTIMATE FOR SCHEME IN WHICH THE SCHOOL TEACHERS ARE EMPLOYED TO MEASURE THE SCHOOL CHILDREN.

3. There are approximately 32,000 primary schools in

the United Kingdom, with an average of 230 scholars in each. 3,200 of these schools must be measured per annum, if the survey is spread over ten years. A surveyor working eight hours a day measures (as stated above) 160 children ; a teacher working at the same rate would measure in one day, working one hour per day, 20 scholars ; and would take twelve days to measure the average school.

Taking twenty fortnights per annum as available (when holidays are excluded), one set of instruments passed from one teacher to another would measure twenty schools per annum. To allow for delays in transmission of instruments, etc., let us say sixteen schools per annum would be measured by one set of instruments.

Now it is necessary to measure 3,200 schools per annum to complete the survey in ten years.

Therefore $\frac{3,200}{16} = 200$ sets of instruments would be required.

The cost of 200 sets of instruments at £8 a set is £1,600.

Each teacher will expect to be paid a gratuity of, say, £1 for measuring his school.

This will amount to £3,200 per annum. In order to train the teachers they will require to go for instructor to London, Edinburgh, or Dublin. Taking 100 miles as the average distance from the capitals, the average return fare at 1d. per mile will be 200d. = 16s. 8d.

For the 3,200 teachers per annum the travelling expenses will be £2,666 13s.

It will be necessary to pay on an average £1 for hotel expenses to each teacher. This will amount to £3,200

On the other hand, if the teachers measure the children, sixteen of the special surveyors might be dispensed with and £4,800 saved.

4. COMPARISON OF COST OF PERMANENT STAFF OF SURVEYORS AND OF THE EMPLOYMENT OF SCHOOL TEACHERS.

Special Staff.	School Teachers.
Cost of instruments £160.	Do. £1,600.
Annual Expenditure.	
Salaries of 16 permanent surveyors required to replace the teachers @ £300 - - - - - £4,800	Gratuity to teachers - - - - - £3,200
Balance in favour of permanent Staff - - - - - £4,266	Travelling expenses - - - - - 2,666
£9,066	Hotel expenses - - - - - 3,200
	£9,066

By employing a permanent staff of surveyors instead of the school teachers, there will be a saving of £1,440 in first cost of instruments, and of £4,266 in annual expenditure.

Permanent surveyors being constantly employed at the same work, and frequently tested by instructors, would measure very much more accurately than the teachers.

The objections which apply to teachers would apply in a less degree to factory inspectors, if these men in the course of their ordinary duties come frequently to London, Edinburgh, and Dublin. The cost of instructing them would thus be materially reduced. But owing to the act that only part of their time could be devoted to

measurement, more sets of instruments would be required, and their skill would be inferior to that of permanent surveyors.

The above estimate, though only approximate, shows clearly, we think, that the employment of a specially trained permanent staff of surveyors to carry out the whole anthropometric survey, instead of employing teachers, factory inspectors, or other existing officials, will be much more economical and much more efficient.

Dated 7th January, 1904.

D. J. CUNNINGHAM.
JOHN GRAY.

APPENDIX III.

SOME RECENT INVESTIGATIONS AS TO THE NUMBER OF THE "POOR" IN THE COMMUNITY.

By Mr. C. S. Loch.

1. There are two counts of the "poor" which have attracted much attention and which, in my opinion, require more close study than they have received, if their real nature and limitations are to be understood. The counts to which I refer are those made by Mr. Charles Booth in regard first to the East of London and Hackney, and then to the whole Metropolis, and those made by Mr. Seebohm Rowntree in regard to York.

It is not possible to ascertain the limitations of those counts and the qualifications which must be borne in mind in making use of them without a very attentive regard to the text which accompanies the figures and tables. The figures and the text must, so to speak, be read together as one expression, a not very easy task in any case and a task quite beyond the energy or perhaps indeed the ability of the general reader who is not specially interested or well versed in the details which underlie the calculations. Consequently such readers, if they are desirous of arriving at their conclusions quickly and by way of reference rather than slowly, and by the difficult progress of accurate and proven data, seize the figures and forget the text. The text thus becomes little better than a footnote left unread or hastily skimmed, though in fact, if the conclusions are to be tested, it is even more important than the figures.

Such a result cannot but appear serious to those who are dealing personally with questions of social life and habit, and are anxious that the people at large should take a sane and accurate view of social conditions. Above all is it necessary in estimating the improvement or deterioration of the national life, during the past generation, to analyse these counts and classifications of the population—if their evidence is to be admitted as having any exceptional validity.

I have used the word "counts" in the above paragraph. In fact the calculations in these books are only in part counts. To a very large extent they are estimates.

2. To ascertain the nature of these counts and estimates the following points have to be considered: (1) the general method; (2) the methods of collecting the particulars on which the classification is based; (3) the classes—the utilisation of these particulars in forming the estimates and conclusions which are submitted, and (4) the conclusions and recommendations themselves.

I begin with Mr. Charles Booth's book on the "Life and Labour of the People."

"Life and Labour of the People."

THE GENERAL METHOD.

3. Mr. Charles Booth states his object to be: "To show the numerical relation which poverty, misery and depravity bear to regular earnings and comparative comfort, and to describe the general conditions under which each class lives." "I have throughout leaned to the safe side," he says, "preferring to paint things too dark rather than too bright."*

He aims at giving a picture, partly verbal and descriptive, partly statistical. He counts and estimates the people as they are as nearly as may be, at a precise moment, as if he were reporter and photographer combined. He makes no comparison between past and present. He collects no data for such a comparison, nor are his conclusions based on any observation of the changes in the development of the people, their present with their past, numerically or otherwise. He thus passes by all questions of progress or decadence, for in regard to them the comparative method is necessary. He works on a flat surface, so to speak; he cannot measure past and present or account for the present by the past, he can only measure quantities as they appear side by side on a certain date and from that comparison can only presume the conclusions.

Now this is obviously in itself a very misleading method. Without the ascertainment of causes, conclusions cannot rightly be drawn; and causes do not lie on the flat surface, the momentary view of things. They can be ascertained only by the observance of their growth. In this method the observation of growth or development is wanting. Hence it does not supply the data which are necessary if any conclusions are to be drawn.

4. Perhaps I may be allowed to give an instance of this in reference to the statistical side of the question, though the principle affects the descriptive as much as the statistical elements of the method.

Mr. Charles Booth, the late Dr. Hunter, and some other writers adopted the method to which I refer in the controversies as to Poor Law relief some ten or twelve years ago. Each took a particular date and argued from the number and proportion of in and out paupers in unions grouped together in various ways. The instances of the fallacy are perhaps more striking in Dr. Hunter's paper "Outdoor relief—is it so very bad?" *Contemporary Review*: March, 1894) than in some of the other documents. I will therefore refer to it more particularly.

Dr. Hunter, like Mr. Booth, took one particular date—that of Mr. Ritchie's return "Poor Law (Indoor and Outdoor Relief)" No. 265, 1 Jan., 1892. He grouped the poor law unions according to their population and in other ways. The unions thus grouped he arranged in two sub-groups or sections—one which he called "outdoor relief unions" and another which he called "indoor relief unions." To form these sections (1) he calculated the percentage of outdoor paupers to total paupers in each union of the group; (2) he calculated the mean of these several percentages; (3) he classed as an "outdoor relief union" and placed in that section each union in which the percentage of outdoor paupers to total paupers was more than this mean; (4) he classed as an "indoor relief union" and placed in that section each union in which the percentage of outdoor paupers to total paupers was less than this mean.

Thus to take an instance:

Group: *Unions in Lancashire.*

Mean of percentages of outdoor to total paupers in the general Lancashire unions* (as above) 66·9.

Section "*Out-door Unions.*"

Rochdale (and others—with percentage of out-door paupers to total paupers in excess of the mean) 70·4.

Section "*Indoor Unions.*"

West Derby (and others—with percentage of outdoor paupers to total paupers less than the mean) 56·7.

From figures thus compiled—with unions arranged in groups and the groups in turn compared with other groups, he drew various conclusions. Amongst others for instance that "the policy of indoor relief drives into the house." This was an inference assumed from the fact that according to his arrangement of unions there appeared at a particular date in a group or groups a larger number of paupers in the section of "indoor" unions than in the section of "outdoor" unions.

But from this momentary view of pauperism no such inference could be drawn.

First of all, the policy of Boards of Guardians is not so clear and settled that they can be placed in sections on the basis of outdoor to total paupers. Unions both below and above the mean are working usually by haphazard decisions and with no determinate policy at all. So far as such a policy is concerned, it is a mere chance whether they come above or below the line of the mean.

Next when a Board has a definite and declared policy, the inference that indoor relief drives into the house is

*"Life and Labour of the People" I. pp. 5 and 6 (First Edition).

* No detailed calculations appear in Dr. Hunter's paper. The above figures are worked out on his method and to explain it.

falsified, not by the figures of the moment which afford no basis for judgment one way or the other, but by the test of the comparative method.

Take, for instance, the case of a union which is classed "indoor." It is not mentioned by Dr. Hunter by name, but it is included in his groupings. Thirty years before the particular date the paupers numbered 1,019—in two groups—one indoor of 107, one outdoor of 912, and the policy of the guardians had been to reduce outdoor relief. Then in the course of the thirty years many recipients of outdoor relief grew old and died, and in accordance with the policy of the guardians their places were taken by very few new recipients. A few of the old recipients went into the workhouse or infirmary as age and helplessness came on them, and also a few others were admitted to these institutions. Then at the particular date the figures stood thus: 100 paupers in all instead of 1,019; of these sixty-nine in receipt of indoor relief instead of 107 and thirty-one in receipt of outdoor relief instead of 912.

Thus the fact as noted on the particular date in this (and in other instances) was taken as indicating a policy and the conclusion to be drawn from that policy. The fact indeed was taken as equivalent to the cause; because on the particular date there were more indoor than outdoor paupers; therefore indoor relief drives into the house. But the fact is itself a resultant of causes which have previously been at work and which only an analysis of previous facts and conditions can indicate. Isolated from them it has no real meaning. To affirm that to be a cause which is only a statement of fact, as disclosed on a particular date, is really to assume the cause, not to ascertain it—to assume the cause without having collected, analysed, or considered the evidence which would show what the cause or causes were.

In this (and in other instances) on the application of the comparative method it is evident that the inference from the figures of the particular date is quite incorrect. The paupers have not been driven into the house but the result has been quite the reverse.

A generation which began with 1,019 paupers concludes at thirty years later with 100; and the potential pauperism is reduced to that extent. The paupers who, on another policy of administration, would have taken the place of the (1,019—100) 919, are not driven into the house, but into the world of self-support.

Mr. Charles Booth's book on Pauperism is full of instances of conclusions of many kinds drawn from one day counts of paupers "in" and "out" in relation to population, and they are, as can be shown again and again, quite fallacious for the reasons given above.

In the "Life and Labour of the People" the method, so far as the statistics are concerned, is the same—though only to a small extent, comparatively, are problems of pauperism there treated. But so far as figures are given of the "poor" and "very poor" etc., it should be remembered that, putting aside for the moment other points in the method, no conclusions can be drawn from the figures themselves. No one can conclude from them in any way whether the people are more or less independent, or more or less poor. They throw no light on the relative condition of the people, and thus Mr. Booth's object "to show the numerical relation which poverty, misery, and depravity bear to regular earnings and comparative comfort" remains unachieved. In the classes A, B, C, D, there is poverty and clearly to some extent misery, using that word to mean extreme poverty, as presumably in A and B, but depravity as a cause of poverty is like other causes necessarily omitted everywhere from the enumeration. Nor is "the relation between poverty, depravity and regular earnings" worked out. His classes "C intermittent earnings" and "D small regular income" are separated only to be merged altogether and finally; so that the distinction of "regular earnings" itself disappears, just at the point where its influence on social habit should be most carefully observed. On the non-comparative one-day method of count and estimate this could hardly be otherwise.

THE METHOD OF COLLECTING THE PARTICULARS.

6. Information has been obtained from School Board visitors. Of the total area dealt with part is called "tested." The tested area covered "fully one-half" or "from one half to two thirds" of the whole population.

The whole area consists of seven districts, Shoreditch, Bethnal Green, Whitechapel, St. George's, Stepney, Mile End, Poplar and Hackney. The population consists of 891,539 persons. The figures in regard to the non-tested

part of this area are arrived at by a proportion as against the figures in the tested part. The latter thus becomes the gauge and standard of comparison. It is not stated however, what is the area or areas of this tested part, or what streets or families make it up. From that point of view the validity of the proportion cannot be checked by the text.

7. The School Board visitors gave particulars of the heads of families with school children. Of these particulars samples are furnished in the specimen streets. "Every house and every family with children is noted with such information as the visitors could give about them. Here are specimens of each class of street" ²¹ I, p. 7.

8. The heads of families with school children are scheduled by *sections* according to employment; and then it is assumed that all male adults in the area, (*i.e.* apparently those in the same district) who are not in the schedule follow the same employments as those of the men, who have been scheduled, in the same numerical proportion. Thus, if there are, say, thirty in the "dress and food" trades section among the scheduled male adults (*i.e.* those with children at school), it is taken for granted, there is a proportional number of male adults engaged in "dress and food" trades among non-scheduled male adults ²² I, p. 4.

9. The adult males whose employment is unknown are thus allocated to employment sections proportionally according to the employments of those adult males whose employment is known. The children not of school age have then to be dealt with on similar lines. The elder children (thirteen to twenty) are assumed to belong proportionally to the several employment sections, the totals of which have been themselves settled by proportion. Thus supposing that in a district the tested families, the families with children attending school, say about half of the whole number, produce 100 railway servants, the other, the untested adult males without children attending school, are taken as producing another 100 railway servants, and then the children and young persons who are in the district according to the census are placed out, section by section, so many to our 200 railway servants, so many to each of the other sections.

10. The relative "poverty" of the section (*i.e.* the section by employment) is thus partly settled by the scheduled cases—the cases of the adult males in the employment-section who have children at school. But it is also settled in great degree by proportional calculations and assumptions. Thus, if in the district there are, say, 100 railway servants, scheduled as fifty in B. and fifty in C., all men with children attending school, it is taken for granted that there are among the unscheduled populations, as the census returns of occupations may suggest, say another fifty B's and fifty C's railway servants, whose circumstances are not known; and though these at the time are at least not maintaining children of school age, or indeed may not have had any children at all, they have to be counted as poor as their brethren, and must for their sake, therefore, be themselves also assigned to B. and C.

11. According to the assumptions that underlie these proportional calculations the "non-tested area" has been scheduled "by other means or in proportion," for "as is the condition of the tested part so is the condition of the whole population." ²⁴ I, p. 5.

12. The speculative nature of the method is obvious. It is not stated what is the area "of the tested part"—or what are the areas in the different districts which taken together make up "the tested part:" the quantitative distribution of the classes of poverty and the sections of employment is assumed. This is an extremely hazardous assumption, unless the similarity of the population class by class and section by section in different parts of the area is tested and "agreed."

But of this no evidence is given.

13. To complete the population "it was necessary to add 68,451 adult women." These are "distributed amongst p. 62 the classes in the proportions shown for the rest of the population to which they stand in the relation of sisters or daughters." "It may be doubted whether class B should contain its full proportion of these women or of girls from thirteen to twenty." This remark shows the very speculative nature of the process. The number of adult women added to Class B is 7,799, ²³ in a total of 100,062. ²³ Table IV.

14. Many of the phrases which are used show how difficult it is to check the figures and to give them any real statistical value.* The known and, so to speak, counted families may be placed in the several classes rightly or wrongly. But in addition, to account for the whole population many adjustments have to be made "by other means or in proportion."

But even so, it may be doubted if Class B has its right number of girls and women; and other similar cases of unsettled approximation to the figure ultimately entered will be found later on.

15. Though the classes are selected by the rule of "poverty," etc., judging from the published schedules of cases, wages are not entered in them, nor do wages appear to have been verified in the individual cases; nor are statements of rental or ages supplied. Nor is the number of children above school age or working away from the home noted—though their payments are often a very important item in the family budget. All these are indispensable details.

THE CLASSES.

16. The classes into which Mr. Booth divides the population are—

"A. The lowest class, which consists of some occasional labourers, street sellers, criminals, and semi-criminals.² Their life is the life of savages with vicissitudes of extreme and occasional excess. Their food is of the coarsest description; and their only luxury is drink.³ This class is now hereditary 'to a very considerable extent.'³ At the same time it is recruited with adult men from all others, and the number of children left in charge of it are 'proportionately small' and the number of young persons is proportionately large."⁴

B.—Class B is "very poor"—"casual earnings, very poor." "The labourers of Class B do not, on the average, get as much as three days' work a week, but it is doubtful if many of them could, or would, work full time and for long together, if they had the opportunity."⁵ "Class B, and especially the 'labour' part of it is, not one in which men are born and live and die, so much as a deposit of those who from mental, moral, and physical causes are incapable of better work."⁶ "From whatever section Class B is drawn, except among the sections of poor women, there will be found many of them who from shiftlessness, helplessness, idleness, or drink are inevitably poor."⁷

C.—Class C, "intermittent earnings poor." "Those who work by the job, who are in and out of work according to the season or nature of their work" are more than any others the victims of competition: on them falls with particular severity the weight of recurrent depressions of trade." There is a passion for drink "among some of the highly paid irregular workers."⁹

The employment section "irregular" in C and D taken together "has a very bad character for improvidence."⁹

D. "Small regular earnings, poor." "It must not be understood that all of these have quite regular work; but only that the earnings are constant enough to be treated as a regular income, which is not the case with the earnings of C."¹⁰ "Of the whole section none can be said to rise above poverty, unless by the earnings of the children, nor are many to be classed as very poor. What they have comes in regularly, and except in times of sickness in the family, actual want rarely presses, unless the wife drinks." As a general rule, these men have a hard struggle to make the ends meet, but they are, as a body, decent steady men, paying their way and bringing up their children respectably. The work they do demands little skill or intelligence."¹¹

The other classes are E regular standard wages. "As a rule the wives do not work, but the children all do." "This class owns a good deal of property in the aggregate."¹² F. "Higher class labour." G. "Lower middle class, shopkeepers, and small employers, clerks, etc., and subordinate professional men." And H. "Upper middle class—all above G. lumped together," "the servant-keeping class."

* So in vol. ix., p. 13, dealing with "crowding and earnings," on certain statements Mr. Booth bases the *average* earnings for an *average* number of employees "not necessarily or probably the true average for the year but an approximation to it."

The classes above quoted are arranged A, B, "very poor"; "lowest class"; and "casual earnings"; C and D, "poor," "irregular earnings," and "regular minimum"; E and F, "comfortable," "ordinary standard earnings," and "highly paid work," and G H, "well to do," "lower middle," and "upper middle."

The following statements further summarise the position:—A, B, C, D are "classes of poverty sinking to want"; E, F, G, H, "classes in comfort rising to affluence."¹³

"Omitting class A, which rather involves the question of disorder, we have in classes B, C and D the problem of poverty."¹⁴ "B," the "very poor," are at all times more or less in "want," though only a percentage "not I think a large percentage," in distress. C and D "poor" "though they would be much the better for more of everything are not 'in want.'" They are neither ill-nourished nor ill-clad according to any standard that can reasonably be used."

THE DATA FOR THE CLASSES JUDGED BY THE INDIVIDUAL CASE.

17. As further definition of these classes thirty individual cases are quoted and classified. The test applied is expenditure. A "male adult" standard of consumption is assumed and the members of the family are calculated as equivalent to so many parts of a "male adult." Thus an adult equals 1, a woman .75, and "in proportion for children."¹⁵ So a family—man, wife, and three children—a son 18, two girls 8 and 6—make up 3.35¹⁶; the man being 1, the wife .75, the son of 18—? .75, the two girls .85 between them.

In this "B" case the man is 38 "in poor health fresh from the infirmary"; his wife 43 is consumptive. The son of 18 earns 8s. a week as carman's boy. The neighbouring clergy send soup two or three times a week. The income is not stated but is supposed to be 10s. 3.4d. but the expenditure is stated to be 15s. 2½d. or 4s. 6d. a week per male adult.

In another "B" case (No. 4) in which the supposed income is 18s. 10.8d. per week, "the family run largely on credit." "The man, a bricklayer, gets something as caretaker, very little by his trade." The wife works as dressmaker and has to put out the washing. There are six children, thirteen, eleven, nine and a half, three and a half, two, and four months. The family is set down as equal to 3.7 in "male adult" measure and the expenditure at 24s. 5½d. or per "male adult" 6s. 7½d. a week.¹⁷

In a third, a "B" case on the line, it is stated, between "B" and "C" there are a man, wife, and five children (ten, nine, five, three, one). The man has irregular work as a wharf labourer at 20s. to 21s. a week. A girl not counted in the family is in service, and "still receives money and clothes from home." The wife earns 3s. 6d. a week by needlework. By steadiness on the man's part and good management on the part of the wife, they live as well as many families in "D." The "adult male" costs 6s. 8d. a week, the family 21s. 6d.—against a supposed weekly income of 22s.

In regard to these and the other cases quoted as typical the following points may be noted:—

In these cases no figures of actual income are given. There is an analysis of expenditure only. The supposed income is given and the amount expended very largely exceeds this. In case No. 1 (above), the expenditure is nearly a half more than the income. If this is to be taken as representing the normal condition of the family budget it is hardly to be accounted for by debt or the avoidance of payment, or by the thrice-weekly soup. Probably the real facts have not been disclosed. At least, the inference is strong that there must be some grave flaw in the statement.

In the second case the difference between supposed income and actual expenditure is almost as significant. The supposed weekly income is 18s. 6.8d.; the expenditure 24s. 5.75d. If the man's actual income were as great as his expenditure, he would assuredly not be in "B" but in "C," or even "D." Here again, the inference must be that the facts of the case as a whole have not been ascertained.

The third case is significant from another point of view. It is said to be on the line between "B" and "C," but so good is the use of means that the family "live as well as many families in 'D'." Here the income though irregular is taken at 22s. (20s. to 21s. irregular, earned by the man plus 3s. 6d. earned by the wife)—slightly

more than the expenditure. The facts are probably better ascertained. Why then should not the family be placed in "D"? It is not wage, but the use of wage, that makes the difference between well-being and want. But, if that is true, as undoubtedly it is, this factor, socially a more important one than the amount of wage, would upset all these classifications. Here a family in which "poverty" is avoided by the good use of means is put in the same category with a family in which "poverty" is made acute by the thriftless use of means. The grouping indeed is arbitrary, unless this factor be taken into account and given its full value.

These cases then quoted by Mr. Booth to define his distinctions of classes more clearly, fail to do so. They suggest rather that the classes are practically arbitrary groupings based on no common principle. They show that the people have not really been classified by him into "poor" and "very poor."

THE DATA FOR CLASSES AS JUDGED BY THE STREET NOTES.

5, 7. 18. Turning to the streets given as specimens of classification¹⁹, we find how large a number of families have to be passed over as unknown. In St. Hubert Street, for instance, an A street: fifty-seven of the families have children at school, and are therefore classified; forty-one having no children at school, and therefore unknown to the School Board visitors, are unclassified. This represents a very large proportion of whom nothing is known, and everything has to be inferred.

16 Or, if we take a C-D street,²⁰ we find the figures: four B families; four C; ten D; three E families; twenty-one in all; and fifteen families without children, and therefore unknown to the School Board visitors, unless possibly children in these families had recently left school. Another C-D street has four F families; twelve E; twelve D, and five C; thirty-three in all, and eighteen unclassified.

Thus the margin of the unknown is very considerable, and the grouping of the streets—so far as the statistics are concerned—based on something very like guess-work.

The details supplied in the specimen entries are extremely meagre, and many, if not most, of those required for a classification drawn on the lines of social science, are wanting.

If classes A, B, C, D are to be described as "classes sinking to want" this evidence is essential, for C-D, it is stated, are "neither ill-nourished nor ill-clad according to any standard that can reasonably be used; and D are, taken as a body, decent, steady men, paying their way and bringing up their children respectably." Such a conclusion evidently can only be based on comparative statistics, not a single day estimate. But it is impossible to regard all A, B, C, D as "sinking to want." The notes of cases (L, p. 140), for instance, suggest that this is hardly the fact.

A classification of families on the down grade or on the up grade might be of real service, but much fuller information would be required for that.

ARE THE CLASSES TRUE CLASSES?

19. The first question is—are they true classes? A class is strictly a "summoning." Thus we might summon a class of the payers of income tax. Here the lines of division are accurately divided by specific count or admitted valuation. So in the case of paupers; all who apply for poor law relief can be counted accurately, and so from that point of view form a class, a "statistical" class, and in view of a particular law—the Poor Law—a social class. But in an investigation of society we can make no such clear counts or valuations; and our classification, to be valid as representing divisions of the population, must be a classification of people and their conditions in relation to social habits and organisation, or to put the question more broadly, the characteristics of the class must be characteristics which in the persons classified represent real factors in the formation of society.

Under the phrase "social habits," which are real factors in the formation of society, are included: habits of nurture and care of children; industry and use of leisure; income and its use; foresight; arrangements for the settlement of children in life, and their marriage.

Under the phrase "social organisation" are included the relation to religious bodies; to the elementary and other schools, school attendance, etc.; to trade unions or benefit societies; to charitable institutions and societies, and to the Poor Law, and so on.

All these questions have relation to society and social life, to whatever grade the individual and his family may belong. They are thus a basis for the classification of society as a whole; and it is obvious classes with different amounts of income might each be tested by such a rule of "social habit and organisation," though in different classes the actual methods of nurture and care of children, industry, etc., may vary considerably (as, for instance, in education in the elementary school and the public school, etc.), according to the purpose of life which each class has in view.

And classification of the people from the point of view of social life must then be founded on "real factors in the formation of society," real, that is to say, as representing the elements in society actually at work in making it.

20. The question is whether Mr. Booth's classification represents these real factors, or whether it represents rather more or less arbitrary groupings of the people.

If we take Class A we find it consists of those at the bottom of society whose "life is the life of savages with vicissitudes of extreme and occasional success." The measure here applied is strictly that of breach of social habit; and, if this be so, we want to know how many have broken loose from social habit. This is how the number is made up. (Vol. I. p. 37.)

This class Mr. Booth "puts at 11,000 or 11% of the population, but this is no more than a very rough estimate, as these people are beyond enumeration, and only a small proportion of them are on the School Board visitors' books. If I had been content to build up the total of the class from those of them who are parents of children at school in the same proportions as has been done with the other classes, the number indicated would not have greatly exceeded 3,000; but there is little family life among them, and the numbers in my tables are obtained by adding in an estimated number from the inmates of common lodging houses, and from the lowest streets. With these ought to be counted the homeless outcasts who, on any given night, take shelter where they can, and so may be supposed to be in part outside of any census. Those I have attempted to count consist mostly of casual labourers of low character and their families, together with those in a similar way of life, who pick up a living without labour of any kind."

In calculating the number in this class, then, practically the method of grouping on the basis of school information is set aside. On that basis the number would have been 3,000; the number actually set down is 11,000. What is the ground for this very large addition is not stated. "An estimated number has been added from the inmates of common lodging houses, from the lowest streets and from homeless outcasts." But the data for this estimate are not given.

Yet this class—an important point bearing on the question of degeneracy—is, it is stated, to a very considerable extent, hereditary. On the other hand, it is said also that it is recruited with adult men from all others, and that the number of the children in the class is proportionately small—while that of young persons is "proportionately large." This analysis seems to be in itself contradictory. The class as described above may be considered a real class—uncivilised in a manner, living without the ordinary obligations of social habit. But comparative method is not applied to it. It is not possible therefore, from the data supplied, to say of what it is constituted or how far it is actually hereditary.

21. The second class is B—"Casual earnings"—"very poor." It contains 100,000 of 11.25 per cent. of the population.

In it are set 22,000 artisans, and 41,000 "casual labour."

"From whatever section (of employment) Class B is drawn, except among the sections of poor women, 19,095 in number (Table XVII.), there will be found many who, from shiftlessness, helplessness, idleness, or drink are inevitably poor."

This raises the question of the meaning of poor or "very poor"—whether they are or can be defined as a statistical class—or whether they are a social class and represent an aggregation of real conditions in relation to social habit and organisation.

23. Poor, like pauper originally, is "paucus" one of small means—a relative term.

It is clear that in the case of Class B as stated, many are shiftless, etc. The question with them is not of means, but the use of means.

The general supposition is that the people are poor not from such causes, but from not having enough—they would, as Mr. Booth says of Classes C and D “be much the better for more of everything all round.” And to carry out his programme Mr. Booth should have made a “depravity” class—thus defining at least two classes of poor—poor by literal want of means, and poor by “depravity.” But the poor by literal want of means—who may be called perhaps the “economic” poor are those only who, having ability to use means with a view to wealth or well-being, do not possess them.

But the material for any such division, by which “poor” should present a social class is wanting. Really the term is used by Booth only in a quite general sense—not suitable for the definition either of a social or a statistical class. Poor by depravity, by inability to use means, by weakness of mind, or of body—all very different groups are merged in one mass—so that for any scientific purpose the term “poor” loses all value as a definition. Difficult as it is to give to so vague and relative a word any precise meaning by direct count, it loses all its meaning when it is used for a large mass of the people—without regard to causes. And on Mr. Booth’s method the causes cannot be ascertained and they cannot, form, as they should, the ground of classification.

24. In the next class we have “C—intermittent wages” and above it, “D—small regular earnings.” Here is an economic difference which is very marked. C are “men who usually work by the job or who are in or out of work according to the season or the nature of their employment. Many of the irregularly employed could not keep a permanent job if they had it, and who must break out from time to time.”

D are, as a body, decent steady men, paying their way and bringing up their children respectably.

Of C and D employment-sections are formed and the two thus find themselves in the same category—under, amongst other divisions, that of “irregular” in Section 3. They the “irregular” (Section 3) “have,” it is said, “a very bad character for improvidence”—“wanting in ordinary prudence;” but on the other hand Section 3 “for the most consists of hardworking struggling people, not worse morally than any other class, though thriftless and improvident.”

Here are two classes of which one is found on the line of “intermittent wage” with either as result or as cause thriftlessness and improvidence, while the other D on the line of small regular earnings is the reverse. One asks whether the economic difference is the main factor. There is no evidence. Neither by examination of any large number of cases nor by any comparison of past and present is light thrown on the problem. But what is more, these two classes, economically so different, are merged and treated as one; and in the extension of Mr. Booth’s method from the East End and Hackney to London C and D as separate classes disappear. The class thus becomes no true class at all, either by economic difference or by social habit.

25. Reference has been made to the absence of any ascertainment of causes. A word more should be said as to this, for Mr. Booth submits a statement of causes, from notes of 4,000 families, and he thus classifies them:—

	A. B.	C. D.
	Per cent.	Per cent.
Loafers - - - - -	4	0
Questions of employment; casual, irregular work, etc. - - - - -	55	68
Questions of habit, drink, thriftlessness - - - - -	14	13
Question of circumstance; large families, illness - - - - -	27	19

It is difficult to reconcile these figures with the general statements of the classes given above; nor do they furnish much information even as to causes.

Take employment. How far does this mean incapacity? Mr. Booth says, “Incapacity of two sorts is no doubt common: that which leads to low pay and that which leads especially to irregularity of employment.” But this does not help us at all. How far we ask does the factor of incapacity affect the question of employment—as a cause? And there is no reply.

Here again also most diverse conditions are brought under one head. Mr. Booth does not give the data for his classification—indeed if we may judge from his

entries, he has not the data. The classification fails at the critical point just when it is put to the test.

So if we ask why A, B—the outcast and residual classes—shows 14 per cent. in drink, and C with D the regular and steady class D 13, there is no evidence; and the figures suggest insufficient knowledge.

Useful as school board information may be, it hardly touches the many who send their children without demur, and only require to be “scheduled.”

THE REMEDY.

26. Then as to the remedy. It is to place B under State discipline, as it is a residual class of those who “from mental, moral and physical reasons are incapable of better work.” “The life would not be attractive; regular meals and fixed hours of work, which would not be short.” This “would not encourage idleness or weaken the springs of energy. The difficulty lies solely in inducing or driving these people to accept a regulated life.”

That is so indeed; and the difficulty is not met by the suggestion.

(1) It is proposed that there should be a social standard of State dependence. Membership of class B would hardly suffice, as indicating a good standard for State intervention. A fairer one would be to bring under State supervision the people on the down-grade wherever they might be, if the project were in any way feasible.

(2) A new servile and dependent residual class would be created, but out of this mass of incapacity what hope is there of any ultimate reform? Of the possibility of driving them to the regulated life, no evidence is offered.

(3) In East London and Hackney the B class is estimated at 100,000, excluding C and its bad ones. How shall such a population be brought under State discipline, and what state is strong enough to educate such an amount of adult incapacity as the class represents by direct measures? The grouping of the people in what are after all unreal classes aids not a whit in the solution of the problem. The remedy depends on the cause; and the causes are lost in the classes; and thus the class only confuses the issue.

(4) There is no evidence to show that such persons as are described as in Class B would be driven into regular employment. The evidence is the other way. Life itself is their taskmaster, and probably a more discerning one.

27. Instead of this system of investigation—it is to be hoped that at some time there may be made a real enquiry—based on closer and more complete observation, in which the enumeration will be actual and all the necessary facts verified. The conditions of families thus studied and grouped in types according to social habits might throw some real light on problems of poverty and deterioration.

SUMMARY:

28. The process of this inquiry and its limitations are now clear. Certain data are estimated, counted, and described as brought under view at one time, but without regard to antecedent facts and conditions. Hence, while there is an immense elaboration of statistics there are no data for forming conclusions.

The data thus viewed at one time are partly founded on statements, but very largely based on inference only; and they are far from complete.

Part of the data—that collected in regard to families with children at school in part of East London and Hackney is classified in numerical form and augmented by proportional additions of unknown members of families and in other ways, and thus made applicable to about half of the population of East London and Hackney, and then in turn these results are applied by a series of proportion sums and in other ways to the other, the unknown, half of the same population.

Then, lastly, the East London and Hackney figures are applied by yet other proportion sums and estimates to the metropolis as a whole.

In all these elaborate classifications, proportions, and adjustments there is an immense liability to error—and the errors cannot be checked in any sufficient manner. To data of the most general description precise figures are applied. Thus, facts by no means closely analysed and not really grouped at all (*cf.* the merging of classes C and D

p. 44.
p. 46.

p. 50.

p. 46.

above) are shrouded in an appearance of precision which is very misleading. As has been evident over and over again, popular writers and speakers have forgotten the intricacies of the process of making the classes, and have used the figures only, as in themselves evidence, summary, conclusion, confession, and admission of wholesale want and distress. To this result many of the generalisations in the book lend themselves (*cf.* above: "classes of poverty sinking to want"); and to this use of the figures no protest is made; and unfortunately it is not possible to check errors and revise classifications in figures assigned to such conflicting and momentary data as are here brought together (though for the sake of the better guidance of public opinion it would indeed be desirable to do so).

The final consummation of the method is reached when by yet further proportion sums the figures of the metropolis are made applicable to the country at large, and the people discuss, "how the twelve millions on the verge of hunger may be fed."

Poverty is a relative term, a secondary or modifying cause. It may act as an obstacle or a spur according to the temperament and conditions on which it acts. It is applied here to classes more or less in want. But classes are not true classes *qua* poverty, but *qua* social habit. Unless in the lowest residual class to some extent, society is not a solid mass across which lines can be drawn horizontally as representing classes, but it is in a state of constant motion. To test social health, one should measure the upward and downward movements. Strictly, if we use the word at all, poverty, as a relative term accompanying certain social habits, would then represent ill-being, the downward movement, and wealth, or well-being, the upward movement.

To make these absolute classes many opposite and contradictory elements have to be forced into unity:

(a) It is taken for granted that there is an equation applicable in all classes (B to F) between (a) members of a family and (b) necessities, *e.g.*, the man stands for 1 in the expenditure, the wife .75, and so on.

(b) Every one is assumed—class by class—to be, though individual in ability and strength, subject to and acting in accordance with an average—the average which is assumed by placing quite different types in one class, *e.g.*, the careful, the drinking, and the thriftless. Thus the characteristics which are important in the making of good social habit are averaged away—indeed ignored. All that the use of money adds to the value of money is ignored and neutralised.

(c) In the same way all physical differences, even those of ordinary and everyday importance—age, sickness, feebleness, etc.—have to be ignored and averaged away.

Thus we have as a statistical creation a degraded society which is from the point of view of social science hardly less like nature than the "economic man" of some political economists.

"Poverty."

THE METHOD.

29. Mr. Rowntree takes the town of York as the subject of his inquiry. Mrs. Bernard Bosanquet has already criticised his method (and Mr. Charles Booth's) very effectively in a paper entitled "the Poverty Line," to which Mr. Rowntree has made some rejoinder, and in a paper in the *Contemporary Review* for January, 1904—"Physical deterioration and the poverty line." Many points dealt with in those papers may be passed over here.

Mr. Rowntree's aim is to ascertain the extent of destitution, *i.e.*, insufficiency of means to obtain necessities and to learn how far this destitution is culpable—that is due to causes assumed to be within the control of the individual, drink, etc.

His method is this—

1. To count and estimate the number of people just as they are at a given time (as do Mr. Booth and Dr. Hunter) instead of using the comparative method.
2. To ascertain the income of the head of the family and of the children who earn and of the wife's.
3. To class families according to income, on the understanding that a man, wife, and two to four children are a "moderate" family, and that if a man has a larger family, he is placed in a lower income class and *vice versa*.
4. To fix a standard of necessary food and the cost of it and to add the latter *per individual* to the cost of rent, clothing, etc.
5. Then to divide the income class by class by the total cost of necessary living for the class, and thus ascertain how far the income suffices for that purpose.

The sum set out is this:—

Moderate family + Cost of necessities.

Income.

The sufficiency of the method turns on: (a) the exactness of the investigation of the amount of income; (b) the reality of the classification of the families; (c) the standard fixed for necessities and its applicability.

AMOUNT OF INCOME.

30. As to the first—the exactness of the investigation of income.

The income classes are—

- A. under 18s. a week.
- B. 18s. and under 21s.
- C. 21s. and under 30s.
- D. Over 30s.
- E. Servants.
- F. Servant keeping class.
- G. In public Institutions.

The population dealt with is 75,000.

The inquiry refers to 46,754 people or 11,560 families.

The inquiry is made by house to house visitors, and the classes are settled after consultation with the clergy, etc., and as to wages, after general consultation with employers.

Everything depends on precision in regard to the P. 14. income. This is what is said:—

The visitor "found that the people with few exceptions were willing to supply the information sought. In some cases there was a disposition to give incorrect information, but experience soon enabled him to distinguish between truth and falsehood, and in doubtful cases the facts stated p. 26 were checked by neighbours and others."

"The occupation of each of the workers was ascertained and sometimes also direct information regarding the wages earned. Where this information was not available the p. 27. wage was *estimated*. In the case of skilled workers the wages were assumed to be the average wage which obtains in the district for the particular trade." These "it is believed, have been *estimated* with a large degree of accuracy." "In all cases, in assuming wages, allowance has been made for short time, including public holidays not paid for, also over-time, and cost of tools, etc." (The italics are mine.) This allowance is based on information from trade unions, masters, etc.

No uniform allowance has been made for loss of wage through illness, but in the estimates of short time some allowance under this head has been made.

A note on this—is given as a "rough indication"—2d. p. 27. a week in a sick club gives 7s. 6d. for six weeks, and 3s. 6d. for another six weeks of sickness.

"Working upon these lines, the earnings of every wage earner have either been ascertained or carefully estimated."

Afterwards the word "estimate" is dropped, and the reader cannot but think he is dealing with actual earnings. On page 116 the words used are "the total earnings of every working class family were ascertained."

31. Now to make some comments:—

(a) The system was one of visitation without verification in the individual case, and as to the earnings of the man, the wife, and the children, this, even with the other sources of information mentioned, is quite insufficient—at least, it would be elsewhere.

Take at random a few families visited elsewhere by people of long experience—and then tested by verification:

(1) Man forty-five, dock labourer; stated earnings, 12s. to 18s.; ages and stated earnings of children; girl nineteen; boy fourteen, 12s.; total stated earnings, 24s. to 30s.; total verified earnings, average 41s.

(2) Man thirty-five; railway labourer; stated earnings 23s.; wife 5s.; in all 28s.; total verified earnings 33s.; and so on.

Obviously visitation without verification in the individual case is no sufficient means for ascertaining the truth.

(b) Next the special examination of seemingly "doubtful" cases is a most misleading method—the inquirer is left in a position of thinking he knows he is right, without knowing where he may be wholly wrong.

(c) Next, the assumption that the skilled worker earned the average wage of the district is quite insufficient in compiling accurate data, which are to be applied to families whose incomes are to be treated as purchasing necessities in very small amounts per consumer.

(d) Next, if deductions are made from the wage—these should be set out in their money value—that the sum may

p. 30.

be before the reader, the notes quoted above are no real guide.

(e) Lastly, as to the earnings of children: "A girl or lad" it is stated "will pay 5s. or 9s. weekly, while a man will pay 9s. or 14s. to the household." But this is a very large variation surely, on which to base either estimate or average, apart from a knowledge of the actual facts—a difference of 55 per cent. Yet what the child actually gives may make all the difference in the family. The family is the social, and in great measure the industrial, unit. Many cases could be quoted in support of this.

The great variation in the sums available from children in particular cases can be shown by reference to many instances. The variations are hardly such as could be dealt with by general average.

32. In regard to the statements of wages Mr. Bowley's paper in the "Proceedings of the Royal Statistical Society," vol. lxxv. of 30th June, 1902, page 359 may be considered. The paper is a note on wages in York, 1899 (B.S. Rowntree). After quoting from Mr. Rowntree's book passages respecting his method and the assessment of wages, etc., Mr. Bowley writes:—

"These figures are not published in detail in the book but merged in family incomes and grouped together. Mr. Rowntree, however, has caused the statements of all adult male wage earners to be extracted from his material." On his basis the wage given has only to be multiplied by fifty-two, to give the annual earning. "The figures are estimates, and in some cases estimates only to the nearest round number. Thus, in many of the skilled trades the average weekly wages approximate to 30s. in some cases being 1s. or 2s. more, in others 1s. or 2s. less, and in such cases the wages are entered at 30s." Hence "the marked grouping is very noticeable, indicating that the gap between skilled and unskilled labour is more perceptible in York than in London, or in the country as a whole." The table divided to show shilling differences is suggestive. The total number of wage earners dealt with is 9,544, the number set down as receiving a wage of 20s. is 1,532, those that receive a wage of 19s., only twenty-seven, those who receive a wage of 21s., only thirty-one. Some other figures stand thus:—

At 23s.	- - -	499	At 30s.	- - -	2,398
„ 24s.	- - -	810	„ 35s.	- - -	260
„ 25s.	- - -	394	„ 40s.	- - -	420
„ 28s.	- - -	471			

The intervening entries of wage have but small numbers of earners entered against them.

This analysed, it is clear that the wage table suggests rounding such as one finds in census work in the case of ages. This rounding clearly seems due to the method adopted by Mr. Rowntree, and it appears to be a very great defect, especially as the question at issue is the ability to utilise a small income for the purchase of very small quantities of necessaries. It is not possible logically to connect large generalisations as to wage with minute investments of the generalised wages in a large number of particular cases.

CLASSIFICATION OF THE FAMILIES.

33. The second point is the sufficiency of the classification as to families.* It stands thus:—

- A.=Under 18s. for a moderate family.
- B.=18s. and under 21s. for a moderate family.
- C.=21s. and under 30s. for a moderate family.
- D.=over 30s. for a moderate family.

34. Some points may be noted:

The great inequality of the classes as measured by income.

Class B stands at 18s. under 21s.

Class C stands at 21s. and under 30s.

Next a moderate family=two to four children—this is an element of great variability in making up the classes.

Next the effect of this adjustment of family scale to income scale is remarkable; thus, if the family income equals 22s. in the case of a parent and four children, the family is put in C, but if of five or more, it is pushed down at least into B. The difference of the one child puts the case within the range of a class earning 18s. and under 21s., instead of in the range of a class earning 21s. and under 30s., and strictly the case might be pushed even further down and become an A case.

So again with a family—income 27s., two parents and two children are in C, but if they have only one child, then in D. This is quite arbitrary.

How the question stands is indicated by the following note on Class A. Dividing the income in the class made

up in accordance with the rules stated above, we have in it families receiving from under 4s. 5d. a head to 2s. 3d. per head or less:—

Thus A equals moderate family with income under 18s. a week.

A moderate family equals two parents and two to four children. (2+2; 2+3; 2+4.)

Eighteen shillings or less is then divisible in a moderate family.

Therefore A equals any sum per head under the following figures:—

(1) A equals
18s. (or less)—

$$\begin{array}{rcl} & \text{s.} & \\ 2+2 & = & 4\cdot5 \\ \text{or } 2+3 & = & 3\cdot6 \\ \text{or } 2+4 & = & 3\cdot0 \end{array} \quad \left. \vphantom{\begin{array}{rcl} 2+2 & = & 4\cdot5 \\ \text{or } 2+3 & = & 3\cdot6 \\ \text{or } 2+4 & = & 3\cdot0 \end{array}} \right\} \text{ per head.}$$

(2) If there is one parent and two children, or two parents and one child, A would equal any sum under the following figures:—

$$\begin{array}{rcl} 18\text{s. (or less)} & = & 6\text{s. per head.} \\ 1+2 & & \\ \text{or } 2+1 & & \end{array}$$

Unless these be pushed up into the 18s. to 21s. class—Class B.

(3) But, on the other hand, all the immoderate families in A must remain in A.

So A equals not only the above in (1) but often immoderate A families:—

$$\begin{array}{rcl} 18\text{s. (or less).} & & \\ 2+2 & & \\ \text{or } 2+3 & & \\ \text{or } 2+4 & & \end{array}$$

But the following as well $\left. \begin{array}{l} 2+5 \\ 2+6 \end{array} \right\}$ as divisors of the 18s. or less.

(4) And into A are also pushed all the immoderate families from B—earning above 18s. and under 21s., and including families falling to it from B to A. Taking shilling divisions the range covers the following cases:—

$$\begin{array}{rcl} 2+5 \text{ or } 6, \text{ \&c., children;} & & \\ \text{Which } = 2\cdot7\text{s. or } 2\cdot3\text{s., \&c., per head.} & & \\ 20\text{s.} & & \end{array}$$

$$\begin{array}{rcl} 2+5 \text{ or } 6, \text{ \&c., children;} & & \\ \text{Which } = 2\cdot8\text{s. or } 2\cdot5\text{s., \&c.;} & & \\ 21\text{s.} & & \end{array}$$

$$\begin{array}{rcl} 2+5 \text{ or } 6, \text{ \&c., children;} & & \\ \text{Which } = 3\text{s. or } 2\cdot6\text{s., \&c.} & & \end{array}$$

Therefore A, including all the cases in (1) (3) and (4) above, covers any income from 4·5s. per head downwards.

This is obviously a very large range—a kind of sliding scale of income checked by family in which there is no underlying principle at all. For the question must be asked: Are these classes real classes? The answer must be in the negative. The classes are but groups more or less indefinitely formed in connection with differences of income and family. They are not based upon any real characteristics; nor would they be necessary for Mr. Rowntree's purpose, if he rested his case upon observation of particular instances and verified material only.

35. Another test might be applied on Mr. Rowntree's lines of averaging. I have taken fourteen families at hazard—not families in Mr. Rowntree's book, but families of persons who have applied for relief to a Charity Organisation Committee.

The average wage of the fourteen families as returned at 23·14s. In five of the fourteen families there is definite upward movement. These omitted, there remain nine families with an average wage of 9s. This average wage would bring all such families into Class A.

But as the following notes show, the relation between average wage and the condition of the families in the class is quite unreal. The cases are as follows:—

- (a) Pension case, 12s. 6d., man and wife.
- (b) Infirmary case.
- (c) Heavy drinker.
- (d) Discharged summarily: falsification of accounts.

* p. 28.

- (e) Bad eyes; large relief; begging; bad temper.
- (f) Old, children well able to support, second marriage; family quarrel.
- (g) Weakly; casual labourer; dependent largely on wife and children.
- (h) Old, son "disappeared" but when found well able to help, rent 10s.
- (i) Drink.

It will be noticed in how few of these cases the question of difficulty or "poverty" is one of income as against expenditure. By reference to Class A in Mr. Rowntree's sample of fifty-one entries on page 33 it will appear that in those cases too the true issue is not income as against expenditure but social habit. Thus in his fifty-one cases three are cadger cases, two are mentally deficient, in seven there is drink, five are entered as large families but not further investigated; and twenty-two are set down as poor law relief but not further investigated.

In the notes of these sample cases there is no statement of wages or of finance and no statement of ages. It seems doubtful indeed whether such evidence was obtained. If it were, it would tend greatly to modify Mr. Rowntree's own conclusions.

STANDARD FIXED FOR NECESSARIES.

36. We turn next to the standard fixed for necessities and its applicability. It is evident that the investigation, so far as it has yet been under consideration, does not afford a basis for precise numerical results. Yet it is upon this basis that the utility of the investigation depends. A food test is next applied. This is done in two ways.

The Local Government Board issued three years ago a dietary for people in the workhouses and infirmaries. There were three conditions mentioned in their circular letter—

- (1) The inmates were examined by a medical officer.
- (2) There were "plain" and "infirm" diets; and
- (3) There were children's diets.

"Owing to the great difference of individual appetites in the case of children, it should be remembered that in their dietaries the prescribed rations represent the average allowance for a group of children and not the amount for a particular child."

- (4) They note that the bread allowance is excessive; and;
- (5) They note that there is a tendency to waste food which should be checked.

From these "plain" dietaries Mr. Rowntree has made a dietary and priced it according to the contract prices of the York Board of Guardians.

Next he has divided his families as grouped on the above plans between "Poverty lines."

Primary Poverty population, 7,230; families, 1,463.

Secondary Poverty (or self-caused), 13,072.

The "Primary Poverty" he has divided into six sections according to immediate cause.

Households affected.	Immediate cause.
403	Death of chief wage earner, 15·63.
146	Illness or old age of chief wage earner, 5·11.
38	Chief wage earner out of work, 2·31.
51	Irregularity of work, 2·83.
187	Large family, 22·16.
640	Regular work and low wages, 51·96.

The whole makes 9 per cent. of the population.

Taking these sections Mr. Rowntree makes budgets charging the cost of food as above, showing a deficiency for the section and then working it out per family. Each adult is taken as requiring an equal amount according to the standard of an average man.

37. To pass to comment. The result of all this cannot be otherwise than unreal, in spite of its being set down in seemingly precise statistics. Thus the consumption of the food depends not on an average of the consumption of adults but on the digestive powers of those who partake of it. Thus the old would take less, the young more; but no ages are given. Weight and size would tell; but the standard figures apply only to a man of eleven stone. The waste which is made in the workhouse need not be made in the home; but here it is not—on this method, cannot be, taken into account. Optional variations in diet, which are petty in themselves, but stand for much in individual cases, are also necessarily ignored.

The method might be of use if applied to individuals who had been medically examined, but here it is applied to the average of a class whose physical condition has not been examined, in conjunction with a statement of income which is after all only an estimate.

Then as to the standard itself. Mr. Rowntree requires in all classes 3,500 calories per diem, food being analysed into calories, *i.e.* into degrees of heat productivity. The value of the food as a source of energy is measured by the amount of heat it produces on complete combustion. The insufficiency of this method has been recognised and it cannot be taken as finally settled—certainly it cannot be accepted without demur as here applied.

The experiments that have been made are mostly on inmates of Institutions under known conditions and living healthy lives. From these experiments it has been concluded that a healthy man of eleven stone weight and doing a moderate amount of muscular work must have from 3,000 to 3,500 calories if his needs are to be fully covered. "Standard dietaries" it is urged, "are only of limited use . . . only drawn up to meet the needs of *typical* individuals living under known conditions and doing a moderate amount of muscular work." Further, the calories needed vary according to occupation: so a clerk at his desk is stated to require only 2,500 calories, a man at moderate work, such as house-painting, 2,631, a navy at hard labour, a highly paid man, 3,513. A point like this makes the greatest difference in Mr. Rowntree's divisors; but for it he makes no allowance.

Many other points may be mentioned, but one will suffice. In the case of women Dr. Dunlop states that "their food requirements have received comparatively little attention," yet these elaborate calculations, with some modifications, are applied to them as they are to men. For all working male ordinary persons, except those of more than usual size, twelve stone in their clothes, and doing ordinary work, Dr. Dunlop furnishes dietaries amply sufficient which would cost say, 2d., a meal.

It may be concluded that Mr. Rowntree's method is extremely speculative, that the information on which it is based is far from sufficient, and that neither method nor information provide the material that would be required for drawing trustworthy "poverty lines," if, indeed, such a task could be accomplished at all with scientific scrutiny in reference to a large population. At least any inquiry should be restricted to observed data, to actual counts, and to classifications founded on social habit.

A CONTRAST.

38. One contrast may be added.

Mr. Charles Booth applying his method to London concludes that "after deducting loafers and criminals, 29·8 per cent. of the people are in perpetual poverty, owing to the family earnings being less than 21s. a week."

Mr. Rowntree, copying Mr. Booth's method, concludes that 9·91 per cent. of the population of York, which, he holds, is generally representative of urban population, have earnings insufficient for the maintenance of merely physical health.

Mr. Booth includes in his 29·8 per cent. those (*see above*) with 18s. to 21s. a week who are "neither ill-nourished nor ill-clad according to any standard that can reasonably be used." On the other hand, he "does not enter into questions of economical or wasteful expenditure." Accordingly Mr. Booth counts as in the same perpetual poverty alike the wasters and the well-nourished and well-clad.

Mr. Rowntree calculates, as he believes, those whose poverty is due to their own fault at 18·51, and those who have insufficient earnings etc., at 9·91, in all 28·42, and fortifies his conclusion by the similarity of his figures to Mr. Booth's.

It is plain that there is no real similarity. Mr. Charles Booth ignores economical or wasteful expenditure, and includes the well-clad and well-nourished and makes a percentage of 28·8.

Mr. Rowntree recognises wasteful expenditure or self-caused poverty, and finds none in his class provided with sufficient means to command the necessities of life—none well-clad and well-nourished—and makes a percentage of 28·42.

How these percentages have been arrived at has been shown; and it is plain that they cannot be said to be consistent one with another, nor either of them based on sufficient information.

C. S. LOCH.

APPENDIX IV.

INSANITARY AND OVERCROWDED HOUSE PROPERTY.

This Memorandum is intended to be an answer to the following questions, and is confined within the scope covered by those questions; it is not intended to deal with Ireland, nor in any detail with Scotland.

I. What is the state of the law on the liability of owners and occupiers of house property in respect of insanitary or overcrowded conditions?

II. What powers has the local authority to bring home this responsibility to the persons implicated, and how can it be made to exercise those powers?

III. What checks exist upon bad building in the case of new tenements, and how are they enforced?

INTRODUCTORY.

The general law with regard to housing in England and Scotland is contained in two sets of Acts, viz., the Public Health Acts and the Housing Acts. Of these the following contain provisions bearing upon the points discussed in this Memorandum:—

1. Public Health Act, 1875—38 & 39 Vict., c. 55.
2. Public Health Acts (Amendment) Act, 1890—53 & 54 Vict., c. 59.
3. Public Health (London) Act, 1891—54 & 55 Vict., c. 76.
4. Public Health (Scotland) Act, 1897—60 & 61 Vict., c. 38.
5. Housing of the Working Classes Act, 1885—48 & 49 Vict., c. 72 (see note under II., 3).
6. Housing of the Working Classes Act, 1890—53 & 54 Vict., c. 70.
7. Housing of the Working Classes Act, 1903—3 Edw. VII., c. 39.

Of the above (1) and (2) apply to England outside London, (3) to London, and (4) to Scotland, (5) and (6) to England and Scotland, and (7) to England alone. There are various other minor Amendment Acts, etc., which need not be referred to here.

A most useful book on the subject of housing, both from a practical and legal point of view, is *The Housing Handbook*,* by W. Thompson, published recently by the National Housing Reform Council.

I.

I.—Liabilities of owners and occupiers under the Public Health Acts.

The liabilities of owners and occupiers under the above Acts are many and various, and subject to different conditions. An attempt is here made to classify them under the following heads:—

- A. Where the owner or occupier is expressly obliged or forbidden to perform or permit any act or thing.
- B. Where no legal liability rests with the owner or occupier until he receives notice from the local authority. On default of performance after notice, penalty attached.
- C. Same as B., but no penalty attached (except, in most cases, liability to pay the local authority's expenses for performing the work).

(The references given are to the Public Health Act, 1875, except where otherwise stated. There are corresponding sections in nearly every case in the London and Scotland† Acts—for a tabular statement of these see *Thompson, App.*, p. 72.)

A.—It is unlawful to build or rebuild any house in an urban district without covered and properly constructed drains. £50 penalty for contravention of this section.

S. 25.

* *Note*.—This book was published before the passing of the Housing Act, 1903.

† *Note*.—The Scotch Act, later in date than the English Act, contains in some respects fuller and stronger provisions.

It is unlawful in an urban district, without the consent of the local authority, to build over a sewer or under a carriage-way. Forfeit of £5 to the local authority, and 40s. for every day on which the offence continues after notice given. S. 26.

It is unlawful to build or rebuild any house without a sufficient water-closet, earth-closet or privy, and an ashpit furnished with proper doors and coverings. £20 penalty for contravention of this enactment. S. 35.

It is unlawful to erect any new building on ground filled up with offensive matter. Penalty £5 and 40s. a day. 53–4 Vict. c. 59, S. 25.

It is unlawful to remove, or obstruct the local authority in removing, any matters which the local authority are authorised by the section to remove, i.e., house refuse, etc. £5 penalty for each offence. S. 42.

It is unlawful in an urban district—

(a) To keep pigs in any dwelling-house or so as to be a nuisance.

(b) To suffer waste or stagnant water to remain in any dwelling-house for twenty-four hours after notice by the local authority.

(c) To allow the contents of any privy, etc., to overflow or soak out.

40s. penalty for each offence, and 5s. a day during continuance. S. 47.

It is unlawful to let or occupy cellar-dwellings (including any vault or underground room) built or rebuilt after the passing of the Act, or not lawfully let or occupied at the date of the Act.

It is unlawful to let or occupy any cellar-dwellings whatever, except under certain conditions

Twenty shillings penalty for each offence for every day during which the offence continues after notice from local authority. After two convictions within three months, Court of Summary Jurisdiction may order premises to be closed. Ss. 71–75.

The keeper of a common lodging-house shall—

(a) Register his lodging-house. £5 penalty and 40s. a day.

(b) Lime-wash the walls. 40s. penalty.

(c) Give notice of fever or infectious disease to the medical officer and relieving officer. £5 penalty and 40s. a day.

After three convictions, Court may disqualify for keeping a common lodging-house.

Ss. 77, 82, 84, 86–88, and see 53–4 Vict. c. 59, S. 32.

B.—Obligation on owner or occupier, after notice from local authority, to repair drains, privies, etc.

Ten shillings penalty for every day during which he makes default. S. 41, 53–4 Vict. c. 59, S. 19.

Obligation on occupier to obey bye-laws, if made, imposing on occupier duty of cleansing of footways and pavements, removal of house refuse, etc., and, when the local authority themselves undertake or contract for the work of removal, duties in connection with such removal so as to facilitate the work of collection, and (in urban district) prevention of nuisances, etc. Penalty may be attached by bye-laws of £5 and 40s. for each day after notice of offence. Ss. 44, 183, 53–4 Vict. c. 59, Ss. 26, 29.

Obligation on owner or occupier, after notice from local authority, to whitewash and purify any house. Ten shillings penalty for every day during which he makes default. S. 46.

Obligation, in urban districts, to remove manure, etc., from mews after public notice by urban authority for periodical removal. Penalty 20s. for each day while accumulation continues. S. 50.

Obligation on keeper of common lodging-house, if required by local authority, to affix a notice to such house with the words "Registered Common Lodging-House." £5 penalty and 10s. a day. S. 79.

Obligation on owner or keeper of common lodging-house, after notice by local authority, to obtain proper water supply. If notice not complied with, local authority may remove house from the Register during default S. 81.

Obligation on keeper of common lodging-house, if required by local authority, to report as to vagrants lodging there. £5 penalty and 40s. a day. Ss. 83, 86.

Obligation on keeper of common lodging-house to admit any officer of the local authority to inspect the premises, when required. £5 penalty. S. 85.

Obligation on any person by whose default a "Nuisance" has arisen, or on the owner or occupier, after notice by the local authority to abate such nuisance. On non-compliance with notice, liability to appear before Court of Summary Jurisdiction on complaint by local authority. £5 penalty and order to abate or prohibiting recurrence or for both abatement and prohibition. If nuisance renders a house unfit for human habitation, an order may be made prohibiting its use till habitable. On disobedience to order for abatement, 10s., or for prohibition, 20s. a day penalty. After two convictions for overcrowding within three months an order for closing the house may be made. Appeal to quarter sessions, and other regulations. Ss. 91, 94-99, 103-109, 269.

Note.—In the above sections "nuisance" is defined to mean a number of things, including "any premises in such a state as to be a nuisance or injurious to health" and "any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family."

Obligations to obey building, etc. bye-laws—penalty may be attached by bye-laws of £5 and 40s. for each day after notice of offence.

Ss. 157-159, 183.

53-4 Vict. c. 59, s. 23.

Obligation to obey bye-laws, fixing number of occupiers etc., drainage, etc., and cleansing, etc. of houses let in lodgings other than common lodging houses. Penalty may be attached by bye-laws of £5 and 40s. for each day after notice of offence.

Ss. 90, 183, 48-9, Vict. c. 72, s. 8.

Prohibition to any person to use or suffer the use of rooms over privies, etc. (except water and earth closets), as dwelling or sleeping rooms. Penalty, after seven days notice, of £40 or 10s. a day. 53-4 Vict. c. 59, s. 24.

Obligation on keeper of common lodging house to obey bye-laws for fixing, etc., the number of lodgers, for the separation of the sexes, for promoting cleanliness and ventilation, for giving notices and taking precautions in the case of infectious diseases, and for well ordering of common lodging house. Penalty may be attached by byelaws of £5 and 40s. for each day after notice of offence. Ss. 80, 183.

C.—Obligation on owner or occupier, after notice from local authority, to drain undrained house. S. 23

Obligation on owner or occupier, after notice from local authority, to provide proper privy accommodation. S. 36.

Obligation, in urban districts, on person to whom it belongs, or occupier of premises, to remove accumulation of manure, etc., on notice from inspector of nuisances. S. 49.

Obligation on owner to provide sufficient water supply, after notice from local authority. S. 62.

2. *Liabilities of owners and occupiers under the Housing Acts.*

The Housing Acts, do not, for the most part, affect the owner or occupier directly. They lay upon the local authority certain duties and responsibilities, and give them certain powers of dealing with house property. The position of the owner and occupier is of course indirectly affected, but it seems better to deal with the Housing Acts under the next section of this Memorandum.

There are, however, two points which may be mentioned here—

(a) If in any way an owner or occupier obstructs the carrying out of the provisions of Part II. of the Act of 1890, with respect to any house, the court may order the owner or occupier to permit the provisions to be carried out. On failure to comply with such order, penalty of £20 a day as long as the failure continues. 53-4 Vict. c. 70 s. 51.

(b) In any contract for letting for habitation by persons of the working classes a house or part of a house, there shall be implied a condition that the

house is in all respects reasonably fit for human habitation. The above only applies to contracts made after August 14th, 1885.

The above is extended by the Act of 1903, so as to apply, as regards any contract made after the passing of the later Act, notwithstanding any agreement to the contrary. 53-4 Vict. c. 70, S. 75.

3 Edw. 7. c. 39, S. 12.

II.

1. *Powers * of Local Authorities † under the Public Health Acts.*

(The references given are to the Public Health Act, 1875, except where otherwise stated. There are in nearly every case corresponding sections in the London and Scotland Acts.‡ For a tabular statement of these, see *Thompson*, App. p. 72.)

Obligation to give notice to owner or occupier to drain undrained houses. If notice to drain not complied with, local authority may do the work and recover expenses.

S. 23.

Power to urban authority to give notice as to buildings built over sewers, or cellars, etc., constructed under carriage ways. Power to pull down such buildings, etc. and to recover expenses. S. 26.

Obligation, on report of surveyor or inspector of nuisances, to give notice to owner or occupier to provide a sufficient "water-closet, earth-closet, or privy, and an ashpit furnished with proper doors and coverings" in any house. If notice to make such provision not complied with by owner, local authority may do the work and recover expenses. S. 36.

Obligation to provide that all drains, etc., within district are constructed and kept so as not to be a nuisance or injurious to health. S. 40.

Power to examine drains, privies, etc., on complaint of nuisance by any person, and obligation (if found insanitary), to order alterations. If order not complied with, local authority may do the work and recover expenses. S. 41.

53-4 Vict. c. 59, s. 19.

Obligation to provide for cleansing of streets, footways, etc., removal of house refuse, etc., and cleansing of privies, etc. Local authority may themselves undertake, or contract for, these matters, and must do so if required by the Local Government Board. If they themselves undertake or contract for removal of house refuse or cleansing of privies, etc., they are liable to a penalty of 5s. a day, payable to occupier, for neglect to carry out the work. Where they do not themselves undertake or contract for cleansing footways, etc., removing refuse, or cleansing privies, etc., they may make bye-laws imposing the duty on the occupier; this does not extend to the cleansing of streets. Urban authority may also make bye-laws for the prevention of nuisances arising from snow, filth, ashes, etc., and for the prevention of keeping animals so as to be injurious to health. Ss. 42-4.

Obligation, on certificate of medical officer or any two doctors, to give notice to owner or occupier to whitewash and purify insanitary houses. If notice not complied with, local authority may do the work and recover expenses. S. 46.

Power to take proceedings for cleansing offensive ditches. S. 48.

Obligation (in urban districts) on inspector of nuisances to give notice for removal of manure, etc. If notice not complied with urban authority may sell manure and recover balance of expenses from owner of manure or occupier. S. 49.

Power to give notice for periodical removal of manure from mews, &c., in urban districts. S. 50.

Power to give notice as to stagnant water in a house. Obligation to abate certain nuisances §; and recover expenses from occupier. S. 47.

* In this part of the Memorandum a distinction is drawn between a mere "power" given to the local authority and a power coupled with a duty, *i.e.*, an obligation; between "may" and "shall."

† Rural District Councils can obtain many powers of an Urban District Council under the Public Health Acts by applying to Local Government Board to be invested with the particular urban power required.

‡ See note on preceding page.

§ See preceding page.

Obligation, on report of surveyor, to give notice to owner requiring him to obtain an adequate water supply; if notice not complied with, local authority may do the work and recover expenses. S. 62.

Power to give notice to persons illegally letting or occupying cellar dwellings. Power to close cellar-dwellings on direction by Court of Summary Jurisdiction. Ss. 73, 75.

Obligation to keep register of common lodging-houses, to inspect and approve by an officer, and to make bye-laws for the regulation thereof. Power to require water-supply and to order reports, etc. Ss. 76-89.

Power to make bye-laws for the regulation of houses let in lodgings (other than "common lodging-houses.") S. 90.
48-9 Vict. c. 72. Ss., 8, 10.

Obligation to inspect for nuisances,* and to enforce provisions of Act in order to abate the same.

Obligation to give notice to owner or occupier to abate on receipt of information. On non-compliance, obligation to make complaint to justice. Ss. 91-95.

Power of entry where order for abatement of nuisance has been made, and to abate the nuisance and recover expenses. S. 98.

Power of entry into any premises for examination as to existence of nuisance, etc., etc. S. 102.

If local authority make default, Local Government Board may authorise police officer to institute proceedings. S. 106.

Power to apply in certain cases for closing order against overcrowded house. S. 109.

Power to urban authority, and in most of the following cases to rural authority, if invested with urban powers or to a limited extent where Part II. of Public Health Acts Amendment Act, 1890 is adopted, to make bye-laws with respect to the level width and construction of new streets, and provisions for the sewerage of new streets, the construction of foundations, roofs, walls, and chimneys of new buildings, open space about buildings, the ventilation, drainage, and closing of buildings, water closets, earth closets, privies, ash-pits, and cesspools in connection with buildings, the supply of water for closets, the structure of floors, hearths, and staircases, and the height of rooms, the paving of yards, etc., and the provision of means of access for removal of refuse.

Notice to be given of laying out streets or erection of buildings: power of inspection.

Power to enforce observation of such bye-laws by pulling down buildings wrongly constructed, etc., and to recover expenses. Ss. 157-159.
53-4 Vict. c. 59. s. 23.

Power to give notice to persons illegally occupying rooms over privies. 53-4 Vict. c. 59. s. 24.

Power to urban authority to cause to be swept and cleaned common courts and passages, and to recover expenses. 53-4 Vict. c. 59. s. 27.

All offences and penalties, etc., are to be prosecuted and recovered in manner provided by the Summary Jurisdiction Acts. S. 251.

2. Power to enforce carrying out of duties of Local Authority under the Public Health Acts.

Obligation for Local Government Board, on receiving complaint that a local authority has made default in providing sewers or water supply, or in enforcing any provisions of the Act which it is their duty to enforce, to make an order limiting the time for the performance of their duty. If duty not performed by the time limited, power to enforce order by Mandamus, or in the alternative to appoint some one to carry out the duty, and recover expenses from the local authority. S. 299.

* For definition, see preceding page.

3 Powers of Local Authorities under the Housing Acts.*

The main Housing Act is the Act of 1890. This is divided into three parts:—

Part I. provides for the clearing of unhealthy areas, and making improvement schemes; this part applies to London, boroughs, and urban districts.

Part II. provides for the closing or demolition of individual insanitary houses, and the reconstruction of small unhealthy areas; this part applies to London, boroughs, urban districts, and rural districts.

Part III. provides for building new houses for the working classes. This part is adoptive.

The whole Act applies, with modifications, to Scotland; but the Act of 1903 does not apply to Scotland.

Part III. does not affect owners or occupiers of insanitary dwellings, and is therefore outside the scope of this Memorandum. The references hereunder given are to the Act of 1890, except when stated to be to the Act of 1903.

A. As to the Clearing of unhealthy areas.

On an official representation, local authority shall proceed to make an improvement scheme. S.4.

Note.—This official representation means representation by a medical officer of health. Any twelve ratepayers, or two justices, may complain to the medical officer, and he is bound to make a representation.

Any twelve ratepayers, on default of medical officer, may appeal to the confirming authority (*see below*, S. 8.) S.S. 5, 16; 3 Edw. 7. c. 39. S.4. (2).

Notice to be served on owners, lessees, and occupiers of lands proposed to be taken compulsorily.

S. 7.; 3 Edw. 7. c. 39. s. 5. (1).

All improvement schemes of the local authority to be confirmed by a Secretary of State† (Home Office) in London, and by the Local Government Board outside London. S.8.

The Act goes on to deal with procedure on making an improvement scheme, rehousing, etc.

B. As to the closing etc., of insanitary houses, and the clearing of small unhealthy areas.

Obligation on the medical officer to represent to the local authority any dwelling house unfit for habitation. Any four householders, and in rural parishes, a parish council, may complain to the medical officer, who is then bound to inspect and report. Such householders, on default of action by local authority, may appeal to the Local Government Board.

S.s. 30, 31; 56 and 57. Vict. c. 73, s. 6 (2).

Obligation on local authority to inspect their district, and, if necessary, to take proceedings under the Public Health Acts, for closing houses unfit for human habitation. By the Act of 1903, a closing order may be obtained, where a house is not capable of being made fit for human habitation, against an owner or occupier without previously serving notice on him to abate the nuisance.

S. 32; 3 Edw. 7. c. 39. s. 8.

After closing order, there may be a demolition order; if owner fails to execute order, local authority may do the work. S.s. 33, 34.

In the case of "obstructive" (i.e. preventing ventilation, etc.) buildings, on representation by medical officer or any four householders, local authority may give notice to owner; after hearing his objections, may order demolition of building. May purchase the premises and pull

**Note.*—The Housing of the Working Classes Act, 1885, is almost entirely repealed, but the following section (S.7) remains and is most noteworthy as a solemn invitation to local authorities to perform their duty:—

"It shall be the duty of every local authority entrusted with the execution of the laws relating to public health and local government to put in force from time to time as occasion may arise the powers with which they are invested so as to secure the proper sanitary condition of all premises within the area under the control of such authority."

† But the powers of the Secretary of State may be assigned to the Local Government Board by Order in Council. 3. Edw. 7. c. 39. s. 2 (1).

down the building themselves, or allow owner to retain premises under conditions. S. 38.

Procedure as to improvement schemes* for small areas. Ss. 39.

4. *As to the carrying out of duties of Local Authorities under the Housing Acts, and powers to enforce such carrying out.*

As regards Part I. of the Act of 1890, the Local Authority are bound to act:—

(a) On the representation of the medical officer †. S. 4.

(b) On order by the confirming authority.

Such order may be enforced by mandamus—

S. 10; 3 Ewd. 7 c. 39, s. 4 (1).

‡ As regards Part II. of the Act of 1890, the Local Authority are bound to act:—

(a) On the representation of the medical officer—† S. 30.

(b) As regards urban authorities outside London, on Order by the Local Government Board which is made binding on the local authority. S. 31.

Note.—There is no provision for enforcing such Order, but as the Order is made binding on the local authority it would appear to be enforceable by mandamus.

(c) On information given in the course of inspection. S. 32.

(d) As regards “obstructive” buildings, on representation of medical officer, or of four householders. S. 38.

(e) If County Council, on default of action by Rural District Council or by Borough Council in London: no supervision, however, over boroughs elsewhere, and urban districts. S. 45.

* In London outside the city in improvement schemes under Part II., the borough councils are the local authority; under Part I., the county council.

† The renewals of the appointment of medical officers of health who have not permanent appointments are by the Public Health Acts vested in the local authority, and the Local Government Board have no direct power of interference, though where a moiety of the salary is repayable out of the local taxation account, the approval of the Local Government Board to a new appointment is required. Where the medical officer of health is appointed permanently under the Local Government Board’s approval he cannot be removed without the consent of the Board.

‡ This does not apply to the clearing of small unhealthy areas; there does not appear to be any obligation on the local authority in this respect, unless they are themselves of opinion that action should be taken.

III.

The chief checks upon building in the case of new tenements are imposed in London by the London Building Act, 1894 (57—8 Vict. c. cxxiii—local), as amended by the Amendment Act, 1898 (61—2 Vict. c. cxxxvii.); elsewhere, by bye-laws adopted by the local authorities under the provisions of the Public Health Acts, except as regards a few towns which have Building Acts of their own.

A.—The London Building Act, 1894, is a long statute divided into sixteen parts, of which the following may be noted as referring more especially to checks on bad building.

Part VI.—Construction of buildings.

Part XIII.—Superintending architects and district surveyors.

Part XIV.—Byelaws.

Part XV.—Legal proceedings.

Under Part VI. may be found, *inter alia*, the following provisions.

As to thickness of walls—S. 53 (and Schedule I.)

Fire-resisting materials for stairs and passages in tenements S. 68.

Ventilation of staircases. S. 69.

Height of habitable rooms. S. 70. (1) (a) (b).

Windows. S. 70 (1) (c).

Part XIII. provides for the appointment, etc., of superintending architects and district surveyors.

On neglect by owner of notice given by a surveyor, the County Council may take proceedings. S. 153.

Under Part XV. it is provided that the Summary Jurisdiction Acts shall apply for the purpose of legal proceedings under the Act. S. 166.

A tribunal of appeal is constituted, consisting of three members, one appointed by a Secretary of State, one by the Royal Institute of British Architects, and one by the Surveyors’ Institute. S. 175.

A variety of penalties for different offences under the Act are given by S. 200.

B.—Building byelaws under S. 157 of the Public Health Act, 1875, have already been mentioned.* These may be made by any borough or urban district council, and the power has been extended (slightly modified) to Rural District Councils by the Public Health Act, 1890. When Part III. of the Act is adopted, a Rural District Council can be invested by the Local Government Board with the full powers of an Urban District Council to make building bye-laws. One of the first duties of a local authority should be, and generally is, to make such bye-laws which have to be approved by the Local Government Board; and the usual practice is to adopt bye-laws based on the “Model Bye-laws” which are issued by that Board. For a specimen of these see *Thompson*, pp. 85–92.

* See preceding pages.

APPENDIX V.

MEMORANDUM ON EMPLOYMENT OF MOTHERS IN FACTORIES AND WORKSHOPS.

By Miss A. M. Anderson, H.M. Principal Lady Inspector of Factories.

I. The main points for consideration are:—

I. The existing law, its means of administration, and its effects.

II. The extent and its effects in particular localities and trades, or generally, of employment of mothers of infants in: (a) Factories and Workshops under regulation; (b) unregulated occupations of a kind comparable or likely to be equally injurious.

III. The circumstances and causes of employment of child-bearing women in occupations separate from their homes and the forces to be reckoned with if the existing law were to be strengthened or extended.

IV. The existing means and agencies, other than direct prohibition of employment, for enabling and fitting mothers to devote themselves both before and after confinement to the necessary care of the infant life.

V. Opinions quoted *re* amendment of the law.

I.—THE EXISTING LAW AND ITS ADMINISTRATION.

2. So far as the Factory Acts (which have hitherto aimed primarily at safeguarding the life and health of the worker herself or himself under a contract of employment with an occupier of a factory and workshop) are concerned, the existing law (1 Edw. vii., C. 22., S. 61) is, as it has been since the repealed Act of 1891 (Section 17) came into force, as follows:—That an occupier of a factory or workshop (or laundry since 1895) shall not knowingly allow a woman to be employed in his factory or workshop within four weeks after she has given birth to a child.

3. Thus no legal offence has arisen unless the occupier or his agent has, with knowledge of the fact and date of the birth, employed or re-employed the mother of the child. No responsibility has been laid on the father or mother in this matter by the Factory Act, and no means are prescribed to aid the employer of the mother in finding out the fact of the birth and its date, or ascertaining the physical fitness of the mother to resume work. The question of the physical fitness of the infant to be left by the mother has, of course, not entered into consideration. There are naturally many cases where knowledge of the fact and date of birth would be out of reach of cognisance by the occupier; for instance, where the mother herself changes her place of employment, and being under no legal obligation to state to the employer the date, or even the fact of the child's birth, commences a new contract of employment.

4. No case was taken under Section 17 of 1891 until six years after it had become law. In 1897 proceedings for a contravention were first instituted by one of the lady Inspectors in a Yorkshire town. On this case I reported to the Chief Inspector, Annual Report, 1897, page 96, as follows:—

“Hardly any infringement of the Factory Acts is more difficult to discover or proceed against than the employment of a woman within four weeks of her confinement, chiefly owing to the burden of proof resting with the inspector as to the employer's knowledge of the facts. Although we have good reason to believe that such employment occurs frequently in certain districts, only one clear case, namely, this one, has yet occurred within our knowledge as suitable for proceedings, and in this case it was owing to the fact that the woman was sent for by the foreman who was pressed for workers, on the ninth day after her confinement, although he had been informed of the reason for her absence on the day she left the mill. This unfortunate woman, although she made some attempt to screen her employers when called as witness by Miss Squire, was nevertheless dismissed from her employment after the result of the case (conviction and small penalty) was known. She

obtained employment from one of the magistrates who heard her case soon afterwards, and this removed her personal difficulties*; it would do little or nothing however, to counteract the effect on the workers' minds of the conduct of the employer, who, by dismissing her, showed his contempt for the law and the kind of course he was likely to pursue with any worker who admitted facts as to infringements of the law to one of H. M. Inspectors.”

Miss Squire herself reported at the same time as follows:—

“Section 17, 1891, although of so great importance to the community, no less than to the individual, must remain for the most part a dead letter, owing to the difficulty of proving the employer's knowledge of all the circumstances, as well as for other obvious reasons. It is probable that much greater control over the evil with which this section is intended to cope could be exercised, and also that both the appearance and the reality of hardship entailed by the present regulation upon mothers dependent upon their earnings would vanish if the production of a medical certificate of fitness for employment in the particular factory to which it referred were made the condition of employment or re-employment after confinement.”

In the case in question the mother of the infant had absolutely no choice but to take such work as offered, when and where she could obtain it, as she was unmarried and had no means of support.

5. Other cases have since then come before me for consideration, but until the present time in only two (both married mothers), after a considerable interval of time (in 1902 and 1903), has it been possible to institute proceedings for breach of the law. In four out of seven cases of employment in a factory within four weeks of childbirth, which have been reported to me during the present month, the legal cases fell to the ground because either the mother sought work in a fresh mill without mention of her infant, or having left her work some time before her confinement she returned after such an interval of time that the occupier was under the belief that the section had been duly observed. In the majority of these cases outside the section the mother is unmarried, or deserted and destitute. Three cases are about to be heard, two in Scotland and one in England, and the decision of the courts will be shortly accessible to the Committee.†

6. During the seven years that I have been directing the work of the lady inspectors, complaints have been received repeatedly of cases believed to be contraventions of the section as well as of general injury to the health of the mothers and infants through early, though not illegal, return to work. All have been thoroughly investigated, with the result, so far as prosecution is con-

* The industrial Law Indemnity Fund, organised by Mrs. H. J. Tennant, now affords support and assistance to find fresh employment in any case where a woman or girl is dismissed for giving true evidence on a contravention of the Factory or Truck Acts.

† I have just received the report on the decision of the magistrates in one case heard in Preston yesterday. There it was proved that the mother returned to work in the same mill within four weeks (reason, poverty, husband out of work), that the agent of the occupier, the foreman knew the reason for the woman's absence and that he sanctioned her return, omitting to ask her the age of the infant. The magistrates decided that the occupier did not “knowingly allow” the woman to be re-employed, although they blamed the foreman for not making the inquiry which would have elicited the fact of the infant's age.

cerned, already stated. On the other wider question, the evidence of doctors, nurses etc., has always been conflicting.

7. There can be no question that, while the prohibition is well known in factory districts, and absence for one month

fully observed in the majority of cases, especially where pressure of circumstances does not lead the mother to seek early re-employment and wages, there are yet many cases where the spirit if not the letter of the present law is broken. The following are cases found in one town in a single week's brief enquiry :—

Name.	Age.	Condition	Employment.	Date of Child's Birth.	Date of Return to Work.	Reason for Return.	DETAILS.
A.B.	24	Unmarried.	Jute Preparing.	11.2.04.	26.3.04. Change of mill.	Poverty.	Had to leave work, being unfit, seven weeks before confinement. Was in lodgings and became quite destitute, so went to work as soon as she found it possible. Worked before confinement in X Mill, and afterwards went to Y's, saying nothing of the baby. Earns 9s 8d. a week. The child's father contributed nothing.
C.D.	34	Married, but child illegitimate.	Jute Spinner.	29.2.04.	22.3.04. Change of mill.	No means of support.	This women is married, but her husband has been in India (soldier) for seven years. She has two children aged eleven and seven years, who live with her husband's mother. She does not contribute to their support. The father of the child born this year went to Canada before its birth and has contributed nothing. She worked in Y's mill before confinement and started afterwards in X's, saying nothing of the child. She stated that she left off work "months before the birth" but would say nothing of how she supported herself then.
F.F.	32	Married.	Jute Spinner.	7.3.04.	22.3.04. Change of mill.	Poverty.	This woman's husband is a labourer. Had fairly steady work in early part of winter but none at all for the past two months or so. He left town when the child was a week old to look for work and has not been heard of since. Three children, the eldest a boy of fourteen working in a mill with 8s. a week, one under two years and the baby. The mother worked in P's Mill before confinement, went to H's after and said nothing of the baby. She tends a single frame and has 11s.—12s. a week. Her mother takes care of the children, living with her. They occupy a single apartment which was very dirty. Signs of much poverty. I had an interview with her Employer who will not employ her again until April 5th, when the four weeks will have elapsed. I saw the Inspector of the Poor on the woman's behalf and arranged for her to have some help.

8. It is hardly to be doubted that there would be a multiplication of such evasions of the prohibition if it were mechanically extended to three or more months without other amendments of the section tending to make administration more effective than it can be at present. Further, although the present limit of one month is (naturally) most willingly observed by all mothers with means of support, an extension to three months or longer would presuppose the introduction of a real change of practice amongst married mothers in a considerable number of cases (as will be seen by evidence presently to be offered). The consideration would then have to be faced, assuming the section to be made effective by throwing the onus of inquiry on the employer and declaration of the birth on the parents, whether the existing staff of inspectors would be adequate to enforce respect for the extension of the law. One of the inspectors re-

porting for the purpose of this memorandum, indicates to me her belief that an extension of the time limit must influence to some extent the marriage and birth rate, and another, while approving further restriction, says, "I realise thoroughly the dangers attached to the restrictions, and that increased vigilance would be necessary on the part of other authorities."

9. In view of the difficulties of administration in England of the four weeks' limit, reference should be made to the law in other industrial states of Europe although it would be impossible without careful enquiry on the spot to ascertain how far either by local custom or by methods of administration, the law in those countries is realised in practice.

10. The limitations as regards employment of women after child-birth may be briefly summarised as follows :—

"Belgium:—'Women must not be employed in industry within four weeks after child-birth' (section 5 of the Law of 5th December 1889.)

"Switzerland:—'A total absence from employment in factories of women during eight weeks before and after child-birth must be observed, and on their return to work proof must be tendered of an absence since the birth of the child of at least six weeks' (section 15 of the Federation Law of 23rd March, 1877). An order of the Federal Council, 1897, indicates a further abstinence from employment before confinement (the length of time unspecified) in certain dangerous occupations, *e.g.*, in processes in which fumes of white phosphorus are produced; or in manipulation of lead or lead products; or where mercury or sulphuric acid are used; in dry cleaning works; in india rubber works; any processes involving lifting or carrying heavy weights, or risk of violent shocks. As the limit of the period is undefined, and means of enforcing the prohibition unspecified, it is difficult to see how the regulations does more than outline an excellent theoretical protection.

"Holland:—'Women must not be employed in factories or workshops within four weeks after child-birth.' (Law of 5th May, 1899.)

"Denmark:—'Women must not be employed within four weeks of child-birth except on production of a medical certificate showing that the mother's employment will not be injurious to herself or the child.' (Law of 1st July, 1901.)

"Germany:—The industrial code contains the same prohibition absolute of employment during four weeks as the Dutch Law, but extends it to six weeks if a medical certificate cannot be produced approving employment at the end of four weeks.

"Austria:—The Industrial Code lays down the same prohibition as the Dutch Law.

"Spain:—By a law of the 13th March, 1900, prohibits employment of women within three weeks of child-birth, but lays a further obligation on employers to allow one hour at least in the ordinary period of employment (for which there must be no deduction from wages) to nursing mothers to nurse their infants. This hour may be divided into two separate absences of half-an-hour, and may be fixed at pleasure by the mother, whose only obligation is to notify the time she chooses to the overlooker."

Quoted from "Dangerous Trades" (Comparative Survey of Legislation), edited by Thos. Oliver, M.D., etc. Published by John Murray, 1902. pp. 53-54.

II.—EXTENT AND EFFECTS OF THE EMPLOYMENT.

11. The extent of employment of mothers in (a) regulated and (b) unregulated work of a comparable kind can only roughly be arrived at by considering the census returns with special reference to the particular centres of women's main industries, and above all those centres where at the same time men's industries for the same class are lacking or scarce. The occupiers' returns for factories and workshops give no information as to the proportion of married women; and the inquiries of inspectors on this point in individual factories have to be made with great care and discretion in the absence of direct legal right (where section 61 is not in question) to make such inquiry. The Registrar's records of births and of deaths, which might be invaluable in throwing light on this important question of the occupations of mothers of young children and infants, show only in the case of illegitimate infants the occupation of the mother. The value of the information in this case makes it appear the more regrettable that a record which could have been so easily obtained has not been kept of the occupation of married mothers, and of mothers of still-born infants at the cemeteries and workhouses. (It may be noted in passing that attention was drawn at the International Congress on Hygiene in Brussels, 1903, to the lack of any general records of still-births in great Britain, and the consequent difficulty of comparing the figures as to infant mortality with those for other countries of Europe.) In certain towns, of which Preston, Bury, and Leeds may be named (although there are others), information on the occupations of the mothers of infants dying under one year of age is, or shortly will be, available in a certain number of cases, as the result of inquiries instituted through lady Sanitary Inspectors or

Health Visitors by the Medical Officer of Health. In Blackburn a valuable voluntary record has been kept by the Registrars for the use of the Medical Officer of Health, of the occupations of the mothers in the case of all births and Miss Squire has drawn from this record an interesting table to which I refer presently.

12. As regards the effect of employment of mothers in factories, workshops, laundries, or as charwomen or in similar hard work away from home or in heavy domestic work at home, no general information, so far as the health of the mothers themselves is concerned, of a statistical kind is available*; particularly is such information incomplete in some of the centres selected for this memorandum (on account of the unusual proportion of married women in factories), for there it is reported to me (especially by Miss Squire for Blackburn, Preston and Burnley) that there is no lying-in hospital, that maternity cases are not taken in at the infirmary, and an insignificant amount of charitable assistance otherwise afforded.

13. "The workhouse is the only institution where patients are admitted for their confinement and here they are of course destitute eases." Enquiry has to be made at length of physicians and surgeons, nurses and midwives in such districts. As regards the effect on the infants, much may be learnt from the comparison of local and general infantile mortality rates, with particular reference to (a) presence (b) absence of much employment of mothers, if careful local enquiry be at the same time made as to presence or absence of other recognised causes of high infantile mortality (insanitary surroundings, ignorance of maternal duties, intemperance, poverty, use of means of prevention of child-bearing). The mere fact of extensive employment of mothers in factories in a locality cannot be regarded as significant by itself without reference to the factors of length of hours, character, and condition of the work itself (which vary enormously from one industry to another) and to the ordinary standard and practice of the mothers in the district as to care of infant life.

14. The enquiry of three inspectors on my staff has been during a few weeks directed towards increasing in three main centres, viz., Dundee (jute trade), Preston, Burnley and Blackburn (cotton trade), Hanley and Longton (pottery trade), our available knowledge of the above indicated extent and effects of employment of mothers, adding consideration of the moral and economic effects as well as of causes of such employment. Two characteristic conditions all these towns have in common: (1) presence of a large concentrated industry necessarily employing many women and with a large proportion of married women amongst them; (2) absence of other important occupations for women. Two of these towns, Dundee and Preston, have a characteristic absence of or insufficiency of industrial employment for men of the same class as those of the women employed. The three Lancashire towns stand apart from the other towns named in respect of the comparatively high standard of living established and deemed essential by the workers in question. Serious struggling poverty in the ordinary sense which is prominent in parts of Dundee and in parts of the pottery towns is generally absent in the Lancashire towns. In all these towns the infantile mortality is high, although as regards some of the towns equally and almost equally high rates are elsewhere to be found where the industrial employment of mothers is not a special feature or where the mothers mostly remain at home. In all of the towns a very striking degree and amount of ignorance of maternal duties, especially of feeding and cleanliness, is at once evident, but the general sanitary conditions in the matter of housing and surrounding sanitation vary widely. Other widely varying conditions are seen in the nature of the work of the factories, in the length of hours, pressure and speed of work, heat, dust, and other sanitary conditions.

EXTENT AND EFFECTS.

15. Turning now to the extent of employment of married women and mothers, it is convenient to bear in mind the general extent of such employment as shown in the census

* Except such as might be indicated through careful comparison of the ratio of mortality from special women's diseases to the female population in selected districts. No idea would be given of the amount of illness, nor could it be precisely stated from existing records which occupations were concerned.

1901. This information is given only for England and Wales, not in the census reports for Scotland and Ireland. In England and Wales more than two thirds of the married or widowed women employed in occupations are to be found in the following groups:—(a) Domestic offices, including all laundry workers and charwomen; (b) textiles; (c) dress. The highest ratio of married women

is among the laundry workers, whose trade is very little regulated; taking those two branches together, while the total number of women over ten years employed is less than half that in the textiles groups, yet actually a larger number (absolute, not relative) of married women are employed than in the textile group. The details are shown in the following table:—

OCCUPATIONS OF WOMEN. FEMALE POPULATION OVER TEN YEARS IN ENGLAND AND WALES. CENSUS 1901.

	Unmarried.	Married or Widowed.	Total Female Population, Occupied.
A.—All Occupations - - - - -	3,254,242	917,509	4,171,751
Unoccupied - - - - -	2,971,399	6,046,435	9,017,834
B.—1. Domestic Offices or Services - -	1,378,156	312,566	1,690,722
{ (a) Charwomen - - - - -	{ 25,378	86,463	111,841
{ (b) Laundry Work - - - - -	{ 86,474	109,667	196,141
2. Textile Fabrics (includes dealers) -	518,252	144,970	663,212
3. Dress (includes dealers) - - - -	553,485	157,476	710,961
4. Bricks, Pottery, Glass - - - - -	23,947	9,201	33,148

The ratios, however, are not the same when we come to consider selected districts.

In Hanley - - - - -	3,306	1,412	4,718

16. Looking further into the census figures for Blackburn, Burnley, Preston, it appears that more than half the women over fifteen years of age in the cotton mills of Blackburn and Preston are married or widowed, whereas less than one third are so returned for Burnley. In Blackburn, 31,445 women were returned as occupied (out of 68,660 females), of these 20,906 were in cotton mills; in Preston 25,279 women were returned as occupied (out of 51,669), and of these 16,317 were in cotton mills. Miss Squire estimates that of the total number of occupied women in Blackburn, 37·9 per cent. are married or widowed as compared with 30·5 in Preston and 33·5 in Burnley. I have not been able yet to work out all the corresponding percentages for the Pottery towns, but Miss Martindale gives the following estimate of the percentage of married and widows in china and earthenware factories to the female population between eighteen and fifty years of age:—Longton, 20·6; Hanley, 9·7; Fenton, 14·0; Burslem, 13·6; Tunstall, 9·6; Stoke, 7·1.

17. In Dundee, which in population takes the third place among Scottish towns, and where a larger proportion of occupied females is found than any of the others, the chief employment for women is the manufacture of jute. As the 'census gives no information about married women the only way of arriving at any estimate is to glance at the figures as to all women occupied, 57·7 per cent.* out of 72,723, at the total number employed in jute mills, 24,879, of whom 13,719 are between twenty and forty-five years of age, and then to proceed, as Miss Paterson did, to take particulars in a group of mills. She says:—

* Paisley follows second with 43·4 per cent.; Edinburgh third with 43·3 per cent.; Glasgow fourth with 38·9 per cent.; Aberdeen fifth with 35·4 per cent.

"I visited a group of mills in the north east quarter of the town. These may be taken as representative. . . . I found it best to make my inquiries personally in the mills, the foremen do not know which women are married and which are not, and they cannot be relied on to get the information correctly from the workers who in one mill where the attempt had been made found great pleasure in giving absolutely misleading information. I, therefore, visited for the purpose twelve jute mills, in which a total of 3,269 women over eighteen years of age are employed. In this way I got information at first hand with regard to the married women, but not the unmarried mothers. In almost all cases I got the information I asked for as to numbers and ages of children and the provision made for them during absence at work, but there was, of course, much greater readiness on the part of some women to give details than was shown by others. On the whole, however, the difficulty was not to get information. . . but to avoid giving hastily the advice so eagerly sought for. . . . I found that the managers generally were of impression that they employed more married women than I found they did, but they no doubt included the unmarried mothers."

18. In order to estimate the extent of employment of unmarried mothers, Miss Paterson searched the Registrars' books for details of occupations of mothers of illegitimate infants in 1903. Out of 4,024 births, 400 were illegitimate, and in 278 of these cases the mothers' occupation was given as textile operative. Many of these cases Miss Paterson visited in their homes as well as many of the married mothers. She found that in the majority of the cases no contribution towards support was made by the father of the illegitimate child.

19. Miss Paterson's details about the 12 Jute Mills may be summarised as follows:

	Women over 18 Employed.	Married.	Widowed.	Separated or Deserted.	Over 45.
Mill I. - - -	36	15	5	4	2
(Total number of Children, <i>living</i> 51, <i>dead</i> 17, eleven in infancy.)					
Mill II. - - -	122	28	4	—	3
(Total number of Children, <i>living</i> 77, <i>dead</i> 27, fifteen in infancy.)					
Mill III. - - -	259	36	21	7	7
(Total number of Children, <i>living</i> 90, <i>dead</i> 37, thirteen in infancy.)					
Mill IV. - - -	243	59	20	10	16
(Total number of Children, <i>living</i> 129, <i>dead</i> 64.)					
Mill V. - - -	92	38	7	6	45
(Total number of Children, <i>living</i> 70, <i>dead</i> 54, forty-two in infancy.)					
Mill VI. - - -	109	34	14	9	13
(Total number of Children, <i>living</i> 84, <i>dead</i> 63, fifty-one in infancy.)					
Mill VII. - - -	274	74	9	10	12
(Total number of Children, <i>living</i> 121, <i>dead</i> 23.)					
Mill VIII. - - -	108	25	6	3	6

(Total number of Children, <i>living</i> 148.)						
Totals	- -	3,269	662	201	101	197

20. As the census figures distinguish the ages from fifteen, twenty, twenty-five, etc., and all the factory regulations and returns distinguish those above and below eighteen years of age, comparison of the two sets of figures for percentages is not satisfactory. A rough estimate, however, may be made for purposes of comparison with the figures given above for cotton mills in Preston and Blackburn that one-fourth of the women employed in Dundee jute mills are married or widowed.

21. It is impossible, as already pointed out, to make any statistical comparison as regards numbers of mothers of young infants employed in the mills (although, as I shall presently indicate, the inspectors have gathered much scattered information bearing on this point). For Blackburn alone have we got the general figures as to births presented in the following Tables by Miss Squire for the year 1903 :—

BLACKBURN.
Births registered in 1903 with Mothers' occupation.
Total Births.

	Weaver.	Winder.	Warper.	Rover.	Slubber.	Drawer.	Ring spinner.	Mill hand.	Total.

Servants - - -	-	-	-	-	-	-	-	-	20
Charwomen - - -	-	-	-	-	-	-	-	-	11
Other Occupations - - -	-	-	-	-	-	-	-	-	69
Housewives - - -	-	-	-	-	-	-	-	-	2,042
Total - - -	-	-	-	-	-	-	-	-	3,288

22. Most unfortunately, this interesting information cannot be brought directly to bear on the problems before us, through lack of parallel information as to the occupations of the mothers in the case of infant deaths. The influence of occupation can only be guessed at by the particulars afforded in the next two tables as regards illegitimate births, and deaths of illegitimate infants under one year in Blackburn during 1903; the figures are so small that too much weight must not be attached to the relative infant mortality. When it is remembered, however, how much higher the infantile death rate is amongst illegiti-

mate children generally than amongst legitimate, and that the general rate in Blackburn ranges from 157 in 1902 to 221 in 1900, it is seen that the death rate shown in the second table affords no positive ground for attributing a specially high rate to the cotton mills alone. A similar observation has been made by the Medical Officer of Health for Bury in his report for 1902, after a systematic inquiry made into the occupation of the mother of every infant dying within the year within his borough; in that inquiry the basis is broader than in the following Tables.

BLACKBURN.
Illegitimate Births.

	Weavers.	Winders.	Warpers.	Rovers.	Slubbers.	Drawers.	Ring spinners.	Mill hands	Total.

Total - - - - -	-	-	-	-	-	-	-	-	33

These figures are for two registration districts only, *i.e.*, north and south. Witton registration district is omitted owing to not being able to go to the registrar's office. This

table is, therefore, incomplete. But there was only one illegitimate birth registered in the Witton district, a servant's child.

23. The parallel figures for Preston and Burnley follow in the next two groups of Tables:—

PRESTON.

Illegitimate Births.

For first-three quarters of year 1903, viz., Jan. 1st to Sept. 30th.

	Total Births.	Illegitimate.	Occupation of all others.				
			Cotton.	Domestic Servants.	Charwomen.	Other.	Unoccupied.
Town of Preston	2,518	117	77	21	4	12	3
Districts of Broughton and Alton (chiefly rural)	461	4	2	1	1	—	—
County Boro' of Preston	2,979	121	79	22	5	12	3

Deaths of Illegitimate Infants under 1 year.

Jan. 1st to Sept. 30th, 1903.

	Total Deaths Under 1 year.	Illegitimate.	Occupation of all others.				
			Cotton.	Domestic Servants.	Charwomen.	Other.	Unoccupied.
Town of Preston	332	23	16	3	1	1	2

County Borough of Burnley -	2,857	167	128	11	5	19	4

Deaths of Illegitimate Infants under One year—Year ending December 31st, 1903.

	Total Deaths under One year.	Illegitimate.	Occupation of Mother.				
			Cotton.	Domestic Servants.	Charwomen.	Other.	Unoccupied.
County Borough of Burnley	606	65	45	8	2	8	2

24. The results as regards the one point of infantile mortality in relation to occupation are in this present inquiry similar to those I have had reported to me on isolated inquiries in the past. For example, in 1898 complaint was made to me that among the infants of hearth rug weavers in and near Huddersfield (a very rough type of workers), an excessively high mortality occurred; it was alleged to be at least 50 per cent. All the factories were visited by Miss Squire, and close investigation made as to the ratio of mothers among the weavers, condition of the infants, time before and after confinement for leaving work; registers were searched, doctors and midwives, employers and others interested consulted. A considerable proportion of the mothers were unmarried, but no definite relation between the occupation and the infant mortality could be established. The alleged mortality of 50 per cent. was certainly not supported by the facts discovered. Although the industry and the figures are small the investigation was of interest, as knowledge can only be gained by successive consideration of all the facts in definite selected areas and industries. Although it is certain that the rate of infantile mortality is only a very rough guide (if any) to the effect (which is moral as well as physical) of the mother's occupation on the health of her surviving children, it is of the utmost importance that we should be able to follow the clue further than with existing records we are able to do.

25. Two directions in which information is lacking which we need are: (a) localisation of the infant mortality rates in a systematic way for particular areas in industrial towns where the workers of selected industries live; (b) general infant mortality rates for selected industries throughout the country.

26. (a.) As regards the first of these points, a comparison of the rates in the special centres I refer to with those for non-industrial towns and counties would show what I mean. Dundee with 57·7 per cent. occupied women (and about one-fourth of the women in the jute mills married) has an infantile mortality rate varying from 217 in 1893 to 142 in 1903 (average during representative years 1890 to 1899 is 179). Glasgow with 38·9 per cent. occupied women had rates varying from 149 in 1901 to 134 in 1903, but in the Brownfield district the rates run far higher (242 in 1901, 233 in 1903, much beyond any localised rate in Dundee).

The whole of Scotland with 37·26 per cent. occupied women has a rate of 129·3.

Hanley with 35·8 per cent. occupied women, and 19·8 per cent. in the potteries (of whom 5·9 per cent. are married) has an average mortality rate of 204 (209 in 1900, 212 in 1901, 170 in 1902).

Longton with a rather larger percentage of women and of married women occupied * has an average infantile mortality rate (ten years) 239 (255 in 1900, 225 in 1901, 195 in 1902).

Throughout Staffordshire the average rate over ten years is 172 and 1901 fell to 164.

We may compare some other counties where there is far less industrial employment for women:

Durham average: 167, risen in 1901 to 179.

Northumberland: 160, risen in 1901 to 182.

South Wales: 163, risen in 1901 to 170.

Returning to the county of Lancashire, we find that the infantile mortality rate has remained practically stationary for eleven years, and was 179 in 1901 (average for ten years previously: 179).

* The exact figures on which to calculate percentage are not published, but could be obtained from the Registrar General if needed.

Preston with nearly half its female population "occupied," of whom about two thirds are in cotton mills, has an average infantile mortality rate (ten years to 1900) of 236; 30·5 of the total occupied females are married, and of women over 15 years of age in cotton mills one half are married.

Burnley with a larger proportion of its female population in cotton mills, has an average infant death rate of 210, fallen in 1902, an exceptional year, to 177; 33·5 of the total occupied females are married, and of women over 15 in cotton mills rather more are married than is the case in Preston. This is in a town where Miss Squire found far more ignorant neglect of infants than in Preston.

Blackburn with nearly a half of its female population "occupied," under a third of whom are in cotton mills, has an average infant death rate of 200: 37·9 of the total occupied females are married, and of women over 15 years in cotton mills over two-thirds are married.

From this rough outline it is clear that much more localised information with reference to sanitary surroundings in selected areas is necessary before we can definitely connect the infant death rate with the occupation.

27. (b.) As regards the second point (above indicated) on which I think there is great need of fuller information, and for which records are now lacking, it seems sufficient to point to the fact, that in the great occupations for married women as laundresses and charwomen, it is at present quite impossible to arrive at either the infantile death-rate or the birth-rate. This is the more regrettable because in several very important features, such as excessive temperature, humidity, over-pressure, straining nature of parts of the work, the influences likely to be adverse to child-bearing women, are found as much in the laundry industry as in the cotton industry. Both these industries of laundry work and charring are naturally refuges for semi-skilled or unskilled working women pressed out of other trades.

28. It has been impossible with the limited staff available to attempt any personal inquiry into the question of the extent and effects of employment of mothers in laundries, though much that would throw light on the whole problem would doubtless be found by such inquiry in West London (especially Acton and Hammersmith), South London and Brighton, and other watering places.

29. As regards the physical conditions to which the women are subject in the various industries under review, reference made to the table of hours of legal employment (already furnished to the Committee) will show the daily and weekly limit of hours permissible. Although legally more hours may be worked in the pottery processes than in textile processes, actually far shorter and easier hours obtain in many non-textile factory processes (but particularly in earthenware and china works), than in either cotton or jute mills. The highly organised conditions, and extraordinarily costly, specialised machinery in these textile trades mean first a far greater pressure as to output, secondly, more heat and noise, often more difficulty as to ventilation; further either dust or humidity is inseparable from certain of the processes.

30. As to the general effect of these conditions on the health of the women and their children, Miss Squire for Lancashire, and Miss Paterson for Dundee report similarly:—

"That it is the employment of women from girlhood, all through married life, and through child-bearing that impresses itself on the mind . . . that it is useless for any medical men and others not familiar with the conditions of mill life there to pronounce any opinion on the effect of factory work upon the mother and infant; they have no

conception of the stress and strain and of the general conditions of life and work in these mills."

31. Miss Paterson expressly points repeatedly to cases showing that it is the stress and strain of the work, and the necessity of maintaining a high standard, coupled with decreasing physical capacity of the child-bearing woman under such conditions that generally determine the moment when the manager in a jute mill sends her home; sometimes (as in one of the cases under Section 61 about to come before the magistrates), the woman is sent away to go into another equally unsuitable occupation as charwoman or house-scrubber or as a home sack-sewer. Sometimes a neighbour will take the place in the mill of the woman who has been sent home on account of her physical inability to maintain her output, in return for her taking charge of that neighbour's children for a small sum.

"How they live during the period of absence is a mystery, but I find that the tradesmen give credit to a surprising extent, and rents are allowed to get much into arrears. . . . Great harm is done and suffering occasioned to the women by their remaining at work too long before confinement, as well as by their returning too soon after it. Factory managers, doctors, health visitors, and workers themselves are agreed that the four weeks' absence is often shortened to three or even less. I have found that a considerable number of the mothers nurse their babies regularly

and continue to do so, but this natural food is always supplemented by other given without knowledge."

32. Miss Paterson personally investigated the cases of 267 mothers of young children employed in the mills, but feels that the information given by them as to precise length of time away from the mill is not sufficiently reliable to be tabulated. As to the effects on health, moral and physical, both of the mothers and children, she was able to form very definite ideas of the excessive and injurious strain on the mothers and of the lack of sufficient care of the children. Visits on Saturday afternoons to the homes showed that any energy that was left over by the week's work in the mill was spent by the mother in family washing and house-cleaning, but dirt and discomfort abounded, and she "never saw any attempt at cooking." She sends me particulars of 144 cases where the health visitors recently found two, three or more very young children left alone in the house (in some cases locked in), while the mother was at the mill, with only such food as the mother could prepare overnight or in the early morning before leaving. Definite arrangement with another woman to take charge of the children seems far less common in Dundee than Miss Squire found in Lancashire, or Miss Martindale in Hanley and Longton.

33. Miss Squire and Miss Martindale send me information, but incomplete, of the time of leaving off work before and after confinement. The former tabulates the information in the case of Preston as follows:—

PRESTON.

Time of leaving off work before, and of resuming work after Confinement in the case of 124 women employed in the Cotton Mills.

Before.						After.						
Under 1 week to 14 days	Under 14 days	1 month to 2 months	2 months to 3 months	3 months to 6 months	6 months to 9 months	Before 1 month	1 month	5 weeks to 2 months	2 to 3 months	4 to 6 months	6 to 12 months	Not returning
14	7	35	22	36	10	2	12	26	42	34	6	2

34. Miss Squire believes that the usual practice is for the mother, particularly if a weaver, to return to work directly the child is four weeks old, or as soon as she can obtain employment; that although in the last twelve months the majority of women remained absent two to three months, slackness of trade and difficulty in obtaining employment was given as the reason. Two of the doctors with whom Miss Squire conferred in Preston attributed the large number of premature births to continued work in the mill during pregnancy, and all considered that an exceptional number of cases of uterine trouble existed and was attributable to too early return to work. For reasons already indicated there is no centralised source of statistical information about such cases among cotton operatives. The doctors in Blackburn mention that the evil of employment of women during pregnancy is aggravated by their desire to earn as much as possible during the time before they are forced to give up work. Miss Squire herself received complaints from the women of the hardship of being discharged by the manager four or five months before confinement. She found that it was the general practice of the Preston women to nurse their babies at meal times, and before and after the day's work in the mill. In Burnley this, she found, was exceptional, while greater ignorance and unintentional cruelty in the giving of unsuitable food to the infant seemed to be common.

35. Turning to the conditions and effects in Hanley and Longton, Miss Martindale reports on the large proportion of women employed in what may be termed light work such as gilding, painting, burnishing. Many are, however, employed in "fairly arduous" work in hot and dusty surroundings. In none of the processes are the hours so long as in textile districts, seldom exceeding, often less than, the limits of 8 or 9 a.m. to 5.30 or 6 p.m.

(less one and a half hours for meals). In many cases women are employed not more than four or five days a week, and intervals of easy leisurely work are possible where so much is done by hand. The usual practice is to continue work until within a few weeks of childbirth; in a third of the cases questioned Miss Martindale found absences of from five to twelve weeks beforehand. More than two-thirds of the women questioned returned to work six weeks or longer after childbirth. In one case only was return found to have taken place before the four weeks' limit. Miss Martindale found that in all the cases she investigated the women were doing their housework at the end of two weeks. For the same reason as in the Lancashire towns (lack of maternity hospitals or charities) little systematic information as to the immediate effect on the mother's health is to be had. Miss Martindale conferred with doctors and interviewed district nurses and midwives, and found little evidence of ill results. She found, however, that 38.4 per cent. of the children born to the mothers she questioned had died in infancy; this she attributed to improper feeding due to "appalling ignorance and objection to being taught." Even though partial nursing by mothers of their infants is general (and only one-seventh of the comparatively small number of cases investigated was the feeding entirely natural) an almost complete absence of cow's milk by way of supplement was noted. "Boiled bread with butter and sugar" and arrowroot biscuits seemed to be the usual supplement to the mother's nursing. The undersized, unhealthy appearance of the children that survive infancy, and the large number of cripple children in pottery towns Miss Martindale traces to diet of the kind named. She traces the larger number of cases of death from respiratory diseases and bronchitis among infants to the habit of overheating dwelling and bedrooms. Coal is cheap in the district and the workers

are accustomed to high temperature in the workrooms. Infants are taken without any extra clothing from overheated, ill-ventilated rooms to the doorstep by mothers as well as the paid nurses who are somewhat systematically employed. Miss Martindale made inquiry as to the methods of the nurses among competent observers (including the Inspector for Prevention of Cruelty to Children) and the lady sanitary inspector), and could not hear that they took less care of the children than the mothers.

III.—CIRCUMSTANCES AND CAUSES OF EMPLOYMENT OF MOTHERS.

36. The circumstances under which the mothers leave their infants and young children to go to the mill or factory have already partly appeared under I. and II. above.

All three Inspectors have systematically directed their inquiries towards making clear the reasons which prompt early return to work after confinement as well as late continuance at work before confinement.

(1) Classification.

37. I classified for their inquiry the possible reasons thus:—

(i) Death of the father or lack of employment, or insufficiency of the father's wage.

(ii) Desertion by the father.

(iii) Fear on the mother's part of the loss of future work in the factory.

(iv) Preference for factory over domestic work.

Some of these reasons themselves would be effects of a concentration of a women's large industry in a district where there is absence of men's occupations, such as is spoken of above. In so far as they are effects of large economic and social causes, not immediately alterable, attempted mitigation of the results of employment rather than attempted diversion on any large scale of the employment of mothers appears most likely to prove effectual, and to be attended by fewest counterbalancing disadvantages.

(2) Summary of Causes in Cases observed.

38. In case of each mother visited the Inspector has noted in schedules (giving also other circumstances) information if obtainable as to the reason for continuing and returning early to work in the mill. In the great majority the case falls under one or other of the three points in Class (i). In Dundee Class (ii) shows itself frequently. Classes (iii) and (iv) appear least of all. Detailed evidence can be given by the inspectors.

(a.) Dundee.

39. Miss Paterson says that when she drew the attention of mothers, who had returned within four weeks to work, to the law, they—

"Admitted that they knew, but asked helplessly 'what could they do?' Poverty was in all these cases the reason for the early return, and that is practically the only reason in Dundee . . . due to one cause or another, for fear of loss of work does not affect the mill operative there; if she does not get back to her own place there is so much irregularity of employment that her chance at a gate is quite a good one, and for some years there has been no difficulty in finding work. In reply to my enquiries as to absence before confinement, I found that only one of the six cases of return within four weeks after confinement had not been absent at least a month before; while there are exceptions, this is much what I have found general amongst the mill-workers. . . . They leave less often on their own initiative than because they are sent away to make room for a more efficient worker."

(I have already quoted Miss Paterson's experience that this dismissal in Dundee often means merely transference to another occupation, say as "scrubber.")

"There has been a great scarcity of employment for men recently in Dundee, but unwillingness to work must in some cases be a reason for the man's idleness; 'slackness' was, except in a very few cases, the reason given by the woman. . . . Of the

mothers of illegitimate children seen, I only found one who had been since married to the father of the child, and in most cases no contribution was made by him. It is not surprising that an early return to work seems to the mother a necessity in these instances. . . . Very little preference for the mill to the home was expressed among the women, the few who said they were dull at home were women without any children . . . in a number of cases the worker has said of the relative or neighbour who looks after her children: 'She can keep them better than I can, she has not been brought up in the mill.' . . . There is little employment for men in the mills, a certain number of labourers and carters are employed at wages from 14s. to £1. Assistant overseers do not get more than £1, and a great deal of labouring work in the mills as well as in the boat yards is paid at from 15s. to 17s. a week. . . . Women's wages, in the preparing processes, are from 9s. 6d. to 12s. a week; spinners earn 11s. to 15s.; winder's and warpers about 15s.; weavers, 16s. to £1. . . . When a man and his wife are working in the same mill, as they so often are, the woman is probably earning the higher wage. The Inspector of the Poor in Dundee stated that the past winter has been a very bad one for working men. The shipyards have been practically idle, the building trade, after great activity, almost dead, and there has been a long strike amongst engineers. . . . Not only skilled workmen but labourers, whose earnings do not exceed £1 a week, were out of employment. It is the latter class who become the husbands of the millworkers, when these do not marry in the mill, and any 'slackness' of work soon renders them destitute."

(b) Preston.

40. Preston resembles Dundee, but is even more striking in scarcity of employment for men. There are no iron works or collieries, as there are in Blackburn and Burnley. Miss Squire says:—

"The men are said to look out for a wife who is a four-loom weaver, and they have the reputation of being lazy."

Miss Squire herself found that the husbands of cotton operatives visited were chiefly employed as labourers in intermittent work, while "in all cases where the husband was in regular employment as weaver, platelayer, painter, bricklayer, etc., the one wage was insufficient to keep the family in the standard of life they expect."

41. In the textile mills nearly twice as many women are employed as men. Ring spinning, in which women are employed, is being gradually substituted for mule spinning in which men work.

"One large firm, employing 1,442 women, told me that . . . being unwilling to turn the men out of employment they had offered to teach them ring-spinning and then give them the same wages as on the mules . . . the men tried it for a time and then gave it up. . . . Except for heavy work such as sheetings, where the weavers are entirely men, women are preferred as weavers. The men seem to look down upon the occupation for themselves. The wages for weavers are the same whether men or women."

42. In one-third of the cases of early return to the mill investigated by Miss Squire in Preston, the reason was poverty due to insufficiency of the father's wage, and in two-fifths of the cases it was due to that and lack of employment combined. In three cases visited the mother was unmarried. In only one case was preference for mill-life expressed by the mother. The wage of the husband found to be insufficient in the cases investigated ranged from 16s. to £1. The wages of the wife, if a weaver, range from 20s. to 25s. net, if a ring-spinner, from 18s. to 25s. (recently on short time the wages have been less). While the medical men advocated, in speaking to Miss Squire, a three months' absence at confinement, both on account of the mother and the child, they considered it would be impracticable to enforce it, as the mother was in most cases "the chief wage-earner." Miss Squire visited, amongst the others, nine mothers of young infants, who were doing their best to remain at home for a time, but some of these feared they would have to go back to the mill soon. Miss Squire says:—

"I do not think that in Preston an extension of the legal time during which a mother is compelled to remain away from the factory after confinement would tend to diminish the employment of married women, and this opinion is that of trade union secretaries."

43. I am much struck in Miss Squire's notes on Preston by the number of times (as contrasted with Dundee) the entry appears, "nice, clean, comfortable home," "superior, tidy home and persons," and by the much rarer cases of illegitimate births. Even in those cases the standard of living appears higher, as may be seen from the following:—

"E. B.—Single, weaver, young, neat, nice-looking girl in tidy home, with parents. Baby aged ten months, healthy looking. Left work six weeks before confinement and does not mean to leave baby yet."

44. The number of illegitimate births, while far below that of Dundee, shows much less unfavourably than there the character of the people, because subsequent marriage of the parents is frequent in Preston. Another significant point in Miss Squire's notes is that the high infant mortality occurs where the number of children born to the mother is large and in rapid succession. The following is a typical case:—

"Mrs. B.—Husband a labourer, herself a weaver with 18s. a week. Has had thirteen children very quickly, buried nine. Baby seven weeks old out to nurse (visited, clean and neat). Breast-fed at meal-times, milk and water between. Premature birth at seven months. Pneumonia, measles, convulsions were the causes of death of the majority of the children (ages six weeks to two years). Cause of mother's return to work, poverty."

Another case shows the reason for early return to work:—

Mrs. A.—Husband fireman at factory, short time twelve months, full time wages £1 a week; herself a weaver, 18s. but 10s. short time; has had eight children and buried four; eldest living sixteen years, youngest one month. Returned to factory after twenty-six days on account of poverty, due to slackness at mills; confessed to having told manager it was five weeks since confinement when it was three."

(c) *Blackburn.*

45. In Blackburn more women absolutely but not relatively to the men are employed in textile factories; there are also more other occupations, such as engineering, for the men, though not to the extent that in normal conditions leaves a large proportion of women (and particularly married women) free to devote themselves to domestic life. Miss Squire found that while "preference for mill life" is the reason given by philanthropic workers and others of experience for the early return of mothers among textile workers after childbirth, the mothers themselves—

"Generally explained to me that one wage was not enough to bring up a family upon, and that the husband would have his 'spending money' whatever the household needs were, and therefore the mother's wage, over which she had control herself, came in handy. . . . The general opinion among those best qualified to judge seems to be that the working classes are well-off, and that if it were not for the proverbial improvidence of the cotton operatives there would be no poverty. Still it seems to be the practice for the women to continue their work in the mill as near to the time of confinement as the manager will allow; always the same complaint was made to me by the manager that he had to keep watch and tell the woman that she must cease work."

46. Miss Squire found that in the case of 234 births registered in 1903 both father and mother were weavers:—

"One would not be surprised to find their children weakly. Probably last year these families would be in poor circumstances, both parents being dependent upon the cotton trade. The men employed in the cotton industry favour restriction being placed upon married women's labour; I received many suggestions on this point."

47. The tendency of the number of women in spinning to increase is the same in Blackburn as in Preston, owing to increase of ring spinning at the expense of mule spin-

ning. Miss Squire finds a high standard of life in Blackburn among textile operatives, comfortable houses and money to spend on excursions, holidays and amusements are considered essentials. She heard adverse comment on the number of weavers and winders, wives of tradesmen, or of men earning good wages, continuing to work and to leave their children to the care of paid nurses or housekeepers. Still she actually found, on visiting at home seventeen weavers, not specially selected, that seven were after several months at home with their infant "not returning;" one was unmarried and likely to return, and the remainder had returned to work because the husband had died, or was out of work or on short time. In one case the mother returned after a month when the father was earning 23s., and the two eldest children 7s. 3d. between them. The mother's return brought in an extra 20s. a week.

(d) *Burnley.*

48. In Burnley cotton mills the women out-number the men by nearly a third, but there is rather more employment for men in collieries and iron works than in Preston. The standard of life, the sanitary conditions in the houses, and morality, Miss Squire finds lower than in Preston. The illegitimate birth rate is higher. Miss Squire says that the impression produced on her in Burnley, and that it received support from medical men—

"Is that the infants are of a miserable, debased type in a large number of cases. Whereas in Preston the important point seemed to be that the infant should be properly fed, in Burnley it seemed as if no amount of nourishment could build up a healthy child."

The housing conditions are worse, and in some ways conducive to immorality.

49. The notes on the few homes Miss Squire had time in Burnley to visit are painful. Poverty and desertion are the causes of the mother's early return to work. In one case the husband, a blaster, had been injured and could not return to work, so the woman had the whole family to support. In one of the two cases where the mother was not returning to work, it was because she was dying of phthisis, and had worked "as long as she could stand," her husband, a collier, being out of work. She had had seven children, and buried two; the baby, three months old, was injured at birth, no doctor or midwife having been present; the previous infant died from neglect in the same circumstances. In another case, where the mother stays at home, the husband is a collier with good wages, and the wife had ceased weaving since marriage; this, however, did not apparently improve the chance of life for the infants, as she had had twenty and buried sixteen, all having died between one and eleven months of age.

(e) *Hanley and Longton.*

50. Miss Martindale summarises her information on the reasons for the employment of mothers and early return after child-birth as follows:—

"In order to obtain some reliable facts with regard to this important matter, I questioned sixty-two women, concerning their husbands' employment, and the reasons which prompted them to seek employment outside their homes, with the following results:—

Husbands in regular work	-	-	24	
„ out of work or working irregularly	-	-	25	
„ delicate or in an asylum,	-	-	3	
„ dead	-	-	4	38
„ deserted them or separated	-	-	3	13
Unmarried mothers	-	-	3	

"From the above it is evident that thirty-eight women were obliged to work; of the remaining twenty-four women fourteen had stated that they worked in a factory because either their husbands' wages were insufficient to allow for any additional comforts, or they desired to save while able to work, or they wished to be able to maintain an aged mother or father. Ten women were not actually obliged to work, but found the additional money very helpful.

"The lack of employment for men in this district appears to be serious. The master of the workhouse informed me that a short while ago forty able-bodied and carefully selected men were allowed to take their

discharge for from two to seven days, in order to seek for work, their families meanwhile remaining in the workhouse. By the end of the week all the men had returned, not one having been able to find work.

"From my investigations I have come to the conclusion that in very many cases the early return to work is prompted by necessity. It does not appear to me that the fear of losing future work in the factory plays an important part in the question. This may be owing to the fact that the gang system which prevails on the 'pot-banks' provides a large number of employers for women beyond the actual occupiers of the factories, and also owing to the neighbourly kindness which is so great a feature throughout this district, the women have no difficulty in procuring a neighbour to 'locum' for them during their absence.

"It is impossible, however, not to be impressed by the universal preference amongst the women for factory over domestic life. I was continually being told how greatly they preferred their work in the factory to the minding of children, and how depressed and out of health they became if they were obliged to remain at home. Surprising as this appears at first, it becomes less so on consideration. At thirteen years of age the majority of these women would have begun to work in a factory, to handle their own earnings, to mix with a large number of people with all the excitement and gossip of factory life. They would thus in most cases grow up entirely ignorant of everything pertaining to domesticity. After marriage, therefore, it is hardly probable that they would willingly relinquish this life to undertake work of which they are in so large a measure ignorant, and which is robbed of that all is to them pleasant and exciting. Until as girls they have been taught to find a pleasure in domestic work, and until there is a greater supply of healthy and suitable recreations and amusements in the reach of all women, to counteract the prevailing squalor and gloom of these pottery towns, it is useless to expect them to relinquish factory life.

"My attention was drawn to the fact which doubtless has to be faced, that the result of restricting married women's employment will be a decrease in the marriage and birth rates.

"I was interested to find from conversations with working women and men, and others, that (1) the opinion prevails that as parents they have not done their duty unless they have seen to it that every girl as well as boy is provided with a trade; (2) that a woman is looked upon as lazy unless she takes her share in contributing to the family income. In Staffordshire the men and boys appear to willingly do their part in the domestic work of the house, and it is no uncommon sight to find a man cleaning and sweeping, caring for the children or even putting them to bed, on the evenings when the women were engaged with the family washing."

51. Miss Martindale analyses at length the occupations of mothers of illegitimate infants, and points to the large proportion occurring among pottery workers. As this forms an important factor in the problem of support of the mother I summarise the information as follows:—

Illegitimate births. 1902.

		Longton	Hanley
No occupation	- - -	11	16
Pottery workers	- - -	67	53
Other occupations	- - -	14	22
Totals	- - -	92	91

In these towns as in Preston, marriage of the parents frequently follows, or just precedes, the birth of an infant.

52. Some particulars on lines similar to those given above of the time and reason for early return to work, are in part accessible, or will shortly be accessible, through the help voluntarily given by health visitors in other towns, in the North of England. So far as I have seen them, the facts are very similar both as to causes of early return and effect of occupation. Only one instance of "preference for factory work" by the mother appears.

53. The forces to be reckoned with in any legislative attempt to alter the present withdrawal of the industrial mothers from domestic life seem to group themselves as follows:—

1. The enormous practical difficulties attending the drafting and administering any sort of legal prohibition of employment of child-bearing women. (See in addition to the information in the first division of this memorandum, the press notices of the recent prosecutions in Preston and Dundee.) It is clear that the existing Section 61 of 1901 (and its counterpart in the Act of 1891) has been ineffective as a prohibition even though it extends only to one month. It may have had some indirect effect as a standard in the minds of those willing to be guided.

2. The existence of a considerable number of unmarried mothers without means of support other than their own labour, whose main chance of rescue from degradation lies in the very fact that they desire to labour and know they ought to labour to support their infants.

3. The presence in certain populous industrial districts of a large proportion of married mothers, who are necessarily the chief bread-winners of their families, if those families are to come into existence at all. (There is no doubt that large parts of the cotton industry could not maintain the same standard or be successful without women's labour.) This necessity as regards child-bearing women can apparently only be met by a balanced development in the same centres of men's industries.

Some attention should be given to the strength of the forces of sentiment, constitution, and character, which practically universally secure that the entire earnings of a working woman go to her family. While, no doubt, the girls and young women often spend a good deal on clothes, the married woman who works for "spending money" for herself, apart from her family, is, at present, so rare as to be negligible.

4. If married women should be against their own will and judgment compelled to forego 18s. to 20s. or more a week (see wages above) of the family income for many months, the allegation that there is increasing use of unlawful means to prevent child-bearing in some of the towns mentioned would have to be further considered. Some of the notes on bad influences in Burnley refer to the presence there of this debasing and disintegrating factor*. My attention has also been called to its presence in Nottingham, Leicester and elsewhere.

5. Although Clause D, (see above), preference for factory life, seems negligible as a motive for leaving an infant while only a few weeks old some consideration must, no doubt, be given to the spinner or weaver's natural tendency to take pride in her trade-skill and greater ease in doing work for which she is trained and fitted than work for which she has never been trained—(though she might have been trained if this had ever been adequately thought of as part of national policy).

IV.—MEANS AND AGENCIES OTHER THAN PROHIBITION.

54. Turning to the existing means and agencies other than prohibition of employment for enabling mothers to devote themselves to their infants the first claim for consideration seems to be made by the infants of unmarried mothers. It cannot be too clearly borne in mind that these mothers, are discharged from the workhouse infirmaries after their confinement before the four weeks limit in Section 61 is complete. I have never heard of any case where they are kept longer than a fortnight, and I am informed that the time is sometime less. Ordinary voluntary maternity charities are, as a general rule, although there are exceptions, closed to mothers of illegitimate infants, as also Charity Organisation Society aid. This may or may not be expedient, but there can be no doubt that such facts make prohibition of employment of the mother the most serious remaining injury that can be inflicted, unless some suitable organised means of support can be devised. It is not always the worst of these women who decline to enforce a claim for maintenance, or who are unwilling to stay in the workhouse. There are very few voluntary rescue homes or "penitentiaries" in England where the

* It seems to be my duty to mention that complaints in London have been made to me, and sustained, that girls are employed in the manufacture of articles to prevent conception. This employment is not illegal in England, and official efforts to persuade the manufacturer to discontinue such employment have not succeeded.

mother is allowed to keep her infant with her. So far as I have seen, incomparably the best results are obtained in those homes where this is allowed or organised. I learn recently from an American lady of great experience in such work in the United States, who came over to learn what she could here, that, in our neglect in England to use that essential method, and in the lack of effective trained government control and supervision of those institutions we are far behind the work that is being done in the States.

55. Leaving this special class aside, and looking at the position as a whole, general neglect of the possible voluntary agencies for helping mothers before, during, and after confinement, to take care of the infant life is the chief impression gathered. In Lancashire, where insurance of all kinds abounds (including infant life insurance), Miss Squire was unable to find any form of Provident Society to which women expecting confinement could contribute while still able to earn wages. I believe it was established at Mulhouse that organisation of a maternity fund by manufacturers, to which both employer and employed contributed, resulted in a reduction of infant mortality by half. Whether by local trade effort or larger national effort, provident insurance of the kind might be expected in time to eliminate the present grave number of cases where infant lives are lost to the State at birth, and needless suffering caused to hard-working, valuable mothers by total absence of skilled attendance.

56. Miss Squire found in Preston and elsewhere a local "Ladies' Charity" of a languishing, antiquated character, "for the relief of poor married women in child-bed." She found in the case of one that—

"Since its foundation in 1811 the number of cases relieved annually has decreased from 300 or 400 to under fifty, although the population has increased so enormously. Last year, a time of special poverty . . . only forty-five mothers were assisted. . . . The Secretary was unable to explain this except on the ground that there was very little poverty. The relief given takes the form of medical aid, loan of requisite changes of linen, four ounces tea, one pound sugar, one pound barley, four loaves of bread, one yard flannel, and one pound soap."

57. It is evident that such charities must be fundamentally reorganised and brought into touch on the one hand with increased scientific knowledge and skill, and on the other with the changed economic conditions of the women's lives, if they are to serve their original purpose. The highly-skilled and strenuous cotton operative, with her invaluable sense of personal dignity, can no longer be helped in her heavy double work, as mother and as mainstay of a great industry, by old-fashioned charities. "Give her of the fruit of her own hands."

58. In Dundee there is a maternity charity hospital, which expressly excludes distinction between mothers married and unmarried. In that town one of the chief problems seems to be desertion of the mother.* Miss Paterson found over 100 cases in twelve mills, only among the married mothers, and these did not include the cases where the husband lived apart, but contributed something to the mother's support. Very often the wife seems to be left with the whole burden of keeping the family, for little reason except that she is capable of doing it.

"Owing to the absence of the mothers in the mills, there is less opportunity for district or other philanthropic visiting in Dundee than other towns, and little information to be gained through these channels. . . . The extensive employment of women with home duties"

is a matter, Miss Paterson reports, which in the opinion of a member of the Social Union is making all social effort ineffectual. I have so far received no information whether effort has yet been directed in Dundee towards organising provident insurance of bread-winning mothers for the time of their confinements.

59. Miss Martindale says of Hanley and Longton—

"As there is no maternity hospital (with the

exception of the workhouse infirmary) in the district, the women are always confined in their own home, and are usually cared for by a kindly neighbour."

60. In the majority of the towns named, the one most important step so far towards fitting mothers better to care for their infant children is the appointment under the medical officers of health, of health visitors, and women sanitary inspectors. Sanitary authorities are in this way providing for instruction of the mother in the case of every birth of which notice of registration is given by the Registrar. Miss Squire visited some houses with one of these health visitors, and was—

"Favourably impressed with the effect she seemed to produce upon the mothers or nurse, as the case might be. The serious proportion of infant deaths is a matter of common knowledge in the town, and the mothers and nurses seemed to take it as quite reasonable that the Medical Officer of Health should prescribe to them what they might and might not do, and to be impressed with the fact that what their mothers did before them would no longer be allowed to be their guide in the treatment of their children."

61. All the Inspectors have reported on efforts, which have more or less failed to establish crèches for the care of young children, while their mothers are at work. This failure may not be final, but it does appear as though English and Scottish mothers have an instinctive prejudice in favour of individual care by nurses.

"Generally the nurse is a relation of the mother, who, on account of increasing years, has given up work at the mill. . . . They rarely take more than one baby at a time, but they will take two or three children of one family. The charge, 4s. 6d. a week,* for a baby includes its food and the washing of its clothes."

62. During the recent depression in the cotton trade the master of a workhouse—

"Had had a large increase in the number of older and widowed women . . . no longer wanted to mind the home and children while the mother went to the mill."

63. I have already explained to the Committee my belief in the great educational work that can be done by early theoretical and technical training of the girls of this country, the future mothers, in personal, domestic, and infant hygiene. I do not mean by this that anything should interfere with or lessen their chances of having, equally with the boys, all that can be given in primary or secondary education of general training of the mind and understanding. Nor do I mean anything that would lessen the chances for able girls in the humblest classes of rising by means of scholarships to a skilled trade or to higher learning. What I do mean is that for the great masses of future citizens, whether boys or girls, the school education that has nothing to do with and throws out no "ideas" upon the main important duties and occupations of most of their lives, is bound, as education or as instruction, to be more or less a failure.

64. No one can contend, least of all those who have any familiarity with the general ways and objects of factory and workshop girls of, say, fifteen onwards at the present time, that these girls have been given a fair chance of starting life with the beginnings of understanding what they may do for their country as housewives or as mothers. Why should the vast majority of them set a high value on their own services in domestic life, or have even a faint idea that they can be of value as things are treated at present? They are permitted to have for their house-keeping (if they do not earn anything themselves) a fraction of the family income, and they may single-handed work at duties for which the highest knowledge and skill would not be too great, by the dim light of instinct and tradition.† And yet it would be no more irrational to try to fight a modern army with the weapons of two centuries back, than it actually is to leave untought girls in their

* In Staffordshire 3s. 6d.; in some towns of Lancashire 5s.

† Such tradition as that which defends the feeding of a five weeks old baby on "bread pobbies" that is bread, salt, sugar, and water, "put in the oven overnight to get the balm out of it."

* Reluctance of the mother to enforce maintenance will always in some cases be a difficulty, but some means might possibly be organised for initiating and bearing the expenses of legal steps to secure contribution from the father.

separate "homes" to raise up, in the midst of all the enemies to infant and child life in our urban centres, the future citizens of our country. Some hopeful beginnings have been made; here and there a little domestic economy as an afterthought in the schools, devoted work of medical officers of health with their sanitary inspectors and health visitors in some of the towns. But who can say that adequate sacrifices in money or anything else have been even thought of, much less attempted, to enable the future mothers and housewives to be fit for their task, or to realise that it is a task to which the governing classes of the country attach any value.

65. Until we have even secured that so many infants are neither injured nor die at birth through absolute lack of skilled care of the mother, it seems strange to be planning for future battleships or future armies or talking of old age pensions, or noting with alarm the decreasing birth rate, or discussing the possibility of prohibiting the mother from re-entering the factory for three months or more. In the case under Section 61 mentioned in a footnote above, the woman was absolutely untended and alone at the birth of her child.

66. It ought not to be impossible to link together in one great national provident and protective association all the isolated, half-informed societies and agencies at work in aid of maternity and for the saving of infant life.* More than that I believe, with Miss Squire, that all over the country, but particularly in the great centres in the Midlands and the North, it needs only an organising mind and purpose to bring such a national movement into being.

67. As regards provision for technical training of the girls, one may point to what is being done for the training of teachers of public hygiene at Bedford College for Women, University of London, and of domestic hygiene at centres such as the Battersea Polytechnic. I need not enter into details or schemes here, but I would point to the striking curves facing page x of the Report of the Mosely Education Commission, illustrating the money value of technical training as compared with trade school, training, shop training, and unskilled labour in the case of men. At present the great masses of housewives and mothers are in the position of the unskilled group, and very

* I have not yet been able to ascertain, but am making inquiries into the work that is being done by the great "Friendly Societies" in aid of maternity. One of the largest societies has, I understand, been giving increased attention to this class of benefit, and an investigation with a view to obtaining reliable data on which to base contributions for it is in progress which should prove of great value.

few have even such chances as would be comparable with those of the trade-school group. What the nation needs is to sink some of its capital in work that is comparable with that of the technical school group, and then wait till those trained young women are twenty-five years of age to see the returns begin. It is not training only in the art of laying a fire or cooking a dinner, or washing or dressing a baby that I mean by technical training in domestic hygiene. That is comparable to the work of the trade school, and that we have already in a rudimentary stage, still to be well developed, in the schools. It is domestic hygiene in the more scientific sense, as based on simple broad ideas that can be afterwards applied that I especially mean.

V.—OPINIONS ON AMENDMENT OF THE LAW.

68. Miss Paterson alone offers a definite suggestion as to amendment of Section 61; I have already quoted Miss Squire's suggestion of 1897 (above, on page 3).

"If any amendment of the present Act were made, I would suggest that the word 'knowingly' should be left out, and the employment made illegal—so that in order that the employer should not be held responsible, 'due diligence' (see Section 141) would have to be shown when he or H.M. Inspector could charge the actual offender. I would be glad to see the re-employment at three months made permissible only on production of a medical certificate, showing that the child's health would not be injured by its mother's absence."

69. This does not touch the question of transference of the mother's services to a fresh employer. Unless some provision could be made, comparable to that of Section 73 (which lays on medical practitioners the duty of notifying certain diseases contracted in a factory or workshop), which would require doctors and midwives to report child-birth to the Medical Officer of Health, and thereupon the latter to inquire into and forward to H.M. Inspector of Factories any cases where there is reason to believe that there is return to employment before the proper time, I do not see how such re-employment can ever be controlled.

70. I have already, I hope, sufficiently indicated what I think should be done to improve and make use of the Registers of Births and Deaths.

71. In my earlier evidence to the Committee, I indicated my belief that much remains to be done to make factory work generally less overstraining to the forces of women and girls.

9th May, 1904.

APPENDIX VA

I.

ENGLISH MORTALITY AMONG INFANTS UNDER ONE YEAR OF AGE.

Prepared under Dr. Tatham's direction, from the Official Returns in the General Register Office

The following table is designed to show the changes in the causes of infant mortality in an urban and a rural group of counties during the last quarter of the nineteenth century—the mortality from several causes in the five years 1873–77 being given in comparison with that in the five years 1898–1902. The most striking feature of the table is the comparatively small change during the twenty-five years in the death-rates from all causes—the change in the group of urban counties being a slight increase of between two and three per cent., and that in the rural counties a decrease of a still smaller amount—about 1 per cent. only. These changes being in opposite directions show a wider difference between urban and rural rates in the recent quinquennium than in the earlier one; in the years 1873–77 the rates in the urban counties were higher than those in the rural by 26 per cent. among male, and by 29 per cent. among female children, while in the years 1898–1902 the differences had increased to 30 per cent. and 34 per cent. respectively.

Looking at the several causes of death mentioned in the table it will be seen that (excepting diarrhoea which will be reverted to later) the epidemic diseases to which children are most liable were generally less prevalent in the recent quinquennium than in the earlier one—small-pox, scarlet fever, diphtheria and croup, and erysipelas showing a decline among both male and female children in the urban as well as in the rural counties. Whooping cough also showed a decrease of more than 10 per cent. in the urban counties, but an increase of nearly the same amount in the rural counties, while measles showed an increased fatality among children of each sex and in both groups of counties. There was also a general decline in the mortality from syphilis, tuberculous disease of various forms, meningitis and convulsions, laryngismus stridulus, bronchitis and laryngitis, teething, and in atrophy debility and inanition. In the aggregate of diseases dealt with in this paragraph there has been a marked reduction of mortality during the recent period, when the rate was 22 per cent. lower than in the earlier years among males in the urban, and among males and females in the rural counties, and 23 per cent. lower among females in the

urban counties. In other words, from these causes infant mortality generally showed a decrease of nearly one-fourth part. The causes which contributed to maintain the total infant mortality at about its former level were diarrhoeal diseases (including enteritis and gastro enteritis), diseases of the stomach and liver, pneumonia, premature birth, and congenital malformations. The increase of pneumonia mortality is coincident with an increased fatality of that disease in the general population, and although this increase between the two quinquennia is proportionally large it counts but little against the decrease from the other causes just mentioned. With diarrhoeal diseases and with premature birth and congenital defects the case is far different, the increased mortality from these causes being very marked. Taking together diarrhoeal diseases and diseases of the stomach and liver, the recent five years show an increase of more than 70 per cent. in the urban, and of nearly 70 per cent. in the rural counties. From premature birth and congenital defects the increase, though numerically smaller, was proportionally even greater than that from diarrhoeal diseases. Among males in the urban counties the rate had increased by 70 per cent., and among females by 64 per cent., while in the rural counties it had increased by 74 per cent. in each sex. The increased mortality from diarrhoeal diseases is probably attributable in great part to the prevalence of artificial infant feeding, and this view appears to be consistent with the fact that the increase has been greater in the urban than in the rural counties.

One point must not be lost sight of in considering these rates of infant mortality—namely, the certainty that more accurate certification of cause of death has been secured in recent years. This would probably tend to a transfer of deaths from indefinite to definite headings, but the changes of mortality indicated in the above comments are so well marked that they probably represent with approximate accuracy the changes which have actually taken place, apart from this disturbing influence.

TABLE A.—*Infantile Mortality. Causes of Death from various diseases among Male and Female Infants under the age of one year (a) in a group of Urban Counties* and (b) in a group of Rural Counties† in the opening and closing quinquennia respectively of the last quarter of a century.*

NOTE.—0 indicates that the deaths were too few to give a rate of .05 per 1,000.

II.

Mortality among Legitimate, as compared with Illegitimate Infants.

In the following tables an attempt has been made to show the relative incidence of mortality from several causes on legitimate and on illegitimate children, in urban and in rural areas. Owing to the large amount of work involved in abstracting these deaths from the registers it has been decided to limit the investigation to the mortality in a single year, viz., that of 1902, and to deal only with London, as representing an urban area. For this reason, the figures relating to several of the diseases, such as smallpox, scarlet fever, erysipelas and laryngismus stridulus are of relatively little significance, and are retained simply to keep this and the preceding table uniform in design. Although for the purposes of an exhaustive inquiry a larger basis of facts would be advisable, the consistent character of the results here presented leaves little doubt that they indicate with approximate accuracy the true conditions as to mortality from various diseases which exist among legitimate and illegitimate children respectively. The top line of the table shows at a glance that there is an excessive death rate among illegitimate children, which is in London about twice as great as that prevailing among those born in wedlock, and in the rural counties, more than one and a half times as great. Glancing down the table it will be seen also that there is a marked excess of mortality under almost every heading, the exceptions occurring only in the cases of those diseases which are relatively so uncommon as to give too small a basis for comparison. Diarrhoea (with enteritis and diseases of the stomach and liver) and atrophy cause exceptionally high mortality among illegitimate children, the rate from these diseases in London being two and a half times as high among male, and more than three times as high among female illegitimate, as among legitimate, children; in the rural counties, too, the mortality from these diseases among the illegitimate is about twice as high as that among

the legitimate. Syphilis is enormously more fatal among the illegitimate than among the legitimate, both in the urban and in the rural areas, premature birth and congenital defects also cause excessive mortality among the illegitimate, especially in London. Comparison of the figures for London with those for the rural counties shows a great excess of mortality among illegitimate children in the former area; for, whereas, among legitimate children in London the death rates are in excess of those in the country by about one-fifth part, among the illegitimate the London rates exceed the country rates by more than 50 per cent. among boys, and by nearly 60 per cent. among girls. This excess is especially noticeable in the case of diarrhoea, from which disease the rates are about twice as high among legitimate children in London as in the country, and about three times as high among illegitimate. There is reason to believe, too, that this excessive mortality among illegitimate children in London is understated rather than overstated, for it is a known fact that many unmarried women who reside outside registration London are admitted to London hospitals at the time of parturition, and that the births are registered in London. The official records do not show what becomes of the mothers or of the children after discharge from the hospital, but it is almost certain that most of them at least return to the place whence they came, so that deaths among these children which occur more than a few weeks after birth are in all probability registered outside London. On the other hand, some few legitimate children who are born elsewhere than in London may be placed out to nurse with people residing in London, and any deaths among them would be registered in London if they occurred there. It is unlikely, however, that these latter cases would be as numerous as those first mentioned.

TABLE B.—*Mortality among Legitimate and Illegitimate Infants, respectively, in the year 1902.—Average rates of death from various causes, under one year, per 1,000 births (a) in London and (b) in the same Rural Counties as in Table A.*

NOTE.—·0 indicates that the deaths were too few to give a rate of ·05 per 1,000.

III.

Age-Incidence of Infantile mortality, in weeks and months of the first year of life.

The following tables are added to show in detail the age incidence of mortality among legitimate and illegitimate children under one year (a) in London and (b) in the rural counties. Table B₁ gives the actual number of deaths recorded at the several selected age groups of the first year of life: Tables B₂ and B₃ give proportions based upon those numbers, one giving the percentage of deaths at each age to the total deaths registered under one year of age, and the other the number of deaths recorded at each age to 1,000 births registered. Taking, first, the table of percentages of deaths at each age, it will be seen that a larger proportion of legitimate than of illegitimate children die during the first month of life, except among male children in the rural counties where the proportions are practically identical. For the next few months after the first, the case is different, the percentages of deaths being generally the greater among the illegitimate, while in the later part of the first year the proportions of deaths among the illegitimate are again the lower.

Here also the explanation of the curious differences would seem to depend in part upon the number of illegitimate children born in hospitals or infirmaries. Admitting the practical certainty that a larger proportion of illegitimate than of legitimate children are born in such institutions, and further admitting the prevalence of a lower rate of mortality among newly born children in these institutions than in the general population—especially in the poorest and most ignorant part of it—it follows that

illegitimate children born in institutions and there efficiently cared for, are preserved during the first few weeks of life, but become subject to a high death-rate on leaving these institutions. These remarks, referring as they do to the *percentages* of deaths registered at the several ages do not, of course, imply that the actual *death-rates* are at any time lower among the illegitimate than among legitimate children: the table giving the proportion of deaths at each age to children born shows that such is not the case, but that, on the contrary, the mortality at the earlier ages, is much the higher among illegitimate children. It shows, however, that this excess is proportionally much greater among children during a few months of life after the first, and that towards the end of the first year the rates among the illegitimate approach very nearly those among the legitimate children.

It might be objected that the number of deaths of illegitimate children is so small as to render unsafe any comparison of death-rates derived from them. On this point, however, it must be remembered that they are the deaths of illegitimate children occurring among more than 130,000 births in London and more than 100,000 births in the rural counties; while the consistent nature of the results obtained would seem to indicate that the figures here presented represent very nearly the true conditions of mortality which prevail among legitimate and illegitimate children respectively, in London and in the selected rural counties.

TABLE B₁.—Deaths among legitimate and illegitimate Infants respectively, in the year 1902. Age incidence of deaths at the several age groups under one year (a) in London and (b) in the same group of rural counties as in Table A.

INTER-DEPARTMENTAL COMMITTEE ON PHYSICAL
DETERIORATION.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

INTER-DEPARTMENTAL COMMITTEE

ON

PHYSICAL DETERIORATION.

Vol. II.—List of Witnesses and Minutes of Evidence.

Presented to both Houses of Parliament by Command of His Majesty.

LONDON:

PRINTED FOR HIS MAJESTY'S STATIONERY OFFICE,
By WYMAN & SONS, LIMITED, FETTER LANE, E.C.

And to be purchased, either directly or through any Bookseller, from
EYRE & SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C.; and
32, ABINGDON STREET, WESTMINSTER, S.W.; or
OLIVER AND BOYD, EDINBURGH; or
E. PONSONBY, 116, GRAFTON STREET, DUBLIN.

1904.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE INTER-DEPARTMENTAL COMMITTEE

ON

PHYSICAL DETERIORATION.

(PRIVY COUNCIL OFFICE, WHITEHALL, S.W.),

FIRST DAY.

Wednesday, 9th December, 1903.

PRESENT

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary.*)

Sir WILLIAM TAYLOR, M.D., K.C.B., K.H.P., L.L.D., called; and Examined.

1. (*Chairman.*) You are the Director-General of the Army Medical Service?—Yes.

2. How long have you occupied that position?—Two years.

3. So that your experience of the subject-matter of these documents does not cover more than a small fraction of the time occupied by the figures?—That is ten years. Well, I was in the office before that as Deputy-Director-General.

4. For how long?—From 1893 to 1898.

5. So that you practically do cover the period?—Well, my knowledge of the office does cover it except in this way, that my tenure of office was broken by various appointments in the field—with the Japs in China in 1894 and 1895; Ashanti, 1895 and 1896; in Egypt in 1898 and 1899.

6. But not sufficient to interrupt the continuity of your experience?—No.

7. We are very much obliged to you for providing us with a second memorandum and the figures attaching to it. You rather complain in that second memorandum of unfair deductions, perhaps unwarrantable is the better word, which have been drawn from the use made of the figures included in the first memorandum?—Where is the complaint?

8. Well, you seem to think that there has been some misunderstanding as to the main question at issue owing to the impression produced by your first memorandum?—No; I think, if I may say so, my complaint was that there was a misunderstanding of its object. Although in the first memorandum “deterioration” or “deteriorating” was mentioned four times, the words were quotations.

9. Your memorandum hangs to some extent upon the Report of the Inspector-General of Recruiting?—To a certain extent it does. What forces itself upon me is that

37.6 of those presenting themselves for examination as anxious to be soldiers now are unfit to bear arms, and whatever may have happened before, I think that is sufficient to demand special inquiry.

10. You remember the Report of the Inspector-General of Recruiting does speak of the gradual deterioration of the physique of the classes from which the recruits are principally taken?—He is not justified in that. We have no data on which to form that opinion. That is the Inspector-General of Recruiting's expression, and not mine.

11. Are you inclined to think that your figures are calculated to confirm the alarm excited by Sir Frederick Maurice's speculations?—Well, if you look at the table, page 3 of my original memorandum, you will find that table was made up on purpose to compare the results of recruiting from our Returns with Sir Frederick Maurice's statement, and you will see that the ratio per cent. (take column 5) is 34.6 as against Sir Frederick Maurice's 60 per cent. Now, that is the result of the primary medical examination; and if you take Sir Frederick Maurice's 60 per cent. and the total of the ratios worked out in columns 5, 6, and 7, *i.e.*, those rejected at the primary inspection, those discharged within three months (9), and those within two years of enlistment (2.1), you get a total of 37.6.

12. Further, while we are on this statement I call your attention to the fact that if you divide the period into two quinquennial periods the inferences are more indicative of an improved state of things?—In the year 1897 we were so much bothered by absolutely unfit recruits that came up to us that we rather protested against examining “Weeds,” and the Inspector-General issued an order to all recruiting officers as well as to recruiting sergeants that men manifestly unfit because of inferior physical development should not be taken before the medical officers

*Sir W.
Taylor.*

Sir W.
Taylor.

at all, and a very large number of men who used to come before them do not come now. That is a great boon to the medical examining officers. I am not in a position to prove it, but I think that that accounts for a decrease in the number of rejections at the primary medical examinations.

13. You think that that is the only cause of it?—No. When you come down to 1899, when the War broke out, men were perhaps sometimes taken who at other times would have been rejected.

14. (*Colonel Fox.*) Of the number of rejections for recruiting were there not a vast number that came up over and over again?—No. I think that has been very much exaggerated. It does happen at places like Woolwich and London. A man tries to enlist at Woolwich and fails, and he may probably try again at, say, St. George's Barracks.

15. (*Chairman.*) But no record is kept of those rejections by the recruiting sergeant, so that you have no means of knowing?—That is so. One of my officers had a conversation with Sir Francis Howard on this subject. He promised to have a record kept for a certain period of the men rejected by recruiters at some of the larger recruiting centres.

16. Will not that be done systematically in the future?—I hope so. It is being done at the present time for fourteen days at certain large centres.

17. The curious thing is that General Maurice's statement is not established by any figures, and cannot be?—General Maurice, I know—because he told me so when he came to see me—says that he has got a very large number of figures with reference to Manchester. Manchester—if you carefully look at the tables in the second memorandum—you will find always takes the lead in rejections.

18. That is not owing to any special stringency, is it?—No.

19. You have the same standards everywhere?—Yes. Here are the twelve largest recruiting centres in 1901 and 1902, and their relative positions with regard to the number of rejections are these:—In 1901, Manchester, Belfast, Liverpool, London, Hounslow, Newcastle-on-Tyne, Birmingham, Woolwich, Edinburgh, Lichfield, Glasgow, Dublin. In 1902 Manchester is first again, Liverpool second, instead of being third, Belfast third, instead of being second as in the previous year, Hounslow fourth, Newcastle fifth, London sixth, Lichfield seventh, Woolwich eighth, as in the previous year, Glasgow ninth, Lichfield tenth, Birmingham eleventh, and Edinburgh twelfth. That is a very constant or very nearly a constant order.

20. Even if the number rejected by the recruiting sergeant is as large as General Maurice supposes, does it not merely imply that large numbers not fit for or disinclined to permanent work present themselves to the recruiting sergeant on the chance of being passed, and that the condition of those rejected is only representative of the state of the wasters of the large towns who live by casual labour?—That is a very big question. Of course we know that under present conditions largely those who have failed in civil life offer themselves as recruits. I may say that figures regarding previous occupation are unreliable.

21. There is no precise differentiation?—No, and we find that men of various professions come up for enlistment who describe themselves as labourers.

22. It would not do in the case of a clergyman for him to say that he was a clergyman?—No, but there are also cases of medical students and art students who have broken down or have got into trouble, and they almost universally return themselves as "labourers." I do not think that the point you are trying to make can be borne out, because a great many would-be recruits of known respectability are rejected.

23. Don't you think that that conclusion is rather borne out by your remarks on the Public Health Statistics? You say the teachings of the Public Health Statistics "appear to show that the progressive improvement of the national health has steadily followed the improved conditions of life which have been brought about by the advance of sanitary knowledge and its practical application"?—That is so.

24. I suppose the improvement has extended to the lower classes?—There comes in another factor, and Dr. Tatham will endorse it, that the compulsory attendance of the lower classes in Board Schools is not tending to increase the physical development.

25. Not even with the physical exercises?—I do not think that the physical exercises are proportionate to the confinement; not in the very lowest class of society.

26. (*Colonel Fox.*) I do not quite follow what you mean?—What I mean is this—although the upper classes have athletic courses and competitions—and I have referred to the fact that records are constantly being broken for all sorts of feats of strength, agility, and endurance, thus showing no deterioration—that has only reference to the upper classes. You take the lowest stratum of society from which we draw the recruits generally, and you will find that the enforced attendance at Board Schools and the confinement resulting from that is acting injuriously.

27. Do you mean that they get too much mental study?—Well, they have been put to things they have not been accustomed to for generations. It is putting them under new conditions that, at any rate in the beginning, are not conducive to physical development; more indoor and less open-air life.

28. (*Chairman.*) You admit that the "bulk of our soldiers are drawn from the unskilled labour class, and consequently from the stratum of the population living in actual poverty, or close to the poverty line"?—But remember I have just said we cannot rely upon those labourers' statistics.

29. But still you do say that so far as the figures teach anything they teach that?—Yes.

30. But you say, "Further, the physical deterioration caused by hereditary or acquired disease must not be forgotten, and in illustration we need only instance the part played in this by tubercle and syphilis"?—Yes.

31. You are aware that the deaths from phthisis in twenty years have fallen, in the case of males, from 1,902 per 1,000,000 to 1,570, and in the case of females from 1,735 to 1,110?—That does not get rid of the constitutional taint. You may have a very much decreased mortality from tubercle, *i.e.*, you may prolong the lives of tuberculous patients by providing favouring conditions that will enable them to live.

32. And multiply?—Yes, and that is the pity. You are putting them under better conditions, enabling them to live much nearer the natural term of life, but you do not get rid of the taint.

33. Is there not evidence that both in extent and virulence syphilis is on the decline?—If it is, it is because of the measures taken against it.

34. But there are not many measures taken in this country?—There are in India, and the number of syphilis cases sent here from India by the Army has a very great effect in affecting the population here.

35. You think that is so?—There is no doubt about it.

36. I have just one or two points to ask you about. I observe that "defective vision" ranks very high. In the Tables you gave for rejections for 1901 and 1902 I see that the labourers' class ranks first. I want to ask you as to the method in vogue for the examination of recruits? Is it only acuteness of vision that you aim at testing?—Yes, but if a man has chronic disease of the eyes—apart altogether from consideration of his range of vision—we reject him. A man with chronically inflamed eyelids we reject.

37. You don't employ ophthalmic surgeons?—Oh, every one of my men are specially trained.

38. It may be that a recruit who did not come up to your own standard as to acuteness or range of vision still might prove a valuable soldier?—Well, that is a big question. What is the use of a soldier who loses his glasses in the field. If he is getting tired of the strain—and a great many broke down under the physical strain in the late war—he will get rid of his glasses if he wants to. The case of false teeth is very much on a par with glasses. There are men who, after bearing the strain of active service in the field for some time, I have no doubt broke down nervously, and probably some of them had been fitted with false teeth. On more than one occasion men have been seen secreting their false teeth in

the corner of their blankets, so that they could get out of the field, making the loss of teeth their excuse. You will find the same with glasses. When I say that, I make no reflection upon a man's courage. It is a nervous break-down. Even officers broke down from too much strain. If a man feels a little "jumpy" (he may have been the bravest man in the world in several actions, and probably that fact has told upon him), he begins to feel nervous, and as the result of his nervous breakdown his glasses get lost or broken. That is a matter that military authorities have to consider—viz., whether that is good or bad for the Army.

39. (*Colonel Fox.*) Do they lose their glasses very often? A soldier is careless, and he goes to a stream to wash himself, and he loses his glasses, and the same thing happens to his teeth—he leaves them on the bank of the river.

40. (*Chairman.*) Touching this question of teeth, it does appear that there has been lately a very great increase in the number of recruits who present themselves with bad teeth, but that is partly accounted for by increased stringency, I understand?—Yes, in the later years that table refers to, because a great many men were found to be sent out with bad teeth, and especially in the Imperial Yeomanry. The Imperial Yeomanry, I may say, were not examined by officers in my Department; the Yeomanry made their own arrangements for physical examination.

I do not know whether it was so—whether the teeth were carefully examined or not, but a great many who went out to the Cape were affected and unable to masticate the service ration, and they were sent back.

At Shorncliffe, I heard from the medical officer in charge that the number of men who came back with bad teeth was very large.

A great deal of attention has been paid to this subject, and the expense of fitting in false teeth, as was done during the War, considerably raised the expenditure on the medical vote.

41. But still the increased number of rejections on the score of teeth swell, of course, the percentage in your Table 3, which goes to augment the force of Sir Frederick Maurice's and other people's plea that the race is deteriorating. But, on the other hand, those who are familiar with the subject of teeth will tell you that dental caries is not, as at present advised, due to these causes which are shown to produce physical deterioration; that a tooth with a lot of caries in it is perhaps as full of lime as a perfectly sound tooth. In the Report of the Departmental Conference between the War Office and the Admiralty it is distinctly said that "mal-nutrition teeth,"—that a circumstance of that sort has nothing to do with physical deterioration, but it plays a large part in the tabulation of returns which are permitted to influence public opinion upon the subject of physical deterioration?—But I did not start it with physical deterioration at all—I must repeat that. Whoever has talked about physical deterioration is responsible for all that, not I. I only say that in this day of grace, 1903, certain percentages of men are unfit for military service, because of certain defects; that is all. I do not know whether our teeth are worse now than formerly. I have an impression that they are, but I have not said that they are. That is not my point. My point is the number of men we have to turn away in trying to get recruits for the Army, and I have given the chief prevalent causes.

42. We shall form our own opinion as to whether that is borne out?—I would rather not express an opinion upon it. The Joint Committee on teeth went into the subject very thoroughly, I think.

43. Am I right in saying that the want of cleanliness is the chief cause of the caries?—I think so. We are taking steps with a view of getting rid of it in the Duke of York's School. The boys' teeth were in a bad state two years ago, and we asked that a dentist might be appointed to go twice a week at first, and the deterioration in teeth has been largely checked. Now we give tooth-brushes to soldiers in the Army, and we lecture them on the absolute necessity of taking care of their teeth, and it is having an effect. If you, with your Committee can do anything to make responsible authorities take some little interest in instructing boys and men in the importance of the caring for their teeth, that would be well.

I think that food has a good deal to do with it. I am very strongly impressed with impure drinks being very bad for the health. What we have to look to, is to see that impure beer and raw spirits are not given to the men. If something could be done in that way, it would be useful.

I am certain that impure and improper food and impure drink are responsible for the production of physical deficiency. The State ought to take measures to ensure the provision of pure spirits as well as pure beer.

44. They can get them in regimental canteens, can they not?—Not spirits.

45. (*Colonel Fox.*) They do not sell spirits in a canteen?—Not since rum was done away with. But there is alcohol in beer, and there is no doubt that it is injurious.

46. The beer is pretty good in canteens, is it not?—In some canteens; if the men are allowed to choose their own brewers it is not always satisfactory.

47. It is better than in a "pub."—Yes.

48. (*Chairman.*) Are the men themselves judges of pure beer?—No, not always. It is not in the canteen that the men get bad spirits. Men get tired of the canteen, and especially of the barrack square. Barracks are often in the slums of a big town. Take Sheffield and Manchester, for example.

49. (*Colonel Fox.*) I know from experience that Manchester is in this respect a bad station for soldiers, but do you not think that in most towns the drink which is sold in public-houses is little better than poison?—Yes. I think that the spirit sold to the men is quite a raw spirit, capable of being purified, undoubtedly. There was a Committee, I think, on spirits some time ago—a Select Committee in 1891 on this subject.

50. (*Chairman.*) Do you mean a Committee of the House of Commons?—Yes.

51. There have been several Pure Beer Bills brought before Parliament.—That is important. If there is deterioration at all, you know probably better than I do, Dr. Tatham, what the effect of drinking impure spirits is. Lunacy in the Army has increased of late years. The evil effects of impure spirits are seen in some of the Colonies, as for example the "white-eye," I think it is called, of Cape Town. In Canada, I have known a man drink "white-eye" and tumble down dead.

52. There is one more point with regard to the percentage of those discharged during the year under two years' service. There is a considerable increase in the last two years under that head?—In 1901 it rises to 4.9.

53. Is that due to the greater ingenuity in malingering?—No, not at all. It is due to enlisting at a time of pressure. Men were sent back in hundreds in the late war.

54. That is a falling cause, then?—Yes.

55. You do not think that malingering has much to say to it?—There is very little malingering in the Army now. I am speaking of the men at home.

56. (*Colonel Fox.*) I have often discussed this matter with non-commissioned officers and men of experience, and they have generally agreed that malingering is a common thing amongst young soldiers. When these youngsters become tired of restraint or are worried by a non-commissioned officer who has in his time been bullied, they either desert or resort to smoking rank tobacco twisted up in brown paper, or a course of soap pills, either of which produce palpitation. Have these devices ever been brought to your notice?—I have known one or two instances. To begin with, the service is too short now. It is only three years. In the old days I have found a man lying in hospital with coppers tied on the ulcers of his leg, which he had probably tied on himself. I have known men take the white-wash off the walls and put it on their eyelids. That has all gone. There is nothing like that now.

57. You think there is nothing like the proportion of malingering that there was?—Nothing like there was in the old days.

58. (*Dr. Tatham.*) I am glad to hear you say bad spirits and bad beer have an evil effect.—I am sure of it. I should like to make that point. When a man comes into the service he gets good food. If you could prevent

Sir W.
Taylor.

Sir W.
Taylor.

our lower classes from taking bad food, and especially bad drinks, beer and spirits, I think you would do a great deal to stop this deterioration.

59. Now, about the point of age. Do you agree with Professor Parkes' opinion, when he places the lowest desirable recruit age from twenty to twenty-one years?—Yes, that has been gradually forced upon me. At the time of the Maiwand disaster, I had to examine a very large draft of recruits for India—at that time an order existed that no man should go to India under 20 years of age—and two-thirds of them were rejected as being under age. Owing to pressure, however, orders were given to pass every man who was physically fit irrespective of age. I have heard of some recruits at Manchester lately some of whom were thought to be under 15 years of age.

60. (Chairman.) Under fifteen?—So it was thought.

61. (Dr. Tatham.) In your medical reports for the years 1897 to 1900 the majority of the recruits were under nineteen years of age?—I am not in a position to say that at the present moment.

62. I will tell you where I got the information from. It was in a letter from Surgeon-Colonel Welch in the *Lancet* of March 7th of this year, in which he says that 44 per cent. of the recruits are from eighteen to nineteen years of age, and that a considerable proportion additionally are under eighteen; that would bring up the whole to more?—That is what I have said already. The majority are between those ages; a great many are under that. It is a very difficult thing to tell from physical appearance; you may be misled. It is difficult to get at the actual ages.

63. I am glad to get your opinion upon that point because I think that is most important?—It is most important.

64. (Colonel Onslow.) There is one point with reference to General Maurice's figures. If you add the rejections by recruiters to those by medical officers you would easily arrive at the 60 per cent?—We do not do this.

65. I know that, but in the Admiralty recruiting we do it, and we could I think easily make up the 60 per cent. ?—We might do it, but I can only ask the Inspector-General of Recruiting to keep such a record.

66. You are simply representing the medical officers. Regarding the age of entry, is not twenty rather old—is not eighteen better?—I do not think so.

67. That is before the bones begin to set?—I think that in the Army we should take care of our recruits, as is done in the Navy, and not start by giving them gymnastic exercises that all recruits are not physically fit to go through. I think when we get our half-starved recruits from the slums or the lanes of the country, the first thing you ought to do is to take care of them and give them good food, as they do in the Navy, and afterwards try to improve their muscular development. We do not want big men, but men of medium stature able to carry their own weight. I would not lessen the age at all; if we could get the men at twenty-one it would be better.

68. Is it not more likely that those individuals having damaged their own physique, either by drink or syphilis or anything of that sort, the older you get them the more chance of those cases appearing?—I do not think there was so much difficulty in getting recruits formerly. We did not want so many as now, but I do not think that we found syphilis in the two years.

69. (Chairman.) Do the two services recruit from the same class?

70. (Colonel Onslow.) Yes, take the Marines; they are practically the same as the Army.

71. (The Witness.) The pure sailor comes from the boy.

72. (Chairman.) Do not the conditions of the Marine service attract a higher class of men?

73. (Colonel Onslow.) Curiously not. I do not suppose that one man in ten entering the Marines but thinks that he is going to be a soldier.

74. (The Witness.) That is quite true.

75. (Colonel Onslow.) Of course we keep them eight to ten months at the dépôt, where they get an extra half pound beyond the average rations, and they are worked gradually into the service.

76. (Witness.) The man wears a red coat and the recruit does not know the difference. You get the boy at fifteen to sixteen and put him into a training ship, where he is well fed, and leads an open air life.

77. (Colonel Onslow.) About ten years ago the Navy started taking in youths at the age limit of sixteen years and nine months, to eighteen, sending them down to sea in H.M.S. "Northampton" and her tenders. Statistics referring to 200 boys and 200 youths who entered the first year have been obtained, and the youths come out far ahead in every way. A larger number of boys wasted by being invalided, etc. The boys had not come forward in efficiency as they were expected, and the Admiralty are so impressed that they are actually raising the age for boys?—That is exactly the point with reference to the importance of increasing the age for recruiting. You cannot tell what a boy is going to turn out at twelve or thirteen. You cannot do it with officers. You are much more certain of getting the class of men you want by taking them at a later age.

78. (Colonel Fox.) Take, for instance, the boys at the Duke of York's or the Hibernian Schools. They leave when 14 years old, and are, as a rule, small, but after leaving, shoot up rapidly. Is this not the natural course with boys who have passed the time of puberty?—That is not a general law.

79. But you can see it in those boys?—That period of shooting up is a very dangerous period. It is a period that a great many boys break down at, and if you get the boy after that period you would avoid that.

80. (Dr. Tatham.) One of the reasons, and an important reason, why you get so many losses by wastage from breakdown in young soldiers after enlistment is the fact that they are introduced into the Service too early, you think?—There is no doubt about it.

81. (Colonel Fox.) But in all other continental countries they take them at twenty?—Of course, I recognise the necessity.

82. (Dr. Tatham.) You would prefer their enlisting at twenty-one rather than twenty?—Yes.

83. (Colonel Fox.) Do you find that there are a great many rejections owing to flat feet?—Not many.

84. I have had cases of flat foot, but it was not the simple flat foot, but the ill-formed foot. I found that the men with flat feet walked from the calf rather than the thigh?—I have found some of the best men flat-footed. If the arch of the foot is gone altogether, and the bones that formed the arch fall to the ground, that man should be rejected. There is a great deal of difference of opinion as to what constitutes flat foot.

85. (Chairman.) It does not rank amongst the highest causes but amongst the lowest?—I have a table here that is rather an interesting one. It shows in two years the position occupied by various diseases with reference to the number of rejections according to occupation. Defective vision is first in labourers, but in trades, such as cloth workers, weavers, and lace-makers, tailors, etc., it is fifth, and in mechanics it is third, and shopmen and clerks it is third. There is a very great uniformity in most of these.

86. (Chairman.) We have got that.

87. (Witness.) The want of physical development occupied the first place everywhere except in one, and that is in boys under seventeen.

88. (Mr. Struthers.) About the chest measurement, the class of mechanics is favourable to development, and yet I see that the want of measurement is the first cause, whereas it is second and third and fifth in some of the others.—Is that peculiar?

89. If those were occupations particularly favourable to chest development, I think that there would not be so many rejections for want of chest measurement?—At that age an occupation has not had time to effect development; boys between fifteen and nineteen have not been long enough at any occupation to be affected by their employment. I do not know at what age they get away from the board school.

90. (Chairman.) Fourteen, and a great many much earlier.

91. (Colonel Onslow.) Artificers, Royal Navy, are recruited from twenty-one to twenty-eight. They are skilled mechanics in employment favourable to development,

and the rejections are 25 per cent. of the whole number of candidates. Number 3 of your list, as to their constitution and health, are far better than in the Navy in the artificers' class?—Really.

92. Of course they come from a superior class of men?—Quite so.

93. But they are not quite so good, as a rule, in chest measurement?—As to want of physical development, the table I sent you, of course, includes these five things: 'Impaired constitution and debility; under height; under chest measurement; under weight; not likely to be an efficient soldier.'

94. (*Chairman.*) That is rather speculative, "Not likely to become an efficient soldier?"—That is after trying him for two or three months.

95. (*Colonel Onslow.*) That is from medical opinion?—Purely medical. The commanding officer can discharge from the disciplinary point of view.

96. (*Mr. Lindsell.*) When you take a recruit there is no means of ascertaining where he has been bred at all—whether he is country-bred or town-bred?—In some instances; but, as a rule, recruits conceal their antecedents.

97. There is no means of telling whether his physical condition is due to his having been reared in a crowded town, or to his having only come up to town quite lately from some country place?—There is, in this way: after he has been enlisted, but not by the medical officer enlisting—he will not confide anything to him—but afterwards, as he gets to know the medical officer and has no fear of him, he may say where he has been brought up.

98. There is no means of ascertaining whether the physical condition of a youth is due to himself or perhaps one or two generations being brought up in crowded surroundings, or whether he has come from the country?—No, I do not think there is any means of ascertaining that at the primary medical examination. As I tell you, there is the greatest difficulty in ascertaining what employment a man has been in.

99. (*Mr. Legge.*) As things are at present arranged, you could not get anything by going to the recruiting centre. Have you no centres that you could group as country centres?—Yes.

100. All these are notably town centres, with the one exception of Lichfield which might possibly be a country centre?—Lichfield comes within the first twelve recruiting centres showing the greatest number of rejections.

101. (*Mr. Struthers.*) Is Lichfield a country centre?—Lichfield is a county town.

102. It is a centre, and as a country centre it would be comparable with others?—It is in the middle of a mining district.

103. (*Mr. Legge.*) It is a long way from a mining district?—I know Lichfield, and the barracks are four miles from the town.

104. (*Chairman.*) What about Hounslow?—Hounslow is practically London.

105. (*Colonel Onslow.*) It does not mean that that district is the centre of a very large area. Recruits are taken from all round?—Yes.

106. Take York or the Royal Navy. In the Navy recruits are taken from the whole of Yorkshire, Northumberland, and Durham, so that it is difficult to say from what part they come. Is that the case in Army recruiting?—Ours is not so extensive as that. We have a medical officer wherever we can examine recruits. The recruiters take them to the nearest stations. It would not be necessary to send all recruits recruited in Yorkshire to York, because we have many other stations in that county.

107. But if a man is examined at Lichfield, it does not say that he has come from Lichfield. Cannot you get at it by having characters from them?—The only way is by inquiring, and inquiry would often lead you to a wrong conclusion.

108. (*Chairman.*) It would not be worth much if you got it, you think?—I do not think so.

109. (*Colonel Fox.*) They get a long way from home?—Yes.

110. (*Chairman.*) The localisation of the Army has not led to enlistment has it?—No, not to the extent expected.

111. (*Mr. Lindsell.*) You attribute a good deal to want of exercise and compulsory attendance at school?—I said that might be. I think that it is very likely. You put a boy into school who comes from ancestors who lived their lives in the open air often without schooling at all, and you keep him indoors four or five hours a day.

112. That would hardly apply to town boys, would it, if they have forced attendance in the country as well?—I do not think it would affect the country boys. Often in going to school they have a long way to go. I asked a boy the other day in the country how far he had to come to the school, and he said, "I have walked five miles."

113. (*Mr. Struthers.*) So that the compulsory attendance does not affect the country children?—Quite so. The boys in the towns who go to the Board schools, and are there for four or five hours a day, would otherwise probably be running about the streets.

114. (*Chairman.*) A good deal of pains are taken in the ventilation of the schools, you know.—Yes, and the warming of the school also.

115. (*Mr. Lindsell.*) You do not wish to press that point?—No.

116. (*Colonel Fox.*) You think if they had a more animal life they would be more healthy?—Yes.

117. (*Mr. Struthers.*) Supposing that these boys went into the country it would be better than being in the streets or in the sweating den?—Yes.

118. You were talking of the effect of a possibly increased compulsory attendance on the physique of the children generally?—I only mentioned that incidentally, it is not a point I originally brought up.

119. (*Mr. Lindsell.*) Do you attach flat feet to any particular employment?—No.

120. But Manchester is very extraordinary in that way?—But Manchester takes the first place for everything.

121. According to this table they are very high?—Flat feet in Manchester is 159 in 1901.

122. There is nothing above fifty-eight in any of the other places?—Yes, to put that into ratios the ratio is 40 per thousand. I do not think you have got the ratios on that table.

123. The total in Manchester is three times that of any other place, which is rather curious?—Manchester is not the highest in flat feet; for instance, in 1902 Manchester has a ratio per thousand of twenty-two, whereas Glasgow has a ratio of thirty-eight—that is in 1902.

124. Manchester has flat feet 159 in 1901, and 99 in 1902?—These are the totals, but I have had the ratios carried out in my two tables here, and in 1901 Manchester has forty per thousand for flat feet, and in 1902 it has only twenty-two; and the highest in 1902 is Glasgow with thirty-eight, and Manchester is highest in 1901, and Belfast next with thirty.

125. (*Colonel Fox.*) As to that point about the manufacturing districts?—Those twelve towns that I have given you are nearly all manufacturing towns.

126. If you believe in heredity, take the case of the Ghoorka, who is a hill man and is constantly using his calf and his instep; he has a well developed calf and a well shaped foot. But on the other hand take the manufacturing operative who is perpetually standing still at his work with the weight of his body depressing the arch of his instep, would not the result naturally be a flat foot?—There is no doubt about that, and especially when you have boys made to stand still, with very bad-fitting boots; the arch breaks down.

127. And the next generation will have it a bit worse until they become a flat-footed race?—Probably.

128. And therefore the manufacturing districts produce flat feet.—I think the habit of wearing clogs a great deal has to do with that condition. They are not only heavy, but the sole of the clog does not yield into the arch.

129. The constant downward pressure must affect it?—Yes.

130. (*Chairman.*) Have you in those returns something further worked out which we have not got?—I have got the ratios worked out here, and I will send you the copies of the ratios as worked out.

Sir W.
Taylor.

131. (*Mr. Lindsell.*) About the teeth generally, you very strongly advocate a State examination of the teeth of children in the State schools?—Oh, certainly, and I should advocate very careful attention to physical development.

132. (*Chairman.*) Would you systematically make an inspection?—Yes, there ought to be dental inspection.

133. And a medical inspection?—Yes, a medical officer, and there should be a competent dentist as well.

134. Would it be possible, with the various recruiting agents all over the country, to establish a system for the collection of anthropometric facts and figures in reference to those which are passed through the hands of the recruiter?—It would be of very great interest, but it would be very difficult in times of pressure.

135. Would it be worth while, with the results to be obtained from such a system, to face the additional cost in connection with the information?—I think it would.

136. That would, to some extent, provide us with some material for a comparative estimate of the physical condition of the people under, at any rate, certain aspects?—I do not think it would be as valuable as it would be if we could get the antecedents of the individual.

137. But would not a comparison of the decennial periods give a clue as to the condition of that class from which recruits are drawn as to whether they were deteriorating or not?—It would certainly help.

138. That is what we find at the inception of our inquiry; as you say, in one of your memoranda, that the material for any comparative estimate is absent?—Yes.

139. (*Mr. Legge.*) I gather from you that there is an enormous increase in lunacy in the Army?—There has been a great increase.

140. I do not want to discuss it, but can you let us have figures to show how it compares with the general population?—Yes.

141. If you turn to column 7 of your Table on page 5, where you give the percentage of rejections under two years' service as 2·1, is that a high and alarming percentage; you say that 2·1 per cent. were discharged as invalids?—No; that was not brought out to show a high percentage.

142. I was asking your opinion. Do you think it is a high percentage?—The purpose for which these three calculations were worked out was to compare figures with Sir Frederick Maurice's 60 per cent. Rejections for being medically unfit for service were at the primary examination 34·6; within three months after enlistment 0·9 per cent.; while 2·1 per cent. were discharged as invalids under two years' service.

143. The object of my question was to get your opinion bearing on the harrowing passage at the beginning of Sir Frederick Maurice's article in the "Contemporary Review," where he is talking of the cost to the country of patching up men who are no good and who are sent to the Herbert Hospital, and who must be ultimately discharged after large sums have been spent upon them without their having rendered any effective service in return?—I do not think that 2·1 per cent. can be called a very large percentage.

144. There is another striking statement by Sir Frederick Maurice also in that article on which your figures have some bearing, and I think myself they support your opinion. He says that in that Herbert Hospital he found a smaller proportion than he should have expected, of the causes for which these persons were discharged, of cases immediately and obviously traceable to one fatal cause of maladies—I take it he means syphilis. Looking at your figures, for instance—at St. George's Barracks and Hounslow—there are only twenty-one rejections for syphilis out of a total number of rejections of 3,908. Do you agree that that bears out Sir Frederick Maurice's views?—Syphilis as taken here is, as a rule, primary syphilis, but what Sir Frederick Maurice means, I take it—is that a

great many soldiers break down through the first two years of service because of an inherited constitutional taint. That could not always be detected at the primary recruiting.

145. But he says he finds far fewer than he expected were discharged for causes traceable to syphilis?—Yes, I daresay.

146. The popular opinion seems to be that it is a very serious matter indeed. Sir Frederick Maurice did not find it as serious as he expected, and your figures show that it is not so serious as is sometimes imagined?—That is a very wide subject, as you know. I should be very sorry to go into it now.

147. You show very few men rejected on that ground, at any rate?—Very few. I take it that he means inherited syphilis, and very few men are rejected on that ground.

148. (*Chairman.*) He does not say so?—Of course one or two men are found. It may be said that no boys of eighteen and nineteen have had syphilis, for it has not had time to develop; at any rate, not secondary syphilis we hope.

149. (*Mr. Struthers.*) What exactly is your view as to the value of those statistics you have given us? I understood you to say that they did not afford any basis in coming to an opinion as to whether there is deterioration or not?—None. We have no data for comparison.

150. Take the other point. Do you think that we can get from it any indication whatever as to the physique of the people, of whole classes of people, in either certain districts of the country or certain occupations?—As to the districts of the country certainly, so far as the class from which recruits generally come is concerned.

151. Do you think that the percentage of rejections at a given centre in a general way indicates the general physique of that town as compared with another. Take the centres you have; take Dublin and Belfast right through and you have the ratio of rejections: Husbandmen and labourers 283 at Dublin, 405 at Belfast. Take the next class, 258 and 333; and the next class is 282 and 359; and it is the same right through. Are we to conclude from that that the physique of the population of Dublin and its neighbourhood is better than the physique of Belfast?—I should be very sorry to say that the recruits recruited in Dublin belong to the Dublin district. I should be very sorry to say that recruits recruited in Manchester belong to Lancashire.

152. Do the figures give any indication whatever as to the relative physique of those two districts?—No, because I do not think that they come from those districts. I do not think that there is much value in any of those tables with reference to the points that are meant to be elicited. I have no data on which to form an opinion as to the physical deterioration.

153. Nor as to the physical condition of the different districts?—It is quite sufficient for the point that I want to make, viz., that the whole nation is in that condition that it cannot supply more than say 50 per cent. of those examined who are able to bear arms.

154. (*Chairman.*) It cannot be supplied under the conditions of recruiting in this country?—No.

155. (*Mr. Struthers.*) How far that affords a general index depends upon a hundred circumstances which it would be very difficult to disentangle?—Certainly. My point is this, that out of a hundred men who come up willing to be soldiers we have to turn away between 40 and 60 per cent.

156. (*Dr. Tatham.*) The question of pay comes in does it not?—I do not say what comes in.

157. You could get recruits if you paid for them?—Still there are between 40 and 60 per cent. of the population unfit for soldiers.

158. (*Chairman.*) Has the effect of the extra 6d. come into operation?—Hardly.

159. (*Colonel Onslow.*) The extra 6d. has not come in, but the 2d. has?—I daresay it has not.

Major-General H. C. BORRETT, C.B., called ; and Examined.

160. (*Chairman.*) You are Inspector-General of Recruiting—for how many years have you held that position ?—Four years. Before that I was Assistant Adjutant-General of Recruiting for two and a half years.

161. So that the period of your recruiting experience covers between six and seven years ?—Yes.

162. You have sent in a statement of your evidence ?—Yes.

163. Will you be kind enough to read it ?—

In my Annual Report for 1902, as Inspector-General of Recruiting, in paragraph 150, I wrote as follows : “ The one subject which causes anxiety in the future as regards recruiting is the gradual deterioration of the physique of the working classes, from whom the bulk of the recruits must always be drawn. When it is remembered that recruiters are instructed not to submit for medical examination candidates for enlistment unless they are reasonably expected to be passed as fit, one cannot but be struck by the percentage considered by the medical officers as unfit for the service.”

Paragraph 75 of the same Report shows the result of the order that all “ Rubbish ” was to be weeded out by Recruiters, and only apparently “ good ” material sent forward for medical examination. The percentage of rejections “ for want of physical development,” which was fourteen in the year 1898, decreased to thirteen the next year, then to eleven, and during 1901 and 1902 was down to between nine and ten. The books kept by examining medical officers give the measurements of all recruits examined by them—whether passed or rejected, and at my inspection of recruiting areas, I found fault if men had been rejected by the medical officers who the Recruiters ought to have themselves rejected for not being up to standard.

The percentage of rejections for various ailments the Inspector-General of Recruiting cannot interfere with. He never takes a man unless pronounced “ Fit ” by the examining Medical Officer. This percentage was 16·3 in the year 1900 ; it rose to 19·46 for the year 1901, and for 1902 it increased to 22·46.

The statement in paragraph 150 of the Report that physique of working classes is deteriorating is based on the personal knowledge of the Inspector-General of Recruiting (myself) as the result of his visit of inspection in the various recruiting districts, and also on the annual reports of the officers responsible for recruiting in the districts. Out of seventy-eight Annual Reports rendered on the 31st December, 1902, no less than sixteen, these practically the large recruit-giving centres, called attention to the large rejection for teeth and flat feet.

During the war a better, stronger, and more mature class of recruits might reasonably have been expected to come forward, and thus, if anything, reduce the percentage of rejections ; but the percentage went up. The number of rejections for “ loss or decay of many teeth ” in 1891 was 10·88 per thousand ; in 1902 it was 52 per thousand.

During the South African War there is no doubt that some men were accepted for the Army who ought to have been medically rejected. I am not prepared to say that this was entirely wrong under the circumstances. During the war we had a large number of civilian practitioners employed as examining medical officers in place of military doctors sent to South Africa. No doubt these civilians did their work conscientiously, but of course they could not be expected to know what was required of a man to make a good soldier as well as officers of the Army knew. During the war I made it my business to get every man I could. I could not tell when the war would be over, neither could I guess what the casualties might be, and I certainly thought it better to have too many than too few men. With this object in view, in speaking to officers commanding recruiting areas and to examining medical officers, I certainly requested them to rise to the occasion, and to remember the wants of the Army. In plain words, I said to every medical officer, “ On no account whatever pass a man as fit, whom you consider *unfit* ; but in the case of men you feel a little doubtful about, do not hesitate to take responsibility, and pass them fit, if you think there is a good chance of their making good soldiers.” I think that in peace time we ought to be careful, and only accept

the really good men, so that when starting a war we have nothing but first-class material ; then we can afford to relax somewhat. I allude to this, because perhaps evidence will be given regarding men who have been medically passed breaking down not long after commencing a soldier's life. This may account for some of the breaking down.

Since the South African War military examining medical officers have been more particular, and there is no doubt it is now harder to pass medically fit than before or during the war.

With regard to my reported physical deterioration of the class recruits mostly come from, I may say that I soon learned what percentage of medical rejections to expect at every class of recruiting area. When I visited Manchester, London, Liverpool, Leeds, Glasgow and other large cities I was prepared to find a large percentage of rejections, and I got it. When I visited agricultural districts—Bury St. Edmunds, Lincoln, Exeter, and so on—I expected to find but few medical rejections, and so I did find it ; or if I did not so find it, it was the fault of the medical officer, who was too strict. Now, every year more recruits come from the cities and fewer from the country. This points to deterioration ; for surely the country lads are healthier than the town lads.

I have no figures to give showing the number of men sent away as “ Rubbish ” by Recruiters. We used to have figures, but I stopped them as they were so very misleading. We have about ninety recruiting areas, and it is impossible to get them to render returns all made up in the same way. For instance, I found men came up several times to try and enlist, and several times were rejected as “ rubbish ” and counted several times. Again, if we could get these figures correct, it would not give the number of men who would enter the Army if they could medically pass ; for there are thousands who, knowing they are under standard, never present themselves, much as they wish to be soldiers. The figures were so misleading I stopped them, and contented myself with the numbers offering for enlistment whom the Recruiters accepted as having a reasonable chance of passing.

I believe that some people say that physique is not deteriorating. Supposing this is so, all I can say is it is a vast pity the physique of the recruit-giving class is as poor as it is, so as to cause such a large percentage of rejections for the Army. That our standard for the Army is too high I cannot admit ; some people call it low. I consider it a very fair standard, and a standard that it is most unfortunate more Englishmen do not come up to.

To sum up the situation. It is the fact, that although I used every justifiable means to keep the medical rejections down, and notwithstanding the fact that the standard can hardly be classed as “ high ” (I class it as “ very fair ”), no less than 29 per cent. of would-be recruits were medically rejected in 1901, and 32·22 in 1902. This cannot be considered a satisfactory state of things.

164. The paragraph in your Report for 1902 on which all this hinges is paragraph 150 ?—Yes.

165. There you do take the responsibility, which Sir William Taylor said he had not taken, of saying that, “ The one subject which causes anxiety in the future as regards recruiting is the gradual deterioration of the physique of the working classes, from whom the bulk of the recruits must always be drawn ? ”—Yes. I formed the opinion because every year there were more medical rejections than in previous years.

166. Then you go on to say, in paragraph 75 of the same Report, it shows “ The result of the order that all ‘ rubbish ’ was to be weeded out by recruiters, and only apparently good material sent forward for medical examination.” Does not the use of the word “ rubbish ” rather indicate what is the source of the whole evil—that unfortunately, it is the “ rubbish ” that to a very large extent presents itself to recruiting agencies throughout the country ?—I use the word “ rubbish,” because in talking to my recruiting doctor I always talk plain English. When I looked over a Doctor's book, and found a man rejected for being two inches under chest, I would say to the Recruiting Officer—“ you had no right to put that in front of the doctor.” I call that “ rubbish.” I learnt from

Gen. Borrett.

Gen. Borrett. experience that the medical rejections do me a lot of harm. I was Inspector-General during the war and the recruiting went well, and we like it to go with a swing, and do not like to check it; and I do not like a lot of men being rejected, it gets a bad idea about, and I like to press upon recruiters to reduce the making of rejections, and I felt it very much better to send up men with a reasonable chance of passing. If I sent up "rubbish," I could run the figures up to anything you like. You might send a man up with one leg or a man with one eye.

167. You have no means of judging now whether Sir Frederick Maurice is correct in his view that, over and above those rejected by the doctor, something between 20 and 30 per cent. are also rejected by the recruiter?—It is probably true. We used to get figures. I do not much believe in figures myself. It is not only London we have to run, but we have ninety recruiting districts throughout the country, and although officers are doing the work conscientiously and well, still it is impossible to work in the same way. They do not know what is in my mind; they all try to send in figures correctly, but they come in differently. The colonels and people who make them out have different ideas. Sometimes they are recruiting the same people over and over again. I found at Manchester a tremendous lot of men rejected over and over again. When a man wants to be a soldier, by Act of Parliament he has to be given a certain form called a Notice form, and I found that the recruiters there were in the habit of giving a great many men those forms, and they rejected them immediately on the spot. That made me think about it, for you see they all came in amongst the rejected. When they gave them the form they rejected them. Well, the recruit could pass that form on. It all advertises the Army, and does no harm. But when I put those figures down as rejected recruits it is all wrong, and I stopped those numbers because they have been so misleading, and I cannot tell you how many should be put down as rejected. In the old days there might be thousands and thousands out.

168. But in acting under your instructions to exclude "rubbish," what methods do the men employ? Do they measure them, and that sort of thing?—Before any non-commissioned officer is made a recruiter he attends at the hospital before the examining medical officer, and they keep that recruiter in the hospital for a week or ten days, seeing recruits being examined. If a recruit has varicose veins the recruiter ought to see them, and also to see a man measured. Of course, with regard to heart disease and lungs he does nothing; but all these men are roughly taught how to measure and to know bad varicose veins and bad teeth when they see them, and the men are instructed in these matters.

169. Then every recruiter is a fairly good judge of raw material?—Yes, and the officers are trained in the same way.

170. Then you say: "The statement in paragraph 150 of the Report that the physique of the working-classes is deteriorating is based on personal knowledge as the result of your visits of inspection in the various recruiting districts." How do you base that knowledge?—When I go round these regimental districts, before I look at the books in the hospital, I have formed an opinion in my own mind what the medical rejections ought to be; and if I go to a certain medical district I expect low medical rejections; and if I go to towns like London, Manchester, Birmingham, Sheffield, and Leeds, I expect to find high medical rejections, and if I do not find them so there is sure to be something wrong. There are more recruits from the towns than the agricultural districts.

171. And I suppose you recruit in the towns men who may have come from the agricultural districts?—That may be, but still the greater proportion would be townsmen. If I go to Sheffield and business is good, the recruiting is bad; and when I go to Manchester if cotton is bad, men come to enlist. We get more men from the towns than from the country districts. I go to medical officers and ask them how they are getting on, and continually the officers have said to me. "The same class of men are not coming up"; men of good character are coming forward, but I know that I am not getting such good men physically. When they tell me that, and I look at the percentages of rejections going up, I could not help forming the opinion that I have done.

172. This is a matter of impression?—And I think that it is right too. I have had a great deal of experience. I know the total number of rejections has gone up enormously.

173. Are we justified in thinking that the increase of dental caries is an indication of the physical deterioration of the race? Might it not be due to more personal and external causes?—I have often spoken to medical officers on this question. I saw one report of a medical man at Liverpool; he was very strict and had a fad about teeth. That is one of the difficulties. I should like every recruit to be inspected by the same doctor. But I may have 100 different doctors, and they cannot have the same opinion of recruits. Well, I was saying I saw him reject two men for being short of teeth; and I looked at the men, and they were most magnificent men, both of them. I asked, "Are these men in perfect health?" He said, "Perfect." Then I said, "Is it not common-sense that a man in perfect health who has lost teeth won't go on losing them?" "Now it seems to me," I said, "that if a man is in a bad state of health—in a poor and weakly state—he ought to be rejected; but not these two men." He said, "That is perfectly true." I said, "Won't you pass them?" and he said, "No, I can't." When my last inspection was made at Preston, I found the medical rejections very high. Lancashire is very bad for teeth. I learned that a lot of rejections were made on that ground, and I made allowances. When I went to Liverpool and those places in Lancashire I expected to see a lot of men rejected for bad teeth, and I was prepared for that. Devonshire, I know, has a reputation for flat feet.

174. Is Devonshire a bad place for that?—Yes, that is so. I was going to say when I was at Preston, after going round I was in the canteen, and I saw three children come in belonging to the dépôt, and the Colonel said, "These are some of our children; ask them to show you their teeth." There were two girls and a boy. I said, "Do you mind showing me your teeth." Well, I never saw anything so frightful—quite young children, and the whole of the children there are in the same state. Teeth are bad in Lancashire, and therefore I was prepared to hear of many rejections on that account.

175. That is the worst quarter in England for teeth, is it not?—Yes. Everywhere it is going up, but in Lancashire it is very bad.

176. You say that it is "a pity that the physique of the recruit-giving class is as poor as it is so as to cause such a large percentage of rejections for the Army." Is that the fact, for it touches directly the subject-matter of our inquiry? It may be that the recruit-giving class is very poor, but it does not follow that the physique of the nation is deteriorating?—I do not say that it is, but I cannot help thinking that it is a most unfortunate state of things that so many get rejected, and that so many men cannot be soldiers and cannot pass. The standard is not too high; it was all fixed fairly and by experts, too.

177. You admit that the standard is not very high?—Quite so. And it is rather a serious state of things that so many men who want to be soldiers get rejected.

178. You say it is "most unfortunate that more Englishmen do not come up to the standard," but the vast proportion do come up to the standard. But still it is the unfortunate class that presents itself to your recruiters which does not come up to the standard. It is unfortunate that the better class do not come forward?—That is so.

179. When you say "men who want to be soldiers," you mean those people who have no opening in life, or who have no occupation, and who drift to the recruiter on the vague hope that he may pass them and get into the Army?—There are a great many of that kind no doubt. I must confess a great many are that way.

180. They are the people who have drifted into the dust-bins of society?—My experience is rather with the young men. We take a recruit for the Line at eighteen, and I would rather take a man at eighteen than any other age.

181. You mean rather than older?—Yes.

182. Because Sir William Taylor held just the opposite opinion this morning?—I hold this view—if a man comes to enlist at twenty, I cannot help thinking, and my experience bears me out that there is something odd

about that man. Why does a man of twenty want to enlist? It must be because he is out of work. Why is he out of work? He must have been in work because the class of men that enlists cannot be idle until they are twenty. Now, a man at twenty gets out of work for some reason. Perhaps he gets drunk and his master won't have him; and he is turned out. But when you come to a man of eighteen that is a different matter.

183. I can understand on the question of character that that may be so. But when a man of eighteen comes to you even with your standards you may have more disappointing material than in the case of a man of twenty?—But a man enlisting at eighteen has at twenty got good food and healthy training while in the Army.

184. No doubt the healthy training would be more important to his physique than the ordinary civil employment, but still a larger number of breakdowns take place after enlistment in the case of those who enlist at eighteen than at twenty. Would not that be so?—Yes. I have not got the Orders under which men are enlisted, but they are made so that the older a man is the more we expect of him. A man of twenty must have greater measurement round the chest and weigh more than a lad of eighteen.

185. That is one of the points Sir William Taylor mentioned. Supposing we enlist at an early age we pass a certain number in the hope that they will develop, and they do not develop?—I would rather have a man of twenty if he was of good character; but taking it all round I take it to be better to have the younger men.

186. (*Colonel Fox.*) Do you not think that the majority of the recruits are men who are more or less failures in civil life—the majority of them—either from want of grit or want of intelligence, and who are incapable of a start in life?—I would not like to say that.

187. Do you not think that there is a vast number who nearly always present themselves in poor clothes and starving?—There may be a great many. That is why I like the men of eighteen best.

188. Do you not think that a large majority of the recruits that come up are of that stamp?—A great many. But we must remember that strikes and things of that kind give us a lot of recruits; sometimes a place is shut up and therefore it is through no fault of their own that men are out of work. We all know that strikes do us a lot of good.

189. If we competed with the skilled artisan, do you think we should get a better class of men into the Army?—Certainly.

190. Which tends to show that we do not get now the representative men of the nation to enlist into the service?—That is so. We do not get them.

191. The fact of the soldier population being of such poor physique and the rejections so numerous, does not necessarily mean that the physique of the nation is deteriorating?—No, it does not.

192. (*Chairman.*) You do say that the physique and character of the recruits appear to be satisfactory?—Yes. The general officers reported that they are well satisfied, that is, looking at the recruits that you pass. It has nothing to do with those who do not get through.

193. There appears to be some discrepancy between the figures on page 153 and those included in Sir William Taylor's memorandum on page 3; the percentages appear to differ?—You are referring to my paragraph 75?

194. Yes?—I got those from the Army Medical Department, which shows the number of recruits. I have to get those figures from that Department.

195. There are discrepancies; perhaps they are not very striking, but still they are discrepancies?—I cannot help that.

196. (*Dr. Tatham.*) It has been stated in your memorandum here, and it is stated in Sir William Taylor's Report, I think, that the recruits which come up to you are for the most part, the majority, under nineteen years of age?—Yes.

197. That is true at the present time, just as it was in 1897?—Yes.

198. And you personally would prefer even that they should come at the age of eighteen rather than nineteen? Is that so?—Of course when I was first Inspector-General of Recruiting the Secretary for War had not issued his

orders strictly about obtaining characters as we have now, and certainly, when that was the case, we did not go so particularly into the character. I cannot help saying I have some doubt about a man who is twenty—I do not mind eighteen or nineteen—but when a man gets to twenty there is always something suspicious about his being out of work; it is from his own bad character, or he is a fraud, or he is a man who has enlisted and deserted, and is trying to enlist again.

199. What about recruits of seventeen?—They are too young for the Army, we take no man under eighteen.

200. Do you know that the Army Medical Reports of 1897 to 1900 show that there is a very considerable proportion indeed under eighteen, between seventeen and eighteen?—No man is enlisted unless he says he is eighteen, except for the Militia.

201. That is a mis-statement on the part of the recruit, is it not?—On the first page of the attestation a man declares his age. We do not ask him to produce a birth certificate, and as Mr. Brodric has answered in the House of Commons, it would never do to get the birth certificate. You cannot get a man to enlist unless you enlist him at once.

202. Would it be impracticable to get the birth certificate?—It would not pay us; we could not do it. On the second page of the attestation you have doctors' opinion of the man as to his measurements and whether he is fit, and he puts down the apparent age, and that apparent age is what he thinks he is. If a man says, "I am eighteen years and six months," then, perhaps, the doctor puts down the apparent age "seventeen years and six months." When he goes before the colonel, he says to the young fellow, "The doctor does not think you are eighteen, and you must get a birth certificate. But if the doctor is wrong, I will take you."

203. (*Chairman.*) In the last resort you do ask for a birth certificate?—Yes, and it is the business of the approving officer to ensure that the lad is eighteen.

204. (*Dr. Tatham.*) With regard to obtaining the birth certificate in every case, would not that be very easy to get?—I think it would be very difficult.

205. Where would the difficulty be?—The delay.

206. (*Mr. Legge.*) A single day's delay would lose you the recruit, you think?—Recruiting is a curious thing. We want men, and we must get them. When this order came out about the character, I had to give certain orders on the subject about getting characters. The recruiting in towns was going frightfully down because the colonels ran the character scheme too hard, and I had to issue orders privately to tell them how to run it. I said, "You can't get recruits without assuming responsibility. If any young man comes before the commanding officer and looks a healthy and athletic chap, take him at once, and get his character afterwards. You lose the man if you don't, probably." I found a great many cases in which the colonels did not take the responsibility, and when they did ask for the characters, the relations of those very respectable would-be recruits induced the men to change their mind. You cannot run recruiting like that. If a colonel takes responsibility and enlists a likely man, and applies for his character afterwards, then if the parents want the man to change his mind it is too late, because the man is already a soldier.

207. (*Colonel Onslow.*) Do not you think also that a great many men cannot trace where they were born?—A great many cannot. I am sure that it is impossible.

208. (*Chairman.*) They could say where they were at school, and all schools keep a register of ages?—Yes.

209. (*Colonel Onslow.*) I have found the greatest difficulty in getting the age witness?—I do not think it necessary to get certificates. If the doctors look at the man and he has the appearance and the physique of a man of eighteen, I am prepared to take the man.

210. (*Chairman.*) Are doctors prepared to back their judgment as between seventeen and eighteen?—They are taken in sometimes.

211. You do not think that the number of cases in which they are taken in is large?—Not with good doctors. We have loads of cases where the doctors put down seventeen, and we find that the doctor is wrong and the man is eighteen. There are a great many more the other way though. If a man is found to be under seventeen—there are

Gen. Borrett.

[Gen. Borrett.] cases when men get in under seventeen, with extraordinary physique—then according to law he is discharged right off and we do not keep him; he is immediately let go.

212. (*Colonel Fox.*) There are plenty of men enlisted at 5 feet 5 inches and 5 feet 6 inches who grow into 6 feet men; and many N.C.Os have told me that they have enlisted at sixteen?—I heard Sir William Taylor say this morning that he thought that these figures did not prove very much. I should like to back that up, because I base my opinion on the physical deterioration more on experience, going around and talking to the doctors, and looking at the men, than I do on figures. When I have ninety different places where men are enlisted it is impossible to get medical officers to work all in the same way. Some reject them and do not put them in their Returns, and others act otherwise. They are all conscientious, no doubt. It was found by experience that a certain district (I think it was Bury St. Edmunds, one of our best recruiting districts in the whole United Kingdom)—the eastern counties is doing very well indeed, and Bury is one of our best places—and it was found not to be a good thing for the recruiters to reject the men. The recruiting was going very well at Bury St. Edmunds, and they found that it did not do for the men to go back to their fellows, who would say, "Ain't you a soldier?" and he would reply, "I saw a fellow. He said 'you are no good!'" "Did not you see the doctor?" "No, I did not." In consequence of that kind of thing the colonel consulted the doctor, who wanted to work it well with him, and he said, "I shall see everybody for you, and then the men that come up cannot go back and say that they were not properly seen by the doctor." The way they work is this: they have perhaps twenty recruits in the morning. The doctor sees the first ten, who have been passed by the recruiters as having a reasonable chance of passing, and then the doctor looks at them and he either passes them or not. And then come the men whom the recruiters would have rejected, and of course the doctor rejects them, and does not enter them in his book.

213. (*Chairman.*) What proportion were passed by the doctor?—I cannot tell you; a fair number. It is impossible for all doctors to work alike. If you take the medical department they will tell you that every man that comes before the medical officer must be put down in the books, and a great many of them keep to that. When this officer asked me, I said, "You are working in a common-sense sort of way." The figures are misleading therefore.

214. The Bury St. Edmunds district is entirely agricultural?—Yes, and the rejections were only 12 or 13 per cent.

215. It is rather a pity that Sir William Taylor did not give us Returns from a place like Bury St. Edmunds?—You can easily get them.

216. (*Mr. Legge.*) But I put that particular point to Sir William Taylor, and he said that there is no guarantee of their throwing light on this point. Now General Borrett has a paragraph which states when he visited Manchester and London and certain towns he expected to find a high percentage of rejections because they were towns. Then you speak of Bury St. Edmunds and you expected few medical rejections because they were countrymen?—Quite so.

217. Therefore in your judgment you could have a set of returns from the recruiting returns of big towns and also a set of returns from recruiting centres such as Exeter, Lincoln and Bury St. Edmunds, and we could draw conclusions from these two returns as to the comparative physique of countrymen and townsmen?—I daresay you could.

218. Sir William Taylor said you could not?—It is only common-sense. Anyhow, the classes in the country who want to be soldiers are a better class than the men in the towns.

219. (*Colonel Fox.*) The reason that he mentioned was that a man might get into trouble with a lass and want to get right away from the district to recruit?—There are a great many such cases.

220. And it might be from other causes?—Yes.

221. (*Colonel Onslow.*) Take Manchester, for instance; in that town you get a great many country lads, but in the country you won't get town lads?—Certainly not.

222. (*Chairman.*) If we can get figures dealing with rural districts it might be useful. Could that be done?—Yes, with the greatest of ease. You have only to ask for them.

223. I wondered this morning that Sir William Taylor, in the places he selected, did not give a greater variety?—He has only to get that from the doctor's books; I always see the books.

224. (*Colonel Onslow.*) Do they not include the whole of these recruiting places? Have you seen that? (*Showing same.*) Those are the names of his districts.—They are all big places.

225. (*Mr. Legge.*) Perhaps General Borrett could give us a list of agricultural places that he could recommend as the main ones?—Yes, I could.

226. (*Chairman.*) What recruiting centres in the agricultural districts would you recommend us to ask for?—There is Norwich and Bury St. Edmunds.

227. (*Colonel Onslow.*) Would there be any difficulty in getting the whole?—No difficulty whatever. For the last year each one would send it in. It would not take three minutes and I could find it out.

228. (*Chairman.*) Could you give us it with the different causes?—It would take longer with the different causes.

229. We should require to have it under the four causes mentioned in the summary?—This return of the Director-General is only made up from districts sent in to him, and instead of adding them all together he has only to keep them separate. When I get a general return I get it from the whole districts, and then add them all together.

230. How many districts have you?—About ninety.

231. (*Mr. Struthers.*) We might get two or three typical country districts?—Yes.

232. (*Chairman.*) Will you give us the places where we should ask for recruiting statistics?—Carlisle, Norwich, Lincoln, Reading, Bury St. Edmunds, Exeter, Shrewsbury, Chichester, Taunton, Armagh, Omagh, Clonmel, Stirling, and Aberdeen.

233. (*Mr. Struthers.*) I see the percentage in Glasgow is low as compared with some of the other towns?—It depends very much upon the doctor again and the way he works it.

234. Can you tell us to what extent bad teeth are any indication of weak physique?—I cannot tell you to what extent, but common-sense tells you that it is so.

235. In this report of the Committee of the Dental Association there is a brief statement of the results obtained by the British Dental Association, who have investigated the condition of teeth in school children, in two classes of schools—the well-to-do children, and those of the poor children in Edinburgh; and the percentage of defective teeth in the case of the poorer class of children is 158·2, and in the better class of children 273 per thousand; so far as that is of any value it shows that you might expect to have bad teeth in the well-to-do classes rather than the poorer class of the children?—Well, there is no doubt since the war in South Africa the medical officers have been more particular about teeth than they were.

236. (*Chairman.*) That is admitted?—There were a great many break-downs for teeth. The Director-General told me that it was not all owing to the doctors, but the climate was bad for teeth in South Africa.

237. (*Mr. Struthers.*) You mentioned the prevalence of flat feet in Devonshire?—I think I am right there.

238. Is there any other defect which attaches to any district or where you find bad teeth more numerous than in another district?—I put down Lancashire as very bad for teeth.

239. (*Chairman.*) Have you any reason to give why Lancashire should be so bad?—The doctor at Preston put it down to the water, but at Liverpool it is the same.

240. (*Colonel Onslow.*) The medical men put it down to the chemicals in the air; and it is the same in a great many cases where there are foundries and chemical works, and so on.

241. (*Mr. Struthers.*) Is there any other defect which attaches itself to any district?—Only flat feet. Teeth is the great one. I think there is no particular district that I find heart disease or anything of that sort more prevalent.

242. (*Chairman.*) You heard me ask Sir William Taylor as to how far the recruiting agencies in the country could be utilised with the view to the collection of data upon an anthropometric basis touching the physique of the people or of that section of the population where in the past you found the recruits. Would it add greatly to the work that is now thrown upon the recruiters if certain limited numbers of observations, which upon medical authority would be held to be useful for the purpose of a comparative survey, were made on the introduction of a recruit into the Army?—What sort of opinion would you want?

243. Chest measurement, height, weight, and so on?—That is all done now.

244. Is it all recorded?—Yes. In a Return which was stopped during the war, the average height and weight and age of all the men that enlisted were given.

245. So that all these facts are actually collected?—Yes.

246. (*Colonel Fox.*) The sight would have to be all right, and do you not admit them with a limited number of teeth?—The Orders are, enough to masticate, and then he should be passed; and if he has not enough then, to reject. Some doctors asked the Director-General to state a certain number of teeth, but we always said that if a man can bite his food don't reject him. I am all for the medical officer using his experience, and judging of a man as he finds him. Some will take the responsibility, and those who take the responsibility, I always think, get on much better than the others.

247. (*Chairman.*) These data that you say are collected are to be found in that volume?—The General Annual Return by the War Office, which gives the ages of all the recruits that enlist.

248. Does it give the chest measurement and height relative to age, or does it merely give an average?

249. (*Colonel Fox.*) Have they got the age opposite each one?—No.

250. That could be done?—Yes.

251. If you could put in the collected figures and facts it should be done relative to age, with the view of establishing a relation between the two?—Yes.

252. There is a minimum of sixteen?—Seventeen for the Militia, and eighteen for the Line.

253. (*Chairman.*) Within limits, do they join more or less at the same age?—How do you mean? *Gen. Bo. rett.*

254. Up to what age do you take recruits?—Twenty-five.

255. Do you take many at that age?—No, we take the greater number between eighteen and nineteen.

256. The relation of chest measurement to average age would be at about nineteen?—The average age is nineteen on enlistment. We go from eighteen to twenty-five.

257. Do you say that 80 per cent. of your men are recruited at eighteen?—Eighteen or nineteen. We have very often to close up eighteen and only take men of nineteen, and this is done for Indian purposes—no man is allowed to go under twenty to India. Supposing the 14th Hussars are short of 100, then we should enlist 100 at nineteen, to have men ready next year fit for the draft. If we enlisted them at eighteen they would be no use for India, and so we often close at eighteen. And the same thing happened with the Boer War, no man was sent out unless he was twenty years of age. Of course a few were under twenty, but that was their own fault.

258. What is the exact name of the Return?—The General Annual Return for the Army. It was stopped during the war.

259. Has it been resumed since the war?—They are doing it now. There are Tables, I know. It is not done in my department.

260. What date would you put upon that?—I think 1899 was the last Return issued, just before the war broke out. I think one is coming out now.

261. (*Colonel Onslow.*) Could you not give us the Returns before 1899?—Yes.

262. (*Mr. Lindsell.*) In those Returns from the different Departments would it show the numbers from the different districts, whether town or country? You say every year there are more recruits from the cities and fewer from the country. Could we have figures showing that—that is to say Bury St. Edmunds—the number of recruits presented each year would show a falling off if that view is correct?—That is seen in my last Annual Report, which shows the number of recruits raised in each recruiting area during the past five years.

General Sir FREDERICK MAURICE, K.C.B., called; and Examined.

263. (*Chairman.*) You were for some years a General Officer Commanding at Woolwich?—Yes, for seven years.

264. Terminating when?—Terminating in September last year.

265. It was during those years that your attention was drawn in a somewhat special manner to the question of the physical health of the classes from which we draw recruits?—Yes.

266. And, in consequence of what came under your observation at that time, you had some interviews with the Inspector-General of recruiting thereon?—Yes.

267. Could you favour us with what passed on those occasions?—I had been very much struck by the fact that we were taking some very bad bargains into the Service, who had evidently cost a great deal of money, and who would never make soldiers at all, and, therefore, I went to see the Inspector-General of Recruiting thereon, General Borrett. I called his attention to certain men who had been passed into the Service, and he immediately drew my attention to the fact that his great difficulty was, that if he stopped the recruiting doctors from taking these men by making their examination more strict, they rejected much too freely. I learnt that in the course of conversation.

268. What was the date of the conversation?—Well, I used to go up pretty frequently.

269. Was that before the war?—Yes, and also after the war had begun; and, in fact, a good deal was subsequently to the war. I used generally to have my attention called to a bad case, and I would go and have a talk to him; I would at a single inspection at the Herbert Hospital find half-a-dozen men perfectly unfit for military or civil life. I very soon found that the practical point

was that the doctors had had such bad recruiting subjects before them that their eyes had got wearied with the classes they were inspecting, and they passed those men in because, relatively to some of the others they had been seeing, they were not so bad.

270. In a spirit of sheer exhaustion?—Yes, and also that the standard of their eyes was lowered by the men they had been seeing. That, of course, rather alarmed me as to the class from whom we were getting our recruits. Then the question arose, whether it was simply that we were getting only refuse for the Army, or whether the failure in physique did not affect other classes, whether my experience was not applicable to these also.

271. The question was whether the condition indicated applied only to the loafing classes, or to the poorer classes generally?—Yes. After that I began to get a good deal of evidence from other people in Woolwich, and I found two most startling cases in my own family; that is to say, a daughter-in-law of my own engaged for a short time a temporary cook who is a married woman, and the house was kept awake at night by the screams of a baby in arms, night after night. We very soon found that the reason of this was that the mother was giving her six months' old baby habitually for supper cold cabbage, though the woman was quite able to give it proper food.

272. Was it pickled cabbage?—I think it was cold ordinary cabbage.

273. It was not uncooked?—I am not prepared to go into those details; how far it was cold after it had been cooked, or before it had been cooked, I cannot say; but the child was certainly given food that it was quite unable to digest.

*Sir F.
Maurice.*

Sir F.
Maurice.

274. Did the child survive?—It was not dead at the time I speak of. But I was perfectly convinced that that would have an effect upon young men at eighteen years of age if that was the way they were treated when babies in arms. Then the question arose whether the case was exceptional or representative. I naturally went about among the ladies who visited the homes of the people, such as district visitors, clergymen's wives and others who had experience, and I found that it was their experience that the children were fed in that way, that the ordinary answers of the mothers when they were speaking of the feeding of their children was, "They eats just what we does."

275. You say that the universal testimony was that parents feed them off their own plates, and include raw herrings, pickles, fried fish, and the like?—Yes. I found also that the societies which sent out children into the country districts, on the system of giving town children a few weeks of country air and country food, habitually received reports that the children could not eat the food natural for their time of life, because in their town life they had been accustomed to what they called relishes, one kind of unwholesome food of which I have spoken.

276. The things that were stimulating to the palate?—Yes. The other case arose from my own experience in my own family. My second son was very suddenly taken with scarlet fever, and before the infectious stage it became necessary to have him taken out of the house, and I had to send him to a hospital. At that time one could not put anyone into a paying ward, and he had to go into the ordinary ward at Blackheath; and, as he was always fond of looking after children, as soon as he was well, he helped the nurses to look after the children in the hospital. There was one little puny three-year-old child, who had had a penny given to him to play with, and the poor little wretch held out his hand to every visitor with this penny in it asking them to get him with it "just a ha'porth of gin." It was his one idea of the way to use the penny. Gin was his ideal of happiness. That led me to make inquiries, among nurses and doctors, as to their experience in this matter, and the answer I got was that livers diseased by in, "gin-livers," for children under three years of age, were a common experience of hospital practice.

277. That's what you call a representative case?—Yes. The question was whether those cases were exceptional or representative, and I came to the conclusion that they were representative. That led me to write, not that article which you have before you but an earlier one.

278. Which I have not seen?—It is of no importance to you because it was my first sketch. The point of view, from what I had at that time learnt which then impressed me was that it was no use our talking of compulsory service; or of universal service; or of any other mode of increasing the inducements for getting soldiers for the Army if there were men in numbers quite sufficient for us ready to enlist, if they were only in fit condition to make soldiers. Obviously the cases that were coming under my observation showed that many who were willing were not fit, not from any hereditary deterioration, or from anything of that kind, but that the children who could have been healthy soldiers, or anything else in civil life were being destroyed in their earlier years owing to their being improperly nurtured from the time of their being babies in arms, and so on. I therefore drew attention to the question in an article under the title of "Where to get Men." It was in the January before that article in the *Contemporary Review*. You will see, at the beginning of that article, I mention the fact that I had written "Where to get Men." It so happened that the Civic Society of Glasgow, which is a society formed partly from the university and partly from the chief people in the town interested in general social questions, had some time earlier asked me to deliver the inaugural lecture of their season, in September or October of last year. I wanted to deal with quite a different subject, but some of them had known that "Where to get Men" was by me, and they insisted on my taking up the subject again. I put this to you to show how very little I myself have had anything to do with the agitation of the question more than flying a kite that everybody has shot at. They were so interested already from their experience in Glasgow, and from what they had been concerned with on the question of health or deterioration (whichever way it may be put) that they insisted upon my taking up this subject, and it was solely on their urgent desire that I gave

the lecture, the substance of which I brought into the article now before you.

279. It may be taken for granted, I suppose, that the conditions of existence in Glasgow are perhaps worse for the great mass of the population than those in any other town in the British Isles?—In many ways that is true, but in many ways it is true as a consequence that there is a more serious effort made to combat these evils in Glasgow than in almost any other town. I rather think a point I shall come to presently is closely connected with the point you raise. I do not think that our most serious danger arises from places where the conditions are most difficult, and most attention is drawn to them, but in those places where the thing has gradually arisen and nobody has looked after it. But I did find this in Glasgow, that there was one particular part of the question which, as it seemed to me, had been practically solved in Glasgow; that is to say, we all know the London County Council and other bodies have endeavoured to meet the difficulty of children not being properly fed who have to go to school. But the people who really know the poor, and who are in close touch with them, are alarmed at the idea of your pauperising, if you feed the children.

280. If you feed them gratuitously?—I shall come to the gratuitous part of it in a moment. There was quite an agitation in London because they said that the immediate effect of feeding the children was to reward the careless parent and to take away his responsibility. But in Glasgow what they have done is this. They have worked with the Charity Organisation Society and the police. They have made it a rule that the children should be fed. They then brought home the responsibility, and the practical result was that what they had done had diminished the applications for gratuitous food and not increased them.

281. Can you favour us with the machinery that they adopted?—I almost think that the most useful way of doing that is to put you on the track of direct evidence, and I think the better plan would be to suggest the names of people in Glasgow who could speak specifically on that subject.

282. Can you mention the names of anybody?—I had better give the secretary some names a little later. I have some names in my mind, but I could very easily find people in Glasgow who would give you the best and most direct evidence.

283. We want to limit the evidence to representative persons who will give us in the smallest compass whatever is best to be known, without risk of endless repetition?—Quite so, naturally. I would rather find out from Glasgow the people you want, because, although I know good names, I am not sure that they are the most representative people. That is a point that I was looking to in my previous answer. It so happens, after the article in the *Contemporary Review* appeared, I received a similar request to go to Manchester, and without entering into all the circumstances of what I said down at Manchester, I may say that I found that there was another side of the question that appeared to me to have been most admirably solved, and that is as to the looking after the mothers in the feeding of their children and the nurture of their children. There they had a system of ladies, who work under the direction of medical men and who get into touch with the homes as soon as they are notified of a birth. The evidence is very completely given in a little report that I certainly think ought to be before your Committee—that is, the report of the Jubilee Meeting of the Manchester Sanitary Association.

284. (*Dr. Tatham.*) That is the Ladies' Health Society, is it not?—Yes. The point I want to make is this: that Manchester, as far as I am able to see, has practically solved that question if they could do it on a sufficient scale. Manchester is working on very small means as compared with the wealth of Manchester, but still the principle is solved, and the evidence is not only as to the great benefit to the children, but as to the fact that the mothers welcome the coming of the ladies who act under the instructions of the doctors. Of course it is necessary that you should have ladies selected who will exercise a good deal of tact, and where that has been done, the mothers actually welcomed their coming and were proud to show the improvement in their babies.

285. (*Chairman.*) Is that commensurate to the cost in Manchester? The cost is ridiculously small. You will

Sir F.
Maurice.

see the figures in the report of the Jubilee Conference. Of course there has been a great deal of voluntary work which costs the town nothing.

286. (Dr. Tatham.) Sir Frederick is quite right. The reason why the Ladies' Health Society do so admirably is that they are now under the ægis of the Corporation, it is the Corporation which supports them. Is not that so?—Certainly; I can give other instances that Corporations are quite ready, where they see there is really a good case, to find all the money wanted (I do not say in all boroughs) for such purposes as that. For instance, at Woolwich the medical health officer had a number of little cards printed with a heading "How to feed Baby"; and a series of quite simple directions were given as to the different stages at which babies' food should be given, and those were printed in very large numbers at the expense of the corporation, and they were distributed through the different agencies, the clergymen, the dissenters, and the district visitors, and so on. My point is, that so far as I was able to see whilst in Manchester, the question of the feeding of the children at their homes has been most admirably solved; the question of the feeding of the children in the schools has likewise been solved in Glasgow. Therefore, I think that the great thing that is wanted is something that will bring the experience of Manchester to bear upon Glasgow, and the experience of Glasgow to bear upon Manchester.

287. (Chairman.) And the experience of the two brought to bear upon the whole country?—Yes. One of the most alarming features of that report of the Jubilee Conference in Manchester is the statement made by the Chairman of the Medical Health Board of the County Council of Chester (because for this Jubilee those most conversant with the facts came from all parts of the country), that the most terrible conditions prevail in the large villages, and small towns that have been growing up without any kind of organisation to look after them. You will find his statement there, and it is most frightful. He says that the death-rate in many of those places is not, as in many places, 200 or 300 per 1,000; but that of all children born of all classes (of course that practically shows a higher percentage yet for the poorer classes), but he takes the whole birth-rate of all children born during certain months of the year, and he finds the death-rate is 800 per 1,000. You can see the statement and the authority. All I can do is to give you the best evidence the case admits of.

288. That is under one year old?—Yes; and then, what he says is, that so far from that slaughter being discriminating, that is leaving a survival of the fittest—on the contrary the very causes that have led to the slaughter lead to the result that those who have escaped the slaughter are being brought up under conditions in which it is quite impossible to be virile.

289. Permanently unfitted for life?—Yes. That was very much confirmed by the view of Dr. Ashby, who I think is acknowledged by almost all the profession as having devoted more special care to the culture of children than almost anyone else. He was speaking at the opening ceremony of the "Infants' Hospital" at Blackheath, as to which I might hand to you this paper. He was speaking *à propos* to that article of mine about the 11,000 people who offered themselves for enlistment in Manchester in 1899, of whom 8,000 were rejected straight off, and he said: "I am prepared to produce, so as to account for every one of those 8,000 recruits who were rejected, 8,000 children now in Manchester at quite a young age who are rickety and unfit to make soldiers, or anything else, because of their improper nurture and improper care."

290. Is that owing to malnutrition?—I am not prepared to say that altogether. One other frequent cause of failure in physique, for instance is "flat feet," representing another form of want of care, because the greater and there would be very few cases of flat feet if the mothers, number of flat feet are due to want of proper care properly treated them. The same is true of bad teeth, resulting both from improper feeding and improper care during childhood.

291. You do not say anything about the housing problem?—That has an enormous deal to do with it. I have expressly mentioned it in the *Contemporary* article you have before you. But I suggest one person who has been working at that question, Mr. T. C. Horsfall, who for at least twenty-five years has been pouring out pamphlets

on that subject, and his knowledge is so great that I am sure he would give you the cream of the whole thing.

292. Is he in Manchester?—Yes. There is another man who would be useful, who has taken up one branch of the subject which is very important, and that is Dr. Clifford Albutt, the Cambridge Professor of Hygiene. At the Sanitary Congress in Bradford, where he presided in the medical section he took up the subject whether the processes by which medical men have been saving life had been a cause of deterioration?

293. By the survival of the unfit?—By prolonging the life of the unfit, and he certainly dealt in an exceedingly powerful argument with the negative of that. He maintained very strongly indeed that, of all the discriminating agencies to produce the survival of the fittest, disease was the worst. He argues that the injury to those who survive is so great that all measures which combat disease tend to improve the race. I have had an enormous correspondence with all parts of the country, and I have had sent to me all the theories that have been put forward by many people. The question is so large a one that it is quite certain that there is no one cause. Undoubtedly, the revolutionary change that has taken place during the 19th century affects the habits of the country, and it is rather that than anything else, that needs to be taken into account.

294. Do you mean the accumulation of the people in the great towns?—Yes: the change from the 75 per cent. of the people in the country at the beginning of the century as compared with the 75 per cent. now living in the towns. But I would not say that the danger is so much attributable to the transition to the towns as to the fact that we have not made adequate provision to deal with that change. There is the whole housing question, and the whole drink question, and an enormous number of questions involved in it. I think, as regards evidence to come before you, there are several people who have studied this question. There was a man I was talking to yesterday who would be a useful man. He is writing a book upon the subject, and he has been in touch with a very large number who have taken up different aspects of the question. He is the London Editor of the *Manchester Guardian*: Mr. Atkins.

295. We propose to call Mr. Charles Booth, who has perhaps more right to speak authoritatively than anybody else in the kingdom?—Most certainly. There is one thing that I have just alluded to in the article you have in your hand, and that is the danger of something that one says getting completely perverted, as it is stated in the different newspaper reports in the country. I have been repeatedly quoted as having said what I did not say. Lord Meath, in the House of Lords, quoted from a report of my speech my having said that three out of five of the men who are enlisted in the Army were lost to the Army in the course of a couple of years. I never said that in any shape or form. I have contradicted it, wherever I have seen the statement, but it is almost impossible to catch a misstatement once started. What I said, was that, as the closest estimate I could reach, 3 out of 5 of those willing to enlist were physically unfit.

296. Even as you put it it is a serious thing, if there are any facts or figures in support of it?—I merely summarised an impression because there are no statistics available for that. I would strongly put to you that the rejections by the medical officers alone are no criterion because they are pretty nearly a constant factor. Unless the recruiting sergeants and recruiting officers who have been ordered not to bring up men not likely to be passed by the medical officers, make a mistake, or unless the medical standard varies by mistake, it is bound to be a constant factor. They get a standard and they stick to that as well as they can; it may be a little too low or too high. Then there is rather an interesting point in the founding of the Infants' Hospital at Hampstead. As one of the steps taken, it to my mind is of very little importance as regards the Hampstead infants, but it is of very great importance as setting up a central school where medical officers can be specially trained in the treatment of infants. I hand that in.

297. You said three out of every five, did you not?—Yes, three out of five of those willing to enlist.

Sir F.
Maurice.

298. But that is merely a surmise?—It is merely a summary of impressions derived from a good deal of research, and is a mere rough estimate.

299. And from impressions gained at Woolwich?—Originally from Woolwich, and then in comparison with a great many things. Broadly speaking, the impression that I have had since then has never led me to think I had put it too high in those figures, though as I have said in that article, in dealing with so vast a subject, one necessarily makes mistakes, and has to change one's impressions as one goes on. For instance, when I wrote that that article, I thought that the total rejections were the constant factor. I now think that the rejections by the medical officers are the most constant figures you have to deal with. The total rejections of those willing to enlist are, so far as I can estimate, certainly not less than 3 in 5. They may very often be much more.

300. But Woolwich being a place where the people have fixed and remunerative employment, the children of the working-classes who submit themselves to the recruiting agencies are probably comparatively few?—I am not taking it from the actual recruiting at Woolwich, but I started from my experience at Woolwich, and then I began to investigate all over the country. The difficulty was that when I came upon that case at Manchester, the impression I got was that I had very much under-rated it. When you have 8,000 rejected out of 11,000 in Manchester, where the local recruiting officer had endeavoured to get the actual figures, and they came out that way, I thought that their rejections were enormously in excess of three out of five.

301. We understood from the evidence of General Borrett and Sir William Taylor that things are particularly bad in Manchester?—I suppose it would be the case in any great manufacturing town. You have exceptional conditions all over the country, not normal. No doubt, when Mr. Rowntree gives the condition of York, that is an exceptional town.

302. I have always understood that, and that there is a large class of Irish who are very wasteful, and Mr. Rowntree admits that amongst the class that he describes as poor, or what was called secondary poor, the waste is to some extent under the control of the class described?—Quite. And, moreover, York is practically below the level of the river.

303. (Colonel Fox.) Is it not about 12 feet above the level?—It is very liable to be flooded.

304. (Chairman.) In your article in the *Contemporary Review* some prominence is given to unduly early marriages. Have you something to say upon that point?—It is one of the subjects that requires investigation.

305. You know in the latest figures supplied by the Registrar-General's Department it would seem that the marriages of minors in the last twenty-five years have diminished, in the case of men from 77·8 per 1,000 to 50, and in the case of women from 217 per 1,000 to 160?—Yes.

306. That is a very marked diminution?—I have no doubt of that.

307. You are aware that one of the causes that has perhaps stopped the growth of the birth-rate is the diminution in the number of illegitimate births?—I have no doubt that is so. But then probably the other process has been going on very largely. I think probably certain causes difficult to discuss have fully come before you in other forms. Our fathers and grandfathers never kept statistics to arrive at any conclusion, but all the time these tendencies have been at work. One of the most serious things is that the country districts are losing the milk as the natural food for the children; the milk has all gone up to the towns and been much poisoned in transit; and I have lately heard in Ireland in the country districts, since the foundation of those creameries and places for making butter, the visible effect of the loss of the milk to the children in the country districts is clear.

308. That fact last autumn came under my personal knowledge from what I was told?—It is the case.

309. (Mr. Lindsay.) You do not confine that remark to Ireland?—No, it was in Scotland also. In Scotland people noticed that if they went out for a walk twenty or thirty years ago the habitual form of hospitality exercised by the peasant was to offer a glass of milk. Now they never can do it and it has gone out, and in many districts

it is the greatest charity to sell to the people skimmed milk.

310. (Chairman.) I know some people who keep goats to furnish the poor with nutritious milk. On page 49 of the *Contemporary Review*:—"Does my ugly figure of the five to two imply that the class from which we have hitherto drawn the bulk of its defenders is from some cause or causes ceasing to supply the numbers of healthy men that it used to do, or at all events to such an extent suffering in its virility that it cannot now supply them?" May it rather not be the case that owing to the operation of many causes voluntary enlistment has had to depend more and more upon the wastrels of large towns for the supply of recruits?—It is necessarily the case that they are drawn from the towns rather than the country districts.

311. And from that class of the towns which supplies the ranks of casual labour?—I am not prepared to speak upon that with authority.

312. Would not you say that it is probable?—Yes, I should think it is. But it is an enormous proportion when you get that figure in Manchester of eight out of eleven thousand persons, and what brought in the great numbers was the actual enthusiasm for the war, which did not touch the wastrels, but rather the other way.

313. (Mr. Struthers.) Was that 11,000 more than the ordinary recruiting?—I should say it was very much larger. I have no doubt that is so. Perhaps in 1899 the average willing to enlist was very much exceeded everywhere at the beginning of the war.

314. (Mr. Legge.) In 1902, the total number in Manchester was 4,400?—Quite so.

315. (Mr. Struthers.) In what year was this 11,000?—In 1899. But the percentage of rejections was very little different in the following year of 1900.

316. But the total number is the total number who offered themselves, but the number given here is the total number of men who came before the medical officers?—Yes, I doubt whether you would get anything about that. This is rather an exceptional thing, the recruiting officer having taken pains to get at the number of men who did offer themselves. What steps he took I do not know.

317. (Chairman.) The fact is the Inspector-General of Recruiting says that it is impossible to show that the Army draws its supply from a lower class now?—Quite so.

318. But the period of industrial activity that we have passed through, may be a contributing cause?—Yes.

319. (Colonel Fox.) And education is beginning to tell, and being educated they get employment, is not that so?—Yes. Under that aspect you have statistics of firms in very large numbers who have employed doctors in testing the lads in the factories in different places. There are a number of medical officers who have been employed by the employers themselves to ensure their not getting in those who are likely to put them under the Employers' Liability Act, so that they have carefully watched the importation into the factories of persons who might come into their employ to be brought under the Act. They show that the percentage of the unfit is very serious indeed. I think that those statistics ought to be obtained for the Committee.

320. (Mr. Struthers.) Could we get those statistics anywhere?—I cannot at this moment tell you where they are published, but I am sure I could get them for you before long.

321. You have not known whether there has been a falling off in the number of navvies who seek employment on the railways?—No, it would be very interesting to have that. But I am under the impression that the porters at the railway stations and a good many other people of that class have certainly fallen off in physique, and I think that is the evidence of the railway companies, too.

322. (Dr. Tatham.) It would not be right to state that it is only in the year 1903 that this question has been brought before the public?—Certainly not.

323. Am I right in saying that more than a quarter of a century ago Sir James Crawford brought this matter forward?—I have no doubt that is so, I only know of it casually.

324. And he complained that the physique of the nation was deteriorating, and not only amongst the lower classes but among the higher classes?—I can hardly imagine the upper classes having deteriorated—it is rather the other way.

325. I believe I am right in saying that it is pretty well twenty-five years ago, so that the matter does not come up for the first time now?—For nearly the whole of this time Mr. Horsfall has been pressing the question as far as Manchester is concerned, and also the towns at large. But what has struck me is that everywhere throughout the country the people who go most seriously into the question are the most seriously alarmed; it was the accidental circumstance of my happening to touch, without knowing it, upon a subject about which, all who had been really studying it were red hot, that has made me appear to have had more to do with it than I have had.

326. I understood you to say in answer to a question that you fully recognise that the class from which we now derive our recruits is not the same class that we derived them from twenty-five years ago?—Not of the same class certainly as the bulk of recruits 100 years ago. You say twenty-five years, but it would be rather difficult to fix a particular period. The tendency has been growing. Formerly all the best recruits were from the country districts, now the bulk must be derived from the towns; but a great many of those enlisted in the towns have migrated from the country into the towns. Naturally they come up to the towns and they do not find employment, and they are on their beam ends, and they offer themselves for recruiting.

327. (*Mr. Lindsell.*) You have not mentioned what you put down here about the Jews. Has it not struck you that the Jewish child, although coming from extremely poor quarters and under very unsavoury conditions, is as a rule a stronger and healthier child than the Gentile, and that is owing to the Jewish mother giving it proper food, and knowing the proper way of giving it food?—Yes, and then she does not just before giving birth to a child and for sometime after leave her home. As a rule she is kept at home looking after the family, and is not the wage earner, whereas a great number of the Gentile women are wage earners, and the men loaf and live on their wives' earnings.

328. No amount of distributing advice could easily act as a remedy?—No.

329. This condition of things prevails among the Gentiles and not amongst the Jews?—Certainly. I do not think that any one remedy is at all a cure; you must do a great many things.

330. You consider that infant food is one of the main factors of what is wrong in the physical condition, and that the people get improper food and drink; and I understood you to say you think that it has shown itself in other employments besides the Army. You mentioned porters, and you will find the evidence given is considerable. Is not that due to the fact that milk and other things are not obtainable in the same way as they were?—Certainly.

331. Would not you also attribute it to the facilities for getting tinned food now?—That is a most important feature, and there is also adulteration, and I think that is very serious.

332. The mothers can get tinned food cheap and there is no trouble in cooking it, and rather than prepare proper food for the child she uses this stuff?—Certainly.

333. And then you attribute a great deal more, in fact, so improper food than deficiency in food?—I think so.

334. And the remedy for that state of things is to go on some of the lines of what is being done in Manchester and Glasgow?—Certainly. The difficulty is to apply it to the small towns and large villages where you have hardly the same *personnel* available for the work.

335. And where it is more needed?—Where it is more needed.

336. There is more ignorance as to the proper preparation of food in the country than in the towns?—Certainly. According to the evidence given in the Manchester Report it is worse in the country.

337. Anything that has a tendency to provide the necessary food by way of free food would be very serious, and probably increase the evil?—Certainly it would. But it is quite possible that every child that goes to the

school could be fed and the responsibility be brought home?

338. (*Colonel Fox.*) If they provide a good nourishing meal during the day you see no reason why parents who are neglectful should not be obliged to pay for it?—That is the principle of Glasgow. Where it was at all possible they were made to do it, and if there were exceptional circumstances that really did not admit of their doing it, the people were helped. You know that evidence you and I heard yesterday of Mr. Atkins; his sister has contrived to give a penny meal of a most valuable character, and to charge that to the parents. So that a good deal can be done to help them without pauperising them.

339. (*Mr. Legge.*) I am going to refer to your article in the *Contemporary Review*. You do not mind my questioning you on it, but it is done simply for the purpose of getting out your views?—Certainly.

340. You draw rather a sad picture in the second paragraph as to the very great number of rejections within two years of a man's joining?—It is a very small percentage relatively to the whole lot who are willing to enlist. When I first had my attention drawn to it I was startled by the number of men who had to be discharged after they had been enlisted, and before they had even been trained as soldiers, but I soon found that it was a comparatively small percentage as compared with the previous rejections, of those who had offered themselves for enlistment.

341. Exactly what we brought out this morning, viz.: that over the last ten years the average is just a trifle over 2 per cent.; of those passed as fit for soldiers only 2 per cent. were discharged as invalids. You agree that that is not high?—Most certainly.

342. So that the burden borne by the country has not been so very enormous?—It is very small. I emphasise that in the course of the article. When I found out that, I did not find fault with the recruiting officers. The evidence really shows that the recruiting officers have kept a pretty satisfactory standard.

343. But what you say in the article is this: "I very soon found that an alarming proportion of these men involved the State in considerable expense, but had given no return?"—That is true; a large proportion of the men I saw for discharge had to be discharged before they had been trained. It was simply in looking after waste of public money in my own district that I first took up the question, but I soon found that it was a much more serious matter than even that. That is not "a proportion" of those offering themselves for enlistment, but of the men from the hospital. If you had been with me and seen the proportion of the men whom they were rejecting, the men who had never done anything, you would have agreed with me.

344. But the percentage is very small?—Certainly, but we are talking upon two different percentages, I am speaking of the men whom I saw they were rejecting, who were in the hospital, and you are taking it from the percentage of those originally offering themselves. The two things are quite different.

345. I do not see what grounds you have for saying that?—I said I was alarmed by it. I have emphatically said that. I soon found that I had made a mistake as to the real cause for alarm, not as to the fact that there was cause for alarm more serious than I then knew. You apparently do not distinguish between the men who come before the recruiting sergeant and the doctor. I have made no charge against them, I think they have done their duty exceedingly well; but, as a matter of fact, if any one of you had been at the rejecting of those men you would have been alarmed by the men who had cost the country so much money. I went to the Inspector General of Recruiting on those subjects, and what he told me led me in the end to investigate the question. It did distinctly alarm me.

346. (*Colonel Fox.*) Were those that had joined the Army, and had gone into hospital, men who had been soldiering—and if so—how long had they been soldiering?—From one year to two years.

347. Was the proportion quite alarming?—It alarmed me. It is not alarming in itself. It was the original thing that brought me to the question. What it did

Sir F.
Maurice.
— — —

Sir F.
Maurice.

represent was that the standard of the medical men was necessarily the very lowest that it could be, that in passing a large number into the Army, and admittedly a few wastrels, it showed how very bad was the standard of those they rejected.

348. But in the case you mention, it must have been more than 2 per cent. or it would not have alarmed you?—Yes. I often out of forty or fifty, who were being discharged, had as many as eight or nine or ten, who had never been able to undergo enough training to become soldiers. I would take up those cases which I thought required enquiry as to why the medical officer passed them.

349. (*Colonel Onstow.*) Did they come from all parts of England?—From all parts of the world. The hospital receives men from all parts of the world, but the presumption is that nearly all those men rejected before they had been trained would come in from regiments quartered in the Woolwich district or from London. I do not remember a single case of a man enlisted in the Woolwich district. Naturally the Regiments or batteries quartered there had recruits from various recruiting stations. I quite admit that I had an impression of neglect on the part of the medical officers when I first began the enquiry which I entirely lost before I had concluded it.

350. (*Mr. Legge.*) My next question is on your allusion in that article in the *Contemporary Review* to syphilis. Now we have got figures which substantiate what you say there—that the cases are much fewer than you expected. Why did you expect to find such a large number?—Because of my knowledge of the condition of things that existed in India, and because I was extremely surprised to find that it was so comparatively small.

351. But you have seen, perhaps, a good many floating statements?—No, it was not that because I was in pretty close touch with the medical men at Netley. I think it was probably due to the fact that all the worst cases go down to Netley, because I have heard most appalling accounts of the condition of the special ward at Netley.

352. When you say that the question of child feeding has been solved in Manchester, what do you mean?—Nothing is solved in human affairs, in the sense that no failures occur. What I mean is that the method adopted at Manchester appears to have been most successful.

353. The number of mothers who receive a domiciliary visit is still only small?—I hardly think that that is true of Manchester, but as I have suggested your getting better evidence about it than mine, I would rather not speak positively. It is certainly small as regards the whole country.

354. Is it that a large proportion of the mothers receive a domiciliary visit, or have they just begun it in that way?—I think that Mr. Horsfall or Mr. Ashby would give more valuable evidence than I could about that. My impression is that as soon as a birth is reported they have the whole town so organised that a visit is almost immediately paid. But I do know that I was staggered by the small income on which the Sanitary Association altogether was living. I thought that the money flowed in Manchester for things that were wanted, but it certainly is not so now.

355. You stated just now that in your opinion the health conditions of many of the small towns in the country were just as bad as the slums of big towns. Would you go so far as to say that the villages were as bad as the small towns?—I did not speak of my own evidence at all; what I quoted was the evidence which is in that Report of the Jubilee Conference of the Association held at Manchester, given by the medical officer, the Chairman of the Medical Committee of the County Council of Chester, as to what he had observed himself in the large villages which have grown up.

356. You said the small towns?—I say both “large villages and small towns” you will find. It was a direct quotation from that report.

357. You have no opinion upon that, yourself, have you?—None.

358. Because I was going to ask you whether you thought that the conditions of health were very much better in the isolated cottages in the country than in the small towns?—So far as the evidence has come before me it very often is the case that the occupant of an old half-tumbled down cottage, even the Irishman's with a

pig in it which has any quantity of holes, lives in a more healthy oxygen than in one of the most perfectly built houses where the window is never open.

359. And, of course, if it was fairly dry?—Yes.

360. You spoke, and it is a commonplace, about the influx from the country to the town, and you said just now that you thought that the class of recruits you are getting in our Army now was a different class from those we got a hundred years ago?—Yes.

361. Can you give any definite grounds for that belief? Take the Peninsular Campaigns, for instance.—Perhaps a hundred years is vague; what I was meaning was since the rush from the country places to the towns began. If we were recruiting the whole country, towns and villages alike, if the 75 per cent. were in the country at the beginning of the century roughly, and it is now 75 per cent. in the towns, naturally on the whole the class that we are recruiting from is changed, because it must be in large proportion a town instead of a country population that we are recruiting from.

362. I do not think that it necessarily follows.—Why not? Surely if you have got 100 per cent. in the beginning of the century, of whom 75 per cent. were recruited from the country and 25 per cent. in the towns, then on the whole your recruiting must be from the country districts.

363. Not necessarily, because the percentage recruited is very small?—But you recruit all over the country, in towns and villages.

364. (*Mr. Struthers.*) It does not follow that the excess is in the towns or the country?—I do not say that it does; but as the whole population of the country changes, so the recruiting changes.

365. (*Mr. Legge.*) I want to know whether there is not some reason for doubt that the physique of the poor townsman is worse than the physique of the countryman?—I have given you a good many reasons in that article which you refer to, for thinking that there are qualifying factors which tend to improve the health of the towns.

366. Later on you spoke of yeomen; and over the page you speak of the country bumpkin. You draw a distinction between the yeoman and the country bumpkin—the yeoman is of a superior class. Do you think ever since we have had a standing Army we ever did enlist in the line a large proportion of yeomen?—I have not said so there; I think I have drawn a distinction between the yeomen who formed the bulk of our Army in much earlier days, and those we had for the Peninsular War, when we used very often to get them out of prison and all sorts of places.

367. You also speak of country districts losing the milk?—Yes.

368. And Mr. Lindsell followed that up. Do you think that the labourers' children in the country, in such a county as Dorset, ever got milk?—I do not know the details of particular counties, but I know wherever I have come across it the people resident in the country say that the change is enormous in the raising of the children, and that formerly the children used to be fed with porridge in England, and now the people have changed their habits and taken to the tinned food instead. It is in England not in Scotland or Ireland that I have known the people gratefully purchase skimmed milk when they were given the chance.

369. You have no idea what the figures are—like those given in relation to Manchester?—I think you could easily get it, but in Scotland you could get it specifically. I certainly, both in Manchester and Glasgow, met various people who were talking of their experience in England, and I think I could put you on to people who could give specific evidence. As to Dorset in particular I do not know.

370. I mentioned Dorset because I know an old country squire who died at the age of eighty-five, and who had gone into this very question, and he said that all his lifetime in Dorsetshire he had never known milk as an article of diet for the labourers. Porridge in a southern English county would probably mean bread and milk?—Very likely, but there is still the milk.

371. (*Mr. Struthers.*) Am I right in supposing that it is your opinion that the physique of the working classes of the country is in a somewhat perilous state?—Certainly. I do not know whether there is a deterioration or not, but the peril is enormous.

Sir F.
Maurice.

372. You have no opinion as to deterioration, really?—I do not think that it is possible statistically to establish it. I think that there are modern tendencies, which make for deterioration, but I do not think you can establish it statistically.

373. As regards the actual state of the population, without comparing them with the past, do you rely for your opinion to any extent on these statistics of the Inspector-General of Recruiting?—Well, I think that the extent to which the Inspector-General of Recruiting has been getting evidence from people all over the country, who for many years past have had it as their special duty to watch the recruiting area, makes the evidence on the whole exceedingly valuable and important. It is rather that than any particular statistics that has impressed me.

374. That means that the article in which you have set forth your views on the condition of things is not so much based on statistics as on personal inquiries made by yourself and what you have learned from other people who collected information?—Yes. We have no statistics in the past which would enable us to compare with the statistics of the present.

375. As far as you are personally concerned, your opinion is based first on inquiries which you have made direct at Woolwich, and conversations which you have had with people in Glasgow and Manchester?—Yes, and with many people from England, Scotland and Ireland, and as a result of much correspondence.

376. I suppose as to the evidence with regard to Glasgow and Manchester we must fall back upon these people?—Yes. I think it would be better if you were to hear their evidence rather than to take mine on that.

377. You do not give me direct evidence on that?—I do not see how any human being can deal with 40,000,000 of people and give direct evidence. What I said at the beginning of my answers was that I thought the best help I could offer you was to suggest where you could get better evidence than mine as to details.

378. When a person makes statements as to the condition of a certain class of people, one wants to know how far it is based on personal experience?—I have made no statement in that article without being prepared to substantiate it in every line, but in every instance I have endeavoured to urge you to obtain the best evidence that the case admits of.

379. The reason for investigating a great many cases comes back to what you have been told by other people?—It seems to me that it is tolerably close evidence when I tell you that it comes within my own immediate family, that certain cases arise in dealing with bodies that are working immediately with me or in co-operation with me, and that is as close evidence as I can get to the actual grouping over a large area.

380. That is where you made personal inquiries, being on the spot; but in Manchester and Glasgow what you have written represents purely what has been told you?—Certainly.

381. You made no actual inquiry as to how the children are fed?—I am giving the principle of the method by which it is done, and it seems to me that this principle is a solution—I cannot tell you how far it is successful in practice. For that I refer you to those who can give you better evidence.

382. I did not quite gather what the principle was?—That every child is being fed that came to the school class; that when that had been done the responsibility for feeding it should be brought home to the parents who are responsible for it, and if there is any parental neglect which causes the children to go starving to school, parents were dealt with by the police.

383. That is a most admirable sentiment which nobody would disagree with; but what I want to know is, is this principle carried out in Glasgow?—Yes.

384. By whom?—The whole of that question was gone through between me and the Chairman. I said I would rather not go into that because I can get better evidence than my own.

385. But you cannot give evidence on the point?—No.

386. (Chairman.) I asked Sir Frederick to explain the machinery?—My reply at once was that you could get better evidence.

387. (Mr. Struthers.) Take the case of Manchester. You say they have solved the question of looking after the mothers?—Yes.

388. How long has this problem been solved?—Again, I am speaking of the principle, and you will find the description in the report of the action of the Ladies' Committee as fully detailed in the Report of the Jubilee Conference, and I refer you to that.

389. Then I think you rather took as a basis of that argument—I mean in reasoning from your own experience of what you had gathered from other people—that if people came from the country, *ipso facto* they must be better than those in the town, that the physique of the man must be better?—I do not think I said that. I said I was not prepared to say that, but the great difficulty has arisen from the revolutionary change which has taken place during the nineteenth century, and that we have not met that by adequate organisation to deal with it. That was my answer. On the contrary I think in many ways there are certain conditions which tend to make life in the towns even more healthy than the life in the country districts. I have put that strongly in my contemporary article.

390. We must not take it that the life in the country is necessarily better than the life in the towns under the present organisation that you speak of?—I think that is rather too wide a question for any one person to speak upon with conviction. I have not seen enough to enable me to say positively that that is the fact. On the whole there is no doubt that the open air life gives a more vigorous physique than life in the towns. Take, for instance, the magnificent policemen we have in London, whose figures as they walked beside the processions of the "unemployable" were a staggering commentary upon that fact. I know a good many police officers who tell me that these men come up from the country districts, but I am afraid that their children or grand-children will be represented by the physique of the unemployed if they remain in London.

391. Why are you afraid?—Because I see the sort of population that comes day after day to watch the Guards parade at St. James's Palace; and it so happens that on Mafeking night I walked down from Charing Cross to Cannon Street by chance, and I went through the whole crowd and I did not see a dozen men that I could have enlisted. A great portion of the crowd were women and children no doubt, but I was watching the whole way from Charing Cross to Cannon Street to see what kind of men they were, and my impression was what I have said.

392. (Chairman.) The streets were well enough lit for you to see?—Yes. You will remember what a blaze there then was.

393. (Mr. Struthers.) You have got some general opinions as to the remedies, and one of them, I suppose, is what they have done in Glasgow, or what they were supposed to have done in Glasgow, as to the systematic feeding of the children in the schools and the other organicisations that you spoke of at Manchester?—With the help of the municipality. You will find that the organisation is entirely independent in the first instance, but it is aided by the municipality afterwards.

394. It is for looking after mothers and infants?—Yes.

395. These things are more possible in the town than in the country, are they not?—I think that is an enormous advantage that the towns have over the country.

396. You mean opportunities for organisation in the towns?—Yes.

397. You mentioned incidentally that Glasgow was probably the worst town in the Kingdom in point of physique?—I did not quite say that. My answer was that it was probable that it may be partly on account of the bad conditions known to exist that efforts have been made in Glasgow to a greater extent than anywhere else—I won't say anywhere else, but among the greatest.

398. Then as to the statistics which we have had before us of the Inspector-General of Recruiting. The rejections in the Glasgow district are considerably less than in any other centre?—All that I was speaking of is what I have seen. How far the efforts in Glasgow have already resulted in improvement I cannot tell. Others will give you better evidence.

399. You are assuming, so far as you have any opinion, that the people of Glasgow are of poorer physique from

Sir F.
Maurice.

the excessive attention they receive?—I never made any statement of the kind, but I was asked: Is not Glasgow one of the worst? I have not put that forward at all, but my answer was that, at all events, what I did know as to the work that has been going on in Glasgow has caused me to think that perhaps the conditions have been very bad. But as to the comparison between one town and another, that is another question.

400. (*Chairman.*) Is not it the case that there are more single-room tenements in Glasgow than in any other town?—Yes. My impression is that that is so.

401. (*Colonel Fox.*) You rather inferred that because they paid such attention in Glasgow that things were getting desperately bad?—Undoubtedly the condition of things there was among the causes that drew people to pay attention to it.

402. I gathered that Manchester and Glasgow were getting so bad that attention was being drawn to it?—There is no doubt that people in Manchester and Glasgow have been alarmed by what they have seen and are working very vigorously. My point is that everywhere, practically I believe in the country the death rate is going up.

403. (*Mr. Struthers.*) That is the case where the organisation of the citizens is more favourably placed for carrying out such reforms?—Yes. There ought to be someone to give evidence from the East-end. The Bishop of Stepney could tell you a story which will represent one of the dangers of towns. He said recently that he knew a certain bed in Stepney which was let out three times in the twenty-four hours; not a bedroom, but a bed, and in that bed three successive sets, for eight hours, slept every twenty-four hours, six at each letting, eighteen people in the 24 hours.

404. That fact would be brought to the attention of the sanitary authorities of the district, I take it?—Of course the difficulty is that in a great number of those cases it depends very much upon the activity of a sanitary officer, who is enormously overworked, and from cases that I have known, I fancy that he is implored by the tenants not to give information of defects lest they should be at once turned out. We have very excellent laws, but they are not put into operation in all cases.

405. But I should have thought that some people, who knew of this fact, would have straightway reported it to the sanitary authority, and therefore it ought to be found in the sanitary report of the district. That is an extraordinary thing you know?—I cannot tell you about that. I am telling you that story told by the Bishop of Stepney. I think that those things ought to come under your investigation.

406. (*Mr. Struthers.*) You have mentioned the feeding of the children and looking after the children, but is there any other remedy you would suggest?—I have been much more anxious that public opinion should be educated to what the actual condition of things is. You have got a nation to save. That is the most important thing of all, and what I want is that some kind of central method should be introduced by which the knowledge and experience gained in one place is brought to the help of another place, and of the whole kingdom.

407. Would you favour enquiry being made in the schools as to the physique of the children as to weight and height at given ages, and as to their feeding?—Certainly, anything that tends to make the nation realise the situation which has alarmed all the people who have come in local contact with it, seems to me valuable.

408. You think we had better do something about that before discussing the question?—Yes. I think that the first thing is to get facts, and that is why I am rather shy about giving evidence about matters I do not positively know about.

409. (*Chairman.*) You think at the present moment there is a great readiness on the part of the public mind for a proper appreciation of facts?—I am sure there never was a time when people were so keen in wanting to face the facts.

410. And that is one of the mitigating circumstances that you mentioned in your article in dealing with the aggregation of large masses in great towns?—Certainly,

and I think there are a great many mitigating circumstances, but I would rather not go into the future of the policeman's children after three generations in town. I ought to have said in my previous answer about the policemen, that the police officers will tell you, as they have told me, that those stalwart men you see in London come from the country districts.

411. (*Colonel Fox.*) Do not the police feed their children well?—Probably, but I do not know whether that will save their grandchildren. Feeding is only part of the problem.

412. (*Witness.*) This problem has come before Germany, as it comes before us, and there they have met it in a remarkable manner. They have enormously strengthened their corporations in the *personnel*, and taken care that they have got very effective people in the *personnel*. Then they anticipated this enormous expansion in the value of land, which has taken place more in Germany than here, and they therefore provided that the enhanced value should benefit the corporations. In all the towns they have reserved for the corporations, at a moderate price, whilst the land was still agricultural a whole area of land round the towns and that is under municipal control. The enormous rise in the value of land has been applied to sanitary purposes, and they have taken care that as they planted out their houses they have planted them out in a sanitary manner. That is one of the points worth examining; but the one thing we should do is to be sure about our facts.

413. (*Chairman.*) You will agree that there is a greater sense of responsibility in the higher civic organisations than in the less developed communities?—I am sure that is so, and I think that the great danger is where there is no organisation.

414. Places that have passed recently from the state of villages to towns, and comparatively large towns?—Yes.

415. (*Colonel Fox.*) In such a place as Walthamstow, which I visited yesterday, they have realised what is going on, and they have taken steps to make things right?—You are quite right. You have no fixed rule applicable to all places. In some places they let things slide, but in others a few people take the matter up. If we are going to keep the health of the people generally, something must be done to make universal what at present is done here and there by the isolated action of the zealous.

416. (*Chairman.*) Do not the Association of Municipal Corporations and the County Councils Association lend themselves to inter-communication between the organised bodies which should take cognisance of these things?—The most effective aid which the Sanitary Society of Manchester gets comes from active members of the Corporation. But I do not find in practice that one town knows what another is doing.

417. Of course there is great reluctance to tackle the housing question because it involves them in so many embarrassments as they proceed?—Certainly.

418. (*Colonel Fox.*) The St. Pancras Town Council is undertaking a crusade against underground tenements, and they wish to clear them all out, but they must go gradually?—Quite so.

419. (*Chairman.*) You are aware that the District Auditor in Battersea has surcharged the expenditure of the Borough Council on milk for the poor, and that an appeal has been made to the Local Government Board on the subject?—That shows how much it is necessary that the powers of corporations for good should be wisely and cautiously extended. I think you want to look strictly after the *personnel*. I am not quite certain that you do not want some permanent officials so that you will have people appointed who shall be carefully selected.

420. Do you not think that the imposition of more important duties upon local authorities leads to improvement in the *personnel*?—From what I have seen I feel sure it does, but I cannot speak of that with the least authority.

SECOND DAY.

Friday, 18th December, 1903.

PRESENT..

Mr. ALMERIC W. FITZ ROY (*in the Chair*).Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Er. J. F. W. TATHAM.Mr. ERNEST H. POOLEY (*Secretary*).

Dr. ALFRED EICHHOLZ, M.D., called; and Examined.

421. (*Chairman*.) You are one of His Majesty's Inspectors of Schools?—Yes.

422. For how long?—Since 1898.

423. And before that you were in practice as a medical man?—I am a Doctor of Medicine of Cambridge University and was Fellow and Lecturer of Emmanuel College, Cambridge, and studied medicine at Cambridge and St. Bartholomew's Hospital.

424. And you are, therefore, thoroughly equipped to give evidence from a medical and educational standpoint?—I hope so.

425. And since you have been employed as an inspector you have had almost exclusively London experience, have you not?—No, I should not say that. I was district inspector for Lambeth for five years, and at the same time I undertook the inspectorial and other duties for the deaf, blind, feeble-minded and cripple schools, and lately for the epileptic schools throughout England and Wales.

426. Did you do that from the first?—For the first years I served a probationary period in order to acquaint myself with general school methods in England and in Germany.

427. And since then you have become almost exclusively charged with the defective class of schools?—Yes. I have a very small district, mainly the district of the City of London which contains very few elementary schools, three Board schools, and about twelve voluntary schools. My interest in the problems of physical degeneracy arose at first from my official connection with schools for the various types of defective children and with schools fed from slum population.

428. On the preliminary point of physical degeneracy what is your experience generally? Does it lead you to think that physical degeneracy is on the increase?—I believe it to be the reverse. I believe that it is less, decidedly.

429. But diminishing at a rate so rapidly as we could wish or might be brought about by remedial measures?—Exactly. And I might furthermore point out at this early stage in my evidence that elementary education has contributed to the stratification of the large urban population into a distinct series of social levels. There is an upper class, well-to-do and well cared for, to whom our methods afford every chance of mental and physical improvement. They come out well, and furnish a population probably not excelled by any in this country or in any other. At the other end of the scale we find the aggregations of slum population ill nourished, poor, ignorant, badly housed, to a small extent only benefited by our methods of training. They are the degenerates for whom this enquiry is presumably instituted. Between these two is the third and largest stratum consisting of the average industrial artisan population in which the bread-winners are in regular employment. It is the aggregation of the slum population which is largely responsible for the prominent public notice called to their physical condition.

430. It is the concentration of slum population which calls attention to their condition?—Yes. I have got

plenty of information which I shall be glad to submit to the Committee in due course. But this is a preliminary talk, I imagine. *Dr. Eichholz.*

431. I propose now to take up the points on which you are prepared to give evidence and go through them seriatim. You are able to tell us something about the poorest type of school to begin with?—Yes, in order to confirm my general experience, I have visited schools in London, and at the instance of one of the members of this Committee, with the assistance of the Secretary to the Board of Education, I made special visits to West Ham, Manchester, Salford and Leeds, and took information from two country schools, one in the North and the other in the South of England, the Ripon Cathedral School, and the High Wycombe Schools, as types of country schools. I have also consulted medical colleagues engaged in public work, charitable and philanthropic workers and members of educational authorities. I did this by way of saving some repetition of evidence.

432. Do you express the views of a good many people who are qualified to speak on the subject?—Yes. My statement represents, in addition to my own information, what I have been able to gather from consultation with as many as 200 people closely interested in the training of our elementary school population, including the members and officers of Education Committees of Manchester, Salford, Leeds, and many officers of the London School Board. Also I should mention Dr. Tattersall, Medical Officer of Health, Salford; Dr. Ritchie, Medical Officer, Manchester Education Committee; and Dr. Hall of Leeds who is very keen on this subject.

433. Dr. Hall is a retired surgeon, is he not?—Yes, an ex-factory surgeon with fifty years' experience. I have also interviewed the officers of the Ragged School Union, and I have held communication with secretaries of boys' and girls' clubs in Manchester and in London, and I have had interviews and communicated with the secretaries of Charitable Feeding Associations. It is only due to those who have helped me with information to express my gratitude, and to free them from every responsibility for the views which I here express, and which must be taken to represent my own opinion only. As regards my own personal effort I have adopted two methods; firstly, the inspection of schools (and in inspecting schools I have selected and enumerated the children of abnormal physique); and, secondly, have taken certain measurements of height averages; and, thirdly, I have made inquiries into the cause of retardation as regards school attainments and physique. I have inquired specially into the causes of progressive improvement in improving schools, of which I consider there are a great many instances in our large towns. I have interviewed the head teachers as regards the circumstances and signs of degeneracy, and their causes, and as to the evidence of hereditary deterioration. I have talked the question over with medical officers, managers, and lay workers, and I have had recourse to persons outside the actual schools as to the variations in physique of the adolescent, and have gone into the conditions of labour which arise in connection with the system of manual training

Dr. Eichholz. at present adopted in the elementary schools. I have drawn a broad distinction between physical degeneracy and hereditary deterioration. The object of my evidence is to demonstrate the range and the depth of degeneracy among the poorer population, and to show that it is capable of great improvement—I say improvement purposely even within the areas of the towns—and to show that there is a lack of any real evidence of any hereditary taint or strain of deterioration even among the poor populations of cities. The point which I desire to emphasise is that our physical degeneracy is produced afresh by each generation, and that there is every chance under reasonable measures of amelioration of restoring our poorest population to a condition of normal physique.

434. Will you give us a summary of your conclusions ?—I will do so immediately.

435. Will you give us the points now, and then summarise your conclusions subsequently ?—(1) I draw a clear distinction between physical degeneracy on the one hand and inherited retrogressive deterioration on the other. (2) With regard to physical degeneracy, the children frequenting the poorer schools of London and the large towns betray a most serious condition of affairs, calling for ameliorative and arrestive measures, the most impressive features being the apathy of parents as regards the school, the lack of parental care of children, the poor physique, powers of endurance, and educational attainments of the children attending school. (3) Nevertheless, even in the poorer districts there exist schools of a type above the lowest, which show a marked upward and improving tendency, physically and educationally—though the rate of improvement would be capable of considerable acceleration under suitable measures. (4) In the better districts of the towns there exist public elementary schools frequented by children not merely equal but often superior in physique and attainments to rural children. And these schools seem to be at least as numerous as schools of the lowest type. (5) While there are, unfortunately, very abundant signs of physical defect traceable to neglect, poverty, and ignorance, it is not possible to obtain any satisfactory or conclusive evidence of hereditary physical deterioration—that is to say, deterioration of a gradual retrogressive permanent nature, affecting one generation more acutely than the previous. There is little, if anything, in fact, to justify the conclusion that neglect, poverty, and parental ignorance, serious as their results are, possess any marked hereditary effect, or that heredity plays any significant part in establishing the physical degeneracy of the poorer population. (6) In every case of alleged progressive hereditary deterioration among the children frequenting an elementary school, it is found that the neighbourhood has suffered by the migration of the better artisan class, or by the influx of worse population from elsewhere. (7) Other than the well-known specifically hereditary diseases which affect poor and well-to-do alike, there appears to be very little real evidence on the pre-natal side to account for the widespread physical degeneracy among the poorer population. There is, accordingly, every reason to anticipate RAPID amelioration of physique so soon as improvement occurs in external conditions, particularly as regards food, clothing, overcrowding, cleanliness, drunkenness, and the spread of common practical knowledge of home management. (8) In fact, all evidence points to *active, rapid improvement, bodily and mental, in the worst districts*, so soon as they are exposed to better circumstances, even the weaker children recovering at a later age from the evil effects of infant life. (9) Compulsory school attendance, the more rigorous scheduling of children of school age, and the abolition of school fees in elementary schools, have swept into the schools an annually increasing proportion of children during the last thirty years. These circumstances are largely responsible for focussing public notice on the severer cases of physical impairment—just as, at a previous stage in educational development, they established the need for special training of the more defined types of physical deficiency—the blind, the deaf, the feeble-minded, and the crippled. (10) The apparent deterioration in army recruiting material seems to be associated with the demand for youthful labour in unskilled occupations, which pay well, and absorb adolescent population more and more completely year by year. Moreover, owing to the peculiar circumstances of apprenticeship which are coming to prevail in this country, clever boys are often unable to take up skilled work on leaving school. This circumstance

puts additional pressure on the field of unskilled labour, and, coupled with the high rates of wages for unskilled labour, tends to force out of competition the aimless wastrel population at the bottom of the intellectual scale, and this, unfortunately, becomes more and more the material available for army recruiting purposes. (11) Close attention seems to be needed in respect of the physical condition of young girls who take up industrial employment between the ages of fourteen and eighteen. The conditions under which they work, rest, and feed doubtless account for the rapid falling off in physique which so frequently accompanies the transition from school to work. I propose to submit evidence on the following points: (1) Description of the poorest type of school (photographs); (2) Disease and physical defect in the poorer schools; (3) Comparative height measurements in various types of schools; (4) The need for systematic medical inspection of schools; (5) The powers of endurance of school children in poorer schools; (6) Feeding of school children in poor schools; (7) Attainments of school children in poorer schools; (8) Alternating rapidity of degeneration and regeneration; (9) Notes on schools frequented by improving and well-to-do populations; (10) Evidence and impressions on progressive deterioration; (11) Compulsory attendance, scheduling, abolition of school fees as elements in the stratification of public elementary school population; (12) Agencies which make for amelioration; (13) Signs of amelioration (photographs); (14) Heredity and deterioration from the standpoints of newborn children, blindness, deafness, feeble-mindedness, and lunacy; (15) The fate of girls and boys on reaching the limit of school age. I shall conclude my evidence by suggesting certain measures which appear to be likely to promote amelioration among the population which suffers most from degenerative influences. If I may be permitted, I shall now ask you to listen to a few notes of one of the worst schools I can find. This is a school in the district of West Lambeth; it is within a seven minutes' walk of this building, just over Westminster Bridge. In this school, Johanna Street Board School, Lambeth, I have enumerated the children suffering from the taint of physical degeneracy, and I grieve to say that there are as many as 90 per cent. of the children whom I consider unable, by reason of their physical condition, to attend to the duties of school in a proper way. The school is in the centre of a non-industrial neighbourhood, and the parents are costers, cab runners, seekers after odd jobs, and there is no continuous form of labour, skilled or unskilled.

436. What you would call casuals ?—It is the casual class. The only definite and continuous form of labour I could discover was the occupation of one father who whistled for cabs at Charing Cross. There is no real work. Their homes are overcrowded; and Dr. Tatham will be able to tell you whether this factor is better or worse here than in other parts of London. There are 13,000 one-room tenements in Lambeth, and, to judge from the clothing and condition of the children, the homes must be filthy; and from what one is able to gather by close inquiry at the school, as to late hours, want of sleep, bad beds, no proper clothing of any kind, one is able to form a very clear, sad estimate of the condition of the children at home. A great proportion of the parents drink to excess. This is a fairly big school, and I am told that there are not more than twelve parents out of 200 who do not fortify themselves by the irregular use of alcoholic stimulants. The women are even worse than the men. Drinking begins early in the day. Even the first meal will consist probably of a bottle of stout and bread and cheese. Then there is the laziness of the women. They do not get up to make the breakfast, and when this is the case the children come to school without it. The laziness of the women, coupled with drink, is at the root of many of the evils of degeneracy. Then as to the feeding—and the whole question practically centres around the feeding—there is the want of food; this is the first factor we have to recognise. Then there is the irregularity in the way in which they get their meals; that is the second factor. Then non-suitability of the food when they get it, is a third factor. And these three circumstances, want of food, irregularity and unsuitability of food, taken together are the determining cause of degeneracy in children. The breakfasts that these children get are nominally bread and tea, if they get it at all.

437. Is it tea without milk ?—May I discuss this point in a moment. There is bread and margarine for lunch, and the dinner is normally nothing but what a copper can

purchase at the local fried fish shops, where the most inferior kinds of fish such as skate are fried in unwholesome reeking cottonseed oil. They frequently supplement this with rotten fruit, which they collect beneath barrows, when they are unable to collect it from the top, the facilities of this nature being considerable, for the whole neighbourhood of Lambeth is one coster area. One of the most important points to which I would draw attention is the absence of fresh milk. In these districts the only milk which many of the children ever know is tinned milk, which does not possess the nutritive power of fresh milk and ought therefore to be abolished from the dietary of a young growing child. As regards meat, if they get it at all it is for the most part once a week on Sundays, and then very little and of a poor sort. The absence of milk and meat is most important as determining degeneracy in these neighbourhoods. Now as to free meals at school. There are about 33 per cent. of the children in six months of the year, from October to March, who require free feeding. I am going into this question of feeding more fully presently, because up to now no real estimate seems to have been made as to what is being done and as to what is needed.

433. How is that organised?—May I tell you that presently? I may say that this free feeding though good as far as it goes is not sufficient to build up a child's constitution; at the best it only arrests further degeneracy. And now as regards the lessons. The work throughout shows want of intelligence. There is a dullness of mind, an early flagging of brain power, and the children are unable to pursue their work for a length of time as compared with normal children. They find the arithmetic most difficult to learn, and their memory power is not a thing to reckon upon. There is very little memory power, and with children, who in a normal condition depend entirely upon their memory for getting hold of things and who only reason later, this is a fatal handicap for any mental progress. The want of food, the absence of any home training and self-control will account for any absent power of endurance. And a further index of their abnormal nerve condition is their exceedingly excitable neurotic condition. They are exceedingly excitable and nervous; it is their nerves which carry them over an effort; for instance, they make a very good start in drill or physical exercises but after a short time they become lumpy and inelastic in their movements, and there is nothing but a heavy thud in their movements. As regards games, the boys and girls enjoy noisy and rough horse-play, but are unable to fix their energy on any organised form of sport. Boys are hardly interested in games sufficiently to enjoy a game of football, and their tendency to flagging is serious enough to make any sustained game impossible. They cannot enjoy football and can only go through part of the game, for they have not the staying power to get through a match. The headmistress of the girl's school who up to six months ago was engaged in teaching in a good school at Hammer-smith, tried to introduce a new school drill on taking up work here, and she found 80 per cent. of the girls could not take up the full course. She displayed her wisdom by taking up something in a minor key.

439. Is the chief degeneracy among the boys or among the girls?—It is equal, I think. Would you like to see some photographs about this type? These are not from the actual schools of which I am speaking, but they are from schools in similar neighbourhoods, Blackfriars and Southwark. (*Handing in the photographs.*) I should like to present now a set of height statistics with regard to this school which I am describing. In taking height measurements I have in order to economise the time at my disposal adopted the plan of measuring twenty children taken haphazard, at each year of school age. I have taken the average height of each set of twenty, and charted the results in curves, measuring heights in the vertical direction and ages in the horizontal.

I made some preliminary investigation as to the adoption of a standard and finally after comparing London and rural schools decided upon the measurements from Honeywell Road Board School, Wandsworth Common as affording me a specimen of the best type of English middle class child, exhibiting a regular uniform rate of growth of a high grade. I could not in the country schools under examination obtain anything so regular or anything showing such a well sustained rate of growth reaching up to the limit of school age.

On each of the diagrams which I have presented, I have charted Honeywell Road as the standard and the school under investigation along with it. *Dr. Eichholz.*

The schools which I have taken as types for comparison are: (1) Slum schools, Johanna Street, Lambeth, and St. Clements Road, Notting Hill; (2) A school in an improving neighbourhood, Virginia Road, Shoreditch; (3) A school in an artisan neighbourhood to show the effect of physical exercises upon children who are able to benefit by them, Eltringham Street, Wandsworth; (4) A mentally-defective school; (5) A school frequented by children of Jewish immigrants, Gravel Lane, Houndsditch; (6) Sets of good and poor schools in Manchester, Salford and Leeds; (7) Curves of country schools (Wycombe and Ripon).

The height measurements seem to point to the following conclusions:—

(1.) A good London school is frequented by children who equal and occasionally surpass in stature a good class of rural children.

(2.) The poorer London schools show a marked and serious retardation of growth all through school life

(3.) The poorer provincial town schools show a similar retardation, but less acutely than in London where the worst population presents graver deflections than that of other towns.

(4.) The good types of provincial town schools present children as a rule equal in stature to those attending good London schools, but not better.

(5.) The poorer population appear to be of unusually low stature at the limit of school age in Manchester and Salford. This is in accordance with an old established anthropological fact as regards South Lancashire, and is not a new fact in the way of degeneracy. The school population in the poorer parts of Leeds appears to be of a sounder type than the poorer populations of London, Manchester, and Salford.

(6.) Feeble minded children show a very marked retardation in their rate of growth especially as they approach the limit of school age.

(7.) Schools in improving neighbourhoods show improvement in height as the limit of school age is attained.

(8.) Physical exercises consistently applied to children who are physically fit to benefit by them, result in remarkable improvement as the limit of school age is reached.

To illustrate a point for a moment: at Johanna Street we find children at four years of age, showing marked retardation in growth. At four years of age they are seven inches too small; at five years of age they are six and a half inches too small; and so on. They pick up a little later on, but they are three inches too small on the average, and throughout their rate of growth is jerky, interrupted, and irregular instead of being uniform. These height diagrams illustrate the point as regards the physical stratification of our school population. What I claim is this: that you get within the towns themselves the very best children at one end and the very worst at the other. Country children, though good on the whole, are less uniform in their regularity of growth. This is another school in London, St. Clement's Road School, Notting Dale—a black spot where we have the same sort of thing as in Lambeth, but in a less degree, the reason being that the children here are able to help themselves. It is a criminal neighbourhood, and the children who survive at all are those who learn to take care of themselves. The National Society for the Prevention of Cruelty to Children is a great force for good in this quarter.

440. (*Mr. Struthers.*) Is this the average of all children at a given age?—I have taken twenty of them at each age just as they came, at random. I was anxious to have weight statistics, but one is not in a position to take them in public elementary schools at present. There are difficulties in the way, arising from the fact that one cannot weigh the children accurately owing to the variation in the amount of clothing they wear. But the school where I was able to get information as to weights, the results obtained followed those of the height statistics accurately. I shall refer to some more presently: I wish to finish my account of Johanna Street. In this school nearly 90 per cent. of the boys are anæmic. They suffer from every physical symptom of anæmia, with pale faces and lustreless eyes, and 15 per cent. have had eczema in one year. The

Dr. Eichholz. filthy condition of the skin and body and head is not so bad as one might expect. It is 12 per cent. of the boys and 20 per cent. of the girls. I may attribute that fact to this, that the schools have been in the hands of school nurses recently who clean up children's heads, and secure a vast and rapid improvement in that respect. A good many children suffer from blight in the eyes and sore eyelids. The hair is badly nourished and wispy, and the skin is rough, dry, pale, and shrivelled, giving a very old look very early in life. There is a point in connection with school attainments—the massing of the children at the bottom of the school. They don't get on. Over 77 per cent. of the boys are above the standard age in the standard in which they happen to be. There are 92 per cent. above age in standard one; 85 per cent. in standard two, and 80 per cent. in standard three. I should like to point out that although dealing with one neighbourhood we probably never see the same children twice, owing to the migratoriness of the parents. The parents move about from one part to another as soon as they are distrained for rent, and go. Of 236 boys at the beginning of the year only 120 were found at the end of the year. The attendance is good, which is not surprising, as the children would rather be in the school, and the health of the children is better in the school than in the filthy tenements which are all the home they ever know. The attendance in all these schools is really good. A very serious fact is that new comers from the country settling in the neighbourhood rapidly take on the degeneracy of their surroundings. The women begin talking, and they are taken to the nearest public house, and then the downward history begins. I do not know whether the Committee desire at this stage to hear anything more about these schools. I have other cases by me.

441. (*Chairman.*) You can put them in now?—Yes. There is another of those slum schools.

442. (*Colonel Onslow.*) Where is this school that you have been talking about?—The school is Johanna Street Board School, Lambeth. I have parallel evidence from St. Clement's Road, Notting Hill, which it is perhaps unnecessary to submit. May I now point out in this connection that the pauper statistics for London are more serious than for England generally, and that corresponding with this fact is the experience that nothing quite so bad in the way of slum schools is to be found outside London. The total number of paupers in London was higher in the third quarter of 1903 than it had been in any of the previous years since 1871. The proportion per 1,000 of the population in the last weeks of July, August, and September, viz., 22·6, 22·8, and 22·9, was somewhat higher than in the corresponding weeks of nearly all the years since 1875. In the country generally there has been a decided decrease in the proportion of paupers during the last thirty years as the following table, taken from the returns for the last week in September, will show:—

Actual total for 1905	- - - - -	702,990
In the same proportion to the estimated population as in 1873	- - - - -	1,077,504
In the same proportion to the estimated population as in 1883	- - - - -	858,182
In the same proportion to the estimated population as in 1893	- - - - -	772,031

On the other hand the numbers for London show a decided increase during the last twenty years (last week in September):—

Actual total for 1903	- - - - -	105,657
“ “ 1063	- - - - -	143,186
“ “ 1873	- - - - -	133,828
“ “ 1883	- - - - -	101,543
“ “ 1893	- - - - -	104,237

which indicates that in London as apart from the country as a whole, poverty has been steadily gaining the upper hand during the last twenty years. This will go far to account for the fact that I can find nothing so wretched as the London slums schools in the provincial towns which I had examined.

443. (*Chairman.*) Not in any of the big provincial towns?—No. May I say what I have done in the way of gathering these statistics. I have made a personal inspection of the children in the schools under examination. I had no difficulty in fixing on schools in London, and in the provincial towns I was always directed to what were considered the worst schools by the local education authorities.

At Johanna Street Board School, Lambeth, which is the worst school by far of any I have seen, of the elder children I consider 92 per cent. to be below normal physical condition, and of the infants as many as 94 per cent. The most grievous reflection of all is that there is practically no improvement in physique as we go up the school. Though there are many children physically as low as these in the Metropolis there are few schools which show such an aggregation of deficiencies. The population by the docks is supposed to be as low in physique as any other in London. I therefore examined the children at one of the poorest schools in that area, South Hullsville Board School, West Ham: 87 per cent. of the infants were below the normal and 70 per cent. of the elders: bad enough in all conscience, and still worse than anything in the provinces. Though a shade better than Johanna Street, in that the elder children show some slight recovery of physique. If only to a slight degree we at once perceive the influence of industries and employment. Lambeth, which is distinctly non-industrial, furnishes the most degenerate population to be found. West Ham at its worst is, on the other hand, slightly redeemed by its opportunities for employment. In Manchester Sharp Street Board School, Rochdale Road, selected as the worst school in Manchester, is situated in one of the most difficult neighbourhoods of the city. Taking the children all round 66 per cent. of them were below the normal, a decided improvement on the worst in London. The school is surrounded by mills and factories, which accounts for the worst in industrial Manchester being better than the worst in the non-industrial areas of London.

444. We have been told by the representatives of the War Office that the type of recruits is worse in Manchester than any other part of England?—One of the reasons is that the best of the population go into the factories which appear to absorb unskilled labour at good wages with even greater avidity than industries in other parts of the country. May I talk about that point more fully presently?

445. Yes.—Another wretched neighbourhood in Manchester is Ancoats. I examined the children at one of the voluntary schools in this area: St. James's the Less. In this school we found that although the improvement was not great, and the children were very bad at the bottom of the infant school, they improved at a greater rate than the death rate would account for. We get 64 per cent. of infants, 60 per cent. in the lower three standards, and 46 per cent. in the upper standards.

446. Is that below normal type?—Yes, and bad as it is it shows a very decided recovery of physique as the children travel up the school. St. John's, Deansgate, selected as a typical school of the poorer class, showed 60 per cent. of the infants, 44 per cent. in the lower three standards, and 27 per cent. in the upper standards—very gratifying, a very great improvement. Greengate, Salford is always considered to be one of the worst areas in the Manchester and Salford district. I thought it worth while, therefore, to examine the two schools there, Gravel Lane Wesleyan, and St. Peter's Roman Catholic. In the infant's school at Gravel Lane it was 62 per cent., the lower three standards was 40 per cent., and in the remaining highest classes of this school it was very much better—only 14 per cent. This was so far the most significant case of rapid recovery I had seen in a bad slum area.

447. (*Mr. Struthers.*) Can you give the corresponding figures for the typical school of Wycombe as to the percentage of physique?—It is probably a negligible quantity in the country schools. They are comparable with our good town schools, where the question of degeneracy does not arise at all. There are a few backward and mentally defective children, nothing more. To return to St. Peter's Roman Catholic Schools, Greengate, Salford, I was astounded at the excellent physical condition of these children, especially as the neighbourhood had been given to me as the very worst in Salford. Of the infants only 15 per cent. were below normal, 10 per cent. of the lower three standards and not more than 3 per cent. of the upper three standards—which shows how well cared for this Irish population is and how rapid and complete the recovery at the top of the school. In my opinion Greengate does not deserve its evil reputation. It is vastly superior to Ancoats. I found nothing in Leeds even as bad as at Manchester and Salford, and nothing approaching London. The worst in Leeds is good in comparison to what we experience in London. I examined the children at Sweet Lane, the school

selecte^d. Three-fourths of the children appeared physically able to take the school curriculum. One-fourth were below par. As an idea of conditions in Leeds it may be stated that no provision for regular free feeding of children has been found necessary.

448. (*Chairman.*) Have you got the statistics of the Jewish schools?—I can tell you something about them. In the course of my investigations I was struck with the almost perfect drill of the girls at Gravel Lane Board School in the City division of London—a school which has in the last few months come into my area of inspection. The school came out very high in the list of London board schools at the drill display at the Royal Albert Hall in the summer of 1903. As the children are entirely Jewish and born either abroad or of foreign parentage I thought it worth while to take their height measurements. Though many of them are very poor it will be noted that in growth and in rate of growth they compare very favourably with the best children to be found. This bears out the experience of other investigators, notably that of Dr. Hall of Leeds. Of course, Jewish children are equally subject to the results of illness and poverty and ignorance with others, and cases are unfortunately not wanting where stature has been found to suffer where food has been withheld through force of circumstances. Here is the height diagram for Gravel Lane (*handing in same*).

449. It almost follows the normal line. Those children are drawn from very poor parents, are they not?—Yes—the food and clothing of the home have to be supplemented by free meal and boot funds. I should at this stage like to submit a set of three curves of weight statistics which I have been able to construct from figures kindly supplied by Dr. Hall of Leeds. I have charted a country school (Ripon) and a good and a poor school in Leeds, and the importance of the diagrams is that they bear out in every particular the evidence adduced from heights. For this reason I place increased confidence in height statistics and am less inclined to press for weights except for confirmation.

450. Do these sections represent weight in pounds?—Yes. As Jewish schools did not come specially in my purview I did not chart a diagram of weights for Jewish children, but Dr. Hall's numbers show how very excellent is the nutrition of Jewish children of foreign birth and extraction in Leeds. May I now turn to the question of the occurrence of recognisable pathological conditions in the poorer schools. I have already discussed at some length the question of undersized children and children of poor weight, the under-size and the under-weight. With regard to the signs of wasting, I have adopted three rough tests in going round the schools, very much on the plan of the American surgeons at the immigration stations, who inspect very largely by manual examination. I have felt throughout the great importance of disturbing the children as little as possible, and this principle, I consider, should weigh with all medical men employed in school investigations. They should always make it a matter of earnest thought as how best to promote investigation and to secure results of value without undue interference with the child or with the work of the school.

In the manual examination of children the covering of the shoulder blade will afford in the first instance a good clue as to the muscular tone and development and the general fatty covering of the body. A sharp, out-standing, loosely-fixed blade will not be without great significance. In the second place the coverings of the upper arm bone will tell their tale where the shoulder blade is inaccessible through excess of clothing, and thirdly if two fingers are held out for the child to grip, a notion will be obtained of the quality of the child's muscle, for thinness and poor muscle do not always go together. Not infrequently a thin child possesses an excellent grip and consequently good muscles as far as they go. A fact of this kind is worth much to those concerned with remedial measures.

Anæmia or bloodlessness I have already touched upon and need say little more now except to warn the Committee how widespread it is and to point out that though 99 per cent. of children in one school will rarely be found as at Johanna Street, yet its prevalence is a very serious factor in the circumstances of degeneracy.

It is a postnatal condition like muscular and fatty wasting and lies at the root of many other conditions physical and mental.

Associated with it are the many skin defects comprised under the heading of eczema, which are dependent upon a depressed power of tissue resistance. Less transient than

eczema are the hardness, roughness of the skin and its loss of elasticity which makes for premature age among our young population. The hair and teeth suffer along with the skin. The hair loses its youthful gloss, becomes dry, thin, and short or wispy. It is a matter for note that Jewish children rarely exhibit this appearance of wispy hair, which points to the fact of good nutrition among them. The Irish Catholics in Salford also showed very little of it.

451. They are looked after better, I suppose?—Yes. With regard to rickets it seems to me that children suffer from it more acutely if not more generally in the north of England than in the south.

Rickets is a condition for which an enormous amount may be done if it is taken in hand early—on the other hand if neglected there are few complaints which produce greater deformities. In the north my impression is that there is a greater proportion of children deformed from rickets than in the Metropolis.

In the examination of school children for rickets it is necessary to distinguish between disabling or deforming rickets and rickets which, though present, may be non-disabling and practically of no effect as regards deformity, which may in fact be non-apparent to any but the expert eye.

It is necessary to dwell on this circumstance in order to explain differences in view which are likely to arise between medical men and those who are not experts in diagnosis. For instance, in the case of a poor school in Leeds Dr. Hall would correctly estimate the children showing signs of rickets at 50 per cent. Of these only about 2 or 3 per cent. are apparent to the non-expert eye, and unless the explanation is forthcoming we are confronted by an uncomfortable discrepancy.

452. Does the employment of the mothers account for it?—I think to some extent, but the true cause is poor and unsuitable food. Dr. Hall finds 50 per cent. of rickets in a poor school and only 8 per cent. in a good school. In a poor Jewish school, he finds 7 per cent. Teeth is another point which should receive attention. Rickets and poor teeth go together.

453. Are bad teeth really a sign of physical degeneracy?—Well, we all have bad teeth.

454. I am not sure that one should make so much of it?—Except in association with other physical defects. There is the question of mouth breathing, a condition dependent on the existence of adenoids—soft-growths in the back of the throat and nose. They lead to narrow chests, stooping, thick speech, loss of hearing, dulness at lessons. Thus their treatment becomes a matter of great importance. No child should be allowed to remain with his mouth open so long as he can breathe in comfort with it closed. If he cannot he should be treated medically. How far adenoids are the cause or effect of mouth breathing is difficult to say, but I have the feeling that early on one can do much by firm discipline for mouth breathing. That is important, and there is a difficulty in getting the children to shut their mouths. How far this is effect and cause is not yet decided, but one notices that with one's own children we can do a great deal in the way of discipline. Then we have eye defects. Dr. Kerr has arranged to talk about these in detail. There is one point I wish to mention, and that is the amount of chronic bronchitis in certain schools. How far this is due to neglect, how far it is the after effect of infectious disease, one cannot say. Dirt, by which I mean vermin, I have referred to. It is very bad in some London schools. A great deal has been done by the school nurses who have been able in a few months to reduce the evil by one half in one of the schools under my notice. And then there is the neurotic temperament of the ill fed child with its excitability, which carries a child over its initial effort to work until the lack of stamina tells and the child flags. There are chronic conditions of deformity, physical and mental defect, notifiable and non-notifiable infections and other acute attacks into which I do not propose to enter here. Now about height measurements I should like to say a few more words in so far as they affect the question of recruits in Manchester district. The population in this district does not attain the same height as the population over the rest of England, and this is partly in accordance with what one knows of the prevalence of rickets in the north of England, which, though it may shorten the stature, may not otherwise disable, and partly with an old anthropological fact,

Dr. Eichholz

Dr. Eichholz and does not indicate anything new in the way of degeneracy. You will see that south-east Lancashire is, roughly speaking, three quarters of an inch in height lower than the average for England.

455. Is that due to racial causes?—There is a considerable Celtic element and a goodly Flemish element as you know—and I do not associate the lower stature with any significant local degeneracy myself. The school population in Leeds does not show this depression in height at the limit of school age to the same extent as the Manchester children. You have more tall Danish element in Yorkshire. Now, as to the feeble-minded children, they show a very marked retardation in the rate of growth. That is what I mean by educable feeble-minded children (*showing photographs*). You might like to see their rate of growth (*handing in photograph and describing it*). Though they grow in stature as they grow older their retardation increases.

456. What sort of position do those children occupy afterwards?—They are selected from among the children who are unable to learn at the normal rate in the ordinary public elementary schools. The process of selection is medical and pedagogical and under the supervision of H.M. Inspector. The children are taught in schools specially certified under the Education Act (Defective and Epileptic Children, 1899), and grants at a special rate are payable for them. Under the special instruction a certain proportion are able after an interval to return to the ordinary school. Others leave for work at fourteen, others stay on till the limit of age for these schools—sixteen—when those who are responsible for them have the great difficulty to face as to their future—for most of them are fit only for custodial treatment. There is at present very little provision after school age for this particular product of degeneracy, and public opinion in future will have to determine whether, with all their moral and mental defects, these children should be thrown in the way of workhouse asylum or prison, or whether they should be treated in suitable custodial homes conducted on humane, industrial lines. To return to the question of general degeneracy in public elementary schools, one of the greatest needs in school organisation is the institution of medical inspection in the poorer elementary schools—at the very least, if I may say so, the greatest need is for medical inspection in the poorer schools.

457. You would not say that that should be the case for all schools?—No, on the ground of expense. It is in the worst schools where it is most necessary.

458. Are these classified?—I have attempted to classify them in the case of West Lambeth Board Schools.

459. What sort of classification would you make?—It is, speaking roughly, in West Lambeth, seventeen. It works out at one quarter very good, and one quarter of the poorer class, and one-half of fairly normal schools. West Lambeth is an average London district, and we may assume the Metropolis on the whole would work out in this proportion. It is for this lower quarter that I should like the medical inspection, and it could be managed for £2,500 a year for London. Ten young men, who ought to be trained in questions of school hygiene, could perform the necessary duties at a salary of £250 per annum each.

460. (*Mr. Struthers.*) But the London School Board has something of the kind?—Nothing like enough. There is something done for those suffering from bad eye-sight and for the feeble-minded, and Dr. Kerr examines pupil-teachers and assistant teachers medically.

461. (*Chairman.*) His time is too much taken up already, you think?—I do, and I think that much of this work is for younger and less experienced men than he. They should work under the School Board Medical Officer's guidance.

462. (*Mr. Struthers.*) But Dr. Kerr has assistance?—He has four assistants now, and eight assistants for the eye work. The bulk of the assistants' time is taken up with feeble-minded examinations. Dr. Thomas has recently been able to give some time to bacteriological examinations in addition. That is all the assistance Dr. Kerr has got. As a first step towards amelioration of general physique and towards the establishment of an intelligent educational curriculum in the poorer schools, the health of these schools must be subjected to medical scrutiny by men specially fitted to take it up by training and experience, because anybody will not do. You re-

quire a young, plastic mind to engage in it; a man in general practice, as the local men are, will not do. It is impossible for them to get in touch with the problems of education and the school. The man must be young.

463. (*Chairman.*) You want the knowledge of teachers supplemented by medical aid?—Yes, and you want a man of an enquiring spirit and not a dogmatic spirit. The business of the school doctor is to examine children at admission when necessary, and periodically later; to make recommendations to the school authority which shall reach the parent without delay. It is for the school authority to determine how to make those recommendations effective. It is impossible that the doctor can enforce anything that he says. The way I suggest this should be done is as it is done in Frankfurt and in German schools generally. They issue a slip of paper, which I suggest should be in duplicate, which says, "Your child is suffering from so-and-so, kindly exclude him until he is fit to attend." In England this would not suffice, as it would give the parent an excuse for not sending the child to school. We want the certificate in duplicate so that the school attendance officer may keep its contents before the parent. The authority would issue one to the officer and the other to the parent, and the parent in this way might be dealt with according to the measure of his culpability or his powerlessness if he did not or could not act upon it. Many cases would still need charitable aid and whatever help managers could procure. I do not anticipate that the need for punitive expedients would often arise. A few wholesome examples would effect a very rapid cure of culpable neglect.

464. You think that would bring home the sense of responsibility?—Yes. I may say that I have great confidence in the official school visitor as an influence in reducing the goodwill of the parent. We have a concrete example in the work of enforcing school attendance where practically every child who is fit comes to school. The attendance in London has risen in the past twenty years from 74 to 85 per cent. We have had very recent experience in the successful working of Mr. Robson's Act. It would be possible for the authority to provide a few specially qualified visitors in each poor area to deal with health cases. Among the further duties of the medical school inspector would be to make recommendations to the local authority on general and special points of school curriculum, length of lessons, apportionment of intervals for recreation, organisation of recreation, ventilation, lighting, artificial and natural, the use and abuse of needlework, desking for children of various ages, use of slates, towels, local variations in curriculum to meet special needs. In the poor neighbourhoods he should visit the schools sufficiently often to examine all new admissions and to re-examine old cases where necessary. I submit that systematic medical inspection of the schools would be a check on a great evil in connection with school attendance, that is, the issuing of sixpenny medical certificates by cheap doctors. One of the greatest evils is the cheap certificate, issued by practitioners in poor neighbourhoods.

465-70. They are bogus certificates, I suppose?—I should say they are too often based upon incomplete examination. To deal more closely with the question of endurance, I should like to express a hope that those who are framing new schemes of drill will bear in mind the large number of children who are physically unable to take a full course, and advise a short course which will admit of frequent interruption and frequent resumption.

471. (*Chairman.*) You need not go into that as the Special Committee has the matter in hand?—Very good. I will confine myself to impressing this point more especially as regards London children, for I cannot find the same amount of distressing loss of power among children after a short spell of exercise, outside London. The same consideration holds with regard to games. I distinguish in the lowest grade children who do not play at all, requiring the teacher's exhortation to call them to participate in any game at all. The next grade exhibit a nervous excitable desire for horseplay which soon gives out. Then come the children who can go through part of a game, say of football, then those who could finish a game of football, but who could not undertake the strain of a match. At the head of all we have the schools who can not only play matches but engage in the inter-school competitions. As regards lessons, I have previously instanced the desire of the children to perform what it

asked of them, their will power outstrips their physical power. With poor memory, poor capacity, poor intelligence, and the difficulty of exerting and maintaining interest, it is not surprising that but few of the poorer children reach the upper classes of the school. At Johanna Street no children reach the seventh standard, and only about 8 per cent. reach standard five. Compare this with a good school—though not higher grade—Lavender Hill School where 10 per cent. reach standard seven and 34 per cent. reach standard five, which brings me to another point, the massing of children in the lower classes of the schools, an evil which is apparently greater in London than anywhere else. The children do not get on as they should, they fail to make the normal progress year by year. We find numbers of them at ten, eleven, twelve or thirteen years of age at the lowest classes of the school in standards one and two. Let me illustrate, for purposes of comparison, the percentages of children in the three lower standards of certain schools which I have selected for the purpose. Belleville Road and Honeywell Road, both on Wandsworth Common, will serve as standards of comparison. They are both good schools. Belleville Road has 45 per cent. and Honeywell Road 51 per cent. in the lower three standards. Of the poorer schools, St. Clements Road, Notting Hill shows by comparison 74 per cent., Johanna Street, Lambeth, 72 per cent. and Bath Street, Finsbury, 69 per cent. Note the difference as between London and a provincial town. Greftan Street, Salford, a poor school, shows 47 per cent. as good as Belleville Road and slightly better than John Street, Pendleton, a good school in Salford which has 56 per cent. in the lower three standards. May I now discuss the very important question of the underfeeding of children. I hold a very firm opinion which is shared by most medical men, school managers and teachers conversant with the condition of our poor schools, that food is the point about which turns the whole problem of degeneracy. Some months ago I furnished an estimate to the Board of Education of the number of children in London physically unable to benefit by the school curriculum through circumstances connected with malnutrition, and set down the number at not less than 60,000. I have since gone into the question in considerable detail and propose to furnish a fuller estimate now.

472. Sixty thousand in London?—Yes. The London School Board said this was an exaggeration, that there were not more than 10,000; so that there must be something wrong somewhere.

473-4. What is your estimate?—The only public estimate I can get from the London School Board is the Annual Report of the Joint Committee on Underfed Children. This is a Committee worked under the aegis of the London School Board which co-ordinates the working of the feeding charities, who collect and provide the funds. The Joint Committee exists to prevent overlapping.

475. (Witness.) I hold a very firm opinion, which is shared by medical men, members of education committees, managers, teachers, and others conversant with the condition of school children that food is at the base of all the evils of child degeneracy; that is to say, if we can take steps to ensure the proper adequate feeding of the children, the evil will rapidly cease. Other circumstances noted in connection with degeneracy are: bad clothing, bad boots, exposure, want of fresh air, overcrowding, filth, late hours, overstrain at work, and, to a less extent, the smoking by boys. But all these causes pale beside the stress laid upon food. As to overcrowding and dirt, they are secondary circumstances compared with feeding, for many of the foreign Jewish immigrants, and the Irish contribute their full share to the difficulties of the sanitary authorities in dealing with dirt and overcrowding. Yet these two sections of population make a great point of caring for their young children, with the result that these two types very usually stand apart in the poorer neighbourhoods from the general degeneracy. The food question is obviously worse to deal with in London owing to the enormity of the problem, yet in the main the results correspond with the pauper statistics, which I have already pointed out have become worse in the last two decades. It is to be noted in regard to this question that there are three main factors. There is neglect, there is parental ignorance, and there is poverty; and it is not for me to assign what proportion these parts play, how much underfeeding is culpable, and how much is non-

culpable. I wish simply for the moment to advance the fact that there is so much. We must recognise nevertheless that there are certain factors which go to swell the non-culpable element, and of these, fluctuation of labour and inconstancy of skilled and unskilled employment are the chief. Then there are seasonal trade variations. Tailors and tailoresses have a very bad time during autumn and winter and are frequently thrown out of work; dock labourers, builders labourers, all outdoor workers are likely to fall into the same plight. The circumstances of employment coupled with a week or so of hard cold weather or even a snap of frost cause an enormous strain upon those worst neighbourhoods. But over and above what is non-preventible and which must for all time remain amenable to charity there exists the large proportion of neglect due to ignorance and culpable causes. Parents do neglect to provide food at all in many cases. They do not get up in the morning and the children must shift for themselves or come to school hungry and unprovided, dependent on the chance provision of a free breakfast at school. This entry occurs in my notes: 'No breakfast, parents well off, keep a fish-monger's shop. Will not pay for medical help for son who needs it badly.' Ignorance coupled with neglect account for the widespread omission of fresh meat and fresh milk from growing children's dietary. The supply of food is in consequence most unsuitable, tea and bread for breakfast, bread and margarine for lunch, the questionable materials of the cheap food shops for dinner. The temptation to steal or to eat the more easily acquired rejected rubbish from coster stalls are consequences not difficult to appreciate.

This almost systematic course of malnutrition begins before school age, in fact, too often from the moment of birth. The health of the children becomes seriously affected by the practice which obtains even among the kindest of the ignorant of feeding their children on "a bit of everything we take ourselves" and indulging them before they have cut their first teeth on such things as raw apples, crusts, plum cake, meat pies, tea, ginger beer, and not infrequently alcoholic drinks.

In the course of my own investigation in London, I have had practically to build up my estimate anew. The joint committee of the London School Board publish a Report which simply deals with Board Schools and omits to mention the very large proportion of work done outside the knowledge of the Board. It publishes the average number of children fed per week during the weeks that the feeding centres were open, which works out to 22,206, in 1902-3. Investigation shows that the number furnished as the weekly average of children fed may be taken as an index of the daily average of meals provided.

Now this figure is very fallacious as an index of the total number of children who are underfed, even as regards Board Schools, for it is a fact of common knowledge that the same children are not being fed all through the season, and that every child computed in the average of 22,206, as a rule represents a great many more children actually receiving food. In fact, as is perfectly right with the limited means at their disposal, the committees feed the children who at each moment seem most in need of succour. Stress at home does not affect all at once, but at one time some, at another time others. I have made an enumeration on this point and find that usually the centres feed about three times as many children during the season as they are feeding on any one day.

Thus a centre which can feed 50 per day on an average will feed 150 different children during the winter. This factor three fluctuates somewhat. It is sometimes lower, two or two and a half, sometimes four. It tends to become lower in districts which are very closely investigated by managers and teachers or in districts where there is plenty of money, and tends to rise in the more indiscriminate and less distressing areas, or in areas where there is little help, which must be spread widely.

The lowering of the factor is not an infallible guide to discrimination. I have seen it as low as one, *i.e.*, where all the children were always fed on the assumption that all were in need.

But it seems clear that the number fed on any day multiplied by three will roughly indicate the number dealt with through the season—in an area which is fairly well investigated. Adopting this factor for London Board Schools we get 66,000 as the rough total of underfed children attending these schools. There is Mr. G. R. Sims of the *Referee*, who collects the enormous amount of £2,895; and the London School Dinner Association collects about an

Dr. Fickholz. equal amount. The Destitute Children's Society collected a good sum, and there is the Lambeth Teachers' Association, which collects a certain amount.

476. The School Board Committee are far from covering the ground, I suppose?—They do not actually cover any ground themselves in the shape of supplying funds. They co-ordinate so far as the Board Schools are concerned the work of the great charitable agencies. Of these agencies, which deal with Voluntary schools as well as Board Schools, according to the last Report the London Schools Dinner Association pays in grants £2,184. Mr. G. R. Sims' "Referee" Fund, £2,595, The Destitute Children's Dinner Society, £959, the East Lambeth Teachers' Schools Dinner Association, £312, and the Southwark Children's Free Meals Fund, £893. Adjusting these funds to allow for what they mutually contribute to each other, the amount comes to over £6,100 per annum spent over the whole of the London schools, Board and Voluntary, by a non-overlapping system.

I have ascertained from the secretary of East Lambeth Teachers' Fund that £100 spent represents 2,000 necessitous children fed per season, and here as in the rest of London one-third of that number are fed on each occasion that the centres are open.

On this estimate it follows that for London altogether, roughly speaking, 122,000 children must be receiving food during the year from charitable agencies. This works out at about 16 per cent. of the elementary school population.

I was unwilling to submit these figures to the Committee without a further test. I therefore consulted the Manchester Education Committee and their medical officer, who have made a very careful study of the feeding problem in Manchester, and they assure me that the number of underfed children is not less than 15 per cent. in Manchester, agreeing very accurately with the estimate I offer for London. The estimate of 122,000, distressing and enormous as it is, is in comparison with other towns not excessive. It is in fact parallel. I feel now that when at first I estimated 60,000 as the number unfit, physically, to take the school curriculum, I was very well within my limit.

477. And the estimate of the London School Board you consider is a very preposterous one?—I feel that, with all the necessary and useful work they are doing to prevent indiscriminate charity, they have so far not estimated the extent of problem which they have undertaken. When you compare London with other large towns it is nothing but what one might have anticipated. In the event of measures being initiated to deal with culpable neglect, an opportunity will occur for concentrating much more than at present in the cases which are necessitous through no real fault of the parents. The present method of feeding in London is entirely of the nature of a temporary stop-gap. There is but little concentrated effort at building up enfeebled constitutions, school-feeding doing little beyond arresting further degeneracy. May I now submit a note as to what is done in Manchester.

478. (*Mr. Struthers.*) I should like to hear what they do?—There is a Free Meals Committee working under the Education Committee, which dealt with forty school departments in 1902, but will now deal with eighty since the whole of the education of the municipality has come into their hands. They fed 3,000 children in 1902-3, or about 6 per cent. They will still deal with at least 6 per cent. when they have taken in all their schools. Miss Dendy, a most reliable authority, who is a member of the Education Committee and who was for years a member of the School Board, and has given constant close attention to the problem, is of opinion that not less than 15 per cent. of the children have insufficient meals as well as unsuitable ones. She does not consider that more than a very small fraction of the under-fed children lack food because the parents are unable to buy it. The circumstances of the homes are investigated by the school attendance officers. In order to arrive at an estimate of necessitous circumstances, the total family earnings is determined; they then subtract the rent from the family income, and they obtain a certain nett amount, which they divide by the total number of members of the family. If there are one or two children, and this amount comes to 4s. a head, they allow free meals to the children; if there are three or four children the limit is 3s. 6d. per head; if more than four in the family the limit is 3s. per head; so that they have a differential scale of a very practical

kind. This system offers a valuable safeguard against parental laziness.

479. But the expense in one way comes out of the School Board?—No, it is all voluntary. They may not spend the rates on it.

480. (*Chairman.*) You cannot bring the culpability home to the parents of the children?—It is almost impossible, under existing circumstances.

481. (*Colonel Onslow.*) Can you get anything out of the parents?—Yes.

482. (*Chairman.*) What proportion does that contribution bear to the total?—It is a very small amount that the children's parents bear. The London School Dinner Association spend £4,682, and out of that the children's parents contribute £218. That is about 5 per cent. The children's pence in the case of the Destitute Children's Dinners Society amounts to nearly 25 per cent. of the whole amount—£374 out of £1,331.

483. Could not that be made much greater by an effort?—I consider that a good deal more could be obtained. You might get it to 10 per cent., but it would be a small proportion of the whole. I know of one case in which the amount of children's pence was quadrupled under careful visitation of homes by the managers.

484. Unless you apply penal consequences?—That is what I am anxious to discuss presently. Most of these meals consist of pea soup, which is good in its way, but which is not the best food on which to build up a child's constitution.

485. Peas are very valuable food, are they not?—Peas contain some of the chemical principles of nutrition, but not in a form in which they are most assimilable, nor do they contain certain essentials of dietary—fat—which a growing child must receive, and which soup cannot adequately supply.

486. What are the other alternatives?—Pea soup with meat. There are schools which offer a plate of meat or rice pudding with fruit or jam pudding; and in the London Cripple Schools provision is made in every case for some form of voluntary feeding, and the dinner consists of meat, food and vegetables, and sweets or pudding, which costs 2d. to the child, the dinners being partially supported by subscriptions. In Salford they have no organisation of any kind under the School Board. There is very little feeding; it is about 2 per cent. of free breakfasts. In Leeds they have no systematic feeding. Dr. Hall has furnished a good deal of information on the superior home dietary of Hebrew children in the Leeds public elementary schools, which accounts for their exceptional growth and general signs of good health. He has also instituted a feeding experiment to show how good food can produce very rapid amelioration in the physique of retarded children. Taking sixty poor seven-year-old children, at the beginning of the period they totalled 455 lbs. below normal weight with fat and with bone, and they gained in three months forty pounds, in addition to the normal increase in weight for three months; and they looked less anæmic and more cheerful at the end of the time. This is what might be expected. Now, there appears to be urgent need in London at least, which is worse than other towns, for some new educational measure in order to deal with the 25 per cent. of school children in poor districts in a state of retardation. As regards urgency for measures we have to remember two things. We have first of all to recognise that for this retarded population the present code curriculum is not going to bring the child into a condition in which his attainments will be of use in after life. The ordinary elementary school curriculum assumes that a child is fit to go to school and fit to take it. It is clear that in a great many cases he is neither fit to be at school nor fit to learn when he gets there. In the second place, in spite of distress and fluctuation in season trades, much of the neglect is due to culpable neglect and ignorance and laziness of the parent. So that there are two sets of associated circumstances, educational and domestic, which make it advisable to extend the industrial school system under Section 16 of the Education Act of 1876. I should like to extend the Act to meet cases of culpability in the parents. It might be necessary to get a short Act of Parliament to do what is badly wanted. But I may say shortly what I mean. I should like to see schools, either urban or rural, schools of industry, not punitive industrial schools, which shall recognise the uselessness of much of our present curriculum for retarded children, which shall,

in the first instance, create self-respect through cleanliness and decency, and aim at re-establishing an enfeebled constitution through suitable regular feeding. As these are secured physical education becomes possible, and the final aim comes into the foreground which is to provide a curriculum based largely on manual occupations and manual instruction, and which shall endeavour to implant in the minds of the children a respect for the dignity of work—a fact which their homes have never impressed upon them, and which the elementary schools likewise fail too often to accomplish. While I consider that the local authority might be empowered to admit at its own discretion, I should not like the power of appeal to the magistrate to be abolished—for two reasons: firstly, lest the establishment of these schools should tend to increase culpability in the parent, and, secondly, in order that the parent might be held responsible for cost of clothing and maintenance of his child. In this way the schools would act as a deterrent as well as a cure.

487. (*Mr. Lindzell.*) Would you compel the parent?—Yes. I should certainly do so in the culpable cases.

488. (*Chairman.*) And remove the child from the control of the parent?—Yes, and make the parent pay. I have sufficient confidence in the deterrent effect to consider that very few establishments would be needed to meet the case for London.

489. Would you not lay some embargo upon the parent?—I would get the payment for maintenance out of the parent.

490. But supposing the parent disappears, would you not have to put him in some industrial place?—I should like to put him in prison. I should like very much to do so.

491. That is the difficulty of bringing home responsibility to the parent?—The State has succeeded in bringing home this responsibility of sending the child to school under the Attendance Acts. When we consider the increase in the school percentage of attendance from 74 per cent. to 85 per cent. in London in twenty years, in face of all the evils connected with an apathetic anti-educational population, it shows that we have still a great hold on the parent. We have not an ideal hold on him, but we have a great hold.

492. Getting the child to school is on a different basis from making a parent pay for proper nourishment, because you can lay hands on the child but the parent may disappear?—We have done so in the case of the blind and deaf schools, and we get the blind and deaf into residential schools when necessary, and get out of the parent whatever he can afford to pay—and many of these are poor and wretched.

493. If the parents are well-to-do that might be all very well, but supposing they are of the wastrel or casual class and won't work, what then?—They ought to be punished.

494. That is an expensive remedy, is it not?—You would not have to deal with many after once taking up the work. The knowledge of an official organisation which will track him down to the arms of the law if necessary, will bring the most casual parent to his senses. And very quickly too, for the very defects which make him lazy and unwilling to work will make him amenable to the discharge of duty under legal pressure. It is clear that when we have provided for the culpable, we should still have to call upon charity for the non-culpable cases, and I suggest that we should still have to call upon charity, and even to a greater extent than at present, in order to make the supplement of food better, more frequent, and more in quantity, and therefore altogether more effective; for it is probable that free meals at present do little beyond arresting further degeneracy without doing much in the way of building up. I should hope that in clearing up the culpable cases it would become more and more possible to focus charitable effort on the deserving cases so as to avoid indiscriminate and ineffective spreading. I should like to see the establishment of the school restaurant as a further step in reform within the four walls of the school itself.

495. Which Mr. Booth advocates?—Yes. We have them in the cripple schools already, and I should like to see the Board of Education include provision for kitchens in future building rules. The expense is very small, and the equipment too.

496. Could not a great deal be done by contributions in the way you suggest, from those schools where cookery is taught? I understand that there is a great deal of waste, and the food is thrown away in many cases?—It is absolutely useless for the present purpose. The materials dealt with are small in amount and not designed to feed any but a small number of individuals.

497. Could not the two be so adjusted as to help one another?—No, you could not get the quantities cooked in the time, or by the inexperienced labour available.

498. As the teaching of cookery becomes more general in schools, there is such a considerable amount of material produced that it might be used, might it not?—If your teacher has to give a demonstration lesson, occupying one hour, and take her ten to eighteen pupils during the process of cooking, it is not likely that by 12 o'clock they would be able to supply 800 or 900. It would not do more than feed the teachers present.

499. Not if the teaching becomes much more general? I do not think so. Many reforms are necessary in the teaching of cookery before it will become sufficiently useful in the home. The children begin to learn it too early to retain much by the time they leave school. They do not follow the work up sufficiently at home or at school to become conversant with the process taught them. It is the exception to find a girl repeat a lesson on the cooking of meat at home. The knowledge which the child gains is too insecure to tempt the parent to run any risks with the modest domestic allowance of meat. So it comes about that the girls become great adepts at making cakes. I think the work would be all the better for being concentrated upon the last six or twelve months of school life.

500. (*Mr. Struthers.*) But still a single course for six months will make a deep impression on them?—I am a member of committee of an orphan asylum, who provide education for 300 children, boys and girls, and we do not teach the girls cookery and housewifery at all until they are from fourteen to fifteen, and then there is hardly a single girl who does not obtain a satisfactory situation at the end of her training. At the Royal Patriotic Asylum for Girls, all girls over twelve receive very full organised domestic training for one half their time. The school was until recently in my district of inspection. I recollect that a good deal of trouble was given by Lord Chelmsford and the committee in elaborating a suitable scheme.

501. That is if the girls come to school up to fifteen, but they are entitled by law to leave at thirteen, and unless you give them instruction in cookery before that age they will have none at all?—I should push the thing a year back, and have it between thirteen and fourteen in the school; that would keep them at school. They ought to have learnt reading, writing, and figuring at the age of thirteen, and the last year might well be largely spent in domestic training.

502. (*Colonel Onslow.*) You speak of a school restaurant to which the children contribute, that is a sort of canteen?—Yes, a very small kitchen will supply a large population. In some of our big institutions we have very small kitchens which provide for many children. The large school halls would provide excellent dining rooms.

503. (*Colonel Fox.*) By that means you think the better class of child would get food better than he gets at home?—The better class of child would always go home. In any case children who stayed to dine would be expected to pay what they could.

504. (*Chairman.*) Those not actually in destitution would get better food at the restaurant than at their own homes, would they not?—Yes, they would get nothing at their homes, there would be no regular dinner. To encourage the improvement of home feeding the Battersea Borough Council have recently established two depots for pure milk distribution—beginning at the right end—with the infants.

505. But the district auditors have surcharged the Borough Council?—I do not know that. In investigating the condition of children coming from destitute surroundings the Manchester Education Committee use *this* form drawn up originally by Dr. Kerr I believe for a proposed physical census of 50,000 London children, but the London School Board have declined to touch the question unfortunately.

506. (*Colonel Fox.*) They have declined it! They moved the previous question?—That means that they will not

Dr. Eichholz. do it at present. In Manchester a sample physical inquiry is now being undertaken by Dr. Ritchie. There is another I should like to urge, and that is the appointment of expert lady visitors who might do much to inculcate proper ways of living into the minds of ignorant mothers. They might well begin by discouraging the young mothers where possible from going out to work. Another very necessary step is the instruction of men and women by every possible agency in the laws of health—and women and girls especially as, how to feed, clothe and tend their children; how to cook and how to mend, as well as to do needle-work, and how to look after the house. It does not seem to be of much use to teach girls housewifery in a flat fit for a bachelor with sybaritic tastes, and expect them to benefit from it in the way of housekeeping.

507. (*Chairman.*) They are taught to make a bed, are they not?—Yes. But what I complain of is that the equipment of housewifery centres is not of a kind to encourage frugal and simple habits in the minds of the girls. We ought also in our schools to lose no chance of pointing out the dangers of alcoholism. They are doing it this way in France. I was in Paris some weeks ago, and I got a few copies of this circular on alcoholism; it is well written, and it would apply almost to the conditions in this country, except that the drinks are different in England.

L'ALCOOLISME.

Ses Dangers.

(*Extrait du procès-verbal de la Séance du Conseil de Surveillance de l'Assistance Publique du 18 Décembre, 1902.*)

(*M. le Professeur DEBOVE, Doyen de la Faculté de Médecine, M. le Docteur FAISANS, Médecin de l'Hôtel-Dieu,—Rapporteurs.*)

L'alcoolisme est l'empoisonnement chronique qui résulte de l'usage habituel de l'alcool, alors même que celui-ci ne produirait pas l'ivresse.

C'est une erreur de dire que l'alcool est nécessaire aux ouvriers qui se livrent à des travaux fatigants, qu'il donne du cœur à l'ouvrage ou qu'il répare les forces; l'excitation artificielle qu'il procure fait bien vite place à la dépression nerveuse et à la faiblesse: en réalité, l'alcool n'est utile à personne; il est nuisible pour tout le monde.

L'habitude de boire des eaux-de-vie conduit rapidement à l'alcoolisme; mais les boissons dites hygiéniques contiennent aussi de l'alcool; il n'y a qu'une différence de doses: l'homme qui boit chaque jour une quantité immodérée de vin, de cidre ou de bière, devient aussi sûrement alcoolique que celui qui boit de l'eau-de-vie.

Les boissons dites apéritives (absinthe, vermouth, amers), les liqueurs aromatiques (vulnéraire, eau de mélisse ou de menthe, etc.), sont les plus pernicieuses parce qu'elles contiennent, outre l'alcool, des essences qui sont, elles aussi, des poisons violents.

L'habitude de boire entraîne la désaffection de la famille, l'oubli de tous les devoirs sociaux, le dégoût du travail, la misère, le vol et le crime. Elle mène, pour le moins, à l'hôpital; car l'alcoolisme engendre les maladies les plus variées et les plus meurtrières: les paralysies, la folie, les affections de l'estomac et du foie, l'hydropisie; il est une des causes les plus fréquentes de la tuberculose. Enfin, il complique et aggrave toutes les maladies aiguës: une fièvre typhoïde, une pneumonie, un érysipèle, qui seraient bénins chez un homme sobre, tuent rapidement le buveur alcoolique.

Les fautes d'hygiène des parents retombent sur leurs enfants; s'ils dépassent les premiers mois, ils sont menacés d'idiotie ou d'épilepsie, ou bien encore, ils sont emportés, un peu plus tard, par la méningite tuberculeuse ou par la phthisie.

Pour la santé de l'individu, pour l'existence de la famille, pour l'avenir du Pays, l'alcoolisme est un des plus terribles fléaux.

Le Directeur

de l'Administration Générale de l'Assistance Publique,

G. MESUREUR.

508. (*Mr. Struthers.*) Would you post it up in the public house?—I would put it in the free libraries and post offices.

509. (*Colonel Onslow.*) You think this would discourage drink?—It is not merely that they get drunk, but the other things which follow. This is a Government document.

510. (*Mr. Legge.*) Have you seen similar things that they put up in the barrack sleeping rooms in France?—No, I have not.

511. They are put there under the authority of the French Government, and they show the notorious horrors which are a likely consequence of drink?—This is in every post office and public kiosk.

512. (*Mr. Struthers.*) But there are a great many temperance agencies at work, and there is a wakening up to the dangers of drink in this country more than in France, so that perhaps that would not do so much good here?—If we were to deal with the evils of degeneracy by the issue of public circulars this might be useful as an example. I have now completed what I have to say about degeneration, may I now submit my evidence on regeneration?

513. Have you dealt with the evidence of progressive deterioration?—I am coming to that presently. The point upon which I desire to lay great stress is the plasticity of human material, the power which it possesses of yielding rapidly in either direction either toward degeneration or regeneration. Just as the normal type falls away very rapidly in contact with bad surrounding, so, on the other hand, the degeneration if taken in hand early enough is capable of marked and rapid improvement.

514. You mean it yields to treatment?—Yes. With our child population we are dealing with a plastic condition, and not with a permanent or retrogressive condition. We get an influx into Battersea and Lambeth from better districts or from the country and are likely to note rapid degeneration under local influences which before long includes the young children. On the other hand there are many schools even in the poorest neighbourhoods which show mass regeneration as we go up the school, and it is a fact of common observation that the lowest types of children turned out of the slums into the industrial schools improve at a great rate physically as much as any other way during their sojourn in the institution. We know that the industrial schools work marvellous improvement on the children sent from the worst neighbourhoods. If you go into an ordinary day school you may mark these children sent on licence from industrial schools by their upright carriage and manly bearing and cleanliness of person. They leave the neighbourhood wretched youths, and come back absolutely improved in stature and carriage, and in the way they keep themselves.

515. They do not degenerate when they return?—They do on occasions. They are only out on licence. Only a very small proportion of the industrial school children are found, after a short time, to be unable to take up the full drill courses. I have discussed that with Mr. Clark, the superintendent of physical instruction in Manchester, and he told me that not more than 2 per cent. are unable to take the full drill course after they have been in the industrial school a few weeks. He had himself been personally responsible for the physical training of not less than 1,000 industrial school boys. So that here we get a good instance of the influence of feeding and regularity of life. People seem to improve, and are seized with a desire to clear away into a better neighbourhood, so that this very rough population becomes sifted time after time. I know of no greater testimony to the good work and influence of the schools than this repeated sifting and remoulding of the poorer population generation by generation. If we are to deal effectively with child degeneration we must begin early—the earlier the better. You cannot deal with bent bones except when they are young. If we take them in hand later as we do in many orphan asylums we turn them out strong and athletic, but not big. After the age of eight or nine you cannot do so much to restore stature.

516. (*Colonel Onslow.*) You mean in height?—Yes, they fill out well—with some of them we do well. At Norwood Orphan Asylum they turned out a dragoon last year.

517. (*Mr. Struthers.*) Is that rickets?—They are Jewish children, and do not have much rickets; but their shortness is not entirely due to rickets. Now as to the rapid normal recuperative power of child degenerates. In all but the very worst London schools we find a very rapid regeneration or physical improvement of the children going up the school. Thus to refer once more to a provincial school with a bad physical reputation—Gravel Lane, Salford—of children of low physique there are in the infants 62 per cent. in the middle school 40 per cent., and in the upper school 14 per cent. Now as death has very little to

say in the matter when dealing with proportions of these magnitudes, it is clear that much of the infantile degeneracy has improved under no special ameliorative measures, and many through the influence of the school reflecting on the home. It is also evident that the large proportion of low physique in the infants is not hereditary, otherwise we should not find so marked a recovery with the progress of years. These facts will serve to indicate what I mean by the plasticity of human material during childhood. May I now submit a note on an improving school?

518. (*Chairman.*) You mean the school that gets its scholars from a poor class?—Yes.

519. But where the period of school life leads to a very considerable improvement?—Yes. Here are some of the photographs of some of the older children from some of the schools. This is in Lant Street, Southwark, opposite St. George's Church. You will note that the series of photographs represents children of the same age taken in one case twenty-five years ago, in another twenty-three years ago, and in a third very recently. They are all from the same school.

520. (*Dr. Tatham.*) Are those photographs a fair sample?—They are improved, and they are not so bad as that now. There is a more civilised intelligent look about the children. They are better filled out and straighter. Would you like to have a note of that school? The population feeding the school consists of 25 per cent. of parents with an average wage of 30s. per week, and the remaining 75 per cent. consists of waterside labourers, and builders' workmen, and so forth. Now as to the causes of improvement—we find that one of the great causes is the dispersal of rookeries. While we are on rookeries, I should like to say that I do not think that the new buildings that they are putting up may not be doing all the good we expect of them; they are tending to do one great harm, and that is that they are putting a limit on the size of families. Families who could live in small tenements with large families are now precluded from entering the L.C.C., and other buildings owing to the high rents necessary to secure a flat large enough to accommodate their families, so as to comply with regulations. This means, therefore, that high rents coupled with rules as to overcrowding may tend to the artificial limitation of the size of families.

521. (*Chairman.*) Is that on account of the accommodation?—The County Council and Borough Councils limit the number occupying a flat or tenement of a given size in order to prevent overcrowding. This means that the modern tenement is too expensive for a working man who may have to bring up a large family. It will avail little to erect dwellings if they are of no use to the class for whom they are intended.

522. If dwellings became general that might be so?—But they are becoming rapidly general.

523. (*Mr. Struthers.*) Have not you different sizes of rooms for large families?—The rents in the larger dwelling are prohibitive. Now the point I wish to make about an improving school of the type of Lant Street is that parents are all on the side of the school—they are all on the side of law and order. The second generation of children (the master has taught the fathers), are better behaved and more intelligent and better clothed and better set up. There are fewer rough faces. I have got a picture here of what they were in 1878 (*exhibiting same*). Their savage type has disappeared and they have become quite civilised.

524. (*Mr. Lindsell.*) But the savage type have gone somewhere?—You do not find them in London now. They have disappeared altogether. They no longer exist.

525. You say this is mainly due to clearing out the rookeries?—That is one factor in the improvement.

526. (*Mr. Legge.*) What do you mean by savage children?—Wild, unkempt, loosely built, ragged, bare-foot children, who look like savages and not like human beings.

527. Is that true of the country generally?—Yes. I do not see any children like that now.

528. (*Chairman.*) But if that is true of London, it must be true of the rest of England?—Yes.

529. (*Colonel Fox.*) Do you attribute that to the civilising effect of the schools?—Yes, the schools have done this.

530. And you think that is likely to go on?—Yes.

Dr. Eichholz.

531. (*Chairman.*) You are dealing now with a population that is not migratory?—Yes, it is a practically fixed population. They are much better knit than they used to be. Now this is a picture well known all over London (*exhibiting*). These children are from the same area, one being the picture of thirty years ago, and the other of to-day. These children come from Clerkenwell, and these are their successors.

532. (*Mr. Struthers.*) Where were those photographs taken?—I do not know.

533. There exist as we know advertisements of charitable societies, and in order to make a contrast, the children are very carefully selected. Those are what you call savage children, and these, which are nicely dressed, are supposed to be of the same class?—Yes. There have been no important migrations or industrial changes during the period. I am passing them round the Committee now. This is a school of St. John's, Deansgate, Manchester. It shows an improvement in intellectual appearance in the face as well as in physique. There is, in fact, an improvement in appearance and intellect altogether in the pupils of to-day and this applies to three-fourths of the child population in the large towns.

534. (*Mr. Struthers.*) And that is so throughout the country generally?—Yes.

535. So that the evidence is in favour of progressive improvement?—I hope I have made that clear. To continue with my account of Lant Street. As regards endurance the boys are enthusiastic for sports, and take them up eagerly, though they still come off second best with good schools when they come to a contest, and they are readier to fight an uphill game in a greater degree than formerly. They make a better finish in the sports competitions than they used to do. They drill harder and more firmly now than formerly. There is a better finish to their physical work. I am informed by the head master, who rewards good drill by promotion to a special costume class, that he needs many more special drill costumes than formerly. There is no flagging at lessons, though they still have a poor memory, and the worst type of child, of which there are some, does not rise in the school at the normal rate. Now the meat and milk question, and the general question of dietary, is still very bad there—an indication that neglect must go very far indeed to make a permanent impression on the child as regards possibility of improvement there. May I instance another school at Eltringham Street, Wandsworth—a London Board School. It is a great school for organised games, and is situated in a poor but industrial quarter, but the boys are well fed. This is an improving school. It is not so bad as the other schools, and by the time that the drill course has been completed, are found to have grown up as well as other children in London.

536. You say it is a poor school and they are well fed, and because they are well fed they are improving?—Yes. It is in Wandsworth where the big industries exist. The boys are able to improve physically and mentally, owing to the fact that they receive adequate home care.

537. It is not a poor school like Johanna school?—No. In this school class work is done without any fatigue. The school succeeds in examinations of the School Board and the Civil Service, and the boys are able to do home lessons. This is always a good sign of a better home. Now as to the games, they obtain excellent results in football; the school shows great prowess in sports, running and swimming, carrying off prizes in great numbers. So that the improving conditions of living, the pulling down of rookeries, rehousing, the signs of greater care on the part of the parents, and their new attitude on the side of law and order, drill and organised games, for children who are able to take them up, greater regularity of attendance at school—all these circumstances are telling gradually, if slowly, on the amelioration in physique. Although the labour field is subject to fluctuations, still there is less of this irregularity than there was thirty years ago or more. For instance, in the North of England, succeeding the cotton famine, a fearful state of things arose. They say they hardly dared to look back upon that time. Signs of improvement are the disappearance of the savage type in neighbourhoods which have not been subjected to much fluctuation of the population; the appearance of well-being as shown in the firm and resolute countenance, and their height measurements. The height measurements

Dr. Eichholz. at an improving school and the improvement in the enumerations of weakly children confirm the other evidence. And then another educational point is the increased percentage of children in the upper standards of the schools which, in the case of eight schools from which I have returns, averages over 10 per cent., a very notable increase. The schools are in Manchester. (*Witness here gave some figures from a return of attendance of children in eight schools in Manchester.*)

538. Is not that partly due to raising the school age by bye-law, that is children are not allowed to leave so early as they used to?—It certainly means that our children are getting a fuller chance of educational and physical equipment for life. The long experienced teachers also are very certain that the older children used to lag behind in the lower classes much more even than now, certainly in provincial schools.

539. It does not mean that there is that larger number of children out of the same population who are able to go to a higher standard?—Yes. It means that a larger proportion of the whole of the children are being passed out of school at a higher stage of development than formerly.

540. I have no doubt that there is some improvement?—But there is an impression throughout the schools that there is a great deal. No account of improving agencies would be complete which omitted to mention the ameliorative agencies at work inside and outside the school. Firstly, there are the Free Dinner Associations, and the Clothing Associations, such as the Ragged School Union. There is the Invalid Children's Aid Association which looks after crippled children. The school nurses, who render splendid service in the schools themselves. The Children's Country Holiday Fund. The Lads' Clubs and the Girls' Clubs, which take on the children at a most important stage in their career when they are leaving school. I consider the Lads' and Girls' Clubs work as the most important social development in dealing with the adolescents, so as to preserve and develop the morale and physique and character during the most trying years which intervene with school life and maturity. Then there are the Boys' Brigades; the Evening Continuation Schools are doing splendid work in the same lines; and in the lower neighbourhoods the National Society for the Prevention of Cruelty to Children. In certain towns there are lady health visitors, but I am sorry to say nothing of the same kind or to the same extent in London. Probably I need not go into that question.

541. (*Chairman.*) I do not think you need say much about that. We had something about it the other day?—Very good.

542. (*Colonel Onslow.*) What is the population of Notting Dale district?—I do not know exactly, but about 20,000. There is no industry there. There used to be a pottery, but that has died out, and now it is a concentration of population of the worst criminal type. Now may I indicate to the Committee what I consider the best children in London. They are the sort I look upon as my standard. That photograph shows the children at Honeywell Road Board School, Wandsworth Common. (*Exhibiting photographs.*)

543. (*Mr. Struthers.*) That is a suburban school?—No, it is in the area of the London School Board.

544. (*Chairman.*) What class of children were they?—Their parents are clerks and respectable middle class people in good position, occupying houses up to £30 to £45 a year rental. They could in most cases afford to pay something in fees for education.

545. (*Colonel Fox.*) What is the school?—Honeywell Road. The educational methods and results of this type of school are not to my mind surpassed anywhere in Europe. The school has acquired a Continental reputation for breadth of curriculum. The Director of the Leipsic Institute for Manual Training has praised it highly. It has been visited by the Chief Inspector for Hanover, by Austrian and French delegates. Some time ago I accompanied a German educationalist to the school. He witnessed the girls drill, and exclaimed in admiration that they bore themselves as well as German soldiers and offered the further comment that the English might pride themselves and feel reassured as to the national physique so long as they came up to the ideal maintained at Honeywell road. What I claim, then, is that in London we are turning out as good population as anywhere in England,

and population which stands exceedingly well in comparison with Continental peoples.

546. What population do the West Lambeth schools serve?—A population of nearly three quarters of a million. West Lambeth is a large London district, not exceptional in the strata of population of which it is comprised and though I have visited almost every district in London to gain information, what I say about Lambeth schools may be taken to apply all round.

547. The worst districts in London?—Are not confined to any one area.

548. There are fewer of the good schools?—No. It contains an average share.

549. That proportion might stand for the whole of London?—I think so.

550. And you confine your medical inspection to the worst class?—I have observed the children in all classes of schools.

551. Supposing you had a medical system of classification?—I should only go primarily for the worst children. They need it most and would benefit most from it. The Committee might like to hear some of the opinions of others which I have gathered in the course of my inquiry as to progressive deterioration. Dr. Tattersall, for twenty years medical officer of Salford, considers that the population is under better conditions than ever. The physique is as good, if not better, than it was; the population is less liable to sickness and death; and his impression is that girls are actually bigger than they used to be, and this is a common impression. The circumstances which cause the less fit to survive act even more favourably on the fit. This is an important point. Dr. Hall, of Leeds, tells me that he does not consider that there is anything which is not susceptible to amelioration under proper treatment; but, bad as things are, he does not consider there is hereditary degeneration, but rather increased neglect.

552. (*Chairman.*) And the conditions are to that extent worse than they were a little time ago?—Yes, but there is nothing which is not improvable. Then I have got the impression from thirty-five head teachers who have been at schools for a long time. Of the thirty-five only four speak for deterioration, and of the rest, nineteen speak for improvement, and twelve offer no opinions, but think that things are stationary. Miss Dendy, of Manchester, says that there is a decided improvement in physique among school children. Mr. Wyatt, the very experienced Secretary of the Manchester Education Committee, says the last thirty years have eliminated the neglected child, what I call the savage child. He thinks the improvement is owing to the schools, and the industrial schools, and street legislation. He says the domestic condition is improved; the children are sent better to school; and there are very many fewer bare feet. This quite bears out my own impression. I remember the matchbox and evening newspaper boy years ago, but he has quite disappeared. The provincial school board inspectors and head teachers are strongly of the view that the children are better set up, less neglected and wasted than formerly. Miss Lee, inspector of Salford, says the infants admitted now-a-days are healthier and more alert than formerly. In Leeds, I obtained the evidence of a retired master who pointed out that thirty years ago his children used not infrequently to faint from lack of food and neglect. This he never saw, though there had been no great population changes he says that older children used to remain in the lower classes more than they do now, which accounts to some extent for the apparent decrease in size in the lower classes marked by some observers. In Leeds, too, one of the old head teachers pointed out that twenty-eight years ago the percentage of visible deforming rickets had been as much as 18 per cent., but had now-a-days fallen to an insignificant proportion less than 2 per cent.—and this in a neighbourhood which had gone down in the interval. The Ragged School Union officials and workers all agree that there has been improvement. Now, then, there is some special evidence which I should like to submit as to the degrees of blindness and deafness. There is both Census evidence and London School Board Schedule evidence that there is a distinct decrease in blindness and deafness in adults and children. In the last ten years—in 1891 the blind adults numbered 3,573 (one in 1,186), and in 1901 the number was 3,556 (one in 1,275). Deaf mute adults

were 5,023 (one in 930), in 1901; and in 1891 they were 4,787 (one in 888). Then coming to the children of school age, in 1891 in the case of the blind it was one in 1,844 and now they are one in 2,233. In the case of the deaf, in 1891 it was one in 744, and it is now one in 866. This shows a decided and satisfactory decrease in blindness and deafness in the ten years—and we must remember that in the case of children the taking of the annual census or scheduling is much more perfect than it was. There is a point I wish to raise with regard to the lunacy census statistics. In the London census for 1901 they show an apparent increase, but the mentally-feeble are included for the first time. It is impossible to say whether that is an increase or decrease. In 1891 there was 5,771 lunatics, and in 1901, 7,058. During 1901, however, the London School Board scheduled 2,733 mentally feeble-minded, which if deducted from 7,058 would bring nett to 4,235 adult lunatics, or an apparent decrease in lunacy instead of an increase as indicated.

553. (*Dr. Tatham.*) That part of the general report of the census is now under consideration?—Then I need say no more about it.

554. The final results are not yet ready for publication, and I should not like to say anything about it.

555. (*Mr. Legge.*) Will you express your opinion upon the point of increase or decrease of lunacy?—I am not in a position to express an opinion.

556. (*Chairman.*) What you have said would lead people to suspend judgment?—Yes, I could not express any opinion. Now I take the point as to the compulsory school attendance, and the increase of school attendance percentage, and the abolition of school fees as a factor in concentrating public attention on the degenerate population. The main strength of opinion in favour of progressive deterioration came from Salford. I therefore made a special point of visiting their black spot, Greengate, as I have observed, and discovered that the schools which are now free as regards fees used to charge a sixpenny fee, and drew from a good artisan population which has now gone outwards. Here, then, is one very good instance where abolition of fees have produced stratification and aggregation of the lowest population. I have some interesting numbers on increase of children scheduled and the increase of children coming into the schools in London during the last twenty years. The increase of children on the roll in the last twenty years in London is 47 per cent.—that is enormous. The increased percentage on the schedules for the same period, that is the London School Board census, is 31 per cent., which is only less enormous, showing in one case 47 per cent., and in the other 31 per cent., which means a much greater relative increase in the roll than in the children scheduled, or in other words, that the schools are touching a much larger percentage of children than formerly. More children are coming into the schools than mere increase of population will account for. The percentage of attendance has increased from 79.5 per cent. to 85.6 per cent. in the same period. This great increase of children brought into the schools (249,000) is obviously not drawn from the best classes. It represents over and above the increase of population the victory of elementary education authority over the apathetic masses and over the worst element. The accommodation in the fee-paying schools in the last ten years has decreased by about one-third; there were 126,000 school places in 1892, and at present there are 84,000, so that there is a decrease of over 41,000, which have been replaced by free places. I have discussed the migrations of better classes from poor neighbourhoods in Salford and Leeds. We have similar processes going on all over London, better classes stratifying in the better neighbourhoods and the worst concentrating in the slums. For instance, when Lord Cadogan cleared the Chelsea slums the result was to drive the poorer people over to Battersea, and this gave for the time the appearance of local deterioration. Finally among the circumstances which throw apparent deterioration in relief is the constant raising of educational acquirements in the elementary schools—a condition with which healthy children can easily comply but which hits the lower classes very hard.

To discuss more closely the question of heredity may I in the first instance recall a medical factor of the greatest importance: the small percentage of unhealthy births among the poor—even down to the very poorest. The number of children born healthy is even in the worst

districts very great. The exact number has never been the subject of investigation, owing largely to the certainty which exists on the point in the minds of medical men—but it would seem to be not less than 90 per cent. *Dr. Eichholz.*

I have sought confirmation of my view with medical colleagues in public work, e.g., public health, poor law, factory acts, education, and in private practice in poor areas, and I have also consulted large maternity charities and have always been strengthened in this view. In no single case has it ever been asserted that ill-nourished or unhealthy babies are more frequent at the time of birth among the poor than among the rich, or that hereditary diseases affect the new born of the rich and the poor unequally. The poorest and most ill-nurtured women bring forth as hale and strong looking babies as those in the very best conditions. In fact it almost appears as though the unborn child fights strenuously for its own health at the expense of the mother, and arrives in the world with a full chance of living a normal physical existence. And I should like to offer the suggestion that the committee seek the opinion of the London Obstetrical Society on this question.

The interpretation would seem to follow that Nature gives every generation a fresh start.

557. Is that apart from hereditary tendencies?—Yes, these affect rich and poor alike.

558. There is a fresh chance of getting rid of rickets with every generation?—Yes, rickets, malnutrition, low height, poor weight, anæmia, and all the other circumstances of neglected existence. It is from the moment of birth that the sad history begins—the large infant mortality, the systematic neglect, the impoverishment of the constitution—the resulting puny material which is handed over to the school to be educated.

559. Are still births on the increase or not?—I have no idea. They are not registrable. Nor do they directly affect the case. We are dealing with those who live.

560. Do you think that the conditions under which still births are produced would be a point of any importance?—No. To continue. It seems clear that every generation receives its chance of living a good physical life, and when to the fact of the large proportion of healthy new births we couple the evidence of improving health and physique in children who pass up the poorer elementary schools, it seems clear that we are not dealing with a hereditary condition at all but with a systematic postnatal neglect by ignorant parents, and that heredity, if it makes for anything, makes for recuperation, and so do the other social forces which are brought into play in dealing with the poorer population. Then we have another point as to the question of recruiting: as far as I am able to speak, it seems to be largely bound up with the general labour question. There is a very large demand for boy's work in all industries, work of a semi-skilled nature which absorbs practically the whole of boy labour. In London and the large towns there is the further demand for unskilled boy labour in the shape of office boys and errand boys. A boy leaving school can get, very readily, work at 5s. to 7s. per week in London. Under the varying conditions of unskilled labour he takes up work for three years, and by the time that he has reached seventeen he has shown either self-improvement or self-deterioration. If he is self-deteriorated you may get him for a soldier, if he is self-improved he goes on with his industrial career.

561. (*Colonel Onslow.*) That is true of a certain class going into the army, but that does not affect the navy?—The boys are drawn directly for the purpose while they are still young.

562. Seventeen is the difficulty?—Yes. You are landed with the failures, and the lack of self-improvement which they have exhibited is largely bound up with their physical condition. At seventeen they become the street loafers—practically the only available source of recruiting for the army. Those with long experience of boys' clubs tell me that thirty years ago, where there used to be one in ten who went into the army, now they do not find one in fifty who go in. That is because the boys have better opportunities; in fact the boys' clubs are working against army recruiting and pushing on their boys for better careers. Now there is another point, the apprenticeship system of labour is disappearing in London. We are sorry to see that that is so, and there is nothing to replace it. Fifty per cent. of the boys passing through

Dr. Eichholz. manual centres in elementary schools are fit to take skilled work. A very small percentage of those boys take up crafts when they leave school, by far too few to meet the ultimate needs of skilled trades. They have to enter skilled work later on, when much of what they have learnt at school is forgotten. These clever youths are bound to enter the field of unskilled labour and consequently put pressure upon the field of unskilled labour, which drives out the less clever youth, swelling still further the percentage of wastrels. Then the other question of the wages of unskilled labour as compared with the wages of army service. We are told that the wages of army service do not attract the boys in the same way that unskilled labour does. As regards the percentage of rejections in England we are told that the rejections in Germany are 16 per cent., and in England 62.

563. (*Colonel Onslow.*) How about the French, they are even greater?—You cannot compare Germany with England. In Germany every man goes through the army, there is nothing very creditable to Germany that 16 per cent. of their men not fit for service, and to my mind it is a great credit to ourselves that we can complete our army numbers at all with the material available. I feel tolerably certain that a physical examination of the whole of our population on the German standard would not find us wanting.

564. (*Mr. Legge.*) How do you get your 62 per cent.?—I have it from Lord Meath's article. I have one point to submit about the physique of the girls. This question of the physique of the girls was first suggested through the official examination of medical certificates for pupil teachers and certificated teachers for my Board. So many of the girls appear to suffer from temporary anæmia, largely bound up with the circumstances of rapid growth and simultaneous hard work. The conditions which arise are so serious that I feel impelled to suggest for the consideration of the Physical Drill Committee the need for a special light drill course for girl pupil teachers.

565. (*Mr. Struthers.*) The girls are from fourteen to eighteen?—I hope that the Committee will consider the question of physical drill classes for teachers

566. The Committee that we are on is not dealing with the pupil teachers, but simply children in the elementary schools?—I hope something will be done for the pupil teachers. It means if you are not going to deal with it it will render the recognition of every anæmic girl difficult owing to the danger which is likely to arise from her undertaking the heavy courses of drill and physical exercises now so much in vogue. I have discussed the question of the physique of young girls with secretaries of girls' clubs, and they tell me that as soon as a girl leaves school she does not fall off immediately, but between fifteen and eighteen she begins to suiter. If her work is too hard she does not recover, but if her work is reasonable she becomes a normal person at twenty. Some girls succumb meanwhile from hot rooms, unhealthy surroundings at work, and so forth; bad food, late hours, excitement, and stress of work, superadded to functional anæmia, are most detrimental during these years. If these girls marry early they as likely as not get still worse, but in some cases early marriage improves a girl. Early marriages are not all equally bad. A girl who marries and has a good home is likely to improve, because married life removes her from the excess of work, so that we find that a good many early marriages act as improving influences. Poor food, unsuitable food, sweets, pastry, tea, and irregularity of meals are again responsible for much of the lowering of health in the case of growing young women. The extension of the midday restaurant to meet the needs of adolescent girls is suggested as a remedial measure; something is being done already in some cases. Miss Kirwan has established a large dining room near Bond Street, where she dines from 300 to 500 a day at 5d. per day. I was asked to discuss the question of country schools for the most degenerate class. If we can bring the Protection of Children Act of 1894 into full activity, and the industrial sections of the Act of 1876 and apply them stringently, or even if it requires some additional legislation to enlarge the powers of the Secretary of State or the school authority, we could largely meet the needs of the country by urban schools of industry, though we should probably find in a country school a valuable adjunct for determining the rapid amelioration of the worst cases

567. You would have the country schools?—Yes, but nothing of the wholesale nature, and at first everything should be done by way of trial rather than by way of policy. The numbers are much too great. We cannot put 100,000 children out to board and maintenance from London alone. It costs £100 per head to build and £25 a year for maintenance—£10,000,000 for capital outlay and £2,500,000 for annual maintenance.

568. (*Mr. Lindsell.*) Do you think that is correct?—The country school is going to cost you £100 per head to establish and £25 a year to maintain.

569. (*Mr. Struthers.*) What do you base that upon?—Upon the knowledge of institutions with which I am officially connected.

570. (*Mr. Legge.*) The industrial school experience bears that out almost exactly.

571. (*Mr. Struthers.*) That corresponds with my own experience, too?—That is our experience. Twenty-five pounds per annum is a very low estimate of maintenance. There is the other difficulty. Certain parents will not let their children go. There are parents who though poor and perhaps indifferent as to the care of their children still desire to have them at home. Now, may I present my recommendations.

572. (*Chairman.*) Are they included in this memorandum?—Yes. There is (1) the provision of non-punitive schools of industry, rural and urban, for cases of neglect; (2) medical inspection of schools with physical censuses—concentrating first on poorer neighbourhoods; (3) the establishments of school restaurants, milk supplies, restaurants for adolescents, supported as far as possible by parents, leaving it for charity to concentrate more efficiently upon deserving cases; (4) the adaptation of school curriculum to meet local needs of poor schools, as regards three-R, education, drill, manual work, housewifery, cookery, and laundry. Then (5) education by classes, clubs, and re-unions of poorer population and all who come into contact with them in the salient practical points of domestic and personal hygiene; (6) to strengthen the hands of existing agencies by calling attention to their existence. They are the Invalid Children's Aid Association, School Nurses Association, Children's Country Holiday Fund, Ragged School Union, The National Society for the Prevention of Cruelty to Children, The School Dinner Associations, and (7) the appointment of bodies of lady School Board visitors and lady health visitors, working together in the homes for the prevention of infantile and child degeneracy; then (8) permanent homes and colonies for the mentally and morally deficient. We have a few, and only for children. We shall have to take up this problem very seriously, and determine whether it is not more humane to deal with these people in industrial colonies than in prisons, asylums, and workhouses.

573. Do you think you will get much out of them industrially?—Yes. I visited a colony in Germany for the Board of Education two years ago. It was situated in Ursberg, Bavaria. There they had 1,100 people of impaired physique and mental deficiency, adults and children; and, apart from the importation of raw material, the whole place was industrially self-supporting. It required 400 workers to run it. Then I should like to give you the further recommendation—(9) an appeal by circular to local authorities, with a view to breaking down the hard and fast line between official and voluntary workers, and to encourage by every means the enlistment of school managers, who have time and leisure to learn from close contact the actual circumstances of the schools, the scholars, and the homes, and avenues of employment for children who leave school. It seems to me that if we are going to get the best out of the Education Act of 1902, we shall have to encourage managers, not only for other purposes, but for this as much as any

574. What do you mean by the note you have at the end: "(10) A Committee on National Physique"? You have certain opinions on that. I suppose?—May I now offer my view?

575. What is your view about that?—I suggest that there be appointed a permanent official executive committee of experts—medical, educational, physical, industrial and philanthropic, acting in conjunction with the Government Departments, and charged with the duty of collecting, examining, co-ordinating, and diffusing information bearing on conditions affecting the national

physique. The labours of such a Committee would affect every period of life, and might in the first instance deal with (a) questions affecting infantile and child physique; (b) the influence of residential schools, homes and colonies; (c) the industrial and physical problems of adolescent life in so far as they react mutually; (d) the work of amelioration as performed by existing voluntary agencies. In addition to this working Committee the appointment of a non-executive advisory Committee would be of the greatest advantage in facilitating the collection of information. This consultative Committee should include prominent clerical, medical, educational, and philanthropic elements.

576. Would not this be executive work done by the professional body?—Yes, by the official Committee; but there is need for a non-executive advisory Committee to facilitate access to all the sources of information.

577. You would make that ancillary to an official bureau, which has the means of doing it?—Exactly. I do think some such committee would be of enormous advantage, certainly as regards the schools, and as regards the difficulties which confront public workers in dealing with adolescent life.

578. One other point. You do not apparently think that the conditions of school life act to any great extent, if at all, in a prejudicial direction on the health of the people?—As regards the schools, I think there is nothing which is not in the power of existing authorities to improve.

579. But, as a matter of fact, they do not, you think?—One has to do a good deal by way of educating popular opinion on important points, the seating of children, the misuse of slates, the importance of light, and especially of fresh air, the seriousness of which is always admitted in theory. As regards fresh air I suffer a good deal from what I am compelled to encounter on my visits round the schools. I constantly begin my work on a classroom by opening the windows.

580. But if it causes a draught, what then?—I consider a draught of less importance than the constant inhalation of fetid, vitiated air.

581. You do not think that the cramped position in which the children sometimes are has a prejudicial effect?—Most certainly. The inspector is there to prevent it.

582. Do you think that the time-tables of schools provide for a sufficient number of intervals?—Yes, they do. They have a quarter of an hour in the morning, and a quarter of an hour in the afternoon. There are also frequent periods for drill—in all London schools three periods of twenty minutes per week. There is no need for more recreation as a rule. If the local circumstances point to the need for more recreation the inspector has power to sanction it.

583. Dr. Kerr thinks otherwise from the evidence that he gave before the Royal Commission on Physical Training in Scotland?—I have seldom come across any evils of ventilation in a school that could not be altered in five minutes. If the windows are not open you can open them and the children can be cleared out of the room if necessary. The draught is not a real objection, but is often an excuse for tolerating irrespirable air.

584. (Colonel Onslow.) With reference to your recruiting question, I say nothing about the class who go into the Army, or become stokers or marines in the Navy. But with reference to the boys, they must come from well-to-do parents for the Navy, because you require certificates. As regards refusing artificers and artisans they have to pass a very stiff examination. Therefore, they cannot be the wasters, and yet there is a large percentage of rejections for artisans and boys. Everybody coming into the Navy cannot be such wasters as you suggest they are for the Army, because everyone who comes into the Navy must produce six months' character from some responsible person; everyone must have a history. An artificer must be a boiler-maker, or something of that sort, and must be able to pass a very severe examination. A blacksmith, a cooper and a carpenter have to go through a fair all-round workman's test. Notwithstanding that we have a large number of men rejected for medical reasons?—What proportion of the whole do they reject in the Navy?

585. I cannot tell you what the numbers are, but the number who are rejected amongst them is very considerable.—Is it anything like 62 per cent.?

586. Very probably they include the rejections by the recruiters as well as the medical officers. The recruiters refuse them owing to bad sight, and varicose veins, and flat feet, and so on.—Do you wish me to go into that point?

587. No. The fact of the large number of artisan rejections counteracts the wastrel idea because the bulk of the recruits of the two services we acknowledge come from the rough element.—Does your artisan come from good employment elsewhere?

588. Yes, constantly, from firms like Vickers, Maxim & Company.—Is that when they are in good work?

589. Yes.—Would you have got them in the time of the South African War? I should not like to offer an opinion until I had the chance of going into it.

590. I could show you the figures which we have worked out?—I should like to see them.

591. All those individuals come from a different class, and not from those that you are speaking of.—Do you get more rejections from those who come from the towns or the country?

592. It is about equal.—That shows that the question of urban deterioration has nothing to do with what you are now speaking of. That is the whole point.

593. It shows that there is not deterioration?—You must remember that for the Navy you are bound to select the finest material to be found. And that the physical tests are as near the ideal as can be obtained. You are already dealing with a very high type of recruiting materials when you are able to say that the percentage of rejections for town and country are not sensibly different.

594. There is another consideration between country and town. The population shifts about from the one to the other. You get rural people from the towns. But your artisan must have been tied to his trade for a considerable number of years and he has the least fluctuation of all?—With the knowledge before us that the town and country rejections for the Navy are not different, I feel that the Navy is not touching the degenerate at all, and the high medical and physical standard required for the Navy is responsible for the large number of rejections.

595. The medical examination is a very much stricter one than for the Army?—It must be a practically perfect standard for the Navy. Look at the men you see at the naval ports. They are a wonderful sight to behold.

596. (Chairman.) What proportion would you reject of those accepted by the Army, do you think?

597. (Colonel Onslow.) That is a difficult thing to say.

598. (Witness.) Then I also submit in this connection that the artisan who volunteers for recruiting even in the Navy is not likely to be the best man at his craft. The private firms are not likely to let their best workers go from them.

599. (Colonel Onslow.) I was only speaking of the artisans, of men in work.—You probably do not get the best artisans.

600. I was only referring to the class going into the Army.—Your condition is clearly not a thing that can be remedied by a return to the land, or anything to that kind, so long as town and country are equal in the matter of rejections.

601. (Mr. Struthers.) Speaking about the Johanna Street School, you gave some information as to the place where the parents lived and their occupations and habits. I suppose that information was derived from the teachers?—From the head-teachers. Practically the whole of those children come under inquiry for the purposes of Joint Committee on Underfed Children, and I have among my evidence a number of picked cases from head-teachers, records, and having gone through them myself I have no reason to think that they are not trustworthy.

602. You are aware by our knowledge of schools that there is a tendency on the part of teachers, especially in poor schools, to exaggerate the difficulty of the work and the hardships?—I find the tendency is rather otherwise. My difficulty has been the opposite one, to correct their optimism. They become so accustomed to the evil circumstances of the schools that they frequently fail to recognise them. Their anxiety is to show what improvement their work has made upon the neighbourhood.

Dr. Eichholz. 603. That is, once they have started?—Yes, and in most cases the schools are a powerful influence for good. I do not think that teachers are always able to investigate far enough.

604. But that is the source of your information?—To a certain extent only. May I refer to that point? It is clearly impossible and out of place for inspectors of schools to visit the homes and enquire of the parents. In the absence of school managers who can and ought to visit the homes, the school teachers who are in constant touch with the children and parents constitute the next line of defence as regards information, and it is surprising how much information the heads of schools have at their disposal, information which is accurate, full, and which bears the most complete cross-examination. It is not possible to commit such enquiries to school managers for the simple reason that managers capable of doing the work do not exist in anything like sufficient numbers. There are isolated workers who are doing most useful work in this way but as to the whole ground being covered it is simply not being done. In enquiring as to home circumstances one is compelled to go to the head teacher. I have in a few cases been able to get opinions based on experience of a very valuable kind from managers and committee members and officers, but have been obliged largely to depend on the head teacher.

605. I merely want to bring out the fact, so far as the information on that point is concerned—that is the source?—Yes, on the point of the homes.

606. Then you gave us some statistics of the height of children in each school. Do you regard height as a better indication of physical capacity than weight?—I find the two things go together.

607. You do not think it necessary to take weight to get a comparison?—At the beginning of the enquiry I should have been unable to answer the question, but now I can say this, that I should be perfectly satisfied with having height statistics. They so exactly correspond with the weights and other circumstances of nutrition, that I should be content to have the heights.

608. That is very important. It is very much easier to take the height than the weight, is it not?—Yes. Weight is difficult to obtain accurately because the clothing varies enormously.

609. In giving the statistics for those schools and several other schools, you have the number of children, the percentage of a certain age; that is, a calculated percentage based on the selected children, I suppose?—We have not selected the children. I have said to the teachers, "Will you take twenty or twenty-five and measure their heights?"

610. Do you give any instruction in picking them out?—I tell them neither to pick the least nor the biggest, but to take them as they come.

611. Do they know the object for which you want it?—Naturally they knew my object but not my views. In certain of the schools the whole school was measured and we find no difference as regards results from the cases in which samples were taken. We get the same result.

612. It does not vary very largely from what you get in the sample measurements?—No. In Leeds they measured the whole school and it is about the same. I should be satisfied with the sample.

613. There is the medical inspection which you spoke about later on, and the collection of statistics as to the facts of children's physique. We must not mix up those things?—Quite so.

614. And the question as to the picking of twenty children in a school in Yorkshire you think would give an accurate basis of the whole?—We must distinguish between samples and statistics. Statistics must cover the whole area of investigation, samples will serve only for demonstration. What I did this for was for the purpose of demonstration, this being all I could do in the time at my disposal, but as I say the sample cases agree exactly with the cases in which the whole school was measured.

615. In speaking about the medical inspection you would confine it to the poorer schools, about one-fourth of the whole?—In the first instance.

616. I am speaking now of medical inspection. In the other half there would be always in each of those

schools a certain proportion of children of weak physique or underfed?—Just as in the poorer schools, who would not come under purview at all.

617. Would not you require medical inspections, not only of poor schools but also of the poorer children and the underfed; that is to say, that the inspection should apply to the whole of the schools?—I do not think that any good would come to apply it to all schools, except for statistical purposes. For remedial purposes I should tackle the slums first. There would be no difficulty for a teacher in an ordinary school enumerating the weak ones, and notifying the School Board with a view to having the children examined by the medical officer.

618. Would it not be a better system that the teacher should intimate that there are so many children that he should have examined?—That is my meaning.

619. I thought that it should be a selected class of the school?—I am anxious that medical inspection should burden the rates as little as possible, and that we should get the maximum good from it. I should concentrate on the poorer schools because I feel that a very large percentage would be in need of it there. For the ordinary schools I should adopt it only by special notification, very much as is done now in the case of feeble minded, deaf, and blind children, where the teacher notifies on a form of the School Board the children he desires to have examined, and they are brought to a centre for the purpose.

620. I have one or two points about the drill of the school. Do you say that a certain number of children could not stand it?—Ten per cent. cannot stand it in many of the poorer schools.

621. It is a question of endurance and not the exercise itself?—It is their endurance.

622. Those children might be able to do their simple exercises, repeated two or three times a day for a couple of minutes without being taken out for a drill, that is to say, a certain number of them?—I believe they could.

623. I put the question for this reason, that in our Committee, which has been discussing this question, we are making a strong distinction between the systematic drill which lasts for twenty minutes, and that taken in the class room, which does not last for more than two minutes?—A very good proposal, provided the class rooms were well ventilated first, for I consider nothing more harmful in drill instruction than taking it in a vitiated atmosphere.

624. My point is this: is not it probable that a certain number of children, who would be excluded from the formal drill, might join with safety in these little exercises?—Undoubtedly.

625. You have no experience of methods of dealing with the vagrant parents of the children?—None.

626. You have no hints as to how to deal with them?—In this school of industry the main point, in the first instance, is the feeding and clothing of the children, the regularity of life before applying a full ordinary school curriculum.

627. But for the industrial schools what would you do?—I should increase the time allotted to manual occupations.

628. But the essential point is the feeding?—Yes, and the cleanliness of the clothing. I think that the physical conditions are the first things to aim at, and then the question of curriculum. To consider the curriculum first would be to waste time.

629. You seem to be under the impression that there was some disadvantage in the teaching of housewifery?—Yes.

630. But you want them instructed in the meantime in domestic methods?—Yes.

631. You approve of the housewifery, but the way in which it is done is what you want to improve?—Yes.

632. (*Dr. Taiham.*) I understood you to say very clearly in your evidence, in answer to a question of the Chairman, that according to your experience at any rate, you knew of no evidence to show that there was anything like progressive physical deterioration among the population?—Among the child population, which I have investigated, which have come under my supervision. That is perfectly so.

633. You think the evidence is in the other direction ? —Yes, I think the evidence is in the other direction, as regards heredity.

634. We had it in evidence last week that not only was drink, that is to say alcohol and beer, used very much to the detriment of the lower orders, but that that drink was very bad indeed in quality, that the spirits and the beer were badly adulterated, and for that reason very much more harm was done. Have you any experience in that ? —Of course, one hears the same thing in every country. Germany is the only country where you can guarantee that the beer is not a chemical product, and this applies only in one part of Germany, Bavaria. In every other part of Germany there is the risk that the beer is a chemical production and not a pure brewed product.

635. Coming in contact as you have done for a great many years with the class of the population which you have been talking about this morning, is it your experience that milk enters into the diet of young children to any considerable extent ?—No. That is, I think, one of the main points I wish to impress upon the Committee, the almost entire absence of milk, almost as soon as possible after the date of birth.

636. (*Chairman.*) Do the mothers nurse their children ? —The duties of maternity are becoming more and more neglected.

637. You think that is so ?—Yes.

638-643. Do you think there is direct evidence on that point ?—You want no further evidence than the high infant mortality in the large towns. In some parts of London a few years ago it was fearful, as the returns of the medical officers of health will show. I believe it is somewhat better now—certainly it is in Notting Dale, one of the worst offenders among the slum areas. The medical officers and other investigating authorities will be able to tell you how much was due to overlaying. The statistics can readily be obtained if the Committee desire to have them. One fact which Dr. Hall has adduced in Leeds is the question of the nursing of infants among Jewish mothers. They fulfil their duty as long as they can for the reason that the woman is not the bread-winner. It is the exception to find the woman the bread-winner, and she is able to perform her duties to her children during the first months ; which, after all, are some of the most important of the child's life. I think the absence of milk is one of the prime factors in underfeeding, not only of mother's milk during the lactation period, but of cow's milk, later on. If these children get milk it is something out of a tin. No one knows what went into the tin. At any rate it is not the material on which to build up a growing child's frame.

644. (*Mr. Lindsell.*) You divide the time of such deterioration as may arise into three periods I think—birth, early infancy, school age ?—And a fourth, the period of adolescence.

645. Yes, and the period of adolescence ?—There are four periods.

646. With regard to the period of birth you do not attach any great importance to hereditary taint ?—That is so. What I feel is that a good many of my medical colleagues—I have consulted as many as possible—feel that the percentage of badly-born children among the poor is not sensibly greater than among the rich, and that such diseases as are hereditary, such as insanity and neurosis, in which we include alcoholism and other inherited diseases, diseases of bad living, affect one as much as the other.

647. We have had a good deal said the other day about syphilis. Do you not consider that still a very extensive thing ?—It accounts for a very small number of degenerate births. Women with active syphilis very frequently fail to complete their pregnancy, this disease being a very common cause of miscarriage. There is a tendency for public opinion to exaggerate the extent of this disease, which is not surprising with a disease capable of so many ramifications, and offering so many difficulties to the medical man himself, in the endeavour to deal with it in diagnosis.

648. (*Chairman.*) He should, when uncertain, abstain from classifying, should he not ?—That would be his obvious duty. A point worth noting is the tendency of the syphilitic taint to disappear in a very few generations.

649. (*Mr. Lindsell.*) With regard to the causes of deterioration which arise in infancy, they are mainly due to bad nutrition ?—Yes.

650. At a later stage you make certain suggestions as to providing proper food, but at that stage there will be no remedy possible except change in the habits and employment of the mothers themselves ?—At the later stages of infancy.

651. At the earlier stages ?—Between the ages of two and school age ?

652. And school age ? The remedy lies with the mothers between the time of birth and the date of school age ?—Nobody can get at the children but the mother or the visitor. I think the lady health visitor might perform very useful service. I should like to see her officially attached to the medical officer of health.

653. So that the child's nurture may be affected before it reaches the age at which you could touch it in the school ? —Yes. I am anxious we should get at the child as soon as possible after he comes into the world. I think a lady health visitor of a properly trained kind, as they have in Manchester, attached to the medical officer of health or the sanitary authority, ought to perform this duty of enlightening the mother. For mothers who are compelled to go to work, the *crèches* or day nurseries which are being established all over the large towns are doing a great service, but the total result of their effort is bound to be small at the most, though excellent as far as it goes.

654. It would require a very considerable change in the present habits of the lower class mothers, in the way of attending to the food and the preparation of food ?—Yes.

655. As well as the quality of food ?—Yes. I think it is not likely we shall effect very much improvement in the people who have already become mothers. But among the people who are about to become mothers, I have suggested a better kind of training which will include household cookery.

656. That is the school age rather ?—Yes.

657. With regard to the child at school age, you advocate a much greater extension of feeding through benevolent agencies ?—What I have suggested is that we should first discover culpable cases and deal with them by industrial methods. The non-culpable cases, cases which are due to poverty, fluctuations of employment, season trades, and so forth, and perhaps non-culpable ignorance, will all remain over for charity ; I should concentrate charity on those cases. Instead of feeding a child once a week, or once a fortnight, at such a school, as we do only too often now, I should feed him as often as he needs it—as far as our sources permit. Money can always be voluntarily raised for such a purpose.

658. Is there not a great danger of decreasing the sense of parental responsibility if you do that to any great extent ?—Not if you divide the culpable off first. I think under present conditions there is a great likelihood of feeding indiscriminately.

659. How would you find out the culpability ? You would make it a criminal offence, an offence for which the parent should be brought before the Court ?—Most certainly. I should like the School Medical Officer to issue a medical certificate from his Department that the child was unfit to enter the school ; I should like that certificate to go in duplicate to the parent, so that he knows, and to the school attendance officials, and if that certificate is not acted upon within a certain time, I should like the attendance officer to summon the parent before the magistrate for neglecting to send his child to school, just as he does now, when a child goes to school with a dirty disease, or filthy disease, or any other objectionable condition. The school authority has the power now, to a certain extent, but I should like to see the practice become much more widespread.

660. You would extend the powers which magistrates at present possess to make orders for children to go to those places in cases where they are known to be habitually consorting with criminals, to cases where it is proved that a parent is neglecting to give them proper food ?—Perfectly so. I should like to have one day industrial school at least for every area in London. That would show how far residential schools were necessary. I do not think residential schools are necessary in all of these cases. In fact, I think they are only necessary for a very small proportion. If we took over the schools in the centre of London which are becoming empty by the drift of population outside, and turned those into schools of industry, and employed those as schools of industry for present purposes,

Dr. Eichholz.

Dr. Eichholz. it would not cost the ratepayers any more in sites or buildings; it is simply a question of re-organisation. I think a very few residential schools on the confines of London would prove an enormous deterrent to this culpability. Having dealt with that we should have the deserving on our hands. I should continue to devote the £6,000 spent in food grants as at present, and we could then determine how much more is necessary. I do think that what we want is to recognise what the enormity of the problem is. It will not do for the London School Board to tell us that there are 10,000 under-fed children, when they themselves in their own schools are dealing with an average attendance of 22,000 at dinners, when every child fed represents three under-fed children altogether, and when we have to rely on non-overlapping voluntary agencies which, working outside the ken of the School Board, doing work of the same kind. We have a deal more than anybody knows anything about. We would appear to have, practically, 120,000 under-fed children in London. The first stage in amelioration is recognition, the second stage is discrimination, and the third stage is effective concentration. At present we are on the verge of recognising the extent.

661. Would you supplement those special schools with means of feeding children in the other schools: you would still go in for your school restaurant?—Yes, for the non-culpable cases and for children who were able to bring the pence. I should like the Board of Education to pass no plan without a small stove in it and a small kitchen, as we pass no plan for a cripple school without a little stove in it. The expense of all this is really insignificant; it would entail practically a very small addition to the specification of a school, and it would be of enormous social value.

662. (*Chairman.*) Do you think it would be a remunerative expenditure?—The experience of the Destitute Children's Dinner Society shows that it could very largely become so. Where they are considering building rules I should like that to be considered. We have school halls, we can turn a hall into a dining-hall in five minutes, as we do in cripple schools. We simply want a stove, which would take very little cubic space and add very little to the expense. There would necessarily be a supplement from feeding charities to meet the cases of non-culpable underfeeding, who could not entirely meet the cost of the dinner.

663. (*Mr. Lindsell.*) You would extend that capability of getting food in the schools beyond the mere neglectful and wasteful class to the ordinary workmen?—Everybody who was non-culpable and who was in need of a meal. It is the common practice at secondary schools. The well-to-do child would be expected to cover the cost of his meal.

664. Do you think that could be made in any way self-supporting?—It is at present to the extent of 30 per cent., as you see in the case of the Destitute Children's Dinner Society. I think under proper methods, if we could get managers to work the schools, we could secure that 30 per cent. more frequently than at present. At present I want to point out that the School Board appoints managers to schools, and does not endow them with sufficient powers or duties to stimulate their full interest in the work of school management. Good managers are therefore very scarce; and so it comes about that there is no one between the School Board on the Thames Embankment and the school teacher in the school to look after the child. We have really no reliable first line of defence, that is to say, no one to go and visit the home and investigate the cases, because neither the teacher, not the inspector, nor any other official can perform that duty, yet it must be performed when we have to discriminate. I know it can be performed, because I know of districts in London which are properly managed, where the children are visited home for home, and, therefore, we get the attendance there 97 per cent., and we get proper feeding. It can be done if we will only put a will to it.

665. You give me the impression that you do not think managers, as a rule, in the schools take so much personal interest in all this as they might do?—That is the point; they do not. And we have not got managers sufficiently trained and educated in the work. We have not enlisted the sympathy of people who could do the work. To secure efficient management of elementary education in all its phases, social and pedagogical, public interest must be aroused, and public interest means local managers intimately conversant with the schools, the children, their homes, and the opportunities of employment at the limit

of school age. I earnestly hope they will get the right people as managers under the new legislation; I hope that the new education authorities will be able to get people with leisure and capacity.

666. (*Chairman.*) Do you think such people are to be found?—They ought to be found; they are found.

667. (*Mr. Lindsell.*) One of the complaints made, I now conclude, is that managers are reduced to such a dependence on authority that the little influence they possessed before is discouraged rather than increased?—There is much of that feeling about at present.

668. You have not had any experience of the work of managers yourself under the new Act?—From what I have seen of the attitude of the new authorities in the country, I have every hope that they will secure the best material for school management. I hope a great deal from the new Act. The work which has been done in the way of school management has been done very largely by the great agencies, Toynbee Hall and Oxford House, in the East End. We owe a great deal, and practically all that has been done in successful management, to such bodies—Oxford House, Balliol House, Toynbee Hall, Cambridge House in Walworth, and the Women's University Settlement, the Bermondsey Settlement, but, still, those are small instalments for covering a great problem. They are great examples, but they require a large and faithful following if their work is to reach anything like completion.

669. Do you know the Notting Hill district?—Yes.

670. Do you know the Harrow Mission?—I know of it.

671. You do not know how it is working?—I have heard of it, but have not actually come into contact with its workers. In Notting Hill, one of the most active agencies is the Society for the Prevention of Cruelty to Children. That is the one of the very few organisations which can get at parents, and they do it very well. I was at Yarmouth some time ago, and I met a member of the Board, a doctor, who is very keen on these things. He said Yarmouth was small enough for him to be able to visit the schools himself, and that when he saw a school child not in proper condition he was able to put into action the machinery of the local "Prevention" Committee, and so got on the track of a parent who was neglecting his child, and prosecuted him till the child was sent to school in a proper condition. That was an ideal condition of what could be done under proper school management.

672. With regard to milk, have you any suggestions to make as to a better supply of milk to the poor town parent?—We have this Battersea scheme. They have opened two centres at which they supply milk at rather considerable cost. It is a costly business, the humanising and sterilising of milk.

673. It was the sterilising of milk I referred to.—It is costly, and it is not likely that the poor parents will take very great advantage of it. It will be the well-to-do people who are likely to take advantage of it, who could very well get milk without the help of the bureau. At present the sterilising and the humanising of milk is going to be an expensive process. I should have thought, if they confined themselves to merely distributing the raw material and seeing that taken into the home, that itself would be useful. I have seen the milk sterilised and distributed in Mainz in Germany. I was there a few months ago. The nurses go to a certain street corner, where bottles are waiting to be distributed to them by an official, and they take them away and bring the empty bottles back.

674. You know nothing of a clergyman named Eyre, in Worcestershire?—No.

675. Do you know about the milk supply of Birmingham?—No. Birmingham contains a very rough element, but I have not discovered any conspicuous degeneration as compared with other provincial towns. I should think when we have dealt with London degeneracy the country cases will not offer great difficulties.

676. (*Mr. Legge.*) You mentioned as an item of consolation the rapid recuperative power of neglected children. Your view would be supported by experience in industrial schools and orphanages, and so on?—Yes.

677. You said that your experience at Norwood went to show that if you got a neglected child of over the usual age of admission, you could not do very much as regards height—have you had any experience to show that that very class of child continues growing to a much later age than the normal child?—I will put it to you in this

way. The Norwood old boys go out to camp every year with other Jewish boys from other schools. They have a very large summer camp at Deal. Our boys cover the age of which you are now speaking. Some of them have left school and some have not, but they include a considerable number of adolescents; our boys are always known as the "Little Nobs," the little Norwood Old Boys. There is a general impression among their colleagues that they do not pull out in height in the sense that you are suggesting.

678. You are aware that there are cases known of soldier's children growing up to the age of twenty-eight?—Yes, quite so, in exceptional cases, but one would not suggest that as a sort of general rule.

679. You have made no effort at Norwood to collect statistics on this point?—I have had the children measured in the usual way; I have gone no further than that. But what I say is, although we put on stamina, although we can apprentice our boys and they go through their apprenticeship properly, and do credit to themselves, and to everybody concerned with them, as regards their stamina, endurance, and capacity for work, yet we cannot pull them out as big as the Gravel Lane boys, and other Jewish boys, from a good school and who are not destitute. What I feel is, that although recuperation can take place to a very great extent, you cannot entirely recover the height you have lost at an early age. But even our Norwood boys we have turned into Dragoons occasionally—confirming Mr. Legge's suggestion.

680. We have heard a good deal from you about a school of industry in certain centres: I should like to get that proposal into a more ship-shape form. You propose something on the lines of a day industrial school?—Approximately.

681. Now, how would you propose that the child should be definitely directed to enter such a school?—I should, first of all, supply places in the way they were provided at Ponton Road, in Lambeth. The School Board had on their hands a school which they could not fill. They wisely turned it into a day industrial school. There are plenty of similar cases where they might extend industrial school accommodation much more than they have done heretofore.

682. But having got your building certified by the Board of Education, as a special school with a particular curriculum, you would get the children directed to attend that school?—The teacher would do what he does now as regards the mentally-defective schools. He would receive a blank form from the School Board, and on this schedule he would write down certain names of children who were in his opinion not fit to take the ordinary curriculum. The medical officer might supplement that; he might supply a supplementary list, or complete the list with the teacher, or re-adjust the list: at any rate some such list would be formed. It seems to me the Board would have to investigate those cases, either through special visitors or through its existing visitors, who would investigate the home circumstances and discover which were cases for industrial treatment and which were not. Then comes the question, and after all, it is a legal question, whether the Secretary of State has power to order the establishment of an industrial school in accordance with the circumstances of the neighbourhood under the 1876 Act.

683. But if he established a school under the Act, then the ordinary legal process would apply; you would have to go to the court and so on?—Yes.

684. I understood your suggestion was that these particular schools you are referring to should not be day industrial schools technically?—They should not be punitive in the ordinary sense.

685. They should not be under the Home Office?—I do not mind under what office they are; I think that is quite immaterial.

686. It makes a very great difference from the point of view of administration. My idea was that you thought the Board of Education might allow a certain school to have a different time-table?—Yes.

687. And very special appliances for feeding and so on?—Yes, it might be done in that way.

688. The Board of Education, I fancy, have power to do that now, but my point was?—Whether you would like the thing to go through the magistrate or not, as a matter of fact?

689. Yes, whether your suggestion was that the child should be directed simply by the School Attendance Committee?—I feel that I would rather it went through the magistrate, and I will tell you why. Because if a boy knows that by not working, and by laziness and neglecting himself, he is likely to get himself put into a school where he need not do lessons, but will do work, he will do so, and you will get those places crowded with underserving cases. The parents will also be encouraged to provide cases in abundance, when the feeling that neglect on their part will go unpunished.

690. Have you heard of the system in America, and also in one or two of our Colonies, of a special magistrate to deal with children's cases?—I have often wished we had it.

691. You approve of it?—I think it is a very good thing for retired school inspectors and officials to do that.

692. I will put your idea in this way. Would this be fair, that certain districts in every large town should be scheduled, and that in those districts the school authority should establish a school of industry, and that in those districts a special magistrate should be appointed to deal with the cases brought before him by a process similar to that which you have described?—That seems a very good mechanism. I do not know whether legislation is necessary for that. I would rather accomplish what is necessary without legislation, because if it means legislation it may take long, and there is a chance of the opportunity of doing a great deal of good slipping away. I cannot discuss this question from the legal aspect, but I should prefer such measures to be taken as would not involve fresh legislation, if it can be done by the Secretary of State's order.

693. (*Mr. Lindsell.*) You can get the school, but not the child. You must have power under the Act?—It must go through the magistrate at present.

694. Yes, it must go through the magistrate at present; he can only give an order when a parent habitually and without reasonable excuse does not provide education for his child, and you wish to add when he does not provide sufficient food?—Yes, food and clothing. If it requires legislation we must have it, but if it can be done without, so much the better.

695. (*Mr. Legge.*) The only exception to the committal by a magistrate is where a parent definitely agrees with the school authority to send his child to an industrial school?—Yes. New legislation might be recommended to give the magistrate authority, the option of dealing with these cases if it is decided that he does not now possess it, and secondly, to give the School Authority power to admit to schools of industry on its own initiative which it certainly does not now possess.

696. Just one other point about the day industrial school; you want, as you stated to Mr. Struthers, primarily a school to provide food?—In the first instance—not primarily. There is a difference.

697. For food, for clothing, and for regularity?—Yes.

698. Also you wanted to provide some elasticity in the curriculum, I mean for the class of children which you have shown in those photographs?—I agree.

699. Their intellects will be improved by a combination of manual occupation with manual instruction more than by giving them full time?—Yes, I said that in the course of my evidence, that the Three-R Curriculum is obviously not going to meet the needs of these children, and what we wanted was more instruction, manual instruction, special instruction, and special drills, and instruction in cooking and housewifery.

700. You miss my point. There is a difference between occupation and instruction. Now, I defy you to keep a child for three hours a day under instruction in manual training; you want occupation. You must have some plain sort of carpentry along with your manual instruction?—Well of course.

701. That is what I wished to bring out?—I do not mind if he makes a hen coop or dog kennel or a box.

702. Or a basket?—Or a basket. It need not be Sloyd exercises.

703. Are you aware of the Swedish system?—No, I have not been in Sweden.

704. Nor Denmark?—No.

Dr. Eichholz.

Dr. Eichholz.

705. Nor Russia?—No.

706. Nor Finland?—No.

707. There is a system in vogue there of children's workshops?—With regard to children's workshops I should like to offer this observation, that you find a very considerable section of our community which is always ready to rise the moment it scents any new move with regard to manual instruction, with some observation of this kind: "You are going to make galley slaves of these children." Therefore whatever we introduce must be under a proper educational scheme. If we are going to let them make hen coops, we must be able to demonstrate the educational value of that to the people who are ready to fly down our throats with the galley slave argument. For that reason I should lay very great stress on keeping the educational notion in the curriculum all through.

708. We are endeavouring to solve that in the Jewish Industrial School at Hayes. You know what they are doing?—Yes, I always have Hayes in mind when considering this point.

709. Now, with regard to lads' clubs. You spoke of them as an agency for good?—Yes.

710. And, no doubt, in your travels about the country, you have seen, as I have, a great number of such excellent institutions?—Yes.

711. Has it ever struck you that it is a pity that all those schools should be working more or less in isolation?—Yes, I think so.

712. You think their power would be increased if they were more organised?—I continually tell those managers whom I come across that if they would only get a conference for that purpose, it would be a great advantage, if they could form a strong active federation. The Twentieth Century League is a move in this direction, and I learn that there is a Union of Girls' Clubs in London as well. I quite agree, and lay very great stress on that point.

713. Further, do you say a great advantage is likely to accrue if boys' clubs are definitely associated with particular schools, to catch up the children leaving the schools?—It would be most excellent. I should prefer the thing to be run in combination with evening continuation schools, and I should like the club to be the recreative branch, held in a different building.

714. Do you know of any other town besides Manchester which has these lady health visitors?—I do not.

715. You have spoken a good deal about the importance you attach to industrial training for girls, in view of their health, and so on?—Rather industrial occupations at school.

716. Now you will be interested to hear that your idea as to the fact that girls are in physique better than boys, in certain strata, is borne out by two physical censuses I have had among industrial schools and reformatories?—I am very glad to hear it.

717. To get this industrial training for girls, would you approve of a system whereby girls, and even boys, could leave an elementary school earlier than the school age—earlier than the legal term of the lessons—a system by which they could do so by permission from the educational authority of the district?—For what purpose?

718. That the girls should go home and work for their mother, or that they should go out to a day place. Do you not think that if the mother found that there was a really decent home ready for her, and she could get her girl out a year earlier to help in the domestic occupations of the home, that would be an enormous incentive to those on the border line, between the lowest of the classes and that class who wish to improve their homes?—I do not think this would be a good move. I think that that class of girl would probably help somebody else for half a crown a week, ruin her own health for a pittance.

719. Do you think that would be bad for the girl?—I think it would. I am anxious to keep these girls away from ugly circumstances of overstrain of their homes as long as ever I can.

720. But they go home every night—I am speaking of girls in ordinary schools. Why not give the manageress of an ordinary elementary day school the same powers of licensing girls as are enjoyed by the managers of a day industrial school?—Because in my experience I have seen a great many girls whose health and constitution have

been ruined by the excess of work piled on them at home by their own wretched parents, or the people they worked for for a pittance.

721. But the licence would not be granted except after very careful investigation by the school authority?—That would not suffice. You would want inspection to see it was done.

722. The licence could be revoked?—Then you would have to have all the mechanism of the school authority to bring the child to school again. It is quite bad enough now to get a child of thirteen into school nowadays, whose parent wishes to keep him or her away. I should offer no facility to parents more than they have now. If they want to do so now they can do it by a child of thirteen passing the labour certificate examination. I should afford the parents no further facilities.

723. But as the tendency of modern legislation goes, the age may be increased to fourteen. Do you think it is a wise provision that, if the age of compulsory school attendance were increased, some such proviso as the power of licensing should be given?—I should be in a position to answer that when the age has reached fourteen.

724. (*Mr. Struthers.*) Perhaps Mr. Legge will say at what age he contemplates the girls leaving.

725. (*Mr. Legge.*) I should say from twelve years six months?—You have seen from my height statistics that some of those children at thirteen are no bigger than normal children of nine.

726. I am not speaking necessarily of the poorest class of girl?—You are talking of some of the children I measured up for you here. A child thirteen years of age who is only of the size of a nine-years-old child is certainly not one that you would encourage to leave school a day earlier than necessary. I should be very sorry to advise it.

727. I am not talking of her leaving school earlier; I am talking of her leaving school for half-time?—I thought you meant for entire exclusion.

728. No?—You are speaking of the restitution of half-time.

729. Under carefully guarded circumstances and for domestic employment?—I have had so much experience of the slavery of young girls in the homes of the poorer neighbourhood that I do not hesitate to condemn any attempt to slacken the fetters of the elementary school authority over these children. Any instruction in domestic employment must come through the school authority until the present legal limit of school age is attained. I feel that it is the least deserving parents, in the majority of cases, who would press for the exclusion of their children. As for really deserving cases, the school authority has at present all the necessary power, in that it need not prosecute a parent whose circumstances are such as to merit consideration. This power is constantly being increased.

730. I have only one more question to ask you, and that is with regard to the collection of statistical facts. Perhaps you could tell me roughly what is the total number of children attending school in London?—I will tell you in a moment.

731. Is it a quarter of a million?—It is many more—three quarters of a million. It is something like 763,000 as a matter of fact.

732. If you only wanted to get physical information for those children for statistical purposes do you think 50,000 would be enough?—They would, for the purposes of information, but not for the purposes of complete statistics. You would get a great deal of information which would be of enormous value by these simple enquiries.

733. But you do not think that would be enough for statistical purposes?—I could not say till we had taken the statistics, but I guarantee to say you would get exceedingly useful information by examining even 20,000. I should be inclined to encourage the examination of as many as the ratepayers would permit us to examine. I should prefer to examine a much greater number, but I think we could get very valuable information from 50,000.

734. One final question. Do you think that we would get better results by calling for information, say of about 50,000 out of a total number of three quarters of a million, taken at random, or by selecting two ages or even one age, and continually hammering away at that one age and

getting all of that age, and comparing the results from period to period?—I should do neither. I should put the thing into the hands of the most competent man I could find, and tell him to use his discretion and take out 50,000 which would best illustrate the points which he had before his mind—which would best bring out the information he was seeking.

735. But suppose that information was simply height?—You could find out a good deal by height measurements of 50,000 children, but you might employ the opportunity by gaining as much more information as possible.

736. Height comes into my mind as a good single test?—With regard to height, I cannot advise you to do better than I have done myself. I will tell you what I have

done. I went to Johanna Street, which is the worst school; I went to Notting Hill, St. Clements Road School, which turned out to be a little better than I thought; then I went to an alien immigrants' school, then to a school improving under the influence of the London County Council buildings, then to one where drill has been allowed full play under fairly good local influence, and then the very best schools; and I was able to get a very good sample of what was going on in the metropolis at the time at my disposal. The height measurements represent something like 10,000 children—twenty here and twenty there. I had not time to do more.

737-8. (*Chairman.*) We are very much obliged to you for your exhaustive and illuminating evidence?—I am glad to have been of any service.

Dr. JAMES KERR, M.D., called; and Examined.

739. (*Chairman.*) You have been for some time medical officer to the London School Board, and before that you acted in a similar capacity to the Bradford School Board?—Yes.

740. How many years have you been with the London School Board?—Nearly two years now, and I was nine years at Bradford.

741. You have given a great deal of evidence before the Royal Commission on Physical Instruction in Scotland?—Yes, I gave evidence before them.

742. In which you went into what you deem to be the causes prejudicial to physical development in school life?—Yes, I took that up as the thing I thought would be useful.

743. Upon that point the witness who has just withdrawn is rather inclined to join issue with you?—I did not know that.

744. He does not think that there are any causes of deterioration to be found in school life which are not at any rate, very easily remediable. Turning to the *précis* of your evidence, you consider that there are no existing statistics generally applicable to the problem that we are asked to attempt to solve?—All the statistics I have examined break down when you begin to look into them.

745. When you press them?—They are unreliable.

746. For anything definite, and for correct opinions, you think we must look to the collection of data in the future?—You must collect your data with a view to that.

747. You advocate the examination of a large number of children, selected from London, for the purpose of giving such data?—Yes. I thought that having regard to causes and errors of experiment and things like that, 50,000 children would be just as good as a census of the whole lot, provided you did not select your 50,000 in any specific way.

748. Provided they were fairly representative of the whole?—Yes.

749. And this card which you have been good enough to furnish us with, if filled in, would provide the material for that?—That was a card which I suggested recently to the School Board, but they have postponed the matter.

750. What reason had they for neglecting your suggestion? Because they are in a moribund condition?—There are some doubts about their legal powers, and it is partly owing to the fact that they are in a moribund condition, as you say. There was considerable opposition on the part of certain members, who said it was not the function of the Board to investigate this matter; they had to do with education.

751. The past history of the School Board has not shown them to be very particular about legal powers, has it?—In this case they were.

752. The condition precedent to the establishment of a system of this kind would be a medical inspection of schools, would it not?—Of course this could be done without having medical inspection of schools. This practically means the medical inspection of scholars.

753. Of this class?—Yes, a superficial medical inspection.

754. Are you in favour of the general medical inspection of schools?—I think there should be some medical control and oversight of schools and school work.

755. Dr. Eichholz was advocating a similar plan. Do you think that if the worst type of schools, said to be one-fourth of the whole, were made subject to such an examination, that would be sufficient for all practical purposes?—Well, I daresay that would be useful.

756. You would like to make it more general?—There is a great deal in the school quite apart from actual ill-health of children that wants medical supervision, and there ought to be some medical inspection of every school really. Every school should have some medical approval.

757. I suppose it would be sufficient to place upon the teacher the obligation to report to the medical staff of the school authority any abnormal cases, or any cases which seemed to indicate physical weakness?—The majority have not a medical staff.

758. But it should be made incumbent upon every school authority to have such?—Yes.

759. You think that is the first step towards any improvement?—Yes. The teachers will not see anything wrong unless it is pointed out.

760. Their own knowledge is very deficient to begin with, is it not?—Yes.

761. That might be improved by the Board of Education insisting upon a knowledge of school hygiene entering very prominently into the qualifications for teacher-ship?—Yes; that is very important.

762. Will you explain how you think this card inquiry should be carried out?—Probably records from 50,000 children would, in London, give as useful results as a census of all the children, at one-twelfth the cost. I recently suggested that such an examination should be carried out, but it was deemed expedient under existing circumstances to postpone it, and probably the results will be more valuable when we can take the children in all elementary schools instead of only those in the board schools. The method suggested for carrying out this work was by recording the facts about each child on a card. The record on each card gives the means of noting the child's (a) educational position; (b) physical condition; (c) social status. The relation of the various factors could have been deduced from the answers. The great difficulty of assessing the various points inquired about was got over by using a system of marks from one to five for any particular quality. The average mark, 3, represented a normal condition; 2 was distinctly below, as 4 was distinctly better than normal; 5 represents a most excellent condition; and 1 represents a condition so bad that immediate remedy, if possible, is required. The data for obtaining the child's educational position is given by the teacher, who is directed to fill in the child's name and address on the card, and then, using no words, only Arabic numbers, to mark answers to the following—I may say that the girls' cards are white, and the boys' cards blue.

763. Is it the case that the Salford School Board are undertaking a census based upon such lines? We have heard so?—They have examined a few children, but I do not think it is on such lines exactly.

764. The cards appear to be exactly the same as yours?—These are the questions on the cards, which are returned by the child's teacher:—

Child's name.

Child's address.

Age (in years and months).

Dr. Eichholz.

Dr. Kerr.

Dr. Kerr.

Date of birth.

Standard in school (not class or division of standard).
Mental condition (as estimated by the child's own teacher).

Visual acuity (as entered in Register).

Hearing (teacher's estimate).

The social status is obtained by the School Attendance Department, the officer's record using x for "Yes," o for "No," and ? for "Not ascertained."

Is the father living at home?

Is the mother living at home?

Is either parent foreign born?

Does the mother chiefly work away from home?

How many others (including the child) are in the family?

How many rooms does the family occupy?

The physical condition is gone into by a medical examiner, who notes:—

Condition of clothing—(a) sufficiency; (b) superficial cleanliness; (c) footwear.

Height without shoes, to nearest centimetre.

Weight without shoes to nearest tenth of kilogram.

He also fills up spaces as to the condition of (a) hair; (b) cervical lymphatic glands; (c) teeth; (d) throat and nose; (e) ears; (f) general nutrition; (g) vaccination marks.

In this scheme the enquiries have been reduced to the lowest number possible, and yet nothing of importance is omitted. Some questions suggested, such as the father's earnings, it is perfectly futile to attempt to obtain, and any inquiry directed to the parents' habits would be resented. The only question here of which the answer might be unreliable is the "number of rooms" occupied by the family (including lodgers, etc.), but it is of such usefulness in relation to other points that it is worth attempting to obtain. The School Attendance Officers can probably here get as accurate answers as anyone. The cost of such an inquiry, extending over six months and embracing 50,000 children, I estimated as from £600 to £700. It should be carried out decennially. From this inspection the data to guide and correct our impressions could be derived, and also suggestions of value to the sanitarian as well as the educationalist. It is probable that the data from such an inquiry will materially alter schooling below Standard II.

765. You say these particulars should be reduced to the lowest possible number?—Yes.

766. You think none of these particulars could be obtained without a medical investigation?—You could omit all the medical inquiry, and make the teachers measure the height and weight, but the results to be obtained from such an investigation would be very trivial compared with what are required.

767. What do you say with regard to chest measurement?—I have left that out.

768. You do not think it is of any value?—It is of value, but it would take so much trouble to get accurate results from it that I think it would be better left out here. It would increase the cost of the inquiry enormously having to do that.

769. You would propose that an inquiry of this sort should be carried out decennially with a view to the results being compared from time to time?—Yes, that gives you a means of comparing children in different districts.

770. You do not think that as a supplement to this, if not as a substitute for it, it would be a good thing to record certain anthropometric facts about every child when he or she enters school and leaves school, or even at every year of school life, with a view to testing development in individual cases?—Who would record these facts?

771. Would it not be possible that school registers should have columns inserted in them in which the barest minimum of what is required could be collected and reported from year to year?—One's experience of that kind of thing is that teachers do not do it well.

772. Of course they are not properly equipped for the task at present?—The teachers cannot do it, that is the point.

773. Could not they be easily made to do it?—It could be part of their training, and if in each school we had a teacher who was practically a sanitarian in an elementary way we could do a great deal more.

774. That is not an ideal which is impossible to attain, is it?—No, that is one of the things which I think is most necessary.

775. That would give us automatically, and without any special machinery, all that we want, continuously preserved?—Yes, it is a record which could be kept.

776. You hold—and this is, of course, confirmatory of what Dr. Eichholz has told us—that a large number of children are permanently damaged before school age?—Yes. Then as to what is noticed during school visits, there are a considerable number of children for whom the present school provision does not seem the best possible. In the first place, a number, whose proportion it is impossible to estimate, come into school between three and five already permanently damaged; of these a small proportion have congenital defects, some are the offspring of apparently quite healthy people, many are from parents who ought never to have had children. We frequently see feeble-minded mothers coming to school about their defective children, or mothers who tell of feeble-minded husbands loafing at home. Where a perfectly definite cause can be assigned, which is infrequent, syphilis is the most evident.

777. We heard from Dr. Eichholz that syphilis was as a rule attributed where no definite cause could be assigned. You heard him say that, I think?—I heard him say that, I do not agree with him. I think if one has had considerable clinical experience of medical cases and medical treatment one is able to assign syphilis definitely. Where a perfectly definite cause can be assigned, syphilis becomes most evident about the middle of school life, and defects of brain, eye, or ear are not rarely associated with other signs held to be characteristic of this taint. A certain small number become nearly blind, nearly stone-deaf, and frequently feeble-minded during school life from the development of the inherited disease. The majority of cases of inherited disease of that sort pass unnoticed in school, not much harmed, but there is no doubt in my own mind that inherited syphilis is responsible for a much larger amount of gross defects and permanent ill-nutrition among children than can be definitely assigned to it. The disease should be properly controlled.

778. What share do you attribute to alcohol?—Other causes are more indefinite and difficult to assign. Alcohol, which overshadows all other injurious things except ignorance, in the child's environment, is also commonly stated in family histories, especially in connection with feeble-mindedness and epilepsy, but it is impossible to definitely assign its position as a cause of hereditary defects.

779. It is not easily detected?—No. So many people are alcoholic, and so many people talk about alcohol, that you cannot estimate the value of their history. That is really what it comes to. In cases not apparently of congenital origin, bad feeding (I use the term bad feeding instead of insufficient feeding), and general neglect, seem common, probably from inability to assign other reasons in one's mind. You see that a child is badly fed, but you do not know why the child is as it is very often. In early school life a large place must be assigned to debility and ill-nutrition after contagious diseases. The abolition of Article 101* of the Code will, I am afraid, still further enlarge this group.

780. (*Mr. Struthers.*) We have still that Article. We have not sufficient evidence of fraud to abolish it.

781. (*Mr. Lindsell.*) We do not prevent the closing of a school on medical authority. It was only that we found there was so much abuse of it.

782. (*Chairman.*) It kept a child away without detriment to the school?—It helped to keep a child out of school during illness and for some time after, and the teachers did not squeeze the child into school. Measles and whooping cough for young children are often as depressing and sometimes more lasting in after effects than influenza on their elders. For some time after these diseases, and so too after mumps, children seem liable to all kinds of ill and infections, probably from depressed vitality. Some nervously disposed children of fine texture seem to fall into the condition of low vitality almost as a permanency. It takes all their time for such children to merely maintain growth, and they are unequal to school work under present conditions. They are not merely insufficiently fed, but other causes are at work. They form a considerable proportion of a group of children, who are of most frequent occurrence amongst school attendance cases; children who do not go to sleep easily, in the morning can scarcely be wakened, have little or no desire

for breakfast, often are sick before going or on getting to school, and suffer much from headache, some in the morning, some in the afternoon.

783. You think school attendance in such cases is distinctly injurious?—The condition is much aggravated by school attendance and ameliorated by exemption. The name of "infantile neurasthenia" has been applied, but the symptoms are chiefly of school origin, and partly due to badly ventilated classrooms, and partly to the irrational amount and kind of work demanded from infant scholars. A child of five will learn to ride the bicycle in a day, but will take a year to write. Education in the growing child depends on giving plenty of work to the proper parts of the brain; 96 per cent. or 97 per cent. of the total weight of the brain is gained by the age of seven; before that age growth is its chief duty, function afterwards.

784. You would suggest a particular class of school for those children?—The conditions of debility and ill-nutrition in school life predispose to consumption later. This is a disease whose incidence and fatality falls after the period of active vegetative growth, and consequently it is quite a rarity among elementary school children, although the soil for its later growth may be preparing there. Quite apart from the class of feeble-minded are children whose backwardness is due to prolonged absence through illness or frequent disorders of various kinds. Many children with long-lasting or permanent defects in vision, not amounting to blindness, or with hardness of hearing, and some with slowly acting brains, or brains only capable of simpler actions than most, can never manage the complete curriculum of the ordinary school, but would all suffer materially, or might even be unjustly treated if put into special classes. For this class of backward and debilitated child, which must run up to about 10 per cent. of the ordinary school population, a simpler type of school is required.

785. Do you mean 10 per cent all over the country, or in those areas where the physical conditions are most depressed?—I should say 10 per cent. of the ordinary school population all over the country, at any rate in the first half of school life, require some consideration on account of debility and backwardness from various causes—some simpler education than the ordinary Board School attempts to give them. A simpler type of school is required, with a modified curriculum, having more elementary and concrete teaching in few subjects, much manual and graphic work with frequent changes, and as little sitting in desks as possible. Classes should be half the size of those in the ordinary school, and there should be a minimum floor space and cubic content of at least half as much again per head as in the ordinary school.

786. Those schools would be distinctly more expensive?—Yes, considerably more costly. At the same time they would diminish the strain on the ordinary schools somewhat, and possibly improve their efficiency.

787. Do you think that that improvement would be at all commensurate with the cost?—Such schools would do great good to the population by giving the weakly a chance to pull up, and would help at a comparatively early age to a classification on a basis of physical and mental capacities without any possibility of injustice, for a child who went into this simpler intermediate school and gained ground, could return to the ordinary school, whilst one who was suited here would do better by the end of school life than from skulking neglected in the ordinary school; one who could not keep up here would soon be certified for one of the Special Day or Residential Schools under the various Education Acts.

788. Are we to understand by this class of school what Dr. Eichholz calls a school of industry?—I have no doubt that Dr. Eichholz had a somewhat similar idea in his head, only his method of selection was totally different. The method of selection for a school like this would depend on the school inspectors, and these schools would be under much more careful medical supervision than the others.

789. That would avoid the legal difficulty?—This is simpler.

790. (*Mr. Lindsell.*) This is simply classifying the existing schools?—The point is to suit the curriculum to the child instead of the child to the curriculum.

791. (*Chairman.*) What do you say as to the feeding?—That could come in here.

792. You would like to adjust the school to the physical and mental condition of the child?—Yes, to suit 10 per cent. of the weaker children. In addition to these children are another group of semi-invalids of long duration, some in London in the ordinary schools, some in cripple schools, some at home excluded and neglected more or less, some in hospitals. These children include: (1) Exceedingly debilitated, anæmic, and underfed or improperly fed children, who have often come through infectious diseases badly. In the poorer districts of London children seem to get four or five diseases one after the other, which is a much greater tax on their vitality than on the vitality of children of better class people. Then these children also include: (2) Many sufferers from chronic bone and joint (spine, hip, etc.) diseases, from various tubercular diseases of glands, and other troubles of similar nature; (3) A few cases of very troublesome eye, throat, or nose troubles, often frequently recurrent, and generally associated with catarrhal diseases due to bad hygienic conditions; (4) Some offensive cases, especially ozoena (nasal) and otitis, where daily or more frequent syringing and treatment is necessary, but at present never obtained; (5) A few rheumatic cases, with chorea and other disturbances; (6) Some chronic skin cases; (7) Some children who require treatment and education to establish cleanly habits. I have seen cases of practically every one of these this week which we have had trouble with in the schools. These are all cases frequently met, where the ordinary school attendance will retard recovery or do harm, and where exemption means a continuance of home conditions, ensuing months or years of ill-health.

793. You think a combination of a country hospital and school would be desirable in certain cases?—Yes, something of the sort. A combination of hospital and school is required where care, feeding, medical attendance and the requisite nursing and cleanliness, along with educational control and discipline in good country or seaside air, could be got for periods of three to six months, or longer if necessary. Such an establishment should mean the stopping of a very considerable leakage into invalidism, which the ordinary hospitals cannot deal with.

794. Do you think that many such establishments would be required?—Possibly five or six near London would be required to start the thing. Of course it would be rather costly.

795. Do you share the opinion of Dr. Eichholz that the condition of London is no doubt worse than anywhere else, and that if the evils in London are dealt with systematically and successfully the rest of the country does not present a problem of remarkable difficulty?—The matter is presented in a more massive way here than anywhere else.

796. He appeared to think that the conditions are more acute in London?—I do not think they are in individual cases; I do not think you find individuals here worse than those in other places; but you find more of them.

797. You do not think the type is worse?—The type is not worse, but you get more in one school in one district.

798. Dr. Eichholz thought the type was worse?—I do not agree with him. They impress one more here, of course, because you go to a school and see half-a-dozen hunch backed boys at once. That is the way it impresses one so much, I think. Lastly, I think that for a place like London we want a central residential establishment, a kind of laboratory, for observation and study of strange and abnormal cases, where complete examinations, not only of physical conditions but of nervous reactions and physiological peculiarities could be followed out.

799. Do you think that should be established by the school authority, or do you think the State should do it?—It does not matter who establishes it in London.

800. The question is, which will work it most efficiently?—I think the school authority would be most efficient for London. The scientific study of details of educational methods in relation to children's health and development can only be managed in an institution of such a kind. Such provision is what is wanted for the complete handling of the mass of children to be seen in London.

801. Then you give a list of the other detrimental conditions you think exist in elementary schools?—Yes. I have said nothing of the infectious disease or dirt contagions which are so abundant in London, as we have

Dr. Kerr.

Dr. Kerr.

machinery for dealing with them, if people wanted to be clean, or of the possibility of providing rapid free diagnosis for cases of infectious disease. The ordinary harmful school conditions may just be mentioned, so that they can be taken up if required. The method of the usual infant teaching is much too fine in hand and eye adjustments required, and leads to nervous strain as a routine part of education at this age, and to permanent habits of close eye work with stoop and contracted chest. The work expected from young children is also of too accurate a nature.

802. On several of those points Dr. Eichholz took a view which is not altogether in harmony with yours. He appeared to think that the defects as to ventilation were merely due to the ignorance of teachers, or their reluctance to make use of such opportunities of ventilation as the school enjoyed?—I know about all that.

803. Are you inclined to say that a great many schools are defective structurally in point of ventilation?—Practically all schools are defective in point of ventilation.

803. Even those of the newest type?—I would exclude from that statement a few schools scattered here and there which have been erected in the last few years.

809. You advocate mechanical ventilation?—Yes, it is necessary. You can keep a school naturally ventilated if you take great care; by investigating and working in it yourself you can improve the results; but the teachers will never get such results.

810. They have neither the time nor the inclination to do it?—That is so. The ventilation of practically all schools—I do not mean every one—is defective. No “natural” methods are sufficient, and schoolrooms should be required to be ventilated so that the carbonic acid present should never exceed a total of ten volumes per 10,000. This is a condition perfectly capable of fulfilment if required.

811. By mechanical means?—Yes, by mechanical means.

812. You think children are kept too long at their desks? Upon that point Dr. Eichholz is inclined to join issue with you?—I think there is too much continuous desk work; and bad attitudes, the relic of habits necessarily acquired in the infant school, are invariable. Frequent short daily exercises to remove fatigue products are required. I would also say that there is no general provision for the testing of visual acuity. 95 per cent. of over a thousand infants between the ages of six and six and a-half managed to get normal visual acuity in London, whilst in the standards 10 per cent. are found with vision not exceeding one-third normal. Mouth breathing and all its evils remains common and uncorrected. That is a serious condition predisposing to disease and materially affecting the prospects of life.

813. Do you think there are many instances of children's eyesight being forced to a fatal extent?—The conditions which exist in infant schools are fatal to the eyesight. The majority of children go through them without much damage, but any children who have the tendency to weak sight are sure to succumb. The conditions are bad for infants' eyesight in every way; the work is too fine.

814. No amount of knowledge on the part of the teacher could correct that?—Oh, yes. If the teacher refused to set infants to do fine work, but let them go to the blackboard and do coarse work, that would correct it. We measured those children to whom I have referred with very great care, and with tremendous trouble, three times over, and 95 per cent. of them, as I have said, between the ages of six and six and a-half, managed to get normal visual acuity, that is only 5 per cent. of young infants at that age were defective. But in the standards, in the ordinary school children beyond the infant department, we found that 10 per cent. had exceedingly defective vision.

815. That is owing to undue pressure upon infants?—I cannot say it is due entirely to that.

816. You think it is largely due to that?—It is partly due to that. The only place where I think there is any real tax on the eyesight is the infant school. I do not consider that there is any real tax in the upper schools.

817. (*Colonel Onslow.*) Those conditions refer to book work?—Book work, sewing, and some of the kindergarten work.

818. That is common to both boys and girls?—Practically. They do a lot of drawing in little books.

819. (*Chairman.*) Then how do you sum up?—First I should say that the teachers as a body are comparatively ignorant of hygienic principles. The sum of the matter is that these conditions in the schools, as also the conditions of ignorance and neglect in the homes, can only be met by increased knowledge. The permeating influence of education must begin in the schools. Hygienic knowledge is necessary for both teachers and inspectors, and a premium should be put on its possession. It should be a necessity for the teacher's qualification, because no one is fit to take care of a school without it. Hygienic conditions in the daily conduct of the school should be a condition if grant is to be given, but most of the inspectors have had no training in these matters. I believe the development of a “sanitary conscience” is a more important affair to the State than any educational topic which has been discussed for a generation, but the first steps towards this have scarcely been taken. The three points I suggest are:—(1) Increased care by separation and treatment, both educationally and hygienically, of the already damaged; (2) The necessity of hygienic knowledge for teachers and inspectors; and (3) The “sanitary conscience” as a school ideal.

820. (*Chairman.*) That is rather an abstract question.

821. (*Colonel Onslow.*) In your card you make provision for the taking of weight?—Yes.

822. I infer from that that you take the weight with clothes on, as you say “with shoes removed”?—Yes.

823. Is not taking the weight with clothes on very unreliable?—It is always done in that way practically for these particulars. In most cases they weigh them with shoes as well. I simply omit them because they take them off for their height, but in the British Association weight measuring they had their shoes on as well.

824. (*Mr. Legge.*) I think in the British Association they had their boots off?—For weight, no. I looked up the point on purpose and found they kept them on.

825. (*Colonel Fox.*) Are not most cases of deficient eyesight or blindness attributable to neglect of children on the part of the mothers—the parents, the mother especially—shortly after birth?—Half the cases of blind children in the blind schools are due to ophthalmia caused by infection at birth.

823. (*Chairman.*) That is due to the midwife?—Yes.

827. (*Colonel Fox.*) It is due to not washing their eyes?—Yes.

828. If it does not make them blind it affects their sight?—The majority escape without becoming blind; but half the cases of blind children—

829. Are attributable to neglect of the mothers after birth?—Yes. It is something a little short of half, to be accurate.

830. May I ask whether you agree with the statement that as a general rule the offspring of unhealthy or tainted parents, syphilitic parents, are born sound, and that they have a fair start in life really, as a rule?—I do not know enough about it to say that.

831. That is what we have heard just now?—A good many children are born apparently healthy.

832. You do not think the fact that parents are tainted, or are weakly at the time of their children's birth, necessarily affects their offspring?—It does not do so necessarily. It affects them.

833. And you attribute the cause of their decline in health to unhealthy surroundings or bad nourishment?—In the majority of cases due to congenital syphilis, the children are born apparently in perfect health, but in some cases they develop all sorts of things, waste away, and become like old men. Others go on till they are seven or eight years of age, and I have known them to go on till twenty-eight before they show any signs.

834. If they were properly nourished, and their surroundings were healthy, do you think that they would deteriorate in that way?—The syphilitic ones would probably develop syphilis in any circumstances.

835. Is not there a natural tendency to recuperate?—Yes.

836. Provided they have good nourishment and healthy surroundings?—Yes; those things have a great deal to do with it. But there are certain children who become unhealthy whether they are well-nourished or not. I am speaking of good class children whom nothing will nourish. They seem to be born ill-nourished and to continue so all through life. They are quite few, however.

837. (*Dr. Tatham.*) You spoke just now in your evidence of the mischief done among school children by the effect of the common infectious diseases?—Yes.

838. Do you think it is possible at all, through the instrumentality of the School Board, to establish something like a register of diseases as they affect school life?—It is very difficult to follow that out. It would require a great deal of machinery. But at present we are attempting to do that for some things in small localities. For instance, we are doing that with measles at present in Woolwich as far as we can; every child is being watched all through its school life, and the facts are recorded on cards. We are doing that in some schools in relation to diphtheria. On Tuesday last my assistant went to a school where we heard there were two cases of diphtheria. About half the children in one class seemed to be so ill that he examined all their throats, and he found several cases which were ill and sick, and must have had the disease, and yet they were still going to school. They would go on showing signs of ill-nutrition for a considerable time afterwards.

839. Having regard to the enormous value of an approximately complete register of the commoner diseases, do you not think that it is possible to establish that system through the instrumentality of the School Board?—It is possible to do it, and it could be made useful. At present of course we do keep a register of these cases simply for schools, not in relation to individuals.

840. Such a register does not exist at present, I think?—We keep a register of every case occurring in a school. I have a huge book, kept by clerks, of every case notified each morning, but now Article 101* has been abolished all that may go overboard.

841. Things are worse now than they were before?—They are very much worse now owing to that clause having been removed.

842. (*Chairman.*) Disease is less traceable?—The teachers do not take so much trouble about it now. It is of no importance to them. It was of importance before.

843. (*Dr. Tatham.*) You have spoken of the conditions of debility and ill-nutrition in school life predisposing to consumption later; what do you mean by consumption?—Tuberculosis of the lungs.

844. Pulmonary tuberculosis specially, or general tuberculosis?—Pulmonary tuberculosis is what I mean especially by consumption.

845. With regard to tuberculosis, is it your judgment based on personal experience that tuberculosis is on the increase among children of school age?—I should say if anything it was on the decrease. One does not see anything like the number of children now with ulcers and bone disease that one used to do. Here in London, if you have a cripple centre one sees a tremendous number, but they are drawn from a big population. That is where mere impressions are so apt to mislead.

846. You have spoken of the effects of over-pressure?—Did I use the expression, "over-pressure"?

847. You did not use the term, but I take what you said as equivalent to that. You said that "For this class of backward and debilitated child, which must run up to about 10 per cent. of the ordinary school population, a simpler type of school is required, with a modified curriculum;" do you think that 10 per cent. is the extent of it?—I do not say it is the extent; I say it runs up to that. In Sweden, for instance, twenty years ago Axel Guy examined a lot of children, and found 17 per cent. were unfit for the ordinary school education. I was reading it last night.

848. When you mention 10 per cent. you do not fix that as the limit?—In some districts it would be quite 20 per cent. I daresay; for instance, in the East End of London; but there are other districts where it would not reach 5 per cent.

849. You take 10 per cent. as the average?—That is a rough, general estimate. I would not like schools to be

built on that estimate of 10 per cent., but I think that is the minimum. I believe that if schools are established for the benefit of that class of children you would very soon have 10 per cent., of the school population in them.

850. When you speak of the effect of syphilis, you refer to congenital syphilis, of course?—Entirely so.

851. Do you think that is increasing?—I have no means of judging that. Here in London I see all these blind and deaf children, and of course it is the great element in congenital blindness and deafness, and in the cases that go blind and deaf—children who have gone to the age of ten or eleven gradually getting blind and deaf.

852. Do you think those cases are mainly due to syphilis?—I should say that those combined cases were practically all due to syphilis; they present the other characteristics of syphilis—interstitial iritis and internal ear deafness, and they have generally the brain deterioration that goes with it.

853. (*Mr. Lindsell.*) What sort of medical staff have you in the London School Board, have you many assistants?—I have one assistant who gives his whole time to the work, and I have two others who give half their time entirely to examining the defective children; then we have about six going about the school testing vision—oculists as we call them—and we have now half a dozen nurses who are concerned with dirty heads and things like that.

854. There is a very considerable medical inspection of schools?—In London we have twenty sessions a week given to eye-work, twelve sessions a week given to mentally defective and cripples and so on, and myself and my assistants full time. But that is over an immense area.

855. Now if you made that medical examination still more complete as has been advocated here, would it require a very large augmentation of the existing staff?—It all depends on the ideal that you seek to attain. If you get your teachers with some hygienic ideas, a comparatively small staff will manage it; if you are going to have doctors in each school every morning, of course, you would want half the doctors in London.

856. But to have a general medical register of all the children who come under the scheme, or under the local authority, that could be done without very great increase of your existing staff, provided that the teachers in the school are capable and intelligent enough to give you what assistance you require?—I think so.

857. It need not necessarily involve a very large additional outlay?—No. When I was in Bradford they had thirty-three schools there, I think. I was able to completely manage all these by giving four half-days a week in the schools.

858. You knew their condition?—I practically knew all the schools.

859. You knew the physical condition of all the schools? Yes, all the children who were bad I knew. Infectious diseases were of course left entirely in the hands of the sanitary authorities there. The work here is done through the School Board.

860. You propose a method by which the country might obtain in future more regular statistics from time to time as to the physical condition of the school population?—Yes.

861. Of course it would be still better done even than by your plan if there were a Government bureau for that purpose?—I do not think it is necessary to be done everywhere for every child; but it should be done at intervals.

862. The more complete we could have it the better—say decennial periods?—Yes.

863. In future that would enable people to form a much more definite judgment on the question of deterioration or non-deterioration than they possess at present?—Yes. Of course if the Board of Education had a medical staff they could do that themselves regularly, continually applying themselves to it.

864. But you would require a special department?—Yes you would, just as you assess their other qualities.

865. You attach much more importance to hereditary taint as a cause of physical deterioration than Dr. Eichholz?—No, I do not attach very great importance to it, but there are cases where it is very marked indeed.

Dr. Kerr.
—

Dr. Kerr. I have no doubt at all that if I say a child has got congenital syphilis he has got it. There is no doubt in my own mind. There are definite signs of that. But the numbers who are affected in that way are not great.

866. (*Chairman.*) Dr. Eichholz appeared to think that the fact that 90 per cent. of the children were born healthy was of much more importance than you do.

867-8. (*Mr. Lindsell.*) Dr. Eichholz used the words "as a rule children are born healthy or not at all." I think those were the actual words?—If he said "apparently healthy" I would agree. There are things developed after birth which were inherited from one's ancestors.

869-70. You agree with Dr. Eichholz that one of the things which is really needed is a new type of school. We have got the ordinary public elementary school, and we have a school for the defective and afflicted, but there is a class between those two?—Yes, a sort of intermediate class.

871. To whom no school is now properly adapted?—Yes, you may call it a Lower Grade School just as you have a Higher Grade School.

872. And that would take the shape of a sort of hospital as well as a school?—Oh, no. With regard to a few children who I think at present do nothing for a year or two sometimes, I think it would do great good if you could take them away for a few months.

873. You are not referring to what you speak of as the combination of schools?—No, there are Lower Grade Schools for about 10 per cent. of the children, and then this hospital school arrangement would be for possibly 1 or less per cent.—a temporary thing for each child admitted.

874. You think these schools would be filled by the ordinary pressure until the children would be selected to go to them?—Yes.

875. You would leave the classification to the teachers?—To the teacher and the school inspector.

876. Or whoever it might be?—Yes, that would be quite sufficient.

877. You would not advocate what Dr. Eichholz called a legal compulsory power, forcing a child into that particular class of school?—You will have trouble with the parents until you have power to send children anywhere. Parents will not send children there if they think it implies any sort of stigma upon them. I should tell the parent that the child was not strong enough, and, until he got better, it would be better to give him simpler education. But you would have to back that up by some compulsion if necessary.

878. You think some further legislation is needed?—You might try that without legislation. I hope to see that tried in London without legislation.

879. It might be done with a little persuasion, without the necessity of any magisterial or Police Court proceedings?—Yes. Even now under the Acts we do not get them into the special schools although we can compel them. As a rule they go to Voluntary Schools where they differ with us.

880. (*Colonel Fox.*) You can call them convalescent schools?—Yes. A good many people would want them to go there.

881. (*Mr. Lindsell.*) You think the present sanitary condition of schools is not exactly what it might be, even in those of the latest type; the ventilation is a matter which has been neglected?—There is room for great improvements in the schools. I have just put down the chief points in my evidence there.

882. And you would say that there is a great want of hygienic knowledge among the teachers?—Yes.

883. Knowledge of hygiene is one of the subjects which teachers require to know?—Yes, but they do not carry it out in practice afterwards. It is not a thing which is in the Code as a necessity, and so you do not get it.

884. But it is one of the conditions that the school is healthy, well ventilated, well lighted, and so on?—They generally are not either healthy, well-ventilated, or well-

lighted. At present there is nothing like hygienic inspection of schools by the Board of Education.

885. But, I suppose, as medical inspector and an officer of the London School Board, you would feel if your duty to call attention to any defects in a school which you might visit?—One cannot do too much in that way, because if it satisfies the Board of Education, you may be looked upon as hypercritical.

886. I think the idea now is that they should get the highest standard which the local authority may attain without giving up the Code standard?—The minimum of the Code is the maximum of most authorities, I think.

887. (*Mr. Lindsell.*) The idea is that that will not be so under the new Act.

888. (*Mr. Legge.*) When you are talking about this special school for 10 per cent. for backward, though not really defective children, you are, no doubt, acquainted with the London School Board's Industrial Schools?—Yes.

889. Do you contemplate for this special school some sort of curriculum, such as you find in Drury Lane?—Not exactly that. The whole curriculum of these would simply be this: I would have a simplified Board school education. Instead of teaching children to write in books I would get them to write with chalk on a blackboard; I would make them do a great deal more hand work and a good deal less learning.

890. You mean simply the manual occupations?—Yes. I would simplify the curriculum—reduce the number of subjects.

891. Would you introduce such things as basket-making and carpentry?—That would have to come on later on in the upper part of the school.

892. Would you further allow them to devote more time to physical training?—Yes.

893. Would you allow such a school to start such a thing as a band?—There is no reason why it should not—those that were musical.

894. Do you not see that by these means a school of this sort might be exceedingly attractive?—Yes.

895. And children would be only too glad to attend?—Yes.

896. You know, no doubt, that the percentage of attendance at the Brunswick Road Day Industrial School has attracted over 99 per cent. and has done for a long time?—I did not know it was as much as that.

897. You may possibly get a result almost greater than that if you make the school attractive enough?—Yes.

898. Do you see any objection, for that special class you have got in mind, to make it as attractive as you possibly can?—Of course not. The point is that you want to reduce the toil of the children. You want to make school life easier to them, because it is a difficult thing.

899. You want to have a shorter time in the class-room?—Yes, and change the lessons often.

900. And then have a little interlude of work and a brisk interlude at drill, and so on?—Yes, and crowd the school less, and let each teacher have less children.

901. A school would naturally be less crowded if the class-rooms were turned into workshops—Yes, that is the increased space I suggest here. Then there should be more individual attention from the teachers—they should have a class of thirty instead of a class of sixty.

902. I gathered from one of your remarks relating to the special school, that you see considerable danger, and, indeed, positive cruelty, in the too great tendency to stuff children into special defective schools?—A child, who is mentally somewhat backward, sticks where it is, as it were. If it is put in one grade it stays there; if it is put into a higher grade it will get on better, and so on. I think a great many of the children who are put into the special schools lose very much. They may not get on as they would do elsewhere.

Dr. Kerr.

903. You think if there is to be more medical inspection of schools, the medical inspector must be very careful before he certifies a child—before he takes a child out of its normal surroundings and put it into a special class?—Yes. I always feel a child should have a chance if possible. At present you have to put them into a special class or condemn them to do nothing in an ordinary school.

904. Then with regard to the census I should like to take up a point about which Mr. Lindsell asked you a question. He referred to the central governing body?—Yes.

905. To collect statistics in a similar way to the Geological Survey or the Ordnance Survey. Would you see any objection to that central governing body working through you?—None whatever.

906. Do you not see the advantages in a system of co-operation by which they might collect information derived from you, in the same form as they derived it from Bradford or Manchester?—Of course all that information is useful, and they could turn it to more account than merely local works.

907. Now about your 50,000 children. I agree that is a substantial number. Do you see any advantage in getting that 50,000, not by taking the mass of the school children, but by making your 50,000 observations upon children, say of two ages, getting 25,000 at the age of seven, and 25,000 at the age of 12? Then if you repeated that at five years you would have practically the facts for the same children at the age of twelve for whom you have already the facts at the age of seven?—Yes, but still there are objections to that I think. You cannot trace out how things vary if you only check them at two ages. Of course two ages is the popular way on the Continent at present. They take them on admission, and they take them either at discharge or somewhere thereabouts. But for scientific purposes it would be infinitely better to have a graduated series of observations at different ages. For instance children grow very differently between seven and eight, to what they do between ten and eleven. They increase in weight about 10 per cent. between ten and eleven, but they do not increase anything like 10 per cent. between seven and eight.

908. You were, I believe, at Bradford before you came to London?—Yes.

909. Where were you before Bradford may I ask?—I was not in practice anywhere. I had simply been resident in hospitals before I went there.

910. Have you formed any opinion as to the difference in physique between London and Bradford school children?—One cannot give a general impression at all.

911. You had, in Bradford, figures which you have been able to compare since with London figures?—Oh, yes, I have had this system put in practice in Bradford. I did it myself experimentally.

912. Were you the gentleman who carried out that inquiry between the different classes of schools in Bradford?—Yes.

913. We have those figures?—I expect those are my figures, if you got any from the Bradford School Board.

914. You are not prepared to express an opinion as to the comparative physique?—It is quite impossible. In the suburban districts of London you cannot get a better description of children if you go up north or if you go down south.

915. We have had downright evidence from Dr. Eichholz, that you reach a lower physical level in London than in Manchester or Leeds, and some other towns he mentioned?—I think there is a very good reason for that. You get a mass of the very poor miserable people aggregated in districts in London sufficient to fill a whole school with their children. You do not get that mass in other towns.

916. Dr. Eichholz says he went to Manchester, to schools selected by Mr. Wyatt and Miss Dendy, as the schools possibly containing the very lowest from the physical point of view of the population?—I should think he ought to have got as bad in Manchester as in London.

917. He says they are better than the similar schools in London. But you could not say?—No, it is a more immense population in London. In a place like that they come and go.

918. (*Chairman.*) I just want to ask this, in regard to this particular class of school, the new type of school, the creation of which you advocate, is it within your intention that the children who enter into such a type of school should remain in it throughout their school life?—Some of them.

919-20. You would draft those who were sufficiently improved?—Back into the ordinary school. Suppose a child has had some severe illness, say at the age of seven and has been retarded in growth; he has been in a particular school possibly eighteen months. If he goes into one of those schools for a twelvemonth, he will catch up at a far greater rate with simple treatment like that, than he would in an ordinary school.

921. And you would use your discretion as to how soon he should be sent back to the ordinary school?—Yes. I think a few would like to go through the ordinary school life.

922. (*Mr. Struthers.*) With regard to the special schools, I am not sure how you get over the difficulty of classifying the children without compulsion. If you mark these schools off as special schools, in any way, parents would be unwilling to send their children to them without compulsion?—Some of them would. Some would rather they go there than to an ordinary school.

923. But the majority would object?—If we said they were of simple character, where regard was paid to the children not being so strong, I think we should get over it.

924. What would be the essential features in the curriculum of these schools different to those in the ordinary three R school? You have mentioned writing on blackboards instead of in copy books—you mean in the junior standards?—Yes.

925. The infants principally?—Yes.

926. The greater abundance of hand work?—Yes.

927. Was there anything else?—One would teach them things like arithmetic in a much simpler way. They would learn by easier methods than giving them long problems.

928. Dr. Eichholz spoke of a similar class of schools except that I gathered in his view the important thing about the special school was that first of all they should feed the children?—I did not think of the feeding, but that, of course, would be a very useful thing. But the majority of these children are not those who specially want feeding. Some are poor children who cannot get on in the ordinary schools, and some are a bit deaf or have bad eyesight.

929. That would not be one of the main features of this special school with you, the systematic provision for feeding?—That would not be one of the main features, but it would be a useful auxiliary to it. But my idea about these schools is that you should do what you can to reduce the pressure on children at school. There are a few children in school who cannot keep up to the ordinary level.

930. I should like to ask you this question then: these are points of difference that you mentioned between this special type of school and the ordinary school such as we have nowadays, and I should have said that the difference you favoured is an improvement in the ordinary school curriculum, even for the ordinary children. Would it not be a better solution of the whole question to have a curriculum for all the schools, more of the nature you have mentioned for these special schools?—On the other hand, you would get less work done, I am afraid. There would be smaller classes.

931. (*Chairman.*) It would be much more expensive?—It would be very much more expensive, but at the same time, you would increase the efficiency of the ordinary school, because the children there would be capable of working more quickly. Instead of being kept going at the rate of the dullest they would be a better class.

Dr. Kerr. 932. (*Mr. Struthers.*) That is very often done in the ordinary school at present, at least it is in Scotland?—Yes, they separate them into classes.

933. They put those who are approximately at the same stage of education into two divisions, one of which progresses more rapidly than the other?—Yes.

934. And it seems to me that provided the curriculum of the school for both divisions is reasonably broad, and has sufficient of those elements you have mentioned, if you make that division in the school, there is scarcely any necessity for a separate school?—I would reduce the whole ideal of the school, which is not to attain anything like the ordinary level. You do not expect the children in it to be anything more than mere labourers, and you do not attempt to put the same education into them that you do in the ordinary school.

935. If you had these two divisions in the ordinary school—I am assuming it is a fairly large school—you could allow those children who are bright and intelligent, and whose parents wished to push them on to a profession to progress at one rate?—Yes.

936. And those who are dull, either from defective feeding or from whatever cause, could move through the school at a more leisurely rate?—Yes.

937. By the time they both leave school, say at fourteen, the one will have got into secondary education, and the other may have just that knowledge of the three R's which you insist on every one getting, if possible?—Yes, that is grading the school practically into two of these schools.

938. It is in a way.—Only if you separate the schools distinctly in that way, I think in the lower grade schools you would get the thing done in a much simpler way, and the whole idea of the school being different, the children would be looked after, physically, better, and their physique would be developed rather than their mental qualities.

939. The only point in favour of the sub-division which I have spoken of, in the same school, seems to be that the average parent is not aware that there is anything special being done in the classification of his child?—That is so.

940. He is attending the same school as those of a better class, who are more intelligent and so on?—Yes.

941. He is not sent to a school where he is specially labelled as being a special child?—That is so.

942. Do you think there is a need for school restaurants in connection with an ordinary school, or that it would be a great advantage to have them?—I am very doubtful about it. I do not feel as strongly on the point of nutrition or rather want of nutrition as most people.

943. That is what I gathered from your evidence. You do not quite lay the same stress on bad feeding or insufficient feeding which we have had from others?—No. I have not considered it as fully as Dr. Eichholz.

944. On present consideration you do not think it is the one outstanding cause?—No. I do not think it is the great cause.

945. You do not think it is the great cause of bad physique in schools?—No. It is bad feeding at an early age which I think is the most important point—when they are infants.

946. Then you consider that the average school could be much better ventilated than it is at present?—Yes. That of course depends on the teachers. The average school, as it is at present, would be very much improved if the teachers only used the means at their disposal, but they do not do so.

947. Do you consider that a mechanical means of ventilation is necessary for good ventilation?—You cannot move the air sufficiently without it in a school.

948. I do not know anything about the subject. I am asking for information. I was going to ask you this: supposing you have a small school, taking a country school—because, after all, bad ventilation occurs in country schools as much as in town schools?—Yes.

949. If you had a small country school of sixty or a hundred children, is it possible to have that place mechanically ventilated except at disproportionate expense?—You could ventilate that place by an arrangement of stove—what they call the Pilot stove to draw air in.

950. It is not specially expensive?—No, it is not specially expensive, but you could also ventilate a room like that with windows, if the teachers used them.

951. Then, alluding to another point, do you think that the teachers need a knowledge of hygiene?—That is the gist of the whole thing.

952. It is the fact in England—at any rate it is in Scotland—that a certain amount of instruction in the laws of health, hygiene and physiology, as a fundamental science, is part of the training college course; but I think you said that they do not pay any attention to what they have learnt after they leave the training college?—No, I think it is a very secondary part of the work of the training college.

953. It may be so. We could lay more stress on it, but it appears that the knowledge acquired there is not made use of when they go into the schools. Do you see any way to avoid that?—If they got better knowledge—they get very little knowledge there—and if there was a kind of sanitary oversight in the schools, and an insistence upon the necessity of keeping the schools in good condition, the teachers would very soon modify their practice. It is their practice that is so bad.

954. It is really the practice of the teachers rather than their absolute want of knowledge that is in question?—Yes.

955. And the remedy would be an effective inspection?—Knowledge on the teachers' part, and inspection. They open the windows when they see me coming into the school, those that know me; but the windows wanted opening before that.

956. I gathered you would like to use the teachers as, so to speak, the first judges of determining whether children require special treatment or not?—I think that selection ought to depend to a great extent on the teacher's history. In three out of four cases it is the history given by the teacher that decides whether a child goes into the special class or not.

957. Then you do not want a somewhat elaborate staff of medical officers to look after all the children in your schools, but a comparatively small staff would suffice for the purpose, provided the teachers came into the business by selecting those children who obviously required medical examination?—Yes. My own idea is that an efficient way of doing this is with a small sanitary staff of teachers who have knowledge. The cost of a sufficient medical staff to do the whole work would be enormous.

958. Taking the teachers' present knowledge of hygiene, and turning to the card which you propose for obtaining the physical census of the children, the only thing which the teacher needs have special knowledge to do—and that very little—are those data for physical conditions?—Those were to be done by medical inspectors in my work. The only thing there which the teachers could do—

959. Is there anything there which the teachers could not do?—Yes, they could not fill up the spaces about the conditions, about the throat, ears, nose, nutrition, vaccination and those things.

960. Could not they get the particulars with regard to the condition of clothing, and the height without shoes?—I would not like to rely upon any teacher's height or weight measurements. Even the visual measurements they do are often very untrustworthy.

961. Surely any intelligent person, with a little direction and experience, could take the height accurately?—They could but they do not. If you could rely upon them it would be all right, but they would do the thing hurriedly and they easily make mistakes. They would get through far more than you would in the time.

962. Do you think that persons specially going round may not make hurried observations occasionally?—Of course they may. But unless teachers are specially trained to this as an important thing, they think it is a mere fad,

and they take no trouble about it. They sometimes hardly take the trouble to write down the results.

963. The teachers might be trained?—Oh, distinctly so.

964. And the doing of it looked after to some extent?—Yes.

965. If that were done, do you not think it would be possible in every school, just as you take a boy's and girl's age when they enter, to take his or her height and weight,

and have that done again every year?—Yes, that would be a very useful thing.

966. You could have a person, under the direction of medical officers to go round and see this was properly done?—Yes, that would be a useful thing.

967. And that, by and by, would give us very considerable data for fairly accurate information to make inferences from?—Yes.

968. (*Chairman.*) We thank you for your evidence.

Dr. Kerr

THIRD DAY.

Monday, 18th January, 1904.

PRESENT

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*)

The Rt. Hon. CHARLES BOOTH, F.R.S., called; and Examined.

969. (*Chairman.*) You are the author of "Life and Labour in London" are you not?—I am.

970. Did your investigations produce the impression that conditions unfavourable to the health of the community were growing in intensity?—I think I should not use the word "intensity." They are growing in amount in connection with the increase of the urban conditions of life. I could not say that the conditions have been more intense, but they are more widespread.

971. Owing to that fact?—Mainly owing to that fact modern conditions of life are unfavourable.

972. And you are satisfied that overcrowding and defective nutrition—or perhaps by defective nutrition you wish to be understood improper rather than insufficient—are the principal causes of such physical deterioration as is to be found?—Yes.

973. Would it be an exaggeration to say that every evil prejudicial to physical development flows from overcrowding, as the preparation of suitable food becomes impossible in the conditions under which numbers are forced to exist?—I should prefer to say that every evil prejudicial to physical development is aggravated by overcrowding, and I should not be prepared to say that the preparation of suitable food is impossible under the conditions, but it is more difficult, and there are many more reasons that make it not done—the food is not properly prepared.

974. You mean reasons owing to the carelessness and indifference of parents to their responsibilities?—Yes, and to the facilities of getting ready-cooked food.

975. From outside?—Yes, and also to the increase of the demand for female labour, for instance.

976. Which withdraws the mother from the house, I suppose?—Yes.

977. And forces her to neglect her domestic duties?—The domestic duties tend to be neglected from a great number of causes. *Mr. Booth.*

978. Owing to the demand for female labour?—That is one cause, and that may be said to be partly due to the bad demand for male labour. The household is more supported from the female side, owing again to a great many industrial causes. It is a very complicated argument.

979. You mean that it is due to economic causes, the desire to get cheaper labour?—Causes such as the introduction of machinery in some cases it may be.

980. Is it at all due to the growing unwillingness on the part of the male householder to take his part?—I should not like to say that, but perhaps loafing becomes more prevalent if it becomes more easy. In all these cases the causes act and re-act in a way which makes it very difficult to trace where you begin and where you end. But there is an evil state of things industrially.

981. Touching the subject of overcrowding, you consider, do you not, that improvements are apt to cause a local accentuation of the mischief very often, owing to the lowest class being always the most reluctant to move, or the most incapable of moving?—I should not use the word "accentuation" so much, as that repeats itself. If there is improvement in one place the evil starts again in another. I do not know that it has accentuated it very often. I think that an improvement which has wiped out one black spot may produce others, but I doubt whether the new black spots are any worse or so bad.

982. In your opinion, the disposal of these people is a standing obstacle to the exercise by the local authority of the powers with which they are entrusted?—Undoubtedly.

983. You have stated emphatically that it is the competition of the very poor that exercises the most de-

Mr. Booth. pressing influence on the class immediately above them who, if the very poor were eliminated, might maintain a more equal struggle for existence?—I think that is true. It was an impression that I gained early in my inquiry, and I stated it then, and I believe it to be true. I have seen nothing to alter my opinion.

984. Fuller experience confirms the impression you first got?—Yes.

985. This undesirable class, which you describe as a dead loss to the State, is composed of the wastrels and ineffectives of society, those who, from whatever cause, have drifted into its dunghills and dustheaps?—Yes.

986. And you advocate interference by “administrative action and penalties at each point at which life falls below a minimum accepted standard while offering every opportunity for improvement,” or, as you elsewhere put it, “the community will be obliged for its own sake to take charge of the lives of those who from whatever cause are incapable of independent existence up to the required standard”?—I believe that to be true.

987. Could you favour the Committee by telling them briefly how you think that might be done?—It would be difficult to do it, because so many influences would have to converge to obviate the widespread evils under which we suffer. Many influences may be brought to bear, and I do not think that any one panacea, any one influence, which you might propose, could be picked out as such. Every influence that tends to the improvement of the standard of life—for instance, to the improvement of the conditions of the class above—tends to drag up the condition of the class below, just as the elimination of the lowest class would tend to the improvement of the class above it.

988. Would you aim at a complete segregation of this class from the rest of the community, and their employment on farms, or in labour establishments, upon suitable work?—I am afraid that is rather too ideal a proposal. That proposal I made at an early stage, and I have thought of it at each portion of my work, and I have been watching and considering it, and during the period there have been some very interesting experiments tried by the Church Army and the Salvation Army which have shown clearly that it has great limitations, but yet the experiments have not been so completely tried out but that I think further experiments ought yet to be made. The object is desirable.

989. You do not despair of considerable effects?—No. Very considerable effects may be brought about provided it is worked together with administrative pressure and moral improvement. It would only be one item, I take it, in a policy of improvement.

990. Part of a general scheme which might, taking advantage of those circumstances and causes which are making for improvement, militate against those influences and causes that are making for the opposite. If any such scheme was carried out, it would be necessary to provide for the children in industrial homes or public nurseries?—I have not thought of it. It might be to some extent, but it is desirable to avoid that as far as possible, I think.

991. You would not break up the domestic life if it could be retained?—The experiment has been tried, on the individual to a great extent, by these two great organisations, the Church Army and the Salvation Army, but the experiment has not been tried of dealing by families, and that experiment might still be tried.

992. Do you think, having regard to the interest the community have in the preservation of the young from contaminating and depressing influences, it would be possible to apply similar treatment to the children of all parents who have proved unfit to discharge their obligations to the children they bring into the world?—It would be very difficult, and I think could not be applied except in extreme cases. In extreme cases, I think it could in the form of an industrial school aimed, not at a criminal class, but at a neglected class.

993. A culpably neglected class?—Yes, where the negligence rests with the parents it might do; the child might be put in some form of feeding school where it would be fed and boarded, and the cost, or a portion of

the cost, charged upon the parents from whom it could be collected.

994. With a view to the enforcement of parental responsibility, do you think it practicable to make the parent the debtor to society on account of the child, and to empower the local authority to charge the parent with the cost of a suitable maintenance, with the further liability in case of default of being placed in a labour establishment under State supervision until the debt is worked off?—It could be only practical to go so far as that in extreme cases.

995. And you think such cases would be so rare that it would be hardly worth while to introduce any such system?—No, because it would be part of a system in which, in some cases, parents would be made financially responsible, and in some cases criminally responsible.

996. As a further step?—As a further step, and in other cases various degrees of responsibility might be enforced, and in some cases it might be a mere charitable assistance.

997. Do you think it possible to lay down a minimum of soundness and sanitary convenience in houses, below which it shall be the duty of the local authority to prohibit their occupation?—That is done already, but it often is not enforced. There is a rule in most cases.

998. A bye-law?—Yes, a regulation with regard to the number of sanitary conveniences. On all points of sanitation we have regulations and laws, but they often are not enforced, and they are difficult to enforce.

999. Do they go to the point of laying down that every habitable house should subscribe and conform to those regulations?—Yes, I think so.

1000. You think that variations from the standard as local circumstances suggest should be permitted?—Oh, yes, perhaps more than is now done.

1001. More latitude you think?—At any rate the authority should not be bound down to hard and fast rules. The difference between town and country labour should be taken into consideration.

1002. Would you go so far as to prescribe the maximum number of inhabitants any house or area should accommodate, particularly in the case of children?—It is done already.

1003. But generally?—It is done in London. I think that it is done generally under urban conditions.

1004. How is it that there is so much overcrowding?—I am not sure about the authority that decides it. There would be extreme difficulty in enforcing the rule.

1005. Those bye-laws and regulations have come to a deadlock in fact?—I suppose they have some influence; constant pressure being exerted.

1006. But is the pressure constant?—There is a pressure being constantly exerted. I should not say that the pressure is constant but it is constantly being exerted, and might be much more exerted if there was more chance of allowing expansion; if the people could more easily find other homes. The authorities cannot enforce the law, when there is no other place for the people to go to.

1007. And you would agree that overcrowding is particularly disastrous, especially where the young children suffer from it?—Yes.

1008. There is a point I have seen referred to in Mr. Well's book, “Mankind in the Making.” Having regard to the risks to infant life from suffocation and fire, would you make separate cots and fireguards obligatory?—I do not think I should. I had not thought of it. Fireguards might be; but I think not cots.

1009. You know that there is an enormous number of deaths from overlaying, is that not so?—Yes.

1010. Infant mortality due to that?—It would be exceedingly difficult to do it, I think.

1011. The risks to a child who has to sleep with grown people is surely very great?—Very great indeed.

1012. And I presume it must be very easy for parents

who wish to get rid of their children to overlay them accidentally?—One cannot deny the evils, but I hesitate to say that that would be so.

1013. But in looking into this question you think that there is a very great want of sufficient care, on the part of the State, of young children, and that idea seems to be borne out by the fact that during the last ten or twenty years, which you are aware of, there has been no diminution of the rate of deaths so far as children under one year of age are concerned?—Yes.

1014. But it appears to me that that requires the attention of the Legislature and every administrative authority; you think so, do you not?—I suppose that the reasons for infant mortality are more in defective nourishment than any question of this kind.

1015. No doubt, but the number of cases are considerable?—I really do not know that they are considerable in the sense of a large proportion—I suppose not. If you add them up, they add up to a considerable number, but I should not have thought that they would be a large proportion.

1016. Have you ever thought of the effect of infant insurance on the lives of the young?—Yes, I am inclined to think less of it than is sometimes said. I am not an authority on it. I have merely thought of it, as everybody else has done.

1017. Do you not think that it is highly probable that it is one of the causes, I will not say one of the principal causes, of the carelessness of parents in regard to infant life?—It must be connected with it.

1018. But from your knowledge of human nature, particularly of that class, should you not say that it was very reasonable to think it was so?—I find it very difficult to say. I do not think that they would do it in order to get the money; but, on the other hand, the fact that they are insured would make them more careless.

1019. Are you not giving away the position when you say that?—I think I am. One has no knowledge at all. It is merely what you say, what knowledge one can imagine one has of human nature, and that is very difficult, when you are judging of another class and another set of people who are not your own associates.

1020. Take another point, with a view of checking the unfavourable conditions in which those who work on small premises are often condemned to labour, you advocate a double system of licence by which both the owner of the premises and the employer of labour may be held responsible to each other and the State?—I do.

1021. How far in your opinion do the provisions of Part VI of the Factory and Workshops Act, 1901, go to provide a remedy for the evils you describe?—They do not touch it at all. They are aimed entirely at the home industries, not what I am trying to deal with, that is, the small workshops. I do not venture to say that you could make the landlord responsible at all for premises which are occupied simply domestically as a home, because some work was done in the home. It did not seem to me to be possible to define or meet that difficulty, but I did think that it was possible to define a workshop in some simple way, so that the landlord would know that he had a workshop on his premises, and that he would be jointly responsible with the occupier of the workshop for certain conditions with regard to health and so on; but I left on one side the home work, not because I thought it was a thing which ought not to be dealt with as soon as possible, but I did not see my way. Existing legislation, I should think, does enable the authorities to deal with the home worker to some extent, and it is perfectly good as far as it goes; but it covers another point.

1022. The Act renders the district council chargeable with the duty of bringing neglect home to the employer, does it not?—Yes, the employer has to have a list of those who work for him in their homes, and he becomes to a certain extent responsible for the conditions, mainly, I think, with regard to contagious diseases. But I should not say that the landlord ought to be made responsible in the least for that.

1023. Do you think that the recent legislation goes any way to meet the evils of what is called sweating?—I do not know to what extent it can be enforced, but certainly it goes in that direction. The provision is certainly good, and ought to go in that direction. I think it would

tend to arouse a sense of responsibility in the mind of the employer. *Mr. Booth.*

1024. In regard to your suggestions as to an amendment of the law of rating in order to encourage what you call expansion, though basing them upon the recommendations of the Minority Report of the Royal Commission on Local Taxation, you go considerably beyond them, do you not?—Yes.

1025. The signatories of that Report mentioned a moderate rate with a maximum fixed by Parliament, to be levied for improvement purposes only, did they not?—Yes.

1026. Would not that be tantamount to the adoption of a plan for adding to the existing rates a fresh imposition on site values, which you strongly deprecate?—Yes.

1027. Is the difference between the two so great as would appear?—It might not be in operation, but it is in principle. It is a step from the point of view of increasing taxation instead of the point of view of incidence of the burden.

1028. From the point of view of re-distribution?—Yes.

1029. That is the ground of your objection?—Yes.

1030. Would the plan, as proposed by the Committee, be adequate for the purpose you have in view of compelling factory owners occupying valuable sites in central positions to clear out?—No.

1031. Because it would not have affected site value to the extent that is required to bring about that?—It depends upon how far it was carried out. If carried out very generously, if in addition to what may be called existing rates, a very heavy rate was laid also on the site value, so that the total amount of rates raised was very great, it would have an effect on industry and perhaps of driving industries out of certain parts of the town, but it would not have the effect that I desire—that of, on the one hand, passing them out of one district, and, on the other hand, of opening another district to them.

1032. Of course the Commission's proposal for levying a tax upon site value implies the payment of that tax by the occupier of the site, not the owner, does it not? It would not be a tax upon owners?—I do not know, but I think it was to be on the owners.

1033. I do not think that was so?—I do not think they intended to forbid contracting out and I am not sure how they have dealt with existing contracts, but I thought it was distinctly intended to impose the additional rate as soon as possible on the owner, if not at once.

1034. It would go back upon the owner?—That is the theory, that ultimately it all falls upon the owner, and I believe it does, but I think their point in putting a very small amount was that it might be levied at once. I am almost sure they suggested that the owners should not have the power of contracting out of it, though I am not quite sure how they dealt with existing contracts.

1035. I do not think they would have disturbed them. In reading what they say upon the subject I certainly gather that the intention was to levy the rate upon the occupier, although, of course, it would fall upon the owner on the theory that all such burdens fall upon the owner in the last resort, at any rate in any new lease?—Ultimately the value of the improvement goes to the owner and the burden of the tax upon the owner.

1036. That is so. In order to try your scheme effectually do you not think that the area, say, of the county of London, contains great enough extremes of site value to give the scheme a fair trial?—Yes.

1037. You think it does?—Yes.

1038. I have heard it suggested that it does not—that a scheme of that sort should be tried over an area where there are larger portions of unoccupied land than would be found in the county of London?—Yes, it would be better no doubt. It might be necessary in certain sites of London to go beyond—I think it would be necessary.

1039. If you took the metropolitan police area, what then?—You would have then plenty.

1040. To give the scheme a fair trial?—Yes, you need more than the county area.

1041. You would make it part of your plan that it should be gradually introduced and should cover a saving

Mr. Booth. of present and future contracts?—Yes, I would certainly say decidedly that contracts should be preserved and be free to be made, and as to the gradual introduction the more gradual it is done the better. Every consideration that is possible should be paid to vested interests.

1042. Your scheme by tenths might be extended to bring it in by twentieths might it not?—Yes.

1043. It might cover twenty instead of ten?—But it would be probably found that the total number of people who were not seriously affected would be greater than the number of those who were seriously affected.

1044. Supposing all those conditions were observed, a good many of the objections to a gradual transfer of the whole burden from buildings to site values would disappear.—Yes, and the reasons in favour are so important that finally private interests must give way.

1045. Have you formed any opinion of the value of the Garden City Association towards the promotion of what you call expansion, having regard to the lines on which it is being worked and the methods pursued by the organisers?—It is a most interesting experiment, but I have not gone into it myself. I have not been down to the site of their new city, and I have not been to their meetings, but I have read of the experiment and it is most interesting, and I hope they may succeed.

1046. Do they intend to keep the middle men out and deal directly themselves with every person who takes land within the area that they propose to administer?—I do not know.

1047. May we take it in the result of your survey, as a whole, that you think ameliorative tendencies are gradually assuming the upper hand in the struggle against the social evils which threaten national prosperity?—Yes, I think so. I am sure they could. I might say that it is not beyond us to do it, and I think on the whole they are. It is a balance of course—some things improving and some things not. But I have no reason to take a hopeless view.

1048. I presume you think that the creation of a public conscience in the matter is of the greatest possible value?—It is of immense value.

1049. And the bringing up of municipalities to a proper sense of their responsibility and their duties?—Yes.

1050. And you think that you would be inclined to say that such a sense of responsibility is on the increase?—Yes.

1051. Do you see any direction by which it could be stimulated by legislative action?—I feel sure that there is a want of more direct powers of administration.

1052. Locally or centrally, do you think?—Locally in rather larger areas. I do not know whether you would call that legislative, but it appears to me that there are certain common interests which require a large area to be dealt with. And in that way you need to have not exactly delegated powers, but an authority responsible to Parliament, whose word should go far in deciding the action of Parliament in giving powers for this or that object. In connection, for instance, with the water supply, with drainage, with locomotion, just as we may say also with education.

1053. You think that some consultative committee that represents local interests on a wide scale, something of that sort, would do?—Yes. Such an authority as is now being proposed with regard to the difficult question of locomotion in London. A paid body, whose business it is to hear and investigate and report, on which the locality should have a member, but the work of which would be that of paid officials.

1054. But it would be advisory and not directory?—Yes, its business would be to report, to assist, to take the place that is occasionally taken by Parliamentary Committees, and it would have this advantage over Parliamentary Committees that it would be permanent and paid.

1055. You think that would be of very great value in dealing with the problems of overcrowding?—Yes.

1056. And the care of the young?—Yes.

1057. And the possible development of the people generally?—Yes. I think that the Poor Law ought to be administered only over large areas.

1058. And you think that the central Department in London should be invested with stronger powers of interference, and should be made to enforce the law with greater

vigour than perhaps it does at present?—What authority do you speak of?

1059. I suppose the Local Government Board is the authority for bringing pressure to bear on most questions of this kind upon local authorities?—I do not think I do quite follow your questions.

1060. For instance, there is one point. The local authority may have a very energetic and enthusiastic medical officer who may report to them that there are nuisances which ought to be removed, and congested areas that should be cleared, and all the rest of it. And they may be supine, and they may get rid of this man and appoint somebody who will acquiesce in their indolence. Now the Local Government Board under the existing law have no veto, I believe, upon the dismissal of that medical officer. Don't you think it desirable that they should?—No.

1061. You do not?—No. I should be afraid of trenching so much upon local government. I think that the local authorities have been given huge powers and that they ought to be free to use them.

1062. You think that the local authorities should be free rather than energetic?—I would have them free whatever else they are.

1063. Do you think that the Local Government Board should exercise all the powers of pressure?—No. A suggestion has been made that by comparison of one district with another it might be clearly shown that some were behind in the race, and then there might be some powers brought to bear to say, "Now, you must step up." But it is not my own suggestion. I think that it is the suggestion of Mr. Sidney Webb.

1064. But you would not despair of the exercise of such powers by the local authorities?—Having given these powers, which are quite recent, we must let it run. Happily the authorities, the men appointed as medical officers of health, and so on, do naturally take up an exceedingly active and vigorous part, many of them, and I do not think that is at all likely that a vigorous man would be checked. On the contrary, I think that his initiative would be supported.

1065. (*Mr. Struthers.*) The Local Government Board, I think, have a veto upon the medical officer.

1066. (*Chairman.*) Do you speak from your Scotch experience?

1067. (*Mr. Struthers.*) Yes.

1068. (*Dr. Tatham (to the Witness.)*) May I ask whether it is fair to gather from what you said that you do not think there is any progressive physical deterioration amongst the lower classes such as has been stated to exist?—I have no knowledge. I have no means of testing that. We are more conscious of it, and I think there is a larger proportion affected by these causes.

1069. (*Mr. Lindell.*) When you say a larger proportion are affected by these causes you will admit at the same time that there is a countervailing cause going on, on the other side, in improved sanitary and other conditions?—Certainly. We are fighting the evil and to some extent mitigating its intensity, but that does not alter the fact that the broad changes of industrial conditions increase the volume of the evil.

1070. The evil exists over a wider area, you think?—Yes, but we are fighting it to a certain extent successfully.

1071. Is the evil specially confined to what you describe as the wastrel, the unemployable class?—Oh no.

1072. Would it go on equally among the steady workers who are in good employment?—Not equally, but it depends upon conditions of life which are quite beyond the mere questions of success and failure. I mean that a labourer whose work is of an outdoor, healthy character may be an irregular liver and have irregular work, but at the same time be a strong hardy fellow; another man who is employed on a confined and unhealthy business—his development may be very bad; and the children in the same way may get a bad start by having a bad mother, seeing the classes they belong to. I am afraid that it is very widely spread.

1073. Of course you know our Inquiry was originally initiated owing to the extremely unsatisfactory condition of the recruits?—Exactly.

1074. Would you say that those recruits were probably mainly derived from the failures, from the class that are below the steady workers?—I think, on the whole, the Army is recruited from a lower class than the average, but not by any means only or exceptionally from the lowest class.

1075. The two ruling conditions which would affect the health of the lower classes, mainly, would be bad sanitary conditions and bad food, would it not?—Yes, including largely in bad sanitary conditions, insufficient fresh air, insufficient opportunity of getting out of town into the country.

1076. Now you think, on the whole, sanitary conditions are admittedly improving?—Clearly.

1077. In spite of the increase of urban population there is an increased improvement in the sanitary conditions?—Yes.

1078. Would you say the same of the modern conditions of food, especially in child life?—I think that they are bad.

1079. Worse than they used to be?—I have not made the inquiry. My inquiry has not compared the past with the present, and therefore it is only an opinion. I think so; I think that the conditions as to food are worse.

1080. Owing to the greater facilities of getting bad unwholesome food, such as tinned food?—There is less home cookery, I should think, just as there is less home dress-making. It is the same thing. Things are done more cheaply in a wholesale way, and no one makes their own clothes, and the poor hardly mend them, and fewer people cook their own food.

1081. Any remedies for improving the food conditions of the lower classes concern not merely the supply of food, but the proper preparation of it when they have got it?—I think the cookery centres of the educational bodies are very useful in teaching to cook, but by far the most important cause would be if there was less woman labour.

1082. Especially, I suppose, immediately before and immediately after child-bearing?—That has not to do with the preparation of the food, but it has to do with the health of the women and the vigour of their children.

1083. In those two great agencies, the Salvation Army and the Church Army, do you know what does become of the families of the people who go to their Homes?—They have not got them. They are people who have left their families, or never had them. They pose as single men and probably in many cases are so.

1084. Are you in favour of similar efforts being made by direct State interference beyond those two voluntary agencies?—I have certainly thought that some Poor Law action should be taken in that direction.

1085. It would be very difficult, would it not?—It would be very difficult.

1086. It would be direct interference with the liberty of the subject to a certain extent, and it would be so difficult to draw a line when the State had the right to interfere with a man's personal liberty and when it had not?—It is extremely difficult. There are very interesting attempts made, as you know, in Germany, the experience of which might be used, but I entirely agree it is exceedingly difficult to do.

1087. (*Mr. Legge.*) With regard to this question of female labour and its deleterious effect on domestic life, have you formed any judgment as to whether the disinclination to attend to one's home is growing among the poorer classes, the women of the poorer classes?—I think they do tend to neglect their homes more.

1088. Do you think that is because nowadays girls are sent to school so early and kept at school so long, and see so little of their homes?—No; I should not think that.

1089. Would you see any objection, from the social point of view, of the movement in favour of keeping girls of all classes full time at school until they reach the age of fourteen?—A year more than now?

1090. Yes?—I should not desire it.

1091. At full time?—I should not think it desirable to extend the time.

1092. The present age?—No.

1093. You would think it still more wrong to extend the age to sixteen for girls?—I should not suggest it.

1094. Would you be in favour of girls being allowed greater relaxation than boys in the way of half-time provided their employment were domestic?—I have not studied the way in which the half-time is worked. You mean factory half-time, of course?

1095. No. I meant allowing only half-time attendance at school, provided they went home for the rest of the day to work with their mothers at domestic work?—That would be, on the whole, very desirable, I think.

1096. There has been a recent tendency in London, as indeed in most big towns in England, to build large tenements for the housing of the poorer classes, improved Peabody buildings. Do you think that the conditions of life in them are better than in the one-storey or two-storey little tenements, of which you get acres upon acres in the East End?—In some cases they are and in some cases they are not. In themselves the extra height and absence of space around are certainly evils; on the other hand there are excellently arranged blocks, infinitely better than the ill-arranged cottages.

1097. The advantages compensate for the disadvantages?—I think in the more recent and improved buildings probably that is so. There were some of the earlier ones that are atrocious.

1098. Now, with regard to State interference, especially connected with Mr. Lindsell's last two questions. I rather gather from what you said that you prefer municipal action to State action?—Each has its own rôle to play.

1099. Yes. It is one of your points that you want considerable powers vested in the hands of municipalities or county councils?—Yes. I do not think we know exactly what will be best to do, or are at all prepared for a centralised uniform system. The experimental influence of local bodies who are trying to feel their way is, I think, more important, as I do not think we really know what is the best course to pursue.

1100. You think that having large powers of central government a department, such as the Home Office or the Local Government Board, regulating any particular detail of administration, should be very shy of checking local authorities in trying experiments?—It is very difficult to say exactly what limit there should be to their action. It could be in some cases an advantage and in some cases they stimulate, but I should wish that freedom were given as much as possible to the local authority.

1101. At the same time I rather gather from the reference to the Salvation Army and the Church Army, that you would like those municipal authorities in their turn to allow as free a hand as possible to such reasonable and well-conducted voluntary associations?—I do not think they do interfere at all.

1102. Have you seen the correspondence with regard to the London County Council's action in reference to the shelters of the Salvation Army, forcing them, for instance, to substitute bedsteads for bunks?—I do not think that because work of that sort is done from charitable motives it ought to rest upon any other regulations than would be enforced if it were done for profit. I do not think that there is any reason for allowing a shelter to be carried on, because it is a charity, in a different way from what you would if it was being done as a commercial undertaking—you should enforce the law exactly the same.

1103. That is supposing nobody was carrying on a particular enterprise in a commercial way, would you allow any relaxation then? As a matter of fact nobody is providing beds for the wasters at less than 3d. a night. Supposing the Salvation Army were doing it at 1d. or 2d., would you force the Salvation Army to provide such conditions in their shelters as to preclude them from receiving anybody who did not pay 3d. a night?—Yes, if that was the result.

1104. You would be in favour of the County Council applying the same sort of regulations to a voluntary institution as to their own, to keep the minimum requirements of the law?—All I suggest is that they should enforce their regulations as to what is the law. The minimum requirements I suppose are all that you can enforce.

1105. Might one expect the County Council to be very careful in raising their requirements?—Why?

1106. Well, to make sure that you are not raising them too high to help the lowest class, the wasters of society. You

Mr. Booth. would agree probably with what the chairman of the Central Committee of the County Council said in his letter in the defence of the County Council action in regard to the Salvation Army Homes, that the County Council were providing homes for people at 6d. a night, and that before those, they should provide houses for the poorest class of all. I think that the pressure, whatever pressure is brought to bear, must be exerted gradually and slowly; you must not act violently. A certain institution has been allowed to come into existence and it must not be dealt with in a revolutionary way, and the pressure ought to be gradual.

1107. Then with regard to the question of the disposal of the children and females, all those who might conceivably under some future dispensation be placed in labour colonies, you are aware no doubt that under the existing Industrial Schools Acts, children can be sent to industrial schools with no criminal taint whatever, who were simply the children of parents who neglect them and who have been very unfortunate?—I thought there were special schools for those children and that they were only sent to those schools in special cases. I did not know that the people who are not criminal could not be sent to those schools. I thought in some towns there were schools that had been adopted, and that they gave them another name, but I was not aware that it was the case that children who have committed no fault can be sent to the schools to which the young criminals go.

1108. Yes, but "criminals" is a hard term to apply to a child under ten?—But are children under ten sent?

1109. A certain number are?—But they have committed theft or something—they have been convicted.

1110. No. No child is supposed to have been convicted who is sent to an industrial school. They have been charged and they have been ordered to go to an industrial school, but it does not rank technically as a conviction. However, I need not press that point. With regard to Part VI. of the Factory Act, you said very truly that it contains stringent regulations prohibiting home work in places where there is infectious disease, but you will no doubt recall also Section 108 of the Act. That provides that where an outworker is working in unwholesome premises, after due notice and after investigation by a court, the occupier of any factory or workshop may render himself liable to suffer penalties if he sends in more outwork to be done in those premises?—Yes, but it is work in the homes.

1111. As you point out, that does not extend to ordinary home work; it must be home work which is done in connection with the factory or workshop?—It is done for a centre.

1112. Exactly. So that it is limited in its extent, so far as it applies to homes at all.

1113. And, furthermore, it has no direct reference to, or effect upon, the occupier or the tenant or the landlord of the house in which the work is being done?—It acts directly upon the employer. It would stimulate him to see the way in which sanitary conditions were not observed.

1114. Yes, but you wish to secure somehow some extension of that sort of influence?—It is not an extension, it is an entirely different point, the object being to make it possible to apply the law with regard to factory work sufficiently to cover the small workshop—which is otherwise apt to escape and be under very bad conditions. It was on that account that it suggested itself to me that the proper engine for pressure was the landlord. But it covers an entirely different point. Those who are outworkers, working entirely in their own premises, not employing others, probably female workers who are given their work from some industrial centre, either a workshop or factory, or a giver-out of work—they are the classes that are covered here, are they not?

1115. Now, with regard to the Garden City movement. You are aware, no doubt, that a large new city is going to spring up on the Firth of Forth shortly, which is the creation of the War Office?—Yes, I have heard of that.

1116. Do you not think that the opportunity, if the opportunity were taken, by the War Office, in connection with the scheme, to see that this new city was properly laid out, would be good?—Probably, but I have no knowledge of the conditions. When you mention it, I

remember I have seen something about it, but I have no knowledge of it.

1117. You would be in favour of the experiment; you do not see why the Government should not try the experiment as well as a local authority or a voluntary association?—It has been done with considerable success by some private employers, and I do not see any reason why the Government should not do it also.

1118. The last point is that question of statistics. You yourself have been conducting a tremendous inquiry for the last seventeen years or so. Do you not think it would be a good thing if there were some central authority whose business it should be not to allow such a piece of work as yours to lapse, either collecting itself or directing through various agencies the collection of similar information to the mass you have got together?—I think a great deal more might be done from the Government centres to put together valuable statistics. But their powers and their line of inquiry would be very different from such as an individual is able or thinks it desirable to carry out. I do not think that an inquiry like mine would be at all desirable to prolong or go on with.

1119. But it has brought out certain facts which might be tested from time to time?—And especially tested in other ways.

1120. No doubt, when I speak of the Government collecting information, the Government in many cases might work through bodies such as Educational Committees, certifying surgeons, &c., all over the country, and so on?—Yes.

1121. You would be in favour of some method of co-ordinating all this work as well as keeping it alive?—Oh, certainly; but I do not know what shape the Government would desire it to take. It is difficult to say what part should be best played by the central authority or by the local authority or by philanthropic authorities. I could not say how it would be best. I have a great belief in the value of statistics.

1122. (*Colonel Onslow.*) Do you consider that the existing laws of sanitation, over-crowding, inspection of food, and all those matters, both natural food, say meat and milk and anything else like that, and also the made-up foods, are sufficiently strong, if the local authorities or other authorities put them into force, to counteract evils which have been brought to light by your investigations and by Mr. Rowntree's investigations?—I should say that they are stronger than can be at present enforced, and if they could be enforced they probably would be altered in various ways because the actual information would be got. We cannot enforce them, and therefore it is very hard to judge whether they might be made stronger.

1123. Why could not you enforce them?—The circumstances are so difficult in dealing with home life.

1124. Surely with sanitary inspection, for instance, the provision of proper sanitary arrangements in the houses, it should not be possible as it is in York for one midden privy to be at the disposal of some fourteen houses—surely that could be altered?—Yes, I think so.

1125. Have the local authorities sufficient power to enforce landlords to build better?—They undoubtedly have. They can get those powers. I do not know what the powers are in York. But Parliament would give those powers and does give them. One difficulty lies in the fact that people are poor and need to get very cheap accommodation, the result being that they aggregate to the worst accommodation, and then if you try to deal with a centre you have a mass of wretchedly poor people whose habits are exceedingly bad. If you give them good appliances they destroy them, so that you have an evil that is very difficult to deal with, and I think can only be dealt with by many means and slowly.

1126. Still as a matter of fact, the law is strong enough really to counteract all those things?—The law is as strong as it can be used at present.

1127. As regards the inspection of those made-up foods, the patent foods for children. Do you think it is strong enough?—I do not know enough about that to say.

1128. Then again, regarding the children, it is granted that many parents are bound to go out early—they have

no time or the opportunity to prepare proper food or to look after the children before going to school—would it be possible to give meals at all Board Schools, etc., for children, making the parents pay where they are able?—I should like to see it done.

1129. Would you like to make it universal?—Yes, as far as I can see, I am in favour of every Board School being also a restaurant or having a restaurant in connection with it where suitable food such as children like, but at the same time is also good for them, is sold at the minimum price—not with any intention of giving it away.

1130. Not to pauperise them?—Quite so. The parents now of that class who have money give their children quantities of pennies to spend on sweets and so on; and if they could be induced instead of doing that to give their children tickets that would not be available anywhere except for their midday meal, they might be better fed and have better cookery, and it would have an excellent effect. If a system of that sort were established it would be the easiest way of providing for those children who do need the charity, and although I do recognise the objection of encouraging the parents to trust to such a thing, yet I believe the advantages would counterbalance any disadvantages.

1131. It would be an advantage to those who are not able, either from poverty or stress of work, to look after their children?—Yes.

1132. (*Chairman.*) But the provision of the mid-day meal would not touch the case of a great number of school children who have to go out in the early morning with an empty stomach?—I suppose not. But that might be got over by giving them oatmeal, which none of them would be eager to take. I think a ration of oatmeal might be given as a breakfast with sugar or something. I think that they might have that given them. They much prefer to have their parents' food. The commonest plan in London is for the father to go away before breakfast, to take something with him, and come home to his one nice meal after his work at six o'clock, or some time like that, and the children enjoy the share they can get at that time. And the mother does not cook for herself, and the children get bread, or bread and dripping, or bread and butter, or bread and tea, in the middle of the day. A school restaurant would, I believe, not decrease the amount of cooking in the houses, and would give the children better food.

1133. (*Mr. Struthers.*) You think that would be the tendency. At present the mother very often prepares a meal in the morning or in the middle of the day for the sake of the children. They come home to have it, and she gets it with them. But if the children get it at a restaurant, she might herself become underfed?—Oh, certainly, that is so. I fully recognise that possible view—that it might do more to undermine the habits of the mother in cooking a mid-day meal. I would chance it.

1134. Speaking on that question of cookery, you said that you attached some value to the instruction given in the cookery classes of the Board and other schools?—Yes.

1135. Of course these lessons used to be given at a fairly early age, from eleven to thirteen, and now the age is raised to twelve. But taking the attendance of a girl from twelve to fourteen, perhaps six weeks in one year, do you think that that would have much permanent effect?—I cannot tell. I should think she would learn far more by helping her mother after school.

1136. Do you think, in the nature of things, that if it could be arranged that these girls came to cookery classes at sixteen to eighteen, rather than twelve to fourteen, the practical benefit would be greater?—Possibly.

1137. I mean they would know more what is really needed, and at a time of life when they would be able to apply their knowledge to practical work?—I have no opinion of my own upon this subject, but many of the women who have given their time to School Board work, I know, do value that very highly, and I have taken my opinion from them; and I should have said if you have a cooking mother, I suppose from that mother you would learn, but if you have a mother that does not and will not cook, what can be done?

1138. Did any of your informants give evidence, or do they believe that the teaching of cookery was really having an effect in producing a mother who would cook?—That is their hope. I do not know whether they attain it, or not, but they believe it to be an excellent system.

1139. Perhaps you will not mind my asking you a question which has been asked already. But I want to be perfectly clear as to what is your opinion as to the physical state in a given area like Southwark—as to whether it is worse to-day than it was twenty or thirty years ago?—No, I do not think it would be correct to say that. But if you take the whole population of England, you will find a larger urban population, and, therefore, an extension of the evils which I trace to urban conditions.

1140. But taking a given urban district which was fully populated twenty or thirty years ago, and that same district now, is the condition of the children worse than it was?—I should not expect it.

1141. You are not aware of any statistics to prove that?—No.

1142. And your view is that, though there is a larger proportion of urban population to the whole population of the country, there is a chance of greater improvement?—Yes.

1143. Although there are a larger proportion living under urban conditions?—Yes.

1144. You do not happen to have made enquiries as to the condition of life in the country at any time?—No. I live in the country a considerable part of my time. I see the people, but that is all.

1145. Of course, as has been already said the sanitation has distinctly improved from what it was.—Yes.

1146. So that it is only a question of food and fresh air that makes the difference between the country and the town at all in the matter of physique?—Food and fresh air and habits generally.

1147. But chiefly those two things?—Yes, I suppose it is chiefly those two things.

1148. It would be rather important to have some direct evidence as to what the physique of the inhabitants of the country village is, as compared with the town population.—Yes.

1149. One assumes that the country population should be healthier and better physically than in the towns, but I do not think that there is much in the way of evidence as to that?—I think not.

1150. Not beyond the general impression. But one finds, and I have known myself distinct cases where one's impression of the physique of the inhabitants of the country village was unfavourable, that on the whole it was not better than that of a pretty populous urban district?—Yes.

1151. So you think it would be rather good to get a little evidence as to what is the physique and what are the conditions of life of a population in certain country districts?—It would. The evidence that I have in the matter is the far greater physical force of those who come into the city from the country. The country, whatever those who are left may be, does send the finest men to the towns, and from that one assumes that the country conditions, which produce these men, are better than the conditions of the towns, which cannot produce them.

1152. I think in the town you say from 18s. to 21s. is what is necessary to support life decently in the case of a man with a wife and three children?—I rather arbitrarily fixed that as a line. I had to make a line on which you might call the people in poverty, and below which they were tending to extreme poverty, and above which you reach the ordinary comfortable condition of the working classes. But it is an arbitrary line, and cannot be definitely drawn.

1153. But your impression was that 18s. to 21s. was necessary to support life decently?—Yes, for a man and his wife and a couple of children.

1154. What proportion of that 18s. to 21s. would be paid in rent?—It would vary in the district they were living in and how they were housed.

1155. Would it be a very wide range?—The range would be from 3s. to 6s.—I am speaking rather off-hand.

1156. But you think that 7s. would be quite a high figure for a family with an income of 21s. to pay in rent? It would be rather a high figure, would it not?—Yes, certainly.

1157. So that that would leave them 14s. for food and other things?—Yes.

Mr. Booth.

Mr. Booth.

1158. I do not know whether you have seen the returns that have been collected, I think it would be by the Board of Trade, of the wages of agricultural labourers in various parts of the country?—I have not.

1159. But there I find that in many counties the total wage of the labourer in full employment, taking it all the year round, of course, is 13s.; 14s. is about the average; and there are very few counties which go much beyond that. So that they do not seem to have nearly so much to spend on food as your urban family, which seems to be well above the poverty line?—Country conditions are very different, both as to the way in which they try to live and as to the extra chances they have in garden produce, and so on. I am not able to give you a comparison.

1160. (Colonel Fox.) Do you consider that the poverty amongst the lower classes is attributable very much to drink?—Yes.

1161. Have you noticed those cabby shelters in London? Since those have been instituted the cabby does not drink as much as he did, because he gets his food there and has drink, too. And it has had a great effect upon the cabby?—Yes.

1162. Do you think this organisation of Lord Grey, the Public House Trust, by which, instead of having a purely beer house, they are trying to introduce restaurants where good beer can be bought and eatables—ought not that to have a very great effect upon the working classes?—It may be hoped that it will prove to be a very valuable movement.

1163. Do you think that a man would drink less if he had good things—food at a low price—do you think that he would be less inclined to drink or “booze,” or to spend the whole of the time in a “boozing” place?—Yes.

1164. Would not that have a great effect upon the families also, and very likely the children would be better fed if most of the money was not used in drink?—Yes.

1165. Well, then, we are told that the Jewish children, both boys and girls, of the age of twelve are much taller, considerably taller and considerably heavier, than the Christian children—you are aware of that?—I was not aware of that.

1166. We have been told that, and we have had statistics about it. To what do you attribute that?—To the fact that the Jewish mothers do not work.

1167. Why is it that the Jewish children should be heavier and taller than the Christian children?—Because the mothers do not work.

1168. Is it attributable to the better food the Jewish children get, or what?—It is due to the more complete home life; they are undoubtedly better fed.

1169. (Chairman.) Is it due to the general character of the Jewish people?—To the domestic character. A Jewish woman is expected to take care of her home. In the poorest classes the married man does not expect his wife to assist in earning.

1170. (Colonel Fox.) It is principally owing to having better food and nourishment, you think?—I cannot express it in terms of nourishment. The food is better done, and there is a better home life. The things they eat, perhaps would not suit the Christian children.

1171. I am told everywhere that the Jews have not only the knowledge to choose better food but also the knowledge to cook it better than the Christians?—It is quite possible, but I really do not know it.

1172. But then, on the other hand, don't you find that the Jewish people are closer packed in their houses and in their rooms than the Christians?—Yes; that does not seem to matter to them.

1173. But notwithstanding that they have bigger children; they have better grown children notwithstanding the fact that they pack their houses closer, and they take in lodgers. They are very thrifty and try to pick up money in every direction, and therefore they take over houses in the East End not only where there is not enough room for themselves but they take in lodgers, so that it points to the fact, I think, that they get better food?—I think it does. On that point I have been told that the Jewish religious regulations with regard to meat tend also to their having wholesome meat. Every family has meat prepared in the proper way; the healthy

condition of every beast is certified from religious motives by the authority.

1174. The butcher and the priest are one?—Yes, they are one.

1175. (Chairman.) There are one or two points which have arisen I should like to ask you a few questions upon. With regard to this drink question, have you ever considered the evil effects of tea are perhaps worse than those of gin?—I do not think that they would be worse.

1176. Is it not the case that a great many children are both anæmic and neurotic, solely from the abuse of the consumption of tea?—It is quite possible.

1177. Should not you say from the chemical constituents of tea that it would be deleterious?—I have really no knowledge on the subject, but I think the way that they keep it constantly going cannot be good for them. What I doubt is whether children take very much of it.

1178. I am told they do. Don't you think if we contemplated a new Tariff that a large relief to the taxation on tea might therefore have a very deleterious effect on the health of the nation?—I see—like a decreased tax on gin.

1179. Don't you think that to remove the imposts on tea—I am putting this question seriously—might have a very deleterious effect?—I never have thought that the freeing of the tax on tea was any particular benefit, or what is called a free breakfast table.

1180. Don't you think that it might have an effect that is positively deleterious. Tea is now taken by children instead of milk. Here is an extract from a letter from a lady to the *Times* of to-day:—“There need be a crusade against tea, at least against the excessive use of it. It does as much harm in the long run as the drink, and has increased so much since the total abstinence movement was started,” and so on. And then she says: “They (children) are reared, Heaven help them, on tea whilst sucking-babes—they are taught to drink tea instead of milk as soon as they can drink at all—they are dragged up on tea till they go to school, and then their mid-day meal, whether at home or at school, is tea, hot or cold,” and so on?—Yes.

1181. I was a little surprised in the course of your evidence to hear you speak so tolerantly of local inaction in dealing with the evils which we are considering. Of course I admit in regard to over-crowding the difficulty of disposing of the evil is a very great one?—It rather is a question from what impulse or authority the action is to spring, and it ought to spring indigenously in the district, and not be rammed down its throat by any outside authority.

1182. Take the Public Health Act of 1875, which has been nearly thirty years in operation. Amongst the duties cast upon the local authorities is the obligation to inspect nuisances, and a nuisance is defined as “Any house or part of a house so over-crowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family.” And then again another provision of the Act is the power to apply in certain cases, that is to say, after two convictions, to a Court of Summary Jurisdiction, for the closing of the house for such period as the court may deem necessary. Should you say that anything like a proper proportion of cases have arisen under which these provisions have been applied by local authorities, having regard to the extent of the evil?—What I have seen in London, an increasing activity in that direction, is immediately traceable to the more democratic of the local bodies. There is a distinctly greater activity; I think in many cases there has been a fresh and strong effort to deal with these evils.

1183. Of course that Public Health Act was anterior to the Local Government Acts, and it is since that time that these powers have been to a much greater extent made use of, in your opinion?—In London it is so, I think.

1184. Do you think in local areas generally in the country that has been so?—Yes, I should think so.

1185. Touching that point, with regard to the condition in the country, here is a letter also in the *Times* of to-day, also from a lady, who signs herself “A Woman,” in which she describes the condition of two or three cottages in the country, and she says here “Man, wife and large family

of young children. No water fit to drink anywhere. Woman boils and skims pond water. While drinking it children constantly require medicine, have no appetite, skin becomes yellow, and suffer in other ways. Whenever possible, rain water is kept in wooden tubs, and when children drink this, they (with the exception of the eldest boy, who is never well) recover their normal health. House built many years after the passing of the Public Health (Water) Act, 1878." Then she describes another—"Man, wife, and four young children. Cottage (one of a row of three) on ground floor, no damp course, brick floors always saturated with damp. Said to be a drain under cottage, and tiles supposed to be broken. Most offensive sanitary conveniences opposite front door. No back doors. Children suffer from chronic bronchitis and headaches, sometimes from diarrhoea, and are very pale, feeble, and unhealthy when infants." And so on. I presume that there are ample powers to deal with conditions such as are described there?—I do not know what the powers of the rural authority are. They are very shy of using their authority I know.

1186. But in cases such as that some pressure from headquarters would be desirable, would it not?—From somewhere, certainly.

1187. You think in reference to what Mr. Legge was asking you, that a bureau of national information on all subjects relating to public health and physical development would be a good thing to create in some form or another?—Yes, I think so.

1188. To act as an advisory and consultative body upon all questions touching the administration of the laws of health?—Yes. I am inclined to think so.

1189. And that might be supplemented do you think, with any use, by the periodical taking of measurements of a certain proportion of the people with a view to actually

collecting facts as to what the condition of the physique was, so far as it can be ascertained by chest measurement and height and weight in proportion to age at different periods?—I think the statistical basis would be most important, and then it could be from time to time checked and compared.

1190. Do you suggest some permanent body which should be charged with collecting these facts and tabulating them, for the purpose of comparison from time to time over certain periods?—Yes, but the first thing is to make the original inquiry, where you would have to find out as you went on what were the salient and important facts which it was worth while afterwards repeating. The first inquiry would be the much wider one. Therefore it would be not necessarily made by the same body.

1191. No, not necessarily the same body. Experiments have been made in that direction by the British Association for the Advancement of Science?—The subject would have to be looked at in the first instance from a great many sides without any foregone conclusion of what was going to prove the results or the important points.

1192. The thing should be entered upon from a thoroughly scientific standpoint?—If a fair basis were found, I do not see any reason why then the study should not be continued regularly on certain lines by a Government Department.

1193. (*Mr. Struthers.*) Continuous?—Yes.

1194. (*Chairman.*) Or by a Joint Committee representative of several Government Departments?—Yes.

1195. You think then that the scheme upon which the investigation should be based should be drawn up upon scientific authority?—Yes, and it would have to be a converging enquiry—enquiries from a great many sides converging on the point.

Mrs. WATT SMYTH, called; and Examined.

1196. (*Chairman.*) You are the author, I understand, of this pamphlet on the subject of Milk Supply in Large Towns?—Yes.

1197. It appeared in the "British Medical Journal" of March and May, 1903?—Yes.

1198. I presume your evidence is largely based upon the material which you have utilised in uniting those articles?—Yes, I saw a great deal of the subject while I was working at it, and after that they asked me to write a series of articles on the National Physique, which are now appearing in the "Journal."

1199. You are also the author of these articles which are now appearing in the "Journal"?—Yes.

1200. I have had them sent me?—I wish to give this evidence because from everything I have seen I have come to the conclusion that the first years of childhood are the most important—I mean the whole thing according to my idea is that the child should be cared for for the first two or three years.

1201. No doubt that is the case?—A child neglected then will never pick up what it has lost, and a child properly fed may have a good chance.

1202. Even those that survive probably issue from the struggle permanently damaged?—Yes.

1203. There is the fact to which our attention has been called, that the mortality in the first year of infant life is excessive, and the causes of that you would attribute?—To improper feeding.

1204. To diseases of the digestive organs?—Yes, caused by improper feeding.

1205. You describe here the effects of an acute disorder of the digestive system, do you not?—Yes, an acute disorder of the digestive system leaves the infant in a debilitated state, and unless the child is subsequently fed and clothed intelligently such an attack is followed by chronic digestive disorders which seriously interfere with nutrition and development, so that the child falls below the normal in weight and height, and the ground thus lost may never be made up.

1206. And further ill effects from failure of nutrition?—Yes. It also renders the child less capable of resisting the zymotic diseases, such as measles and whooping-

cough, thus producing indirectly a mortality which is not included in the returns of deaths due to digestive disorders nor confined to the first year of life.

1207. The advantage of good feeding is shown in the rapidity with which a child grows, is it not?—Yes. It is important to feed a child, because its weight should be doubled in about five months and trebled in twelve or fifteen months. Warmth, sunlight, and fresh air accelerate the rate of growth, so that, other things being equal, an infant will grow more rapidly during the summer than during the winter months.

1208. How far does the question of teeth enter into the matter?—It does not seem to have been recognised that the teeth of the child depend on its early feeding.

1209. Is that so? Is it not somewhat in dispute?—I do not think so. I have very high authorities like Mr. Tomes, who is at the very head of his profession, who states that one tooth is already in process of formation when the child is born, and that six months after it is born there are twelve teeth, three on each side of the upper and three of the lower jaw, which are partly calcified.

1210. But is it not the case that teeth which have got a normal quantity of lime in them are just as liable to decay as those which have not?—No, I believe not, because the ossification is better. I believe the salts in milk are necessary for the proper formation of teeth—for their proper strong formation. Of course, the digestive system acts on the teeth, and, like proper feeding for bone, teeth require certain things in their conformation just as bone does. If they do not get that, they do not form properly.

1211. Is it not the case that the investigation of the chemical constituents of teeth which have suffered from caries shows that it is very often the case, or generally the case, that a decayed tooth has as much lime in it as a sound tooth—so I understand from authority?—I believe it does.

1212. So that there must be something else besides the mere providing of teeth with the proper complement of lime, or whatever it may be?—I think they attribute bad teeth, all bad teeth, to the fact that the children have had bad milk and are fed on farinaceous food, containing starch and such things, instead of on milk,

Mr. Booth.

Mrs. Smyth.

Mrs. Smyth. which contains the right properties for the formation of teeth. That is the way I understand it.

1213. You do not think that food which causes a certain amount of friction on the teeth is good?—Do you mean for infants?

1214. No, elder children?—I am talking of infants. I mean in the formation of teeth just as in the formation of bone. I should imagine it would affect teeth very much as they begin so early. I do not think it used to be imagined that the second teeth began to grow until the first one dropped out, but they are growing all the time.

1215. That shows the importance of proper sustenance?—I should think so.

1216. You believe in the case of older children want of cleanliness has a great deal to do with it?—I should say so. The food in the teeth causes decay and the old teeth affect the new ones which are appearing, and then when the new ones appear they are neglected. I do not think that poor children use tooth brushes. I should doubt it; but at any rate very few.

1217. Very few indeed, I should think?—Yes, at the Duke of York School in Chelsea they have them in the room; each boy has his own little box with his tooth powder and tooth brush.

1218. Do they use them?—I believe they use them; they may use them under supervision. No child will use a tooth brush without supervision.

1219. You attribute rickets here to hand feeding?—Yes.

1220. Rather than being fed in the maternal way?—Yes.

1221. Do you believe the reluctance of mothers to suckle their children is growing in this country?—It is growing, not perhaps from their own wish but because they go out to work.

1222. It is the amount of female employment which is the cause of it?—Yes, they cannot do it. A woman going out to work cannot possibly nurse her infant in the same way as women who have nothing to do, who are at home.

1223. Do you think the inclination to shirk responsibilities has something to do with it or not?—Yes, I should think it had.

1224. You know the recent Factory Act makes it penal on the part of any employer to employ a woman for a month after her confinement?—Yes.

1225. That is not long enough to encourage a woman to suckle her child?—No, it should be three months.

1226. You think that should be so?—Yes, because it is probable the woman might begin and take an interest in the child and think that it was worth while, whereas if she feels she must go back to work in a month it may not seem worth while.

1227. You know there are certain members of your sex who say that such a provision would be an attack upon the chartered freedom of a woman to use her time as she likes?—I daresay they do. I daresay they talk nonsense.

1228. You give some statistics here with regard to an institution of Paris?—Yes.

1229. Showing the death-rate was much lower amongst breast-fed infants than amongst those artificially fed?—Yes, it was much lower amongst those breast-fed, and I think that is recognised.

1230. Do you know if any statistics have been collected in this country upon any considerable scale?—Not, I think, on a considerable scale, but I think they have been collected. For instance, Dr. Hope, of Liverpool, and Mrs. Greenwood have done so, but I do not think it is very satisfactory, because they do not give the numbers which they judged from—it does not seem to me that they are very good.

1231. Mrs. Greenwood gave some statistics covering a considerable number of children?—Yes; for every twenty-five women who nursed their children 200 fed them artificially with the bottle and gave them often every kind of food.

1232. That means what they are eating themselves?—Yes, everything they eat they give their children, as a rule.

1233. And the large mortality from diarrhoea is due to that?—Yes.

1234. And they issue from it with permanently impaired digestions if they survive?—Yes. That is from ignorance. They mean very kindly, but it is ignorance.

1235. You have no figures to show the proportion of infants fed artificially all over England—no general figures?—No, I have not; and I do not know that they exist. That is a thing which would be useful.

1236. You attribute the number of infants fed artificially to two causes?—Yes; one the physical debility of the mother, and, secondly, that she wishes or is compelled to go out to work.

1237. Upon the first point, what have you to say—the physical debility of the mother?—Some mothers cannot nurse their children.

1238. Is that a prevalent cause, you think?—I should think very often they cannot be bothered doing it.

1239. Is it due to poverty, to inherited feebleness?—I should think it is due to the fact that they do not wish to do it. Of course, some women are weak, and it would be very bad for them to feed their infants. If they have tendencies to consumption or any disease I should think it would be very unwise.

1240. I understand in the rural districts it is not the case; there they do nurse their children to a large extent?—To a large extent. Probably they are healthier women than town women.

1241. That may be one of the causes of the superior health of the children in the country?—Yes. Mr. Rowntree points out that many women are very badly fed during that time—insufficiently fed. A couple marry; they are comparatively well off until the children arrive; then they stint themselves in food and probably they are not fit to nurse their infants.

1242. Do you think early marriages have anything to do with it?—I do not think there are anything like so many early marriages as there used to be. I think it is chiefly the increase of work—women doing more work.

1243. You have classified the causes of digestive disorders, I think?—Yes. The first is overcrowding, imperfect ventilation and insanitary conditions in and about the houses—dust bins, middens, etc.; secondly, contaminated or unsuitable food; and, thirdly, unsuitable clothing.

1244. That first point is, of course, the question that we were discussing with Mr. Booth when you were in the room?—It is useless to preach cleanliness to a woman if she sees that her yard is left neglected by the sanitary authority.

1245. Or the street?—Yes. The children are very badly clothed, probably covered with heavy clothing and not, perhaps, a scrap of flannel.

1246. Nothing round the loins?—That is so. It ought to be very light clothing but very warm.

1247. Turning to the subject of food, in which we are specially interested, what have you to say?—It is a fact that the milk when it arrives in large towns has been proved to be putrescent. I mean it goes through so many stages, from the country farm to the towns, that it is badly contaminated. But that is not the worst of it. The farms are in such a filthy condition that the milk when it leaves the farm is already poisonous. I have been over many farms, and the conclusion one must come to is that at the bottom of the whole question is the filth of the farms.

1248. And is the source of the milk liable to inspection?—That is where the thing fails now. There is a medical officer of health who has over him the sanitary authority, a Committee of farmers and others.

1249. You are speaking of the rural districts?—Yes, that is where the farms are. If the Medical Officers of Health complain to the Committee about a farm, they have told me over and over again that they are simply asked to draw their pay and keep quiet. These sanitary authorities have the power to oblige the farmers to be clean, but the County Council have no power; they should be given power to oblige the

local sanitary authority to compel the farmers to have clean farms.

1250. The Local Government Board should intervene if they do not exercise that power?—I think some very strong measures should be taken, because it is not one farm, but almost every farm.

1251. You have examined these farms yourself?—Yes.

1252. In many parts of the country?—In many parts of the country; all over England, more or less.

1253. Are these farms supplying milk to a great many towns in the neighbourhood?—Yes. The milk goes to a big dealer, who again supplies retailers, and it cannot really be traced; there should be some means of keeping a farm under constant inspection, to oblige that it shall be kept clean. It is quite possible to do it, and it is quite possible to do it without any extra expense and to make the thing pay. I went over a farm at York the other day managed by a Dane, Mr. Sorensen. His farm is on the most simple methods—Danish methods. He has made a large profit in the two years he has been there, so much so that he has had to raise the price of his milk twice in order to keep away the press of customers. It is most splendid and fit to drink pure from the farm without sterilising. Mr. Rowntree had it for his depôt, until really this farmer could not afford to supply him any longer.

1254. Very little of that milk gets to the poorer class I suppose?—None. It would if our farms were managed in the same manner. We are not asking for anything unreasonable, because I have proved it can be done quite as cheaply as a farm kept in a filthy manner.

1255. Then you want some urban organisation to bring it into effect?—You want the County Council to have the power to oblige the sanitary authority to make the farmers keep their farms clean.

1256. Granted that you can get pure and good milk from the farm you want some organisation in the town which would facilitate the poorer classes in those towns obtaining the supply that they want?—You know at present the country children get no milk practically; it is all sent straight off to town.

1257. But even the town children do not get it, at least the poorer class?—No. They get what is called milk.

1258. Is it not the case that tinned milk is to a much larger extent used in the homes of the poor in big towns?—Yes. That is done because it is cheaper.

1259. Do you think that is deleterious?—I do, because I think it is very often made of skim milk.

1260. Some brands are good, I suppose?—Yes, some are, but it is difficult to rely upon it. These women have no education, and they cannot be expected to understand what is good and what is bad.

1261. What do you think are the causes of unsuitability of cow's milk supplied by ordinary milk dealers when it reaches the infants?—The dirty farms. The dealer waters it, or lowers the proportion of fat by diluting it with separated milk.

1262. That is an offence against the adulteration law?—Yes, but of course it is done.

1263. Is it not brought home to those who do it very often?—Not very often—nothing like what it ought to be.

1264. Yours is an impeachment of general neglect?—Certainly.

1265. The mother herself is, I suppose, very often responsible?—She does it, because she thinks she is watering pure milk. She probably thinks the baby ought to have half milk and half water, and she adds half water to the already watered milk. She does not probably do it because she wishes to starve her child. I think they are very kind often.

1266. She has no security that the milk is what it is represented to be?—No.

1267. And she treats it as better than it is. You quote the opinion of Professor Thorpe?—Yes. He says that it is putrescent, that is, it is on the verge of decomposition. Dr. Priestly, medical officer of health for Lambeth, has stated that much of the milk consumed in the poorer quarters is three or four days old, and probably Lambeth is not the only district in which this state of affairs exists. The milk has passed through the hands of three or four dealers by each of whom a dose of some preservative has

been added in order to prevent the actual onset of decomposition. The mischief is caused by the many hands through which it passes. If there were some system of collecting milk in the country and sending it straight to milk depots it would be better.

1268. I suppose such things are capable of organisation?—They are. There is one we are in the act of organising at Shadwell in connection with the Shadwell Hospital for children.

1269. You think some good might be done by taking steps to inform parents as to the management in rearing infants?—Certainly, I think that is very important.

1270. Of course, papers are given away in hospitals now?—Yes; they should be given away everywhere.

1271. By the sanitary authority chiefly?—Yes.

1272. The most important agency for improvement in these respects is the personal advice given by the lady visitors in the homes you think?—I think that quantities of papers ought to be in the registry office to be handed to every mother who registers the birth of her baby.

1273. And to supplement that, there should be advice.—Yes, by lady visitors. They have been employed in Manchester and in other towns, and they have done much good. The help of the clergy should be enlisted to induce all district visitors to pass the examination of the National Health Society or Sanitary Institute, in the elements of domestic hygiene. That would be very useful, because people go about talking to these women who actually know nothing of what they are talking.

1274. Do you know about the operation of that Manchester system?—Yes.

1275. (*Dr. Tatham.*) It is the Manchester and Salford sanitary association is it not?—Yes. I believe ladies go about and visit the homes, and talk to the mothers—women who are really capable of doing it.

1276. (*Chairman.*) I will read you this extract from a speech that Dr. James Niven made at Manchester some time ago in which he says, "I am disposed to believe that the milk derives much of its fatal power from its origin, though it receives additional infection in the city, that further it is owing to ignorance and neglect in the preparation of the food of the child, that the contaminated milk is able to do the mischief which it does." You quite concur with that?—Yes, I do.

1277. Do you think that a system of giving girls during the last period of their school life systematic instruction in these subjects, to the exclusion of the ordinary subjects of school curricula, would be a valuable training?—I think it would be very valuable indeed. I think that if they neglected all their other lessons it would be necessary to do that.

1278. For the last few months of their school life, the attention of the school course should be concentrated upon subjects such as these?—Yes, but at the same time I think they should be gradually learning from the time they are able to understand anything about it.

1279. But increasing the amount of knowledge of these subjects as the girl's school life continues?—Certainly. In regard to the teaching of cooking and domestic subjects, I do not think any child is too young before it leaves the school to understand these thoroughly. I think that is much more important than between sixteen and eighteen, because then they are probably working, and have no time to bother about it.

1280. But there is some value in their learning these things *pari passu* with practical experience of its value in their own homes?—It is very good indeed if they can spare time, but you have to induce them to do it. But at school they are obliged to.

1281. They might have to attend a continuation school afterwards?—Yes. I should think it would be very useful indeed, but those children in London at twelve or thirteen are as intelligent as grown up women of our class.

1282. (*Colonel Fox.*) They marry about eighteen so that there is only a lapse of four years?—Yes. And they work in their own homes for their mothers. I do not think you can do anything now with the present generation of fathers and mothers; I think the whole thing depends upon the education of the children.

Mrs. Smyth. 1233. Do not you think they are teaching them rather fancy cooking at present, with French names?—Yes, it is ridiculous. I think they should be only taught things which they can eat in their own homes, and that it is essential to lay the greatest stress upon the value of the properties of food.

1284. (*Chairman.*) You give some suggestions as to systematic instruction?—Yes. A more hopeful suggestion is to give systematic instruction in elementary hygiene in schools. The mothers of to-day would not be reached in that way, but many of the elder girls now at school will be mothers in four or five years. The school Board in London already gives practical instruction to some girls in domestic economy and cooking, but all girls should be taught, and more attention might be directed to the feeding of infants and young children. Cooking is taught also in Manchester, Liverpool, Bradford, Birmingham, Newcastle, and other towns. But all do not learn. They have not room. Kitchens and so on in the schools, should be made compulsory.

1285. They are now in most of the schools?—I do not know that they are in most.

1286. Most schools in large towns?—I mean in London.

1287. (*Chairman.*) There are central classes where they can be taught.

1288. (*Colonel Fox.*) It is proposed that there should be restaurants in schools to provide a midday meal?—Yes, I propose that, and the elder children should cook the food for the younger ones.

1289. (*Chairman.*) Then the question arises with regard to the provision of milk for the needs of the population, and that you think has not been sufficiently well considered yet?—Before we come to that I should like to refer to the fact that lessons on the elementary chemistry of food should be given showing the children what the food contains, the carbo-hydrates, the fats, and the proteids.

1290. Do you not think there is a risk of the children being confused by the jargon of scientific terminology?—No, I think they would be taught in simple language. I think they should be taught those properties of food, because a woman may spend a heap of money on unsuitable food.

1291. (*Colonel Fox.*) You mean to show that the yolk of the egg is the buttery part, and the white of the egg the albuminous part?—I should say, "If you buy half a lb. of meat it will be much better for you than ten lbs. of"—something else. I would explain that to them.

1292. (*Chairman.*) That is what you explained in the *Journal* the other day?—Yes.

1293. You put peas very high?—Yes.

1294. We had medical evidence here the other day. The witness quite admitted the ideally high value of peas as a food, but he said it was not half as assimilable as many foods which were of less value and therefore for that reason it did not occupy so high a position as you attribute to it?—It was not my own idea, because I am not a doctor. I quoted my authority, Noel Paton's report.

1295. I think it was; you gave a sort of summary of that book?—Yes. I think he is an authority.

1296. You think his opinion is just as good as that of the gentleman who was here a little while ago. I am not an authority on the point?—Yes, I daresay it is.

1297. That is one of the difficulties on the question—that doctors differ?—They differ about the question of oatmeal. Some people say it is poisonous and others say it is excellent.

1298. Can you tell us what has been done to provide dépôts in certain places?—They have provided them in St. Helens, Liverpool, Leith, Battersea and probably in other places; they are municipal dépôts. The milk comes from an uninspected source; they get it from a local dealer.

1299. They make no inspection of it?—No, they know nothing about it. Then they sterilise that milk to make that safe. It is like purifying sewage to make it into clean water. It is not right. Then they sell this milk and if a woman likes to buy it for a certain length of time she can; and if she does not appear again no question is asked. They have no statistics to show the good or the

bad which the milk does except in the death rate. The death rate is less, and therefore they say that it must be doing good. The way they are managed in Paris is that statistics are kept of every child that is looked after. They can lay their hands on that child and say "This is the child—he has increased so much." They weigh them and examine them.

1300. That is only done in connection with the hospitals?—It is done with most of the organisations. Dr. Henri de Rothschild has a system of milk dépôts pretty nearly all over Paris; they go to his head place and are weighed.

1301. Do you tell me that a large proportion of the population come under observation in that way?—Of course some do not; but in Paris a large proportion do because there are so many dépôts.

1302. Has the municipality anything to say to this organisation in Paris?—They have not anything to say to Dr. Rothschild's organisation and in connection with his numerous dépôts. He has a hospital of his own and all the milk supplied to the hospital dépôt and all the branch dépôts, which are really little shops, comes from his farm in the country.

1303. Surely that cannot be done on a scale touching any great amount of the evil?—It is done on a large scale.

1304. Then you say there are other institutions?—Yes, there are municipal institutions.

1305. (*Colonel Fox.*) Not philanthropic?—No.

1306. What I want to get at is whether the municipality in Paris concerns itself to do this sort of work?—There are the institutions maintained by the Assistance Publique, the department which administers the hospitals.

1307. (*Mr. Struthers.*) That is a public body?—Yes. That supplies funds for the institutions for the *Surveillance de Nourrissons* maintained by the *Conseil General de la Seine* and administered by the *Assistance Publique* of Paris. Many of the infants treated are only brought after they become ill. That would be naturally public money.

1308. That is the form in which the poor law is administered in France?—Yes. Then there are several dépôts in connection with the hospitals.

1309. (*Chairman.*) That I can understand. It would be easy to establish a system of that kind in connection with the children born in hospitals and with whose future life for a few years the hospital could concern itself; but that only touches a small proportion of the population?—Yes.

1310. What I wanted to get from you is how any general scheme which would be of use could be worked in this country?—I think they could be worked by the municipality. They are worked all over France, and I think they are worked there by the municipality.

1311. What do you hold to be the distinguishing feature of these establishments?—That they are all under medical supervision and they all weigh their babies. The distinguishing feature of all these institutions is systematic medical supervision. The first indications of failing nutrition are quickly recognised and traced to their source, in the errors of the mother, the unsuitability of the milk or milk mixture and the digestive powers of the particular infant, or the onset of some disease. If the children are seen once a week they can see if they are sickening for anything; they can see if they are increasing in weight or doing well on the milk.

1312. You think no resistance would be offered to an invitation to come every week? You think the parents would not object to bringing their children?—They seem to bring them most willingly. I have seen them bringing them myself.

1313. In Paris?—Yes. I believe the system has worked splendidly. Dr. Rothschild's scheme, which is a very large one, is done on a commercial basis. He objects to encouraging anything in the form of charity; he says that his system pays well, and the money which he gets from it he uses to establish other dépôts.

1314. Extending the operations of the Society?—Yes.

And he spends something on giving free tickets for milk, but he gives them as a present—not as charity.

1315. You mean occasionally—in special cases?—Yes.

1316. What are your general conclusions?—I am convinced that, were all children judiciously fed until the age of three or four, they would stand every chance of growing into robust men and women. I am equally convinced than no amount of care will make up for neglect during those first years of life. Public attention has been aroused as to the importance of proper feeding of children during school life, when they are doing brain work and are being trained physically by drill and gymnastics, but I submit that feeding during infancy and up to school age has not received the consideration to which its importance entitles it. During this period the weight of a healthy child ought to increase from about half a stone to about three stones—a six-fold increase. The rate of growth after this age is much less rapid.

1317. What I wished to ask you was with reference to Mr. Booth's statement. Has it come in your experience at all that tea is very deleterious in its effects on young children?—I have no personal experience, but people have told me, in the course of this inquiry, that every child almost is fed on tea—he gets it at every meal. It is made, probably, in the morning. What makes it so dangerous is that the tea is made and let stand. Probably the tea made in the morning is watered up for dinner, and watered still more for tea. The tannin in it makes it dangerous.

1318. Is the tea of that character likely to produce anæmic and neurotic children?—I should say certainly neurotic. I do not know about anæmic. I should think it was very bad.

1319. (*Mr. Struthers.*) Do you think it is at all palatable—that children would be likely to take it?—I cannot imagine it. They seem to drink it. I have questioned children and they say they like it.

1320. (*Colonel Onslow.*) Would it not have a bad effect on older people?—I should think it is excessively bad? For the nerves it is the very worst thing.

1321. And it would affect the children through the mother?—Yes it would affect their constitution through the mother in the same way as drink affects the constitution through the mother.

1322. (*Chairman.*) You say your experience has been pretty general in this country. Can you specify any particular parts of England from which it has been drawn? Do you speak of London, or the provinces, or rural districts?—Chiefly London.

1323. Where are the farms?—I have visited farms in Sussex and in Essex.

1324. In the home counties generally?—In Yorkshire and Somersetshire—in different counties; not every county but pretty generally.

1325. Not confined to any one particular place?—No, it is not a narrow conclusion; it is from a general view.

1326. It is based upon a wide set of facts?—Yes.

1327. (*Mr. Struthers.*) Do you know that milk comes to London from Yorkshire?—I know it does, but I could not tell you from what district. I know it comes from Cheshire also.

1328. (*Dr. Tatham.*) Will you tell me whether, in your experience, the infant children of the working classes have really, as a matter of fact, much milk of any kind?—I could not tell you that, because I do not know.

1329. Is it your general impression?—My impression is that they have much more condensed milk than ordinary milk.

1330. You do not think they have any sufficient quantity of milk?—No, I do not think they are fed entirely on milk ever; I should think they have milk and patent foods mixed. The patent foods, of course, are very bad for them; they cause rickets and other diseases. But I should think very few children are fed on milk for more than two or three months, except in the case of those who are fed by these milk depôts.

1331. That is speaking generally?—They send out the milk from these depôts in stands with bottles.

1332. In Paris?—In London too, and the children get *Mrs. Smyth*, it out of the bottle that it is sent out in.

1333. It saves it from contamination to a certain extent?—Yes, but with the exception of those children fed on depôt milk they are not fed on milk. I have no reason for saying so except what I imagine and what I have seen.

1334. From what you know of the work of female health visitors in the towns you have spoken of, do you generally approve of their work?—I do not, because I think that anyone who is a health visitor should have a special education for it. They mean very well, but I think that, short of knowing something about a subject, you have no right to talk about it. Of course, there are, I suppose, very clever ones.

1335. In the case of health visitors who are acting under the instructions of a society, for instance, the society which I know of, the Manchester and Salford Sanitary Association, you know they consist of ladies?—Yes.

1336. Of gentlewomen who superintend the work of the female health visitors—paid officials?—Who are paid officials? These ladies?

1337. No, the health visitors, the women. They are in pretty much the same social position as the people there.—I understand.

1338. Would you approve of that under those conditions?—Yes, I think so. I live at Brighton, and there is a society called the Women's Health Society. I belong to that just to see what they do. I have now been a member for about six months, and the only thing I have heard about it in those six months is the annual meeting and a lecture on consumption. You pay your subscription, and you are not asked anything further. I think most of those societies are really for collecting money. If a Health Society were formed and I were president of it, the first thing I should say is, "Will you kindly learn up the subject and let me examine you in it?" I do not think it is a bit of good sending kind-hearted people round who are probably tactless and will only annoy those they visit.

1339. You would approve of the general principle of attaching a number of female health visitors to the municipalities as part of the sanitary staff?—Yes, I would. I do not think you could have too many women in this particular thing. I think they are far better than men. I think they are quicker, and it is more in their province. In anything connected with women and children especially, and in subjects of education too, I think they can judge better what is necessary for a woman than a man can. They would probably be more liberal-minded, too.

1340. Might I ask you to what kind of diseases you refer under the name of digestive diseases—speaking generally?—Gastro-enteritis.

1341. Were you referring more especially to diarrhœa?—Yes.

1342. My reason for asking you is that physicians consider diarrhœa an infectious disease now. Had you any other diseases besides diarrhœal diseases in your mind?—I should say indigestion. There are people who suffer from that. I should say that a child made unhealthy would always suffer, it would not be able to eat every sort of food when it grew up—it would grow up delicate.

1343. Have you any knowledge of the spread of tuberculous disease amongst young infants?—I have heard that they get diseases of the bones and joints, and I believe it comes from milk. I am persuaded that tuberculosis is conveyed by milk, but of course, until the question is decided, one cannot tell. But I should say that the tubercular diseases from which children suffer are caused in part by milk.

1344. (*Mr. Lindsell.*) Good as milk is for young children, it would be almost better for them to have no milk at all than the milk they get under present conditions?—Yes.

1345. And you think those bad conditions start at the original farm with the cow's milk?—Yes.

1346. And not between the original farm and the time that it gets to the mother?—I do not think there is any

Mrs. Smyth. comparison. I think the harm done at the farm is so infinitely more than that which is done afterwards that I would attack the farms.

1347. In what particular way would you say the original farm is very bad?—I believe there are 600,000 bacteria on one cow's hair; the cows are in the most filthy condition, standing in manure, and the cow-sheds, the stalls, are covered with manure; and outside the yards are heaped up with it. There is no proper ventilation; the milkers are filthy, their hands and clothes are dirty, and their vessels very often are dirty. These things have been proved. There was a most realistic letter from the Medical Officer of Health at Bradford on that point. The dirty conditions have been proved over and over again.

1348. (*Mr. Struthers.*) But these are merely exceptional farms, are they not?—No.

1349. (*Mr. Lindsell.*) Do you think that in a good Sussex milk farm this state of things would go on?—Yes, I know it. I have had them under my eyes. I had a great deal of trouble in finding a clean farm for my own child, who is an only child, and whose health I value above everything in the world.

1350. (*Chairman.*) What part of Sussex is that?—I live at Brighton. I have found a very nice farm in the neighbourhood. But with regard to the farm I was dealing with before, I got milk straight from the farm, and the moment I became interested in the subject I went to see it. I have never seen anything so disgusting. They were beautiful buildings, but the sanitary state of the place was very bad. There were lumps of manure and hairs off the cows in the milk. I said to the boy, "Look at that." He said, "That ain't nothing; it's only off the cow."

1351. (*Mr. Lindsell.*) The only remedy for that would be a much stricter superintendence and inspection of dairy farms?—Yes.

1352. (*Chairman.*) Would you go further and register them for the supply of milk—have some sort of certificate given to them?—Yes, in the way they do in America.

1353. In the absence of which they should not be able to sell milk?—I believe they are registered now in America.

1354. (*Colonel Onslow.*) Are there depôts now which can only take milk from a given source?—If you could get clean farms that would be the thing. I attribute the whole of the bad milk supply to women and housekeepers. You know these lovely looking milk shops; they are the most attractive of any shop. I went into one of those buildings the other day and said, "I would like to deal with you, but before I do so I should like to see your farms." They made a fuss, but eventually they let me see the farms, and they were filthy. If every mother and housekeeper before dealing at a shop said to them, "Before dealing with you let me see the farms which supply you," this would not occur. They are generally supplied by one, two, or three farms, and it would be no great hardship.

1355. (*Mr. Lindsell.*) Surely you would not expect a mother in Lambeth to go out beyond Willesden to see a farm, would you?—I am speaking of the country, now.

1356. It would not be possible, would it?—I am talking not of poor mothers, but of our own class. If we educated people show such a frightful example, how can you expect a poor uneducated person to know any better? I should expect that we should provide them with good milk.

1357. Supposing we have a good well-managed farm you still think there is a good deal of contamination which goes on between the milk leaving that farm and the time it reaches the consumer?—I do.

1358. It is not all the original farm's fault, I suppose?—No, but I do not think that milk after leaving any clean farm, and passing through the hands of the dealers, and arriving at a poor woman's house would be so dangerous as milk from a dirty farm arriving straight at a woman's house. The latter would be more dangerous than the clean milk from a clean farm passing through all the dealers.

1359. I see what you mean, that more harm is done at the original source than anything in transit between the farm and the mother?—Yes. Of course there are exceptional cases when probably other things go on, but as a general rule it is not so. They perhaps water it, but that is not so serious as dirt.

1360. The presence of dirt could easily be detected by analysis?—Yes, there should be analysis.

1361. You know the county councils all analyse, they can walk up to any milkman and say, "I want a pint of that milk," and they analyse it?—They cannot unless it is in their own district. The town official has to communicate with the rural authority, and he has to manage it. The town man cannot take action against a country farm.

1362. Not the original farm, no?—He can take a sample, but he cannot do that if the cart is not in his own district.

1363. (*Colonel Fox.*) Milk sent from a clean farm into a dirty depot would be better than milk from a dirty farm sent to a clean depot?—Yes, distinctly.

1364. (*Mr. Lindsell.*) It is no good getting good milk to the doors of these parents unless they will use it?—No.

1365. Your idea is that some means should be adopted for disseminating a knowledge of the good properties of milk amongst the people?—Yes.

1366. That I suppose you would entirely propose to do by voluntary agencies?—Yes.

1367. Also visitors, and so on?—Yes, and by leaflets.

1368. They might be issued by local authorities?—Yes.

1369. It would be no good doing that until you got good milk for the people to use?—I am afraid not.

1370. Another good agency you think would be the better education of the future mothers in the schools?—I think everything rests with them. I do not think that you will do much with the present mothers, but I think that you will do a great deal perhaps, not in the next generation, but in the next generation to that.

1371. In the elementary schools in London not only is cooking largely taught but also domestic economy generally?—Yes, in some, in a very few, where they have special facilities.

1372. But still there is every facility offered by the Government by means of grants for these subjects and so on?—Yes, but I do not think they take advantage of it. It only exists in a few board schools.

1373. We may look for a great improvement in that respect on account of the county councils?—Yes.

1374. Who have the management of the schools and so on. Do you know anything about sterilisation of milk in itself?—Yes.

1375. Do you know any places where that is done for the purpose of distributing it?—It is done by milk depôts. It is done very often in France by the farmers themselves. In municipal depôts milk is very often sterilised down at the farms and sent up in bottles ready to be sold.

1376. The advantage of that is it will keep much longer?—It keeps longer, but some people say it destroys certain properties in the milk. It is drinking cooked milk. To do any good it must be brought to a very high temperature.

1377. Did you ever hear of a place in Worcestershire where it is done very largely by private agency?—No.

1378. A clergyman named Eyre?—No; does he do it?

1379. Yes, for the benefit of the village and then it goes to Birmingham, to the mothers there?—I consider that in the country, with scientifically managed farms, it should not be necessary to sterilise, and I hope that it will not be necessary even for milk coming from a reasonable distance, from the country to London, during the cold weather. It probably would have to be done during the very hot summer months. In the depôt now being organised at Shadwell, they are going to put up a steriliser, but we hope that even if they use it at first it will be only necessary in the very hot summer months.

1380. You think milk is better unsterilised—more nutritious?—Yes, much.

1381. (*Colonel Fox.*) You must remember that milk is one of the best vehicles for conveying disease?—Yes.

1382. Foreign germs get into it at the first opportunity?—Yes.

1383. So that you want something to prevent that?—If you have special rules for your farms I do not think it would be a question of contamination, if the milk came direct from the farm to the depôt.

1384. (*Colonel Onslow.*) And properly sealed up?—It should all be sealed. Every drop of milk going from the Sorensen farm is sealed. I mention that because it is the best I know. It is sealed before it leaves the farm. I think the Aylesbury Company and Welfords seal their milk and inspect their farms, but of course there is a chance of its getting tampered with at the big factories in London.

1385. (*Mr. Legge.*) I do not want to dilute your evidence by pouring cold water into it, but I want to ask you one or two questions about your important suggestions for improving the milk supply. Will not all these provisions which you suggest mean increasing the care at the farm—the sealing up of the bottles, the placing of depôts where the milk is sealed under medical supervision—will not that enormously increase the cost of milk?—I had that very question asked me through the *British Medical Journal*. A letter was written saying that these suggestions were very beautiful, but would I kindly give some substantial ground for stating these facts. In reply I gave Sorensen's farm, which I lately saw. Perhaps you would care to read the letter in the *British Medical Journal* of January 6th.

1386. I thought you said the price that he charged for milk had considerably increased?—He has increased it within the last month to choke off customers. He had so many people pestering him to take milk from him that he raised the price twice within a month so as to stop them. But he is going on with that at the same price to his ordinary customers. It was merely to check increase. But as a matter of fact he sells milk at the ordinary price.

1387. He finds it a paying transaction?—Yes.

1388. He is quit of the considerable expense of the depôt?—Yes.

1389. He has not the expense of selling his milk through one of these depôts under medical supervision?—I do not understand that.

1390. You suggest that milk depôts should be established, and the milk should come from scientifically managed farms, and after being sterilized at the depôts should, under medical supervision, be sold to mothers for their infants?—Yes.

1391. It is very expensive to provide medical supervision for every depôt, where you sell milk?—I suppose in the case of a municipal depôt the services of a doctor living in the neighbourhood would be called in who need only come in for half an hour every Monday morning, and I do not think it would be very costly.

1392. (*Chairman.*) The duties of the medical officer of the district might be made to include it.

1393. (*Mr. Legge.*) You say it could be examined by a doctor once a week?—Yes.

1394. How could he weigh and examine each child once a week?—I do not think it a long business. The matron of the place would put it in the scales, and have it weighed for him before he arrived. He might see the child, but the matron would weigh the child.

1395. Do you seriously think that it is possible to get the slum parents to bring the child to be weighed every week?—I think seriously it is possible if the depôts are sufficiently spread about the different districts. I do not think they will walk six miles, but if it is fairly near they will.

1396. Do you think they would go 200 yards?—I think they certainly would, if they are taught and educated up to it. I daresay it will take time. You have to make a beginning in everything.

1397. You would not be prepared to go so far as to impose legal penalties upon them if they did not, or if they buy milk from any other source?—I do not think you could do that. I do not think it would be possible.

1398. You do not propose anything so drastic as that?—No, I think they should be gradually led to think it is for their good.

1399. Another point which you made was this: you suggested that health visitors should be generally employed?—Yes.

1400. Ladies going as sanitary inspectors. Have you thought what an army would be required to do that work thoroughly?—I think a great many would be required.

1401. You do not suggest it is thoroughly done in Manchester. They have made a beginning there?—I do not know very much about it except that there are good results in Manchester. My idea was that people whose duty it was to inspect, and others who do it for philanthropy, or a wish to help the people, should be advised to tell them to do these things. You need not necessarily have one person for every family. I know Sir Thomas Barlow, in connection with drink, thinks that each person must be watched individually for ever. That is what I think nonsense, but I think you can do a great deal without that, by taking every opportunity, and chiefly I say that I do not think you will do much with present mothers. Educating the children in the schools is the principal thing.

1402. All I wanted to get at was this: You have not any scheme or organisation in your mind?—No.

1403. You agree that all efforts at present of the sort you indicate—Must be tentative.

1404. I should like to ask you whether you have had any experience of the conditions of dairy-farming abroad, principally in Denmark and in Normandy?—I have been in Denmark and I have been in France a great deal.

1405. And you have been over their dairy farms?—Yes. I have been over them.

1406. Is it your opinion that they are better managed from the sanitary point of view than English dairy farms?—Of course Danish dairy farms are, distinctly, but I do not know that the French are.

1407. You are clear about the Danish?—Oh, quite clear, and I think it is a recognised fact.

1408. (*Dr. Tatham.*) You were speaking just now of a considerable number of dairy farms in England which you had personally visited?—Yes.

1409. And you spoke of their condition as regards cleanliness or the reverse?—Yes.

1410. Can you tell one even approximately, what proportion of the farms you have visited are in such a condition as in your opinion make them unfit to supply milk to the towns—half or a third?—I should say nearly all. I know there is one decent farm which I deal with near Brighton, and I have seen Sir James Blyth's private dairy, but I cannot think of any others which were clean.

1411. Is it what is called the sanitary condition of the farm or the condition of milk, or is it all together?—Everything. There are certain rules laid down about cleaning cowsheds, ventilation, brushing the cows, washing the milker's hands and having special white coats on—these are things which are not expensive, but that simply mean supervision.

1412. And they are not put under them?—Not at present. Nothing one says has the slightest effect. I think that if the public are content to accept dirty milk, it is the instinct of the farmer to be dirty, and you cannot expect him reasonably to be clean, and to force clean milk upon the public. If the public are satisfied to pay a high price for bad wine they will not have good wine forced on them; if every woman in a household, the mother who is interested in her children, or the housekeeper, were to go and see the farm supplying her milk shop, I can assure you that in six months the whole thing would be revolutionised. A very serious thing is that they have discovered now that they can aerate milk, and there is a threatening of a great amount of foreign aerated milk coming in, as foreign butter has come in, and that we shall lose the milk trade as well as the butter trade. Another especially important thing is to get farmers to make a profit out of their dairies for their own sakes. If men can find profitable employment in the country they stay there and do not go to towns. If they find that people will not any longer buy their milk after having discovered it to be dirty, more than ever they will migrate to the towns.

Mrs. Smyth.
— — —

Miss ADELAIDE MARY ANDERSON, called ; and Examined.

Miss Anderson. 1413. (*Chairman.*) You are Principal Lady Inspector of Factories under the Home Office ?—I am.

1414. I should like you to state, first of all, what your qualifications to give evidence are, as drawn from your experience as an inspector under the Home Office ?—I was appointed as Inspector of Factories in 1894 by the Home Office ; I had had some previous experience.

1415. Will you give us that please ?—Yes. I had worked two years for the Royal Commission on Labour, from 1892 to 1894, and before that I had seen something of factory girls in clubs, and women of the Co-operative Guild. From 1894 to 1897 I spent the greater part of my time in the great textile and clothing districts of Lancashire and Yorkshire, but I also visited Dundee, and inspected from time to time in London, Leicester, Bedford, Luton, Brighton, Gloucester, Bristol, and other towns. Since August, 1897, I have been in charge of the work of the women's branch of the factory department, and have found it necessary in the course of supervision to visit various parts of Ireland and Scotland, as well as England.

1416. That was in the ordinary course of your duties ?—Pursuing the duty of supervision, following up points in different parts of the country. I have spent some time in North Staffordshire visiting earthenware and china works. In every centre visited I have seen workers in their homes as well as in factories and workshops. I am in constant receipt, from the staff of lady inspectors under my direction—gradually increased from four in 1897 to seven in 1903—of special reports on conditions affecting the health of women and girls in factories and workshops in all parts of the kingdom. One inspector is stationed in Glasgow, and has special knowledge of the conditions of women's employment in Scotland and the far north of England. Another has special charge of laundries and of dressmakers and milliners' factories and workshops in the western section of London, out to and including Acton and Chiswick. The remaining inspectors I send to any part of England or Ireland where I find it most necessary to investigate conditions affecting women.

1417. You are specially qualified to tell us whether the industrial conditions under which women work in this country are likely to prove prejudicial to health, or have in the immediate past proved prejudicial to the health of the female population ?—I think so, so far as the ordinary observation of one who is not medical is concerned.

1418. Quite so. I presume medical opinions often come under your observation ?—Very often ; and inspectors make it part of their duty to consult medical opinion in all the districts they are going to, so that we have practically a medical opinion on broad, general lines and in particular cases.

1419. (*Chairman.*) I will ask Mr. Legge to take you through the main part of your evidence.

1420. (*Mr. Legge.*) First of all, can you give us some indication of the proportion of the female population of the United Kingdom which would be affected by the conditions relating to health which obtain in factories and workshops ?—I have brought together from the latest returns that we have accessible the figures of women and girls employed in factories and workshops, and I have also endeavoured to form some estimate, but it is quite impossible to make it complete, of those who are employed in domestic workshops which are only very partially under control. In this table, which I will put in, I have compared women and girls employed in factories and workshops with the total female population over ten years of age in all the different parts of the kingdom and with the total of those engaged in all occupations, so as to get some kind of idea of the proportion. It is about a million and a half who are employed in factories and workshops under regulations.

1421. (*Chairman.*) Have these tables been published anywhere ?—No, they are compiled from various sources by myself.

1422. They have not been compiled before ?—No, not in this way.

1423. (*Mr. Legge.*) I see you have separate tables for laundries and that is, I take it, because they are not under the same regulations ?—Yes, mainly ; but also because we have only recently had any figures at all. No return was possible before 1901. The Act of 1901 made that

possible. We had only tables of the work-places under inspection, but no return of the persons employed.

1424. The net result of these tables seems to be that 9·101 per cent. of the total female population above ten years of age in the United Kingdom, or 28·774 per cent. of those engaged in all occupations come, more or less, under your purview ?—That is so, for the whole of the United Kingdom, but the percentage varies greatly in the various parts of the kingdom. Scotland is very high, and Ireland is low. Scotland is above the average, and Ireland very much below, but I would like to add there that a large number of Irishwomen are employed in Scotland and in the north of England, and it is, presumably, because there are not industries enough in Ireland, that they come over to these countries, where the industries are ready-made.

1425. I might ask here, perhaps, conveniently, one or two questions about those tables. I notice that taking the number of those employed in textile factories the proportion of children in Ireland employed is considerably greater than in Scotland or in England and Wales ?—Yes, that appears to be so.

1426. And I suppose that would apply almost entirely to the north-east of Ireland ?—Yes, I think so.

1427. I also notice that if you compare the numbers employed in non-textile compared with textile factories, the proportion of young persons and children employed is very much less ?—Yes, it is very much less in non-textile factories.

1428. In fact, young children are hardly employed at all in non-textile factories ?—That is so.

1429. That is the same, oddly enough, in the case of laundries, which I thought was characteristically a woman's occupation. The proportion of young persons employed in them is very small ?—Yes. It has been characteristically in the past a middle-aged woman's industry, I think. A high proportion are married women, but that has varied very much since steam power was applied to laundry processes. I have, published in a small report for the British Association this last year, figures bringing out the growth of employment of young persons in steam laundries. If the Committee would care to have that, those give the latest figures for laundries. I might get a copy from the Secretary of the Committee, but I am afraid I cannot spare that one. (*Document handed to Mr. Legge.*)

1430. It seems as the net result of these tables that if one were mainly considering the question of the youth, of the immature population of the country, it is in districts where textile industries are the staple that one would have to be most on one's guard ?—I think so, but I think we must be on the alert as regards the employment of young persons in laundries, because it is a growing proportion.

1431. You are not able to give us any idea as to the proportion of married to unmarried women in these tables ?—There are no returns to the Factory Department, and the only returns I know of are those in the 1901 census for England and Wales. They are not given for Scotland or Ireland, I think, for occupations. They could be made out for England and Wales, but they would not exactly correspond to these figures returned to the Factory Department.

1432. I will come to that later. Do you not think it would be a valuable item in the returns if we could find out whether the women are married or unmarried ?—Yes. It probably varies in districts. I think it is a less serious item as regards the whole than has sometimes been supposed.

1433. You think that fewer married women are employed in factories and workshops than is supposed ?—I think so, except in certain districts. It is very serious in certain districts—I think in Dundee, for instance, and in certain textile centres in Lancashire.

1434. (*Chairman.*) On what is that belief of yours based ?—Simply on observation and reports from my staff.

1435. (*Mr. Legge.*) Referring to your point just now, that the terminology as regards the classification of industries does not quite agree with the census returns and the Factory Department's returns, do you not think it

would be a good thing if they could be made to agree?—I have wished it many times.

1436. So much for your general figures. You would admit, or claim rather, I suppose, that the numbers employed in home work are considerably in excess of those which you have just given?—No, I would not say considerably in excess as regards the whole.

1437. I do not mean merely out-workers, but people working at home on their own account?—It would not be so in the case of the great textile industry which forms such an enormous proportion of the women employed. In clothing I think you would nearly double the figures if you could get all the domestic workers and out-workers, and a good many of the other trades lend themselves to home work, domestic work—but earthenware, china, and food-preserving only on a very small scale; laundries, no doubt would be more than double. In tobacco there would be no home work, in furniture a little; book-binding very small. In the meantime no precise idea can be formed of the numbers of women and girls employed in domestic workshops (that is, partially regulated by the Factory Act), although in certain classes of industry comparison of the census returns with the Factory and Workshops returns gives a clue, and in some classes of industry the census distinguishes those working at home from the total employed in the industry. Taking a great group, such as the dress group in the census, in England and Wales, and excluding dealers, 252,610, and in Scotland 20,073 female workers are classed as working at home. In the laundry and washing trade in England and Wales, 73,046, and in Scotland 3,658 female workers are classed as working at home. In the hosiery industry in England and Wales, 5,529, in Scotland, 5,836 female persons are classed as working at home. In the clothing and laundry industries the number of female workers is very nearly as large as that of those employed in factories and workshops. The hosiery industry is an exception to be noted to the general rule that textile trades are not carried on much at home. You can see that in Scotland where there is so much hand machine knitting how it is that so high a proportion of home workers are found in the hosiery industry. There is some home work in the hand-weaving in Scotland in the shawl trade. I have come across it. I have visited some of the outworkers.

1438. And Harris tweeds?—It is not only in Harris tweeds. There are regular outworkers to the factory industry, but they are not reported, they are not notified, they are not returnable under the Factory Act, they are not amongst the industries classed by the Secretary of State's order for lists about which workers have to be supplied, and so I cannot form any conception of the number.

1439. It was rather a feature of the last Census that the number of women employed did not seem to have increased?—That is so.

1440. Is that borne out by your Factory Department's figures too?—On the whole, yes.

1441. But of course a large proportion of the young workers under eighteen who pass on marriage out of the factory employment have been subject to certain conditions which will affect their future health?—That is so; and that is a very important point, I think.

1442. Under the Factory Act administration there is the immense number of certifying surgeons; about how many would there be?—The last return I saw was close on 2,000.

1443. Have you any idea of what the vote for their present payment comes to?—I cannot bear it in mind, but it could be very easily found.

1444. Can you give us the difference in the points of view of an inspector and certifying surgeon with regard to this question?—The factory inspector is appointed to administer certain definite requirements of the law, and as the number is not very great in proportion to the work to be done, almost his whole energies are concentrated upon those external conditions which are to be remedied, and only where there seems reason to believe that some alleviation can be got does inquiry into health necessarily follow. Although the Factory Act administration provides in its great staff of 2,000 certifying surgeons (appointed all over the kingdom to examine young workers as to physical fit-

ness for work in factories) an admirable basis for means of registering the progress or otherwise of the health of successive generations of workers in factories and workshops, factory inspectors, appointed to enforce certain definite prescriptions of the law, are better qualified to speak accurately of the conditions affecting health in the factories than of the results in the workers' state of health. Impressions as to health are being continually formed, and action taken thereon; but in the absence of precise measurements of physique comparison of past and present can be far more accurately made by an inspector as regards change of conditions than change of physique.

1445. The certifying surgeon's main duty is, I believe, to certify as to the qualification of children and young persons for employment?—That is the beginning, and to inquire into accidents.

1446. And also certain cases of notifiable disease?—Yes—those we may class with accidents. But they also have the duty of re-examination of persons under sixteen if required by the inspector. They also now have the duty of inquiring and reporting to the Secretary of State as to health generally.

1447. As I understand they can certify a child not as fit for all work, but for particular work?—Yes.

1448. Would you view with satisfaction any extension of their powers in that direction?—They have very considerable power.

1449. I mean in the exercise of it?—Certain standard tests of physical fitness might be laid down I think to ensure application of an equal standard throughout the country.

1450. Would you like to see that power extended to cover women, adults? At present it is confined to children and young persons; and "young person," I take it, ceases at sixteen?—Yes, I think that possibly with advantage the age might be raised. I am not quite sure whether I would immediately take that big step of the examination of all.

1451. You would limit it to women?—No; I think all persons under eighteen. Say one chooses the age of eighteen or twenty-one, all persons under that age should be examined as to fitness for employment.

1452. You would not place young women under certain liabilities that would not apply to men also, I suppose? You would be on your guard against interfering too much with the liberty of the female subject as distinct from the male subject?—Yes.

1453. With a little trouble the certifying surgeon, when he examines the child, might take certain observations in every case, and record those observations?—I think so.

1454. You think that would be a good thing?—Yes, for the purposes which I understand the Committee have in view, to note progress.

1455. And inasmuch as he examines every child when that child reaches the young person's stage one would have something like a progressive record?—Yes.

1456. Would you agree, if that could be brought about, that it would be valuable?—Highly valuable.

1457. I believe the certifying surgeons are paid for each examination?—They are.

1458. And if you put more on to them, I suppose one would have to make some provision for extra remuneration?—You mean to help the employer? At present the employer pays for these examinations.

1459. Do you think it is important enough to call for State assistance? It would be rather a hardship for the employer to provide for this additional information unaided?—It would have to be carefully weighed, no doubt, as to what would be the extra burden, and whether the subject is so important that the State should pay for it.

1460. During the period you have held your present office, have you noticed any marked change for better or worse in the physical health of women and girls employed in industrial life?—I have not. Sometimes I have fancied that I saw rather less than progress—rather a retrogression. But one sees so very much improvement in the health of women in the upper middle class that one is, perhaps, led astray by contrast and comparison only. I believe,

Miss
Anderson.

Miss
Anderson.

on the whole, there has simply not been as much progress as there might have been. One gets to know more and more of the physical condition of the women in factories and workshops and it is very serious.

1461. (*Colonel Fox.*) If the improvement had been very marked in the upper middle class, surely it would be more conspicuous if the others did not improve in the same proportion?—That is so. Sometimes when I have thought they were going back I have explained it to myself by saying that we expect more than we should.

1462. Have you noticed that there is any difference between the upper and the lower middle class?—I think the upper middle class has advanced markedly in the last fifteen years.

1463. More than the lower working class?—Much more.

1464. (*Chairman.*) You doubt whether they have advanced at all?—I doubt whether they have advanced at all. Certainly it does not seem to me that they have advanced in the same degree as the conditions have improved in the factories.

1465. They have not responded to the advantages they enjoy?—No. Also I think it is very largely because of external conditions outside factory and workshop life.

1466. (*Mr. Legge.*) You say that the ill-health is comparatively seldom of a kind which is attributable mainly or solely to the surrounding conditions in the factories and workshops, although it frequently is aggravated there and generally is capable of being either improved or made worse according as there are or are not good hygienic conditions and reasonably good wages, without unfair and uncertain fines and deductions?—That is so.

1467. These indications of ill-health, of course, are not confined to factories and workshops, but are to be found elsewhere?—Yes, excessive prevalence of anæmia, malnutrition, inappropriate clothing, lack of physical vigour, gastric and various functional troubles, headache, indigestion, poor circulation, toothache and faceache, backache, are all to be frequently found amongst factory and workshop employees, but are not peculiar to them. Apart from special industries (to be touched on presently), where injury is attributable to the work itself, or particular methods of working, factory and workshop labour within proper limits as to hours and periods, and with such hygienic surroundings as are attainable, may be a means of improving the health of women and girls of the poorer classes. I think in some cases it has improved by those means—I mean where the employer has done his best. I have seen progress myself in individual factories.

1468. And you are aware of factories where the employers, though not legally bound to keep a doctor of their own, or to submit workers for medical examination, have done so?—Yes, I have. I am thinking particularly of a case where the employer had a very large workshop and had a medical woman attached to the place to examine them.

1469. You would like to see the extension of the medical inspection of women by women doctors?—Wherever it is practicable. I think it would tend to make the examination more thorough where girls and women are concerned.

1470. I suppose you would admit that one reason why there has not been more apparent improvement in the health of working women in factories is due to the fact that many of the most valuable provisions of the Factory Act are of quite recent date?—That is so. The provision for the ordinary ventilation of work-rooms did not exist in the Acts before 1901. It is true that a provision for reasonable temperature existed before, but the temperature might be raised or lowered by means which vitiated the atmosphere, and it was so very frequently.

1471. What about legal working hours?—The legal working hours remain very much the same. I think in many cases they are too long.

1472. Could you hand in a summary, which could be printed, of those hours?—I could prepare one, certainly, with the exceptions allowing for overtime and so on.

1473. Could you hand in a table setting out the main women trades individually in descending scale as to numbers employed?—I can hand that in now. I have prepared a table which does not pretend to be exhaustive. If the Committee desire, I could make it exhaustive.

1474. I think you claim, under this table, that though half-a-dozen of them have an overwhelming importance from the point of view of the total numbers employed, yet the other trades have a considerable significance, inasmuch as each may be concentrated in a particular district?—That is so.

1475. And affect the majority of the inhabitants in that district?—Yes, that is a most important point to be borne in mind.

1476. Will you kindly give us instances of that?—Interesting and significant for individuals as are the health conditions in the last ten trades on the list, the overwhelming importance of those in the first six are more obvious. The first four alone form 79·943 per cent. of the total female workers in factories and workshops. The importance for the community, however, of the health conditions in even the smaller trades, as in the greatest, is greatly increased by the tendency of trades to concentrate in localities. For example, india-rubber, seventeenth on the list (with processes certified as injurious to health), can and does exert a considerable depressing influence on the health of working women and girls in one town where large works are found. I say one town, but there are others. Not merely the notes of the inspectors, but observations in hospitals, dispensaries, and local practitioners establish this point. In the same town also great hemp works with injuriously dusty processes have to be considered. The importance of the nail and chain trade for women is not shown by the percentage its employees form of the whole female working population. Its concentration in a district of the Midlands, and the great extension of the "out-work" system in it, have to be reckoned with. Again, the risks and injuries of even a comparatively larger industry like the "potting" or earthenware and china trade assume a far more serious aspect by the concentration of nearly three-fourths of the whole industry in one district of England.

1477. Then you have laundries in London?—With regard to laundries in London I shall be able to supply the Committee with a complete table—it is incomplete at present—with laundries for England, Scotland and Ireland, showing that the great bulk of the laundry trade is in the southern half of England and very largely in London.

1478. Also you have lace and other trades in Nottingham, jute in Dundee, tobacco in Bristol, Liverpool and Glasgow, and clothing in Leeds, Stockport, Bistol and Belfast?—Yes, all these are very important. Some of the industries in this table one would like to group together in another way. Rag-sorting stands at the very bottom of the list with 3,048 female workers. That is the rag-sorting for non-textile trades. In the shoddy trade there is a good deal.

1479. In the West Riding?—Yes. That would immediately double the figures. And if one added the paper mills elsewhere, where very peculiarly dirty rags are sorted, you would bring it up pretty high in the table, somewhere near the nail and chain industry.

1480. Could you classify broadly the sources of injuries to health, life and limb?—The first class is accidents from machinery, explosions, falls or other external agents. The second class is injury or poisoning from toxic agents or injury from excessive dust, fumes or vapour or extremes of temperature. The third class is injury through over-fatigue (long hours, insufficient pauses for food, carrying too heavy weights, etc.). The fourth class is injury through defective ordinary hygiene in the workplaces.

1481. As regards the first and second heads, do women or men suffer most?—As regards the first, absolutely men suffer most on the whole.

1482. But there are exceptions?—There are exceptions.

1483. (*Colonel Fox.*) I see later on you refer to the aerated water and laundry trades, where you say the risks absolutely are reversed?—Yes, those are the exceptions. There are enormously greater risks for women and girls in the aerated water trade.

1484. But as regards the second?—As regards poisoning the great majority of sufferers are men, again.

1485. Are we to understand that the work is the same for men as for women?—No. I am taking the whole of the industry throughout. Accidents are more liable to happen to men than to women.

1486. But when you compare the men with the women

Miss
Anderson.

you are comparing them doing similar work?—No, the women and men are generally doing different work.

1487. The heavier work would go to the men?—Yes.

1488. The more fatiguing work?—Not more fatiguing in relation to the strength of the person.

1489. The men in some cases predominate enormously in the way of injury?—Yes, because they are working more dangerous machinery.

1490. But they are working at the same factory?—In the textile trades it is a different work or different part of the same factory.

1491. Absolutely different?—I was going to give the total figures for poisoning.

1492. (*Mr. Legge.*) Not merely for earthenware and china?—No. The total in 1902 of cases reported for men was 581, of which twenty-two were fatal; the total for women in 1902 was 100, of which three were fatal. But if you take an individual industry like earthenware and china you find the proportion reversed.

1493. You are taking the same number of women and men?—No, in earthenware and china, on the whole, 44,000 men are employed and 29,000 odd women. There were forty cases of lead poisoning amongst men and boys, and forty-seven amongst women and girls.

1494. Then your fourth head, injury through defective ordinary hygiene in the workplaces, that would affect men and women equally?—All classes of workers.

1495. What about your third head, injury through over-fatigue?—I think that applies more to women and girls than to men.

1496. And you think that is an aspect of the problem which has not been sufficiently studied?—Yes, I think the question of fatigue resulting from work ought to be scientifically studied.

1497. Has there been any attempt made?—There has been an attempt made. The question has been discussed recently, for the first time broadly, I think, at the International Congress on Hygiene in Brussels, this last autumn. I was present, and some very valuable observations were made there, and recommendation was made that Governments should do all in their power to further this inquiry so as to arrive at something more like the scientific adaptation of work to the human motor.

1498. Fatigue, of course, can arise through long hours. You have already said you will hand in a table of the hours of work of women, and you have indicated your opinion in some cases that they are too long?—I think they are certainly too long in some cases. They are longer for women than men would have in their organised industries.

1499. Another point is insufficient pauses for food. You think the pauses secured by law now are insufficient?—In certain industries where it is the custom to allow only half an hour in the middle of the day for food, very serious results are produced—in London, for instance, in the dress trades.

1500. Which are the industries which give the best field for illustration of injuries arising from insufficient pauses for food?—The clothing trade and dressmaking, particularly in the big towns. In the large towns where workers have to come a long way to begin work, and come from outlying districts, and only half an hour is allowed in the middle of the day, they do not have a proper meal. They start in the early morning, with an insufficient breakfast, and have a hasty meal in the middle of the day in a vitiated atmosphere. They have no time to go out, and have not sufficient money to get food from restaurants.

1501. Are there any other industries besides clothing?—For long hours laundries are most important. There are long spells of work in laundries; and also in the food preserving industries you find exceedingly long hours, such as jam making, fruit preserving and fish curing.

1502. Another item is the undertaking of work which involves a strain, such as carrying excessive weights?—Yes.

1503. Can you give me any illustration of that?—The Inspectors of my branch have paid considerable attention to this subject. They have seen so much of enormously heavy weights carried by young persons and by women. I can give you illustrations. Illustrations may be given from food preserving works, the bleach and dye works

class, earthenware and china works, various metal trades. During 1903 (in addition to numberless instances given in my published reports of earlier years), I have come across and received reports of the following:—In earthenware and china works (*a*) a frail girl of fourteen carrying a wedge of clay, weight 67 lbs., carries three to four of these an hour; (*b*) a girl of seventeen fetches eighteen lumps of clay a day, each about 56 lbs.; (*c*) a girl of sixteen fetches four lumps of clay a day for each of seven moulders—twenty-eight lumps—each lump 56 lbs.; in a brick works two women wheeling a trolley on rails, 812 lbs. Young workers frequently carry weights nearly as heavy as themselves; *e.g.*, weight of young worker, 77 lbs., weight carried, 69 lbs. One of my colleagues weighed the worker and the burden here. That was during 1903. In a textile factory in 1903 complaint received and verified of cumbrous heavy weights, one young woman of twenty-three overstrained, under medical care, attributed to carrying bags 5 ft. by 4 ft., filled with fibre weighing from 48 to 59 lbs. In the tin-plate works many striking examples quoted in the annual report from Miss Squier's reports of immensely heavy, bulky weights carried as part of ordinary work by women—100 lbs. and over. At a sack works during 1903 I had the weights carried by a child of fourteen weighed—70 lbs. These are all very remarkable weights, and they were just incidental. There are a good many instances in the past published reports which are even higher.

1504. Other circumstances conducing to excessive fatigue would be dusty processes?—Yes, extremes of temperature and working in a humid atmosphere.

1505. I do not think we need go into the details of those; it is the general question which occupies our attention. Still I suppose for all these products remedies of some sort are provided by law?—Yes, and of course are being year by year better applied, more thoroughly enforced.

1506. Many of them in fact are of too recent an origin to enable us to see their effect yet?—Yes, they are. Do you mean the injuries or the regulations are too recent?

1507. Many of the legislative remedies and departmental regulations which have followed on them?—Yes, they have not been long enough applied for us to state how far they are efficient.

1508. In what particular line do you think most definite improvement has been shown?—On the whole in the application of exhaust ventilation to removal of injurious dust, and in the remedies for defective structural conditions in factories I have seen most advance. But there is, of course, an enormous amount to be done.

1509. In fact we have only made a beginning?—Yes.

1510. All that you have been saying about the conditions of life in factories is very much the same as what any social reformer would say of the conditions of life outside the factory—the condition of the homes—with regard to ventilation, dust, and all the rest of it?—Yes, you want greater cleanliness there, too. We are trying to get it in factories. I should imagine that over a considerable field of factories and workshops we have advanced beyond the conditions in home dwellings. Possibly some of the ill-health and anæmia one finds is more due to the home conditions than to the conditions in the factory.

1511. It is not only necessary to provide time in which people can take their meals in healthy conditions, but they must also learn how to cook their food properly?—That is most important. I do not think nearly enough is done yet to teach the girls, while they are still within reach, the science of domestic economy and the practice of it.

1512. This anæmia and low vitality which you seem to single out as one of the marked features of the female working population is supposed to be largely due to want of proper attention in their childhood before they reach the labour age.—I should think so.

1513. Any improvement in the care of infants and young children and so on would also help?—It would tell on the improved physique of the factory workers which one would see later on in their power to resist disease which may be associated with the occupation.

1514. Have you any considerable knowledge of the domestic servant class?—I would not say I had considerable. I think I have a fair average knowledge.

Miss
Anderson.

1515. Has it struck you that a very fair proportion of them suffer from this anæmia?—Yes.

1516-7. Are you aware of any means by which one could get statistics on that point? It is rather difficult we know. In your judgment are most young domestic servants working in better sanitary conditions than the average factory workers?—In the well to do upper middle class I should think they are considerably better; better food, and not quite such long hours. Then of course a very large proportion of them are suffering from anæmia. The way to get at the information would be the way in which we get at the information as to the health of the workers, by inquiring of the medical practitioners in the locality, or at hospitals, by noting the occupations of the persons treated at the hospitals as we have done in the laundry trade, for instance—Miss Deane has made a special study at the hospitals in the locality where laundry workers are much to be found—and by getting at the comparative ratio of women suffering from diseases likely to be engendered by the employment. I cannot think of any other way in which you can get any estimate as to the health of domestic servants.

1518. (*Mr. Legge.*) Could you summarise the significance of what you have been telling us?—I desire to emphasise my experience and point out its significance in connection with the scale of numbers employed in the industries shown on the third table, that progress in health in factory and workshop life is mainly a question of raising the ordinary general hygiene. Sufficient inspection and, where necessary, well-considered amendment of the law to make thorough cleanliness, sufficient ventilation and light, freedom from dust or extremes of temperature, adequate provision of proper sanitary conveniences, reasonable length of hours and adaptation of workers to the work for which they are fit throughout the kingdom are, if possible, even more important for the general welfare than remedies for injurious trades. You are dealing with the great masses when you are dealing with these subjects, general sanitation and length of hours and proper arrangement of hours.

1519. (*Colonel Fox.*) And a period of rest?—Yes, a proper period of rest.

1520. (*Mr. Legge.*) Of course, besides the effect the factory inspectors are having in improving the conditions under which work is carried on, there are local authorities as regards workshops?—An immense task lies before them now.

1521. What do you think of the way they are doing it now? Do you think they are doing it pretty well?—In some districts they are working it thoroughly well, but it is only since 1901 that they have had powers to deal with them in a systematic way.

1522. Where the inspector thinks they are failing in their duty he or she can step in?—Yes, with the authority of the Home Office.

1523. With regard to the value of repeated medical examinations and the great need of some standard test of physical fitness, you think this should be secured?—That is extremely important. The certifying surgeons have now a tremendous power for good. They can select young workers for certain processes. They may qualify their certificate.

1524. Indicating special work?—By refusing a certificate for a class of process that is not suited to them individually.

1525. Especially in that one case?—It may be done by rejection. They may decide to see for themselves whether the process is suitable for the individual child or young person. That is most important. You cannot get at what is proper normal work for a normal worker until you have weeded out the unfit for particular processes. One worker, a young person, might be quite fit for one class of work and able to grow and thrive under it and be unfit for another, and be gradually turned into an invalid through a wrong selection having been made.

1526. That power of discrimination has been granted?—Yes.

1527. (*Colonel Onslow.*) Is that power exercised in the case of boys as well as girls?—Yes.

1528. But only up to a certain age?—Up to sixteen years of age. Up to sixteen years of age an inspector may,

if he or she shall see fit, specify the child or young person for re-examination with regard to the particular work the child is doing.

1529. Would you advocate that re-examination should take place in all cases compulsorily?—I believe the time has come for considering that.

1530. Automatically at a certain age?—Yes.

1531. (*Mr. Legge.*) Of course you inspectors are periodically conducting inquiries as exhaustively as you can into the health conditions of particular trades?—Yes, we are.

1532. You have given me examples of Miss Patterson and Miss Deane at work with regard to laundries, fruit-preserving, and fish-curing?—Yes, and india-rubber works.

1533. And lucifer match works?—Yes. In one or two instances very exhaustive inquiries were made, producing certain figures. In others more general inquiries were made.

1534. So far as is practicable, you think the inquiries of the inspector should be more extensive than they have been?—I think the inspectors could produce most valuable information, if they had sufficient time to continue those inquiries.

1535. And if they had assistance from the certifying surgeons or other certifying people?—Yes.

1536. You perhaps would agree that there is some advantage in having a central Government bureau or small office, whose business it should be to superintend, working through other agencies, the collection of statistics—not only from schools, but also from factories?—I do not see how you could have that carried on in conjunction with the Home Office administration very well.

1537. I meant, for instance, those people would be people of very wide experience, who would assist the Factory Department very much in deciding on what particulars to call for and in what form?—I do not think I could express any opinion about that unless I saw just what the scheme was.

1538. We have an Ordnance Survey and a Geological Survey. Is not the survey of ourselves just as important?—Yes, so far as it is purely survey, I think it would be admirable.

1539. You think that, so far as getting any facts about the health or physique of employees in factories and workshops is concerned, one must work through the inspectors and certifying surgeons?—I think so. I think that by duplication of inquiry you would only get confusion and irritation of the employers.

1540. (*Colonel Onslow.*) You say: "At the same time, sight must not be lost of the very large proportion of young workers under eighteen, many of whom pass later on to marriage out of factory and workshop life, after passing the critical years which more or less determine what shall be their future physical health, in work places which are under inspection." You are speaking of girls working under the Factory Acts. Notwithstanding the inspection of workshops and ventilation and other improvements, does the actual nature of the employment render those girls more unfit for marriage and for child-bearing than in the case of a country girl employed in country employment?—No, I should think not, on the whole. I think if you compare the health of young women in many rural districts it actually is not superior.

1541. The work itself does not cause physical deterioration?—No, only in individual cases.

1542. And the way it is done?—Yes, and the way it is done.

1543. If it is well looked after?—It ought to be a means of raising health.

1544. (*Colonel Fox.*) Is there any fixed limit of hours they have to work?—Yes, and overtime beyond for women over 18 years.

1545. May I understand there is a real fixed limit?—For all factories and workshops, a daily limit except laundries, where the limits are more elastic.

1546. But nothing in the way of a period of rest in the middle of the day?—There is a period of rest prescribed.

1547. It is fixed?—It is not fixed within definite hours. The employer may choose.

1548. He may choose the period of rest?—He may work ordinarily in the round of the clock—that is, seven to seven, or eight to eight, and out of that time he must let them stop work at least an hour before three o'clock and in all an hour and a half for non-textile works and two hours for textile factories.

1549. I understood from you just now that many of them only get half-an-hour?—They get half-an-hour in many cases because they start work at half-past eight instead of eight, and they stop for only half-an-hour in the middle of the day.

1550. That period of rest is purposely given for a rest in the middle of their work, is it not?—Yes.

1551. I mean that was their original intention?—Yes.

1552. Not to divide it into two half hours, but to have one long rest, enough for them to digest their midday meal?—Yes.

1553. That is not adhered to?—It is not laid down that the hour must come as a whole.

1554. That is where the importance comes in is it not?—Yes; they cannot give less than half an hour: that at least is prevented.

1555. (*Dr. Tatham.*) What is the earliest age at which young persons of either sex come under your official notice?—At twelve years in factories and workshops now.

1556. You have no official cognizance of the health of young children?—No; only incidentally seeing them when I visit the workers in their homes. Of course we saw them at eleven years of age during the first few years of our experience. Eleven was the limit until quite recently, now it is twelve.

1557. Does your organisation permit of anything like a complete register of sickness amongst the factory operatives?—It could not be now enforced, but there are a good many employers who fall in with suggestions in that direction, and we make use sometimes of sick clubs in the factories or workshops, and get a good deal of useful information in that way. I could give instances if you desire.

1558. You know I am sure that once in ten years at any rate particulars are published by the Registrar General with respect to the mortality of occupation?—Yes.

1559. But that is only mortality?—Yes.

1560. Can you see your way at some future time at any rate to the establishment of a corresponding register of sickness—you see it would be much more valuable?—It would be ever so much more valuable. If we had only some such system of insurance against sickness as exists in Germany then we should be able to get at it.

1561. You would appreciate it if you could get it?—Yes.

1562. It would be of enormous value to you in your work?—Yes. When we made that inquiry into the health of china scourers in Longton we had only the returns of death, the census returns, and the factory returns. All we could find out was that the deaths from phthisis of china scourers were fifteen times greater than that of other women in that locality. We could not get any further than that.

1563. With regard to the question of phthisical sickness amongst the operatives which you have just spoken of, is there any attempt, private or otherwise, to obtain statistical evidence of the prevalence of tuberculous phthisis amongst the operatives?—They have spoken of it.

1564. You speak of one class?—Yes, amongst the hatters' furriers—the felt hat makers. They have a sick fund. We got some statistics from them as to the amount of phthisis. It is a matter we are going to follow up sometime—the amount of sickness amongst them.

1565. As regards tuberculous phthisis more especially?—No, it is rather a rough classification of the various sorts of lung troubles. (*A document handed to Dr. Tatham.*) Those were personally given to an inspector by that society. By following the records and carefully visiting the workers who were not in the society one would get a great deal of information.

1566. I notice this is death, not sickness?—I am afraid it is so. However there are societies which keep registers of the administration of their sick fund to those who are only sick.

1567. If it were possible in any way to obtain such a register of sickness for your own purpose it would be enormously valuable?—It would be enormously valuable, yes. I had some help in the Potteries in one or two factories; the men helped the girls to start a sick fund and contributed to it largely, too. There I got information as to workers who were away ill at the time from the factory in receipt of sick pay.

1568. In the event of your hearing of the excessive prevalence of such a disease as phthisis amongst the workers in any particular factory, do you find any difficulty in getting at the facts from the factory owners, or do they object to your asking questions?—No, not ordinarily.

1569. They are willing?—Yes, it only wants a little patience, and going about it quietly. You generally get all the information in time.

1570. You have not heard of cases where in particular factories, for instance, there has been concealment?—Yes, there has been.

1571. I wanted to get that fact from you because I happened to know of certain cases of the same thing myself in times gone by?—Yes, in times gone by, but I think there is less of that, and I think it can be overcome.

1572. By the process of education?—Yes, by process of education. In the lucifer match industry, of course, there was a great deal of concealment, in one case wilful systematic concealment, but it all came out in the end.

1573. It was not necessary in that case to prosecute?—Yes, it was; there was prosecution by the Factory Department.

1574. And what was the result?—The result was perfect openness afterwards. We got all the information.

1575. You think speaking generally, the health condition of the factory operatives is improving, and not retrogressing at present?—The external conditions are certainly on the whole improving.

1576. And the physical conditions, the health conditions?—Do you mean the state of the persons themselves?

1577. Yes?—I do not think it is as great as the external conditions.

1578. You think not?—I think not. I have seen more change in the surroundings of the factory for the better, than I have in the actual condition of the women and girls.

1579. Could you account for that in any way?—No, I should imagine that it springs from the same general causes which prevent progress in all the women and girls of the poorer classes. They start insufficiently fed, and not properly clothed, and sometimes they have too sedentary a life, and sometimes too fatiguing a life. There is not enough knowledge from the beginning of how to attain personal health. They do not think about it; they do not know about it. There is not enough knowledge of how to make the best of food materials and how to make the best of clothing, and how you ought to have fresh air always in your rooms, and so on.

1580. And you think sometimes the ill-health of factory operatives may be really the result of mischief begun in early childhood, probably?—Yes, and continued throughout.

1581. So that they start with the disadvantage of impaired constitutions before they get to the factories?—Yes.

1582. You have no reason to believe factories themselves do much harm?—With the exception of the injuries which do come from them—a very dusty process, or heat, and so on. I wanted to make it quite clear that I do think that ill-health is often aggravated by it, but it is not essential in factory and workshop life; it can be remedied and it is being, very gradually, more or less remedied.

1583. Things are improving?—Yes.

1584. Should you think it is practicable in almost all cases to conduct factory labour without harm to the persons who work there?—Yes, except in some cases, and even in those our knowledge will advance, of course.

1585. (*Mr. Lindsell.*) I suppose the most direct bearing of the employment of women in factories which comes

*Miss
Anderson.*

under your notice with regard to such an inquiry as we are holding now is how far the conditions of factory life interfere with their duties as mothers; do you consider the present conditions of factory life are such as to materially affect the physical condition of the race at the present time?—On the whole, comparatively not.

1586. It does not have a very important bearing on it?—No, I should think there were bigger causes to be considered.

1587. And so far as it did have any bearing upon it it would be in that way, in unfitting them for the discharge of their duties as mothers?—Yes.

1588. (*Mr. Legge.*) Or as soldiers in the case of men?—Yes. I think it could be made more a means of raising the standard than it is, and no doubt it will be in time, if people continue to think of factory legislation as a means of helping to raise the race, making the race progress.

1589. The men employed in factories and so on would be fitter as soldiers, and the women would be fitter to be the mothers of soldiers?—Certainly, and I think there is a growing tendency amongst employers to have a sense of responsibility in that direction, and it should be encouraged.

1590. You think at the present time, good as the recent factory legislation has been, that a great many of the children born of factory parents are physically deteriorated in consequence of their being in factory employment?—I should think so from the past, yes.

1591. But that is daily getting less?—Yes.

1592. Would you be in favour of more stringent legislation about women being employed in these factories immediately before or immediately after they have had children?—I do not see my way to further safe legislation in that direction. I think it is highly desirable that they should not be there.

1593. I think the time is a month now?—Yes.

1594. (*Chairman.*) Why should not that be extended to three months, say?—I do not think we have got enough knowledge of the number and circumstances of mothers who are being employed in factories yet—before we take a big step like that—to say that they shall not work. You have to think of the number that you may expose to the greater misery of starvation.

1595. Do you think that that would be so?—I do not know.

1596. (*Colonel Fox.*) Take the case of a widow who happens to have a child—her husband dies we will say a month or two before. If she is to be away from the factory for three months she must starve?—Yes, unless someone helps her.

1597. The factories do not assist her in any way?—No.

1598. (*Chairman.*) She might be a fitting object for charity. You say it depends in your opinion upon the number of married women employed?—Yes.

1599. Surely if only a few married women are employed excluding them from the factory for three months will not have a particularly great effect?—Except on the individual.

1600. Whereas if a great number are employed surely the prejudicial effect must affect a great number of children and therefore there is all the more reason for interference?—Yes, but you have to think of the rates.

1601. I think the rising generation is more important than the rates?—It is, decidedly; but you have to consider that and the effect of restriction on the women. You do certainly drive them out upon charity or upon the rates if you prohibit them from employment.

1602. You assume there is no husband in receipt of wages?—Yes.

1603. But there may be?—Yes, of course it may be that a woman goes back and deserts her child for a little money, but I think that is rare.

1604. (*Colonel Onslow.*) Is it not common in the cotton industry for the woman to do the work and the men to loaf at the street corners?—I think it would be more common in the laundry trade. I think we want more figures and more information as to what happens. It is very desirable that the women who are mothers should be kept out of the factory.

1605. In Dundee, for instance?—It is desirable they

should be persuaded out if they can be persuaded, if they are going there when they ought not. But with regard to compulsion to keep them out, I think to force them on charity is rather a serious step.

1606. (*Chairman.*) The recent change in the law must rest upon principle or not. If it does, surely that principle would require that the prohibition of employment should extend to a period which is of real value?—To the mother or the child?

1607. To both?—Yes.

1608. (*Mr. Lindsell.*) Tremendous importance has been attached to this point. It has been instanced to us that Jewish children are so much healthier and stronger for that very reason that under the Jewish dispensation, the mothers are not allowed to go to work for some time before or after?—Yes, and that is a voluntary regulation of the race.

1609. Yes?—And it is accompanied by a provision for the mother from the start.

1610. (*Mr. Lindsell.*) We had evidence to-day that abroad it is made compulsory.

1611. (*Chairman.*) It is three months in Switzerland?—That is quite recent.

1612. (*Mr. Lindsell.*) It was said that in Belgium, Holland, Austria, and Germany, the regulation is the same as in this country, but in Germany the period is six weeks unless a medical certificate can be produced approving employment at the end of four weeks. In Switzerland the law goes further and prescribes total abstinence from employment in factories of women during eight weeks before and after child-birth.—I think it is highly desirable that it should be extended if it can be done without producing other and possibly worse evils.

1613. (*Colonel Fox.*) You do not want to go so far as three months?—I do not know enough to be able to say. I want more light on the subject. I do not think that women with young children ought to be in the factory if they can possibly be out of it.

1614. (*Chairman.*) It is accepted I think from what you have said that the conditions of factory employment are much more favourable to health and physical development than they were?—Yes.

1615. Even to those who go there with constitutions impaired?—I excluded from that general statement the industries where there was special injury—poisonous or dusty surroundings.

1616. You cannot make the process of certain industries healthy?—No, there you want to select workers who are best able to do it. You want to work in that direction.

1617. Could you say that the employment of women in factories is on the increase relatively to population?—No. I think the returns show that is not so.

1618. Is it diminishing?—No, it is not diminishing, but there is no significant increase with the exception, say, of the laundry industry. It is increasing there.

1619. Should you say that the conditions of factory life in their effect upon young persons disincite them to undertake home responsibilities?—In some districts I believe there is the tendency that way.

1620. Do not you think it is likely to be a general tendency?—No, I do not think so.

1621. The excitement and sociability and so on of factory life would prevent a woman settling down when she marries and looking after her children?—That is so in some districts. There seems to be a tendency that way, but not on the whole.

1622. You would not say it is a general tendency?—No. But they certainly do want companionship and they like to work together.

1623. You would admit, I suppose, that the employment of married women has a disintegrating effect?—Yes, it ought to be discouraged by all means possible, but I do think that more important than anything is to see that the women get sufficient knowledge while they are still at school. If it were possible to keep them longer at school, longer than the boys, in order that they should learn something about principles of domestic economy, that would be most important.

1624-5. Or at any rate concentrate the acquisition of

knowledge of that sort upon the last period of school attendance?—Yes, it is most important. Everything that can be done in that direction should be done, and every step that can be taken to convince young women of the honourable nature of that work should be taken.

1626. In reference to the point I was asking Mr. Booth, are many women employed in small workshops where the immediate employer is merely a sub-contractor of some man in a larger way of business?—Yes, they are, in the clothing trade.

1627. Because Mr. Booth refers to that class of employment as having about it all the worst evils of the sweating system?—Yes.

1628. He suggests in this book of his a way in which he thought that might be dealt with, and that was making the owners of houses used for industrial purposes legally liable if improper conditions prevailed. He said he upheld the same view when giving evidence before the Royal Commission on Labour, and that he reverted to that suggestion because he believed that in no other way could the evasion of the Factory Acts in small workshops be checked. Referring to his book I said, "With a view to checking the unfavourable conditions in which those who work on small premises are often condemned to labour, you advocate a double system of license by which both the owner of the premises and the employer of labour may be held responsible to each other and the State," and he agreed to that. Then I asked, "How far in your opinion do the provisions of Part VI. of the Factory and Workshops Act 1901 go to provide a remedy for the evils you describe," and he answered that they did not touch them at all.

1629. (*Mr. Legge.*) I had that out with him and we went into Section 108?—Part VI. relates to home work. It seems to me that affords a better prospect than anything we have ever had yet. We are at the beginning of getting real control of sanitary conditions in workshop and outwork.

1630. (*Chairman.*) But no attempt is therein made to make the owner of the premises responsible?—The

local authority who administer it have power to attack the owner.

1631. Surely a district is only charged with the duty of bringing it home to the employer and not to the owner of the premises?—But that is in addition to the power they possess under the Public Health Act to require owners of property to make them in a healthy condition.

1632. It is when the owner is an employer himself, is it not?—No, the sanitary authority, I believe, has power to visit every dwelling house in the district; in fact it is their duty. It is a house-to-house visitation, and of seeing that all the premises are in a sanitary condition.

1633. But for the purpose of labour?—They have the additional powers given by Part VI. of the Factory Act.

1634. Then you think the case is met?—I have a little summary here of the powers of the local authorities which might perhaps be useful. It gives a history of the powers to deal with workshops by the local authority. (*Document handed to the Chairman.*)

1635. It is in the preface to this?—And there is a summary of the existing law.

1636. What book is it?—It was a paper which I prepared to cover the whole field of the sanitary conditions of workshops for the International Congress on Hygiene. The power of the local authority is briefly summarised there. They have both powers. The Factory Act only adds to their powers for particular cases of out-work. The whole of the sanitary condition of workshops is regulated; the ordinary sanitation of workshops is regulated by the law relating to public health.

1637. (*Colonel Onslow.*) You think the existing powers are quite sufficient?—I do not say that. They are a great advance on anything we have ever had before. They were only enacted one year ago and we are waiting now to see their effect. I do not see how we very well can fundamentally alter the law at this stage by requiring a licence. It was thoroughly threshed out at the time.

*Miss
Anderson.*

FOURTH DAY.

Wednesday, 20th January, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*Chairman.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

COLONEL GEORGE T. ONSLOW;
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY, (*Secretary.*)

Dr. ALEXANDER SCOTT, M.D., called; and Examined.

1638. (*Chairman.*) You are certifying factory surgeon of Glasgow?—That is so.

1639. Will you kindly state for the information of the Committee what your experience has been?—For a short time I was certifying Factory surgeon to a small district, but while acting as such I had considerable experience in general practice amongst an industrial population of factory employees. Then about five years ago, I was appointed to a large district in Glasgow where I had far more scope for investigation than I had in that place, except those cases that came under my personal knowledge as a general practitioner. Besides that I am one of the physicians to a department of Glasgow Royal Infirmary, the largest institution of the kind in Scotland. Then I have also been medical officer to Parkhead Reformatory for boys.

1640. You also have been chairman of the Shettleston School Board, I understand?—Yes.

1641. Are you chairman at the present moment?—No, I had to give it up owing to the hard work. I was six years chairman of the District School Board.

1642. You have written upon subjects relating to the health of the people, I understand?—Yes, a great deal. I will give you a few examples of them.

1643. You have set them out in your *précis*?—These are just a few of them, and I have copies here if you would like to see any of them. The following are contributions on diseases of dangerous trades:—(1) chronic lead-poisoning in dye-works, with special reference to its prevention; (2) poisoning by carbon-monoxide in ammonia works; (3) the danger of anthrax in the manipulation of horse-hair; (4) nervous tension among railway servants as a cause of accidents; and (5) medical inspection and supervision of workers in factories.

1644. I do not know that we need go into these cases,

Dr. Scott.

Dr. Scott. with which you are familiar. It would probably take up an unnecessary amount of your time. They seem typical of the diseases that people employed in factories are liable to. But I understand you have some remarks to make upon them—would you kindly indicate what those are?—Well, first of all, I give you these cases for the sake of explaining to you the wretched condition, I might almost say, of factory workers in 1887, when my attention was first drawn to the prevalence of lead poisoning and to compare it with my experience of last year in a much more extended area. You have the cases there that I detailed in my paper in 1887, and I need not go over those. Coming to 1903, I have only five cases of lead-poisoning that came under my notice. Now the first one was a case of very great interest to me. I was physician to the Royal Infirmary and a patient was sent to me, by a practitioner in the suburbs of Glasgow, suffering from lead-poisoning with complete paralysis. (That was a recruiting case and I have got the history of it). This is an extract from the Ward Journal to show you how these cases originated and it was written before I was asked to come here. It is headed “Dr. Scott’s Note, 25th November,” and goes on:—“When between twelve and thirteen years of age the patient began work in a pottery and was engaged dipping the various articles in a solution of lead glaze. He continued at this work for six years, and although there were no special rules in force for careful washing of the hands and the use of the nail brush, the patient never suffered from any symptoms of plumbism. He states, however, that always before taking food he washed his hands. After having served a year in the Army he was next engaged for two years as a hammerman—a hammerman is a sort of a smith—“About one year ago, he resumed his old employment as a dipper when shortly after that date the symptoms of the present illness”—that is the lead-poisoning—“began within six months. How is this to be accounted for? For at the present time special rules are employed whereby the dipper must wear an overall, must wash carefully, and must use the nail brush. The reason is apparently to be found in the fact that the patient’s habits have not been so regular and temperate as formerly.” How interesting that case was! Here was the boy who went in at thirteen years of age and worked as a dipper in this solution of lead glaze for six years, and never suffered anything from it. He had the advantage of keeping his hands and arms clean. After that the next story which we have, he becomes wild; he gets a better wage, and he becomes intemperate, and joins the Army, and after a year his parents bought him out.

1645. Do you attribute that to the demoralising effects of the Army service?—No, not at all. It was after he had been out of the hands of the factory inspector and after he got a bigger wage, he became a little wild and then joined the service, becoming a soldier. Very well, then, his parents bought him out a year after he joined the Army, and when he came home he did not resume his former employment; he went to do hammerman’s work; but his evil habits had not deserted him, with the result that he continued to be irregular and intemperate. And the man who, as a youth, as a growing youth, could work as a potter and be impervious to this lead poisoning, within six months developed the most violent form of lead poisoning after his physique had been depreciated.

1646. And I presume he was lax in observing precautions?—Yes; lax in that too; it was within six months. He ought to have been in better condition than he was as a youth of thirteen years of age. That case I thought would be interesting.

1647. (*Colonel Fox.*) You think that it had lowered his vitality, and that he was less likely to resist disease?—That is the point. That was the case of B.D. My next were three cases of men engaged in enamelling baths with lead powder. They have to use a powder made of lead and shake it over this iron bath when it is red hot, and thus inhale the poisonous dust. Strange to say, this does not come under the Factory Act, and all that we have got to do is to report it. There is no medical supervision or inspection, because it is not a plate and does not come under the provisions of the Act. These baths are not said to be plates. It is a pure quibble. In each of those three cases these men all earned good wages, contracted this disease from the same cause—intemperance—a lowered vitality, as you said, and therefore they took this

disease. The next case was that of a fitter who was using white lead, and neglected to wash thoroughly. Of course I have given you the remarks about these cases, but there are many in addition which are not in this list which should come under medical inspection and supervision. That is all that I have got to say with regard to lead poisoning.

1648. (*Chairman.*) The last cases were not persons whom the Factory Acts affected?—The Factory Act does not look after them, and even at the present moment there are no special rules for them. These three last men that I have just referred to, were exposed to lead poisoning very much indeed.

1649. Would you make it an obligation on the employer to employ a doctor for this purpose?—Well, strange to say, in two of those cases the employer had a doctor. What was the good of him? He went and reported to the Inspector of Factories that there was a case of lead poisoning; whereas when I go in under the Factory Act, I say to a girl—“Now you have got a blue line along your gums. If you do not be more careful to wash your hands, and to keep yourself perfectly clean, I shall suspend you. You are taking lead poisoning.” At the same time I say to the Employer—“This girl has got incipient lead poisoning.” There is nothing that these people fear more than suspension by a certifying surgeon—“Unless you be more careful—you have lowered your vitality by taking alcohol—we will suspend you for two or three months.”

1650. But those persons were not under the purview of the Act?—Not at all, but that is what I recommend.

1651. Those who are engaged in work that results in lead poisoning you think should be under the purview of those Acts?—Yes.

1652. (*Colonel Fox.*) What did you say about that blue line?—It is the blue line along the gums.

1653. (*Chairman.*) What have you to say with regard to the workshops that are detrimental to health?—Well, that is an anomaly altogether. The certifying surgeon examines girls in factories and not in workshops. Workshops in my experience are not so healthy as a factory. They are all sitting sewing, for instance, in a great big workshop, and they are mostly young growing girls and young women, and what I have found is that they suffer most from defective ventilation.

1654. Did not the recent Factory Act touch this?—It did, but not with anything like medical supervision. Here is the strong point that I have marked on my proof, medical inspection, to note that these poor girls are not suffering from any disease.

1655. You think there should be medical inspection of workshops?—Yes, the same as for the factories, and above all to work this test for carbonic acid—C.O.₂. It is horrible, the ventilation and the amount of carbonic acid that is in it. And then the dust, supposing any of them be tubercular, which is very likely, and which is highly dangerous in that respect—if they spit on the dry workshop floor the danger of tuberculosis by infection is very great.

1656. Do you think, as far as these factories are concerned, the changes in the recent law are sufficient for the ventilation?—Yes.

1657. Do you think that they should be extended to cover workshops? Is that your view?—Yes, I believe in that strongly.

1658. Will you state what you know as to the comparative results of examinations and rejections during recent years. It is understood the same standard is applied, I suppose?—The very same standard. I have made no difference whatever. As I have already told you, in 1898 I had a very small district, but then I was appointed to a larger district in Glasgow, and during the year 1898 I examined 1,912 youths, that is, children and young persons. Of these 904 were rejected.

1659. Just under 1 per cent.?—Yes. In 1899 a much larger number were examined, 2,305, and 1 per cent. were rejected. In 1900 there were 1,620 examined with 1·2 per cent. rejected. In 1901 there were 1,895 examined, and 67 rejected. In 1902, 1,736 were examined, and 0·8 per cent. were rejected. In 1903, this last year,

there were 1,912 examined and 0·4 per cent rejected—a considerable diminution, you see.

1660. Yes, but you do not attempt to infer that that diminution is due altogether to an improvement in the physique of the persons examined?—I would say so. That is noticed further on where I point out that it decreases just as the age limit was raised, and as you put away the number of half-timers.

1661. You were dealing with a stronger type?—Yes, far better.

1662. Would you give us the medical reasons for those rejections?—The chief medical rejections are first, imperfect constitution and debility. I mean children of low vitality and weakly debility.

1663. A child damaged from its birth?—Suffering from its birth; no rich blood in it. Then second, and I give them according to the numbers rejected—Number one was the most important, that is imperfect constitution and debility, and next in importance is number two, rickets and tuberculosis; number three, ophthalmia and bad eyes; number four, bad legs and flat feet; number five was mental defects. The decrease was most marked in rickets, ophthalmia, and bad legs and flat feet.

1664. The first of the reasons you give for the decrease of rejections does not point to any improvement in the health of Glasgow-bred children?—That is to say, rickets?

1665. No, the reasons for the decrease—that hardly points to any improvement in the health of Glasgow children, as such. As you say, the reasons for decrease in rejections are the influx of country-bred children. You say that produces the decrease?—That is my first reason. There is an enormous influx of country people coming into Glasgow at the present time. That is one of the reasons why there is this decrease.

1666. What becomes of the persons they displace?—I have something to say about that later on in the next paragraph. The first reason I give is the influx of country-bred children—there is a large number of them. Then the second reason I give is this—of those rejected the youngest were in the majority; the younger the children you find the greater number of rejections.

1667. When you say young you mean between fourteen and sixteen?—Say, it is fourteen now. They can be allowed to work now between thirteen and fourteen, if they get a certificate from the schoolmaster, which is a stupid thing, and which makes our work all the more serious. If you notice my numbers, they have decreased very much since 1900, and the reason of that was, there have been no half-timers since then, and I am awfully thankful about that, because it was a terrible mistake to have half-timers. The children are brought there and are not fed and cared for with the same regularity. Not only that, but the fact that they went the half-day to the school and the other half-day to their work made them irregular in their habits. It did not make them punctual and those boys grew up to be loafers and not at all like those boys who come in at fourteen and get their food regularly.

1668. You mean they have settled habits of industry?—Yes. And now the age limit is raised to fourteen years, except under special circumstances which I have already mentioned. Then here was the case of William Macdonald which to me was intensely interesting. That boy I rejected because he was suffering from imperfect constitution and debility. He was not fourteen years of age. I rejected him. What did he do? He had got this certificate from the schoolmaster or the board school to say that he was allowed to leave the school. He quietly goes away and gets another boy's certificate of birth, a boy called Todd, and passes down to another works, and presents his certificate as "John Todd," and passes, and I hear nothing more about him till within two months. That boy is brought to my ward in the Royal Infirmary in Glasgow, suffering from chronic rheumatoid arthritis, just as if he were an old man. It was a most interesting case, but to the day of his death that boy will never be better, and that is owing to his physical development having been arrested by the premature employment. He was employed at bottle work, a hard and exhausting occupation. With regard to ophthalmia, I have had no rejections for two years, owing to better home

comforts, better hygienic and sanitary precautions. That is remarkable. But in examining this public school I found no fewer than twenty-five children suffering from ophthalmia; the epidemic had set in and they had not the means of keeping it down that they ought to have had. When I became medical officer of the Park-head Reformatory there were three cases in the year. We have not had a single case of ophthalmia for ten years. If we see anything about their eyes, however trifling, we rest not until it has been stamped out. They have to be isolated. If these twenty-five cases had occurred in our Institute, His Majesty's Inspector would have demanded an explanation.

1669. What is the prevalence of this sort of ophthalmia due to?—First of all, it is an infectious disease of the eyes. Secondly, it is due to dirt.

1670. Is it owing to neglect at the period of birth?—Very often it is—sometimes it is. But what I am speaking of now is school children; but home life seems to be better now because there are very few cases. I have had none for two years in the factory. I have to be very careful to look out for a boy or girl suffering from ophthalmia, in case the eyes be affected by their work. You would ruin that person's eyes for ever, and besides spread the infection right through, if you did not take some steps. Well, that is very much better. Then the next note I have is—imperfect growth and development are favoured by city life, by cold, damp, atmosphere and by ill-ventilated houses.

1671. Is it not the case that the conditions of life of the great mass of the people are perhaps harder and more depressing in Glasgow than almost in any other town in Great Britain?—That is so. You will have boys placed here, country-bred children.

1672. What becomes of them?—I have had the stevedore district, the district along the banks of the Clyde, a very poor district; not only that, but the houses are miserable and they go down to the very harbour. They are dirty, awful dwellings to be in. They call that the Finnieston district of Glasgow. Well, now, in that part you have some of the finest shipbuilding yards in the whole of Glasgow. The chief industries are ship-building, engineering, boiler-making, and iron-moulding. All first class shops. I was appointed on 1st October last, and as I surveyed the surroundings and considered the nature of the work I anticipated a good many rejections. Not at all. They were splendid boys. I measured several of their chests, and did not get one under twenty-nine inches—they were splendidly developed boys.

1673. What age were they?—Fourteen; that is the time they come to learn the trades there—say from fourteen to fifteen, and I have not had a single rejection. Why? Because these boys are sent to a trade to which they are required to serve an apprenticeship, perhaps for seven years. It is a splendid trade, the shipbuilding trade—it is a splendid trade to be an engineer on the Clyde. The prospect is a very good one for a working man. Therefore a very good working man, a well-doing working man, is anxious that his son should go down to this excellent place to learn his trade. They, therefore, come here, big strong boys, and any other ones will not be employed. The question that arises is the one you put to me: what becomes of the poor miserable wretches running about the streets where the works are? What I found out was that there are large works in the district, such as printing, lithographing and book-binding, and those undergrowths rush into there or else become loafers, for they are not fit for heavy work. But the majority of these cases of undergrowth have been born and reared in these wretched houses on the banks of the Clyde. And yet they are working people; they are not like the thieves of the slums, but actual working people in those houses built hundreds of years ago on the banks of the river and never improved.

1674. Are they frightfully overcrowded?—Yes.

1675. Is the Corporation doing anything to improve these things?—They have done their very best.

1676. But they must proceed gradually, I presume?—Yes. I live out of Glasgow three miles, and the number crushed out by the city improvement, where they can get a cheap house! they are simply shifting them and sending

Dr. Scott

Dr. Scott.

the thieves and dirty people out there. But the Corporation is simply proceeding on the right lines in that respect.

1677. Is that class multiplying, or becoming more or less sterile?—I think there is not much improvement, I am sorry to say.

1678. Have you any suggestions to make as to the line the statistical inquiry should proceed upon?—With regard to the factory employees?

1679. With regard to the next subject heading of your evidence?—That is the children attending public school.

1680. Yes.—I thought this might interest you, although your Secretary did not mention it in his first letter to me, with regard to the examination of children, and I have a knowledge of children in the public school. I examined the public school on the 12th of January of this year. Now the parents of these children are all working men, that is to say, belonging almost exclusively to the industrial population. As you can understand, three miles from Glasgow, any person who is well off sends his children to a higher class school in Glasgow. Therefore, I thought that this was a very good example of a school of working men's children and I examined them. There were 856 children present. It was a mixed school. I simply wanted to know, first of all, with regard to how these children would stand supposing they were presented to me as a certifying factory surgeon. Supposing they were fourteen years, how would they stand, how many would I reject on examination?—I took rickets first. I found that in that school suffering from rickets the proportion was 1·16 per cent. Then I took the different ages and I found between ten and thirteen years of age the percentage was 0·29.

1681. Was that with regard to rickets?—Yes. Then between six and ten years of age the proportion was ·87 per cent., nearly four times as much, showing that youth was the point—that between six and ten was the time in which there was great prevalence of rickets. Well, then I took my next subject, undergrowth; and as to undergrowth among those 856 children the percentage was 2·8 per cent.

1682. (*Mr. Legge.*) What was the standard for height?—I did not measure them for height; I could not measure them, but I just had every class before me and went round each of them, and saw one that I knew ought to be much taller than he was.

1683. It was a standard fixed by observing the mass of the children before you, was it?—That is so. In the short time that you gave me I could not have got up the particulars, and I took the survey such as I do in examining under the Factory Acts. As to the undergrowth of those, I said that the proportion was 2·8 per cent.; between ten and thirteen the proportion was 1·12 per cent.; between six and ten it was 1·68 per cent. Then the next thing I came to was eyes. In that school there were 25 children suffering from diseases of the eyes in some forms that ought to be attended to. As there was an epidemic, I do not think it is worth while my giving you the different ages, but with twenty-five that gave us the percentage of 2·92 per cent.

1684. (*Dr. Tatham.*) Will you mind my asking you, as a medical man myself, if you will kindly say in what form you found rickets to show itself more especially?—In bad legs.

1685. You mean bent bones?—Yes, bandy legs.

1686. What is your standard which would lead you to reject a person?—For example, now, with a growing boy, if the leg was bent at all you would have almost surely flat feet. That is always my standard. Whenever I found the leg going, I said, "Now, we cannot allow this; this must be attended to in the hospital or somewhere else." The torture which these children sometimes suffer, who are not under the Factory Act, and are perhaps doing some kind of work, from these flat feet, is very great. They are brought to me in the Royal Infirmary and their fathers and mothers say to me that they have been very much troubled with rheumatism. Nothing of the kind; they are suffering from plain flat foot arising from the condition of the limbs, so that I generally take the two together, and reject them, knowing it would be bad for them.

1687. Have you any degree of deformity of rickets to warrant you in rejecting them?—Yes.

1688. Is it the same high standard commonly adopted by factory inspectors?—I really do not think so.

1689. You spoke just now of ophthalmia: Is that purulent ophthalmia *i.e.* the granular lids so common in school children?—Yes, granular lids.

1690. That is caused by the common use of towels in washing?—Yes, and want of cleanliness. If I get a strange case into the infirmary of the Reformatory with blepharitis, I am just in terror when that boy goes out to see his friends in Glasgow in case he should take that ophthalmia; that boy with blepharitis goes into the slums, and his eyes are peculiarly susceptible, and he no doubt will take the infection with him.

1691. Do you reject such cases of ophthalmia in the factory?—Yes, first of all I have to do that, for the child's own sake. He is perhaps a weaver or works with papers. Then, secondly, I have to reject it for the sake of others. It would spread like wildfire, as in this case; here there are twenty-five at the present moment. Well, I have said with regard to these eyes the epidemic was there, and that I did not take it into account as really a disease of that school, which I have examined. I have something to say about it. There was one with mental defect. The total number rejected was sixty, that is to say, in a school of 856 it gives a percentage of 7 per cent.—of 856 in that school presented to me at fourteen years of age I would have rejected 7 per cent. of them.

1692. What is the test of mental defect? Is it simply dulness of intellect?—If he is too dull I would not pass him. I was sent the other day to inquire into an accident to a boy, an apprentice fitter. He was a stupid looking boy, and he was between seventeen and eighteen years of age. So he told me quite intelligently how the accident was caused. Then his mother said to me: "You know he is an unfortunate boy." I said, "How?" She said, "That is the third time he has been injured, one time he nearly got his arm torn off, the other time he got his arm broken, and now he has got his fingers taken off." So I said to her the boy looked fairly intelligent. At the same time I began to question him and I found out that the boy was just a stupid, heedless boy, and I said to his mother, "Now, don't you think it would be very much better to change this boy's occupation?" "Why?" And I told her. She said "I think you are right." Of course that was beyond my duty. I had no business under the Factory Acts to do it, but I told the mother that she should not allow that boy to work among machinery, and in my report I simply said that, unofficially, I had advised that this boy should not be allowed to work in this place again, as it was the third time he had suffered by an accident from machinery, and that in my opinion it was due to mental defect.

1693. To extreme mental dulness?—Yes; he would do to fill a barrow and carry a load to a station, but when he sees the machine he has no idea about his fingers. He was thoughtless and careless.

1694. You do not call it disease of the mind or brain: you simply would consider it backwardness or dulness?—Simply stupidity. There were between ten and thirteen years of age 2·3 per cent., then between six and ten years of age there were 4·6 per cent. rejected—still holding out what I say, that the younger you go you get the greater number of rejections. Then another thing which may interest you, when examining this school of 856 children, I took occasion to ask them regarding how many of them had porridge and milk for breakfast. Now this was very interesting, inasmuch as the fathers were working men.

1695. (*Chairman.*) Were the fathers earning good wages?—They were coal miners and such.

1696. Did they get very good wages?—They were getting 5s. 6d. and 6s. per day, the carters and labourers, up to engineers and mechanics.

1697. All more than £1 a week, I suppose?—No, some of the labourers might have 18s. or 19s. I would say not less than £1. Then I asked them how many had

porridge and milk for breakfast, and they came out to exactly 90 per cent. that took the porridge and milk for breakfast.

1698. That is rather remarkable?—That is very remarkable. It is very interesting. First of all I said to them, "How many had porridge and milk this morning." There were 65 per cent. held up their hands for porridge that morning. But you must remember that while I was making the investigation it was the time of festivities.

1699. After Christmas I suppose?—They had hardly got over the festivities. I said, "I know many of you take porridge" and I said, "Now then those boys and girls who did not get porridge this morning, but were in the habit of getting it, hold up your hands," and I got 90 per cent. of the whole of those children who took porridge and milk. I shall have something to say about the reformatory on this point.

1700. (*Colonel Onslow.*) Your 7 per cent. is the rejected from all causes whatever?—From every cause whatever in that school. Supposing 856 children to be presented to me under the Factory Act, I would have rejected 7 per cent.

1701. (*Dr. Tatham.*) Is that a high percentage?—Not a very high percentage.

1702. And you attribute it to being fed on unwholesome food not porridge and milk, and getting plenty of it?—Yes; good milk.

1703. (*Mr. Legge.*) What sort of milk, was it butter-milk?—No. Sweet milk, pure milk.

1704. (*Chairman.*) Not tinned milk?—Not separated milk, as we once had at the reformatory—it is pure milk as it came from the cow.

1705. Do you desire to establish a comparison between the condition of those children and those in the reformatory schools?—I thought that my experience there with regard to that might be useful. What I was going to establish between them was this: this is a very remarkable communication by James G. Thompson in 1884 in a paper read to the Philosophical Society of Glasgow. He was very much interested in the number of cases of rickets in Glasgow. You know at that time Glasgow was simply notorious for the number of people who had bad legs and pigeon chests. It was something terrible.

1706. You mean crooked legs?—Yes; bandy legs. Well that gentleman was quite a scientific man, and he was taking a great interest in this subject, and got up an enormous number of statistics. He went into the most typical streets in Glasgow, and waited the whole day there to see the children, and counted the number of them with bad legs and flat feet. The number of children he saw gave the percentage of bad legs and flat feet. The list was something terrible as you will see from that paper (*handing in the same*). Besides he went out to several villages and towns surrounding Glasgow, such as Lanark, Strathaven and Larkhall. These are towns and villages on side Glasgow, and he gathered statistics there as well. I thought that coming before you I might be able to show you that really this condition was improving very much in Glasgow. You know it was the home of Osteotomy, and statistics prove that there were hundreds of cases for every ten that there are now, and not only that, but the number of cases of flat feet that comes under my experience in the Royal Infirmary is not one-tenth of what it used to be.

1707. (*Colonel Fox.*) What is the principal cause of rickets amongst the poor?—Soft, ill-fed bone.

1708. Is it owing to bad nourishment?—Yes.

1709. (*Colonel Onslow.*) No farinaceous food?—Not proper food, but bread and jam and tea, instead of milk and oatmeal and potatoes.

1710. (*Colonel Fox.*) Now you say lately they have improved. Is that owing to better feeding?—Yes.

1711. (*Chairman.*) Is it due to more consumption of sugar?—That is a mistake: that is not scientific.

1712. (*Dr. Tatham.*) You are not afraid of sugar?—No. I agree with Herbert Spencer in his famous essay.

In this paper which I have given your chairman, Mr. Thomson examined in the town 755 children, and he found that out of that number 22·57 per cent. were affected with rickets.

1713. (*Colonel Fox.*) 22 per cent?—Yes: 22 per cent. Then in those places in the country he examined 400 children and he found 6 per cent. affected.

1714. (*Dr. Tatham.*) Against 22 per cent. of the towns?—Yes. Taking town and country he examined 1,135 children, with 17·7 per cent. affected with rickets. Now if you take the case with the figures for many places now you find that there is a very marked improvement, and that coincides with my own experience as a physician of Glasgow of the Royal Infirmary where I did not get them as surgical cases, but as cases of rheumatism and entirely due to flat feet and bad legs. In the school where I examined 856 the percentage affected was 1·16 per cent.

1715. Before you pass on may I ask you whether you have made any observations with regard to the prevalence of pulmonary tuberculosis?—No. In the time that you gave me to look after those children I had no chance of getting that out. Under the Factory Act with regard to tuberculosis it is out of my duty to look after that in the present state of the law, but with the good will and consent of the employer I sometimes have the chance of examining a girl or boy, but I have had no large experience.

1716. You will agree with me that the prevalence or absence of phthisis amongst children of this class is a very important matter?—Very highly important.

1717. Do you think if sufficient time were given, you could provide the Committee with statistics as regards the presence of pulmonary tuberculosis?—I think so.

1718. It would be of enormous value, probably more than any other point we have to consider?—I had the report of the Physical Inquiry lately, and in that Inquiry there is a report of Dr. Leslie Mackenzie, of Edinburgh, and one of Dr. Matthew Hay, of Aberdeen, giving this very thing that you are speaking of, and I have no doubt that Dr. Chalmers will be able to say something about that. He is the medical officer of Glasgow, and I have no doubt that he will give you that information, as he told me that he was coming before this Committee.

1719. But I think it would be very advisable if you could add to this information in your proof of evidence when it is sent to you?—In the case of factory children or school children?

1720. In the case of both?—Just my own personal observation?

1721. Yes. In England the question of phthisis prevalence is of vast importance in this relation, is it not?—It is very important indeed. When I was getting up this work for the Committee I was impressed more strongly than ever how it is that it is allowed to be spread broadcast. There was one strong point that has never been touched under the Factory Acts and that is employment of children in coal mines. There is no medical examination. Fancy a fine factory, a factory inspected by His Majesty's Inspector, in which no young person is allowed to enter unless he is examined by the certifying surgeon, and yet with regard to the coal pit with all its grime and dirt and misery and damp there is no medical examination of those boys. In the night time I have heard these wretches coughing as they were going along; and yet these boys go down these pit-holes where the air may be impure, and water constantly dripping from the roof. The only condition is that they are to be of a certain age, and it does not matter to the manager whether they are scrofulous, ricketty, phthisical, or anything else—they get them into the pit.

1722. (*Colonel Fox.*) You explained to us just now that there is a great diminution in the number of children suffering from rickets, and you attribute that to better nourishment. Am I right in that?—Yes.

1723. Can you explain what has been the cause of this; how has it come about, this getting of better nourishment?—The social condition of the working man is very much better. He gets far more, and if he would not drink whisky he would be far better off; and the food is cheaper, in fact they get more food.

Dr. Scott.

Dr. Scott.
—

1724. (*Chairman.*) And they have better water, I suppose?—I will come to that.

1725. (*Colonel Fox.*) How do you explain that? You say that it is far more plentiful?—Lately, when passing, I have seen pieces of bread thrown aside by school children, a thing which would never have been thought of at the country school when I was there. They have more food, their social condition is better, they are far better dressed, they go to church better dressed, and the houses are better. Since the passing of the Act in which the medical officer is appointed for each county, houses that were insanitary and uninhabitable have been taken down, no matter whether they are in the country or in the town. The people's surroundings are more healthy and the sanitary precautions are far better. Then again, all infectious diseases are just looked after at once. They are taken care of more than they used to be. They always say that the rickets in children in our city was due to the want of lime in Loch Katrine water. There is a want of lime. It is the finest water in the world if we had a little more lime in it. But apart from that the rickets are disappearing.

1726. (*Chairman.*) You go as far as to say that?—Yes.

1727. (*Colonel Fox.*) Is there any difficulty about the milk supply amongst the children?—No. We can get plenty of milk. But it is the dishonesty of the milk seller when he waters the milk.

1728. (*Chairman.*) Does it come to the market in a clean condition?—Yes, if it is watched. But with regard to the watering of the milk—this is what I was going to refer to as regards my experience in the reformatory school—some years ago, H.M. Inspector asked me to give a very full and exhaustive report and analysis of our dietary list. He gave me a number of dietary lists from other institutions of the same kind from which I made a comparison, and our dietary list took a very honourable position indeed. The reason of that was that we kept cows and that we had a large supply of excellent milk. We got a new manager who insisted that the cows should be put away and that we should be supplied by contract with our milk. The contract meant that the milk seller sent his offer as to the price for which he would supply these children with a sufficient quantity of milk. His price—that is, the man that was successful—was 5d. per gallon of milk. Well, this was terrific; I at once reported this to H.M. Inspector, pointing out the danger to life and health, and sent specimens to the Corporation analyst. What was the result of the analysis? It was not milk; it was not even skim milk with the cream taken off: it was what is known by milk sellers as separated milk. You know, Dr. Tatham, the salts only were left in the milk and there was 13 per cent. of added water to it. I sent that to H.M. Inspector, but fortunately for me and him, too, he came down and I took care that I was there to meet the Inspector, and I said to the governor—"Now you will bring a glass of milk that these boys are getting, because I want the Inspector to see it."

1729. You did not want the Inspector to taste it?—The Inspector got it and tasted it, and he put down his foot and a change was made at once. I remember this in his report in the next visit—"There is a better supply of milk, and a very great change on the poor rubbish I tasted on my last visit," with what result? I have made a comparison of my work on November and December of 1900 with that of the same months of 1903, and find that besides the usual cases we had in that reformatory, we had no fewer than 110 cases among those boys during November and December, 1900.

1730. (*Dr. Tatham.*) What kind of cases were they?—Febricular, especially, and pneumonia. The boys had nothing in them to withstand the cold. They had no fat, to withstand the cold, and almost every boy that was exposed was brought into the sick room, and I had to attend 110 cases in November and December of 1900.

1731. Of a more or less dangerous disease—pneumonia?—Yes, that is out of the general run of cases. They are very liable to take catarrhs.

1732. (*Colonel Fox.*) Was this owing to the milk?—

Yes. They were getting this at 5d. per gallon until the inspector put it down.

1733. (*Dr. Tatham.*) They were being starved wholesale?—Yes. In my last quarterly report to the Inspector, I intimated that during November and December, 1903, the worst months of the year, I had only four acute cases. Why? Because we have excellent milk, and I get the milk analysed and examined. The Governor is most attentive, and the milkman never knows when his milk is to be analysed, and my professional work is being reduced to a minimum altogether.

1734. What price do you pay for the milk now?—10d. per gallon.

1735. In place of 5d.?—Yes, they take it from the cheapest man, and I proved this, that it was not milk, not skim milk, but separated milk.

1736. (*Colonel Fox.*) You were paying a high price for it then at 5d.?—Pigs would not have thriven on it. In this institution I have had a good opportunity of making out all these things.

1737. (*Chairman.*) Have you anything further to say as to your experience in the reformatory school?—Of course, the inspector now asks for a Return, which I do not interfere with in any way whatever, of the height and weight and the chest measurements. Of course, I do not take these, but they are splendid fellows now, and since the season of the bad milk the physique of the boys has improved, and many will develop into good men.

1738. They are all derived from very poor parents, I suppose?—Many of them have been constitutionally unhealthy—unhealthy for generations.

1739. (*Dr. Tatham.*) Would they make good soldiers?—Yes, and good workmen too. The only thing is that they have to go back to their old haunts, and I am always sorry to see some of the finest fellows going back to their old haunts and falling into slum life again.

1740. Do you find much syphilis among them?—Not very much—perhaps 2 or 3 per cent.

1741. Is it hereditary?—Oh, yes.

1742. (*Chairman.*) You attach the very greatest possible importance to nutrition of the young, do you not?—Yes. If we can preserve their health between birth and seven or eight years of age, that is the time that makes or mars.

1743. With regard to the first year, is the infant mortality in Glasgow as bad as ever?—Yes, in certain districts; this very district—the Broomielaw or Finnieston.

1744. Is that owing to the carelessness of the mothers and fathers?—It is due to the ignorance of the mothers. I give you an interesting example. I was down in Arrar, a health resort of Scotland, a lovely spot, an island, where everybody bathes in oxygen. There was a shepherd who had a family of girls, with one boy. This boy was a little delicate boy, and the shepherd and his wife were very proud of their boy, who was called Angus. He did not thrive, and yet they were kinder to him than to any one of the family. But their kindness consisted in not giving him the nourishing food that they gave to the rest of the family, but they gave him tea from a pot that was rarely cold, and he died.

1745. He was being killed with kindness?—Yes. In the result, the others got the milk from the cow, and Angus did not. He was "dwining away," to use an expressive Scotch phrase—he was simply falling away. Well, that boy with his tea was being poisoned, simply through the ignorance of the mother.

1746. I want to ask one or two questions about infant mortality. Do you think that infant insurance is one of the causes which makes for carelessness of the lives of the children?—There is no doubt that some of them are made careless. I would be inclined to think it makes them careless.

1747. You think it makes them indifferent?—Yes.

1748. Will you go so far as to recommend the prohibition of infant insurance up to a certain age?—Yes, up to a certain age.

1749. What age?—Five years.

1750. Do not you think that the absence of any proper

medical certificate for registration of deaths may also have a bad effect?—That is terrible.

1751. There is no means of finding out what is culpable carelessness, almost to the point of criminal liability?—That is one of our difficulties in the Royal Infirmary of Glasgow. They bring their children, and we cannot tell what is wrong with them until they die. The only thing we have to say, is this: "If you do not allow us to make a *post-mortem*, we will not sign the certificate, and you will not get the insurance money." But a very sad thing happened not long ago. A child of six years underwent a *post-mortem*, and that child suffered from a cirrhotic liver. It had got "d. t." from the day that it was born.

1752. Would you like to see a medical certificate in the case of registration of deaths up to the time the children are five years old?—Yes.

1753. A leading obstetrician, Dr. Champneys, was with me the other day, and he said: "I hope you will make compulsory the registration of any still births," which he thought of very great value?—Quite so.

1754. You know Dr. Champneys. I suppose you quite agree?—I am very strongly of that opinion. Any man of experience would agree with that.

1755. Do you see any prospect of overcoming this ignorance of mothers. From your experience as Chairman of the Glasgow School Board, you may be able to indicate it to us. Do you believe that the efforts to teach household management and cookery are having an effect upon the rising generation?—At the present time I do not. I have very fixed opinions upon that, especially from my experience as Chairman of the School Board of Shettleston.

1756. Is it because the instruction is not of the right type?—Not at all.

1757. Or at the right period?—Well, I was one day present at the examination of the very school that I referred to about the inspector. He said, "Dr. Scott, come here. This will interest you very much." And I said, "Yes," and he handed me a test card of an examination on physiology for the children attending the school. He said, "Let me hear what you think of it." Well, the first question that was on the paper was—"Describe the skin." "Well," I said to him, "I do not know that I could do that very well, but it would take me an hour and a half, or two hours." Well, the second question was—"Describe digestion." I said, "that would take me three hours, at the very least. I could not do that very well either." Then the third question was—"What is the composition of the air?" "Well," I said, "that will do mighty little good." And the fourth was something about albumen in food he was to describe, and he says, "Now, you are hypercritical—what would you do?" "Now, here, as to the first, 'Describe the skin.' I would say—'Why is it necessary to keep your skin clean?' And the second would be—this question with regard to digestion—'What is the use of your teeth?'" I would take the first part of digestion—"What is the use of your teeth, and how would you preserve them?" That is No. 2. Then I said with regard to the 4th question about albumen, "Tell me which forms the best breakfast, porridge and milk, or bread and tea and jam, and why?" No. 3: "What is bad air, and what would happen if you breathed bad air?" One of the boys of this school went home and told them that he suffered from a pain in his epigastrium. How can the schoolmaster teach these boys to answer these papers in five weeks? And in five years after they have left, they do not know a single word of it. But if you have questions such as mime the boy cannot forget them for his life, and you will teach him something. With the result that he never had another paper. That schoolmaster is dead now, and he never presented a paper on physiology in that school in his lifetime.

1758. But still you agree that a great deal might be done if proper methods were adopted?—Oh, yes.

1759. Now as to the cooking?—We have got a cookery teacher for each school, but their idea is that this teacher is to teach the children how to make puddings. It is not to explain to them how to boil a potato or to make beef-tea. It is not that at all. They think that the teacher is there for another purpose. The mother will say, "What have you been learning?" and if the girl replied, "To

make porridge and boil potatoes," the mother would have been shocked—it would have been impudence on the part of the teacher to do that. Now that is what I think about cookery. Now as to what I think about teaching. I would have the laws of health taught in these schools. It is far more important than to let them know about ambulance work, to tell them how to protect their health and how to live healthily. A great deal of our intemperance, and I know we have an enormous amount of it in Glasgow, is due to this ill-cooked food, and they want something that will rouse them.

1760. You mean something with a bite in it?—The grimmer the work and the more depressing, the more anxious are they to get a dram when they come out. I would teach them what I have indicated in my account of the examination paper to the children, namely, about the laws of health and so on. For example, I once lectured in a series of popular lectures in a village that I took a great interest in, and I had for one subject, "Alcohol, its use and abuse." Well, I explained in that lecture how tremendously dangerous it was to be dead drunk; how that a man who was in that condition was simply on the brink of a precipice; and that had more effect than all the temperance lectures in the world. Judging from that, I hold that it is necessary that they should be taught these things. They do not know. The mother does not know that the fresh air that is coming in is really life and health to herself and sick child, and so she covers up every crevice. They should be taught these things. The physiology that is taught in the school is not worth anything. Neither is the cooking. It should be done entirely differently. Until you have that result, you will require to have this medical inspection and supervision. These children ought to be medically inspected.

1761. Medical inspection of all school children or only those served by the lower classes of the population?—That is so.

1762. That is the most important?—Yes, the schoolmaster that I visited on the 12th January actually has turned a boy away with desquamation from scarlet fever—and this case was from one of the dirtiest families in the school. I would have, first, medical inspection of school children, and, secondly, of factory employees. I read this paper on "Medical Inspection and Supervision of workers in Factories." (*Handing in the same.*)

1763. Would you like to have it put in the appendix to the report?—Well that is what I advocated at that meeting in Manchester. I have got copies of these other papers to which I have referred, and will be glad to give you copies, except of the first one of 1887 which I have not got, but I can give you the others.

1764. We shall be much obliged if you will let us have them?—Then I have pointed out that the chief rock is up till eight years of age. All my experience of those cases goes to prove that it is up to eight or ten years of age that you have the most trying period. During the time that they are under the Factory Act they do very well. You have no deterioration then; you have no deterioration except from the diseases in dangerous trades, of which I have already spoken. But immediately after the young man gets out over eighteen years of age, and is not under the Factory Act, and gets a better wage, and becomes irregular or intemperate, then his health suffers and he gets to be an old man at forty-five.

1765. What proportion of them go to pieces in that way—I hope not a very large one?—I could not give you an idea.

1766. Have you ever considered the effects of cigarette smoking upon boys? That is a subject which is attracting some attention now?—My experience is quite definite on that score; I mean in every case, if you have an undergrowth, there is hardly one, say 2 per cent., of those undergrown who has not been habitually a smoker of cigarettes.

1767. Are you prepared to say that it is frequently due to that?—There is no doubt of it.

1768. Would you prohibit cigarette smoking?—I would have it an offence.

1769. I am told that the evil is partly due to the fact that sweetshops very often hold a license for the sale of

Dr. Scott.

Dr. Scott.

cigarettes, and the young get into the habit of smoking cigarettes?—Yes, and that is extending very rapidly. The mother will buy a cigarette instead of “rosebuds” and other sweets.

1770. Then you think that anæmia and neurosis are due to excessive tea drinking?—It is a fact, but it is mostly in those workshops where the women take tea.

1771. The evil is not so very apparent in the young children?—Oh, no.

1772. (Dr. Tatham.) You promised that you would give us all the information you could by way of adding to your proof with respect to the presence of tuberculosis amongst people coming under your observation. That will be of great value to us and it will permit of comparison with similar facts accumulating in England on the same lines?—Yes. Of course I am handicapped. I cannot go as far as I would like to in this respect. In granting my request to examine children, the School Board suggested that I ought not to be too particular in case the parents might object. However, I can give you particulars of examinations under the Factory Act, and at the Out-door department of the Royal Infirmary.

1773. One question more. You know that in England, at any rate, there has been a statement made pretty widely that there is not only physical deterioration amongst the lower classes but that it is a progressive physical deterioration. Now, according to your experience, is that the case in Scotland?—It is not.

1774. Should you say that the reverse is the case?—I would say that they are even improving. I thought that question might be asked and I have seriously thought of it since you first intimated it to me—I cannot say that it is. I thought that in this case, with reference to the case of lead poisoning, when he joined the army that he had been one of those sent off within the two years' discharge, but that was not the case. He was a healthy man and the father and mother bought him off.

1775. (Mr. Lindsell.) You consider that there is a marked improvement?—I do.

1776. And that is due to the general improvement in the supervision of factories and health conditions generally, the sanitary conditions generally?—It is due to sanitary hygienic conditions.

1777. Are there any influences working in the opposite direction?—Yes, alcohol—intemperance.

1778. You mean the increase of intemperance?—Yes, they are living on it, some of them; and the lower you go the worse it is. In one of these fine works, for example, I said to the foreman, when looking at a workman working with very great care on a piece of beautiful work: “Was it possible that that man was not a teetotaler? I was sure that that man did not have drink.” The foreman said, “I know he does.” I said, “I am quite sure from the condition and the fineness of the man's work, and the delicacy of the work he had to do at this ship-building place that he must not take drink,” but still he had. The foreman explained that most likely that man had had a dram to steady his hand. I was quite disappointed that day, because I asked about a great many of the workmen, and there is no doubt that this intemperance is killing more than anything else.

1779. Is that intemperance confined to the male sex?—No, not altogether. You know, last Saturday a woman, the mother of nine children, came to the Royal Infirmary to consult me, and she had come from her work and I smelt whiskey on her, and, after examining her, I said, “You are in the habit of taking whiskey?” She said, “Yes, she whiles took a half because she had to do hard work.” That is the beginning of alcoholic neuritis. And yet that was the case with that poor woman, the mother of nine children, working hard and simply living on it. It is that constant tipping, the “nipping” that is going on, that is the chief cause of deterioration.

1780. And it is increasing among women as well as men, you think?—Yes.

1781. Does that affect the children born of those parents?—Oh, yes. I read a paper once on the diseases of the nervous system through heredity and the number of cases of hereditary alcoholism that I had was

appalling. I was going to say in the last number of the *British Medical Journal*, printed last Saturday, the very recommendations which I had sent on to Mr. Poo'ey were given here in an article on “The Physiology of Fatigue.” It says: “If we are to classify the reforms necessary in connection with factories and workshops in the order not only of importance but also of practicability, we should place first the sanitary improvement of workplaces. Much has already been done for these, though, with the exception of lead and other forms of metallic poisoning, the subject has been too little regarded as a problem in the prevention of disease. When phthisis in workplaces becomes a notifiable disease much more can be done. Next comes the prevention of accidents, and here factory inspectors are doing admirable work. There remain the problems of the limitation and rational distribution of the hours of labour. In our opinion the advocacy of a ‘day’ of any particular duration would be a mistake. The conditions vary in different industries.”—That is a strong point that we took.—“Much more exact and detailed medical investigations in workplaces are needed before a positive conclusion can be arrived at.” That is exactly what I had sent to you, and that is in the *British Medical Journal* of last Saturday.

1782. Another cause operating against steady improvement would be the continual spread of urban instead of country life?—Yes. We have little or no country life compared with what we have had.

1783. You have no doubt that the physical conditions of country life are infinitely better than those of any town, however good its sanitary arrangements may be?—Yes: I think that my conclusion is that it is seventeen years better in the country than in the town. It is long ago I came to that conclusion when working upon this subject.

1784. But, suppose, owing to the increased facility of locomotion, an increasing proportion of the labouring classes in towns were living in a quasi-country, what would you say then?—Oh, yes, in the suburbs, that is a fact: since the electric cars were introduced into Glasgow that change is most marked.

1785. And the hygiene of the suburbs is almost as good as the country?—Almost. For instance, in that school to which I drew your attention there were no slummers. They were working men; they were all engaged in something; but they were not loafers or living by thieving.

1786. I wanted to ask you about page 3 of your evidence, about the half-timers. You say there have been no half-timers since 1900. Is that due to the school law of attendance that it is dying out?—No, no. You will excuse me saying that it is a very strange thing that in Scotland the chief town for half-timers is Dundee, and that is the most wretched town in Scotland for rickets. At that meeting at which I read that paper on medical inspection and supervision, my friend Dr. Campbell, who is the certifying surgeon in Dundee, spoke very warmly in favour of the half-timers and their condition; and I could not help standing up and giving my experience in Glasgow as being entirely the opposite of his; and yet I saw Sir Archibald Hunter's remarks on the children of Dundee, and I could not help thinking that if there were fewer half-timers it would be better.

1787. The abolition of half-time would be, in your opinion, a valuable thing in improving the health of the younger generation?—Certainly. If they want to work they could run errands, or something of that sort.

1788. (Chairman.) There is plenty of home work that they could do?—Yes. A very interesting case is this: A girl came before she was fourteen years of age to be examined by me. She wanted so long before she was eligible, and I told her, “I cannot pass you,” and she cried. But I said, “I will tell you what I will do: if you will go and come back here in three months' time, I will examine you again and see what I can do,”—with the result that she came back to the day, a rosy, healthy girl. Why? The reason was this: The child was crammed to death in the public school. When she came to me she was anæmic and I could not allow her to work, and I said, “Come back in three months.” During the interval she got plenty of work to do, such as the running of messages and carrying milk, and so on, and came back a fine, rosy girl, and continued to be.

1789. (Mr. Lindsell.) But she was free from school?—

Yes. I said to her, "If you come back in three months you shall go to this factory." With this experience the girl went away to carry milk and run messages, and came back in splendid health, with the fresh air that she had got, and she was blooming and rosy.

1790. Then you do not think that great regularity is altogether a benefactor in national health?—No, and especially cramming. Of course, we are not so badly off now, as used to be the case. When they passed the 5th standard they used to be allowed to leave school.

1791. You said there was a change in the law and that the age limit had been raised to fourteen?—Yes.

1792. You were referring to the Scotch Education Act of 1901?—Yes, that is so. You are not allowed to go into the factory until fourteen years of age, unless you get a certificate from the School Board.

1793. It gives them power to certify. Under the old conditions is that being applied?—There are no special standard conditions—they impose attendance conditions, is not that so?—No, if they are over thirteen years of age, and under fourteen, they will be allowed, if they have passed the examination and taken a certificate, to leave school; then they can be presented to a certifying surgeon before fourteen.

1794. But there seems to be no distinction in the Scotch Education Act between children between twelve and fourteen?—No.

1795-6. Any child over twelve may be employed subject to such conditions as the School Board think fit as to further school attendance?—I know; they first must satisfy the School Board that they have got a sufficient education.

1797. And that is the condition substituted for the Factories and Workshops Act of 1901, in the case of Scotland, for the English condition about becoming a young person at the age of thirteen?—That is so.

1798. At that public elementary school that you spoke of, they were a better class of artisans?—I would not say that they were a better class of artisans. They are labourers with about £1—18s. or 20s.—a week, and then up to perhaps 35s. a week; they were there of all kinds. But as I said, it was a typical working men's children's school.

1799. I suppose it was better than a good many in Glasgow?—Yes.

1800. You have not applied a similar test to any other school?—I had just this one school and I had plenty to do.

1801. (*Colonel Onslow.*) Is that the Eastern district of Glasgow?—It is the Tollcross district; it is where the working classes are—those who can afford it send them to a better school, and they could do that by electric car or by the train. But I thought it was an extremely good case of the working men class.

1802. (*Mr. Lindsell.*) Among the remedies that you consider most important to improve anything wrong in the physique of the young you attach more importance to food than anything else, I think?—Yes.

1803. And among them a supply of good milk?—Yes, and this inspection and supervision.

1804. Well then you also advocate that there should be a medical inspection and supervision of all school children?—Every child.

1805. That would entail enormous expenditure?—I do not think so. I see in the recommendations of the Physical Inquiry report that they say the medical officer of the town or county should do it, and that his honorarium should be £100.

1806. To go round the thousands of children in elementary schools, would it not require an immensely increased staff?—No. In this report they suggest an increase of the staff of the Inspectorate and medical men connected with the Government, but not in the medical officers of health.

1807. To require medical inspection of the eyesight you would require an optician, and for the teeth a man who understands dentistry?—Perhaps not.

1808. But great importance is attached to the eyesight and the teeth now?—Yes.

1809. But even when they have recommended general medical inspection they have recommended beyond that the examination of the teeth of children?—Yes.

1810. I am afraid you are rather severe upon the system of the laws of health and hygiene in the school teaching?—Yes.

1811. Is it not the case that in England, and I suppose in Scotland, the education authorities provide grants and facilities for teaching those subjects?—I know.

1812. What do you think is wrong?—I say that it is not practical enough.

1813. Your objection is the unpractical way in which it is taught?—Yes, it is not practical, it is not every day life.

1814. Could you suggest anything to us, for we should be glad to have any hints to improve the present system of instruction on these subjects?—Well, I have already given you an example of what I told the inspector of schools, for example. Instead of teaching the children about their epigastrium you should teach them that milk contains all the elements of good food.

1815. What is really wanted is that teachers should be educated to give this instruction in a practical and not in a mere book form, you think?—I say they ought to be told about these common things and not to teach them as if they were going to make the boys and girls doctors.

1816. You think there is a want of intelligence in the system, in the way the teachers impart this knowledge?—That is so. There is one point that I should like very much to go into that I thought very interesting, but I have not time to do it, and that was to go round the various works and to get the list of all the recruits that have gone out from these works and how many were rejected, and why.

1817. (*Chairman.*) Could you take the opportunity when you return to Glasgow and let us have it?—Yes.

1818. (*Colonel Onslow.*) Would you be able to get it? In some places you would?—Well, I am thinking of a large good-sized engineering works where there is a commissionaire who is the gateman, and this is the man I first spotted as the man who would help me. I said to him "how long have you been here," and he said, "fifteen years." I told him where I was going and I asked him if he could tell me the number of young men who have joined the army and the navy, and he said he could, and he gave me a list of the names and the addresses of those young men who have left there in these fifteen years. Only one man, William Baines, was rejected in the whole lot; his father and his mother were wee people and he was rejected on account of his height. Of course we could not help that.

1819. (*Chairman.*) If you could get that it would be very interesting?—I shall do so.

1820. (*Colonel Onslow.*) I know a great many men who only pass a short time in these places, and those men come to us in the army and the navy. They are only the casual labourers as it were?—Very likely. This man that I have been speaking of is a commissionaire, an old soldier himself, and he is interested in the whole subject.

1821. (*Chairman.*) If you can let us have it in the next few weeks we shall be glad to have it?—Yes, it would be reliable information. I have had a great number of the miners who joined the army during the war time, and I do not know one single man who was rejected.

1822. That would be interesting if you could give us information about it?—Of course the population is a purely industrial one.

1823. (*Mr. Legge.*) That instance you gave of the girl whom you provisionally rejected from the factory service but afterwards passed leads me to ask you if you would be prepared to except from your adverse criticism the half-time employment of girls in their own homes who assist their mothers, provided the school authority was satisfied that the home was a decently kept one?—As I pointed out the first thing that struck me was that their habits were not well bent in that direction; they were not regular; they have a half day or a whole day, and the next

Dr. Scott.

Dr. Scott.

day they are idle ; and they were working in a factory not getting the regular benefits from work in that factory, the regular habits such as the breakfast hour and the dinner hour, and the next half day they were running wild. You know they are bound to attend school when they are working half a day in a factory.

1824. I quite agree with all that you said about that, but I am asking whether you would make an exception in favour of allowing a school authority to license a girl if the home were a decent one for half a day ?—Then that is not under the Factory Act at all.

1825. No, I am talking of an entirely new provision of the law ?—That might be. It never struck me.

1826. You think it might encourage a mother to have a decent home ?—It might in the suburbs ; that might be a very good idea.

1827. It might be perhaps the means of providing them with the more practical instruction in cookery and so on that you desiderate. With regard to progressive deterioration, have you any feelings that the lowest form of home life is dying out not through sterility, not because the parents cannot bear children, but because the children they bear are too feeble to survive the first year of life ?—There is a great deal of physiological truth in that statement.

1828. I have one or two questions to bring out your views as to the extension of the Factory Acts. First of all I gather that you would like to see the provisions of medical examination and inspection already obtaining in factories extended not only to workshops but also to a number of employments at present outside the law ?—Yes.

1829. Now would you like to see what powers you have in regard to factories extended ?—Yes.

1830. Further, would you like to have similar powers in relation to the examination of adults that you now have in relation to children and young persons ?—No, that is to say unless there was something prompting me to do so. For example, to a working engineer I would say no, but if that man were pointed out to me as having a cough and spitting, I would say that it was my duty to say not only for the sake of himself but for the sake of his neighbours that something should be done ; and then again, in the enamelling work I want power to go into that enamelling work and say “now your health is lowered and I am afraid you are taking chronic lead-poisoning. If you do not be careful I will suspend you for a month and you will require to get other work.” That to me would be a strong lever in making this man take care of himself. There is nothing they are more terrified about than that they should be kept off for a month. They make splendid wages, and the drink results in the vitality being lowered and they become subject to lead poisoning. If they are strong and healthy men and clean men that is a different thing. I spoke in my evidence as to the dipper in a pottery who had been there twenty-five years, and he never had the sign of lead colic about him, but he is a total abstainer and a cleanly man. In my opinion especially those laws under the Factory Act, given to us at the present moment, are quite sufficient to keep it down, but they would require to extend it, as Mr. Legge said just now, to other parts, not to have special rules but rules to apply to every factory wherever disease arises or crops up in dangerous trades.

1831. With regard to adults you would be satisfied with extension from time to time, as might be found desirable, of the provisions already obtaining with regard to certain dangerous trades ?—That is so.

1832. I was interested to hear you say of a particular class where you gave a note to the employer about a girl as to the girl's condition ?—Yes.

1833. You think that anything that makes the occupier of the factory responsible or feel the responsibility is an advantage ?—A great advantage.

1834. With regard to the employment of women during pregnancy, would you like to see an extension of the period within which she must not return to the factory ?—I would not allow the woman to go to the factory at all.

1835. You mean before birth ?—Yes, whenever it is known that she is pregnant she ought not to be there, and she ought to be dismissed, and if she is a married woman

and have children she has no business there—I would set my face against it.

1836. You would be prepared to advocate an amendment of the law by which it would be made illegal for a pregnant woman to work in a factory ?—Yes, that is so.

1837. And for what period after the child's birth would you exclude her from the factory ?—That is going against my recommendations that I have given to you already. I say that the great danger arises in the period of youth when the mother goes out to work.

1838. Would you absolutely prohibit a mother who has children from working in a factory or workshop ?—Yes. The children must be attended to if they are to be healthy subjects of our King, and I would not let them work. Look at the case of that woman of Saturday last in the Royal Infirmary, the mother of nine children, and yet drinking all the money she was making.

1839. Now as regards statistics, do you not think that it would be a very good thing if we had some sort of means of a comprehensive survey continually going on. We have an ordnance survey, we have a geological survey, would it not be a good thing to have a survey which would bring out facts, which would show the physical condition of the population or certain specified sections of it at a particular time ?—I do.

1840. As regards factory operatives, a large portion of the population, any central bureau, ought to work through the certifying surgeons : ought that not to be ?—Yes.

1841. You have given a number of examinations you have taken in particular years ; would it have been a great addition to your labour in examination of those 1,912 cases, say in 1896, if you had had a card on which you filled up certain physical details ?—It would have increased my work and it would have increased my interest and I should have liked to do it.

1842. You are paid a certain fee for those examinations and that fee would have to be increased ?—It would take longer time.

1843. Could you say what absolute minimum of physical measurements is necessary. You would want height ?—Yes.

1844. Would you want weight ?—No.

1845. Do you want chest measurement ?—I would, and the very fact that you are taking the chest measurement would give an idea about phthisis.

1846. You would take chest but not weight ?—I would, with all my heart.

1847. But the chest is not easy to take ?—Why ? Those I did take, that I have given you to-day.

1848. How did you take them ?—First of all, they were working in Finniston ; those good boys that I was telling you about. The boy had a vest on, and what is called a sweater. I said, “Pull up your sweater,”—a knitted thing ; and I got my tape right round his nipples and under the scapula.

1849. (*Colonel Fox.*) You took in the scapula ?—Over the nipples.

1850. And under the scapula ?—Yes. And then I measured it. Took a little time, but got it pretty satisfactory. The boy generally had nothing but this sweater on, a cotton shirt, and that opened out, and you put it right round. I had not much difficulty.

1851. (*Mr. Legge.*) Did you take the chest fully expanded ?—Yes. I said, “Breathe out, and draw in your breath.” And it took a good while to get the boy educated to that.

1852. (*Colonel Fox.*) You took two measurements ?—Yes. One on the expiration, and the other on the inspiration.

1853. (*Mr. Legge.*) You think that rough and ready method would be ample ?—I think so. I repeat that taking that rough and ready method would lead you to see if there was any marked sign of tuberculosis. Do you not think so, Dr. Tatham ?

1854. (*Dr. Tatham.*) Probably.

1855. (*Mr. Legge.*) I do not know whether you are aware—they seem to have made very elaborate inquiries about linen workers in Belgium—whether the Belgian authorities laid great stress on grip ?—Yes.

1856. Do you attribute great importance to the strength of the grip?—No, I never tested it, except in nervous diseases.

1857. Do you attach importance to what they call a reactionary test?—No; there are so many concomitant circumstances.

1858. You would be satisfied with the form which gave height and chest measurement?—Yes.

1859. You would be glad to see an extension of such inquiries as have been made by the factory department, either by their own inspectors alone, or working in conjunction with the certifying surgeons, as a more detailed survey of those engaged in a particular occupation?—Yes. Very strongly. There is an interesting field there.

1860. One of those particular points, which you have laid stress upon as a matter for detailed enquiry, is fatigue?—Yes.

1861. I have one or two questions to ask with regard to the teeth. Do you think for the proper keeping of the teeth a tooth brush is indispensable?—Almost. If they live on porridge and milk, and good healthy food I would not care so much; but it is very useful.

1862. But I mean, would you be satisfied if they rubbed them with a rag or a finger. Have you ever heard of a crust of bread being used?—Yes. I have heard of that. The fact is, that the use of the tooth brush to my mind is this, that it simply draws their attention to the fact that it is absolutely necessary to preserve the teeth in any possible way whatever.

1863. Now, as to anæmia. Is it your opinion that this is commoner amongst females than males?—Yes.

1864. Why is that?—I would think that it was due in a large measure in the females from the drinking of more tea, and their being more sedentary in their habits. The young man plays football, and gets out a great deal more.

1865. (*Chairman.*) You think it is the confinement in the case of the females?—Yes.

1866. (*Mr. Legge.*) Now we have had some evidence very strongly condemning the conditions under which milk is supplied in this country. Are you satisfied with the sanitary conditions of dairy farms, as you know them, and dairies?—In the first place, I would say that the conditions have very much improved. I would say yet that there is much requiring to be done—very much with regard to servants' hands and sore throats, and I think there should be far more examination and supervision.

1867. Would you go so far as to advocate rigid inspection of all dairy farms?—I would in Hendon cow disease, which is allied to scarlet fever.

1868. Would you advocate an extension of the system that has already begun, of municipal depôts?—I would, especially in towns such as Glasgow.

1869. But you are not prepared to roundly condemn, so far as you have the means of judging of the present system?—No.

1870. (*Colonel Onslow.*) What standard have you of examining factory children?—Have you any standard laid down for the guidance of inspectors?—No. Just what you consider. First of all, you know what the boy or girl is going to be engaged in, and the question one has to decide is, to say whether that boy or girl is fit for the work, and you are at liberty to go and see that place.

1871. You say that you find that porridge was greatly used in Glasgow?—Yes.

1872. Is that generally the case in Glasgow the whole year round?—The statistics I gave here just now are from that school.

1873. Just at that time. I know that Dundee is a great place for rickets?—I have only read that. I never saw them.

1874. I am speaking from a practical recruiting point of view that in Dundee that is a very constant cause for rejections for recruits. In inquiring into it last summer I found that practically none of the poor people took porridge—is that the case?—I could not tell you with regard to Dundee.

1875. And that porridge is now confined almost entirely to the country?—That is not the case in Glasgow.

1876. That accounts a great deal for the prevalence of rickets in Dundee?—Yes.

1877. In your experience do you find much trace of hereditary disease, such as syphilitic?—Yes.

1878. Anything which is liable to be transmitted—you find that?—There is no doubt about it.

1879. You say you do not think it is important that children in case of any regulation for constant inspection should be weighed. Why do you not attach importance to it?—You will get one big flabby boy for instance; another spare and muscular.

1880. But weight conjointly with the height would surely be some guide?—I do not think it would be much. I get far better results from grasping the muscles of a boy's arm.

1881. As regards that system of taking the chest measurement, that would do no doubt to ascertain the presence of any disease in the chest?—Yes.

1882. But it would not do where you have a scale of chest measurement that would debar from following a particular occupation. For instance, in the case of recruits you take a recruit under a certain chest measurement and your chest measurement would not do—it would not be sufficiently accurate, would it?—In taking these measurements for example in the way I did—

1883. You spoke of taking the clothes up like that?—Yes.

1884. But that shows the bad form of the shoulders?—You have looked at the shoulders already and you have simply to keep the clothes on and get it round. You cannot do it with girls at all.

1885. But with boys?—I find that quite serviceable with boys. Well it certainly as you say makes them unshapely.

1886. Does it give a very good measurement?—Yes. I would be quite satisfied with it.

1887. Do you find that the teeth are very bad in those children?—No; they are not very bad.

1888. (*Colonel Fox.*) You said just now that you were prohibiting mothers from attending the factory before childbirth?—Yes.

1889. (*Chairman.*) He said altogether.

1890. (*Colonel Fox.*) For a certain period.

1891. (*Witness.*) If they were having young children they ought not to be there at all.

1892. Would you prohibit them from being there?—Yes.

1893. And for some time after childbirth?—If the child died, she could go back, but so long as the child required a mother's care, I would not allow it.

1894. For how long would you prohibit it?—A child requires perhaps not so much attention after three years of age.

1895. (*Chairman.*) You said that no mother that had young children should work in a factory?—Yes.

1896. (*Colonel Fox.*) Now in the case of a woman whose children are absolutely dependent upon her wage what would you do?—In that case there should be a *crèche* or something to put the child in. It is not fair to leave it anyhow.

1897. I am speaking of a woman who is entirely dependent upon her wage for the support of her children. What would you do then?—The child should be taken care of by the municipal authorities.

1898. Then you recommend that she be provided for by the municipality?—Not to take away her independence.

1899. She has to live?—Well, she is working. Here is the point. I say that if this child is younger than three years of age it should be taken in charge by the Corporation, by the authorities, and they will take care of this child from six in the morning until six in the evening.

1900. (*Chairman.*) And the mother pays?—And the mother is working.

1901. (*Colonel Fox.*) But she has been prohibited?—No, she goes there if the child is taken care of. But I say if there is no one to take care of the child she has not to go to the factory.

Dr. Scott.

1902. (*Dr. Tatham.*) You were mentioning just now the notification of phthisis. You know that in this country it has been proposed to make the notification of phthisis compulsory just as in the case of any other infectious disease. You agree with its notification?—I do, strongly.

1903. Do you propose that in Scotland notification of phthisis should be made compulsory?—Yes, it should be made, but I would not say compulsory. I would not have it reported, the same as scarlet fever, but that every medical practitioner should notify it voluntarily to the medical officer of health.

1904. With what view would you wish for voluntary notification?—This information would direct the attention of the Medical Officer to the district of the street, and even the house in which the disease was most prevalent, would keep him in touch with those more directly exposed to the infection, and would enable him to use means for the prevention of the disease.

1905. But you have not in your mind the desirability of compulsorily isolating a patient because he has got phthisis?—They will require to be educated to it.

1906. You have not that in your mind?—I would have that, if possible.

1907. Do you think that the people would stand it?—I think that they would. Besides, they are educated up to that point now, especially with regard to small-pox and other germicidal diseases; and they would be isolated, and it would be to their benefit to be isolated.

Mr. HARRY JAMES WILSON, called; and Examined.

Mr. Wilson.

1910. (*Chairman.*) You are His Majesty's Inspector of Factories and Workshops in Newcastle-on-Tyne?—Yes.

1911. In considering the question of physical deterioration you have found an initial difficulty in determining the normal type?—Yes, I understand no standard height, weight, or chest measurement, for different age periods, has ever been agreed upon so far as the United Kingdom is concerned, and one is immediately confronted with the difficulty of determining what a normal individual should measure relative to his age.

1912. You know the normal type will differ in different parts of the United Kingdom according to the ethnological tradition of the people?—Yes, according to the racial characteristics. In studying this question myself, I have considered the crofter or small holder, such as one finds in the rural districts of England, but more especially in Scotland and Ireland, as a fair type physically of what an individual brought up under reasonably healthy conditions ought to be. The men and women of this class are usually of good height and weight, have superior muscular development, and possess the power of endurance in a marked degree. I am not aware there have been any fundamental changes in the environment of this class for many generations, except that their habitations have been materially improved, and their diet slightly modified of recent years. In all probability also this type represents fairly accurately the rural inhabitants who tilled the soil of these islands during the last few centuries, and constituted then the bulk of our population.

1913. How does the town-bred artisan compare with the type you have taken?—Very unfavourably.

1914. Will you explain how?—Contrasted with this class the town-bred artisans are, more especially in large, industrial centres, distinctly less both in height and weight, and their general development inferior. Even shop assistants and clerks drawn from the families of the lower middle classes compare very unfavourably with these men, and their equal is only reached among the upper middle classes where the individuals have been trained to an outdoor life, or allowed sufficient exercise and sleep during the period between leaving school and attaining full growth. Students might be considered as having these advantages, there being no necessity for them to commence work at an early hour, thus curtailing sleep, nor any pressing reason why they need remain many hours on end in confined or dusty atmospheres.

1915. Where do you find most marked degeneracy?—The most marked degeneracy, in my opinion, is found where the greatest number of adverse circumstances are

1908. But do you think that if you went to a man to part with his wife because she has got phthisis he would allow her to be taken to a hospital? Do you think that that would be generally acquiesced in in Scotland?—I do.

1909. Your principal reason for advocating it would be in order that the sanitary condition of the house should be improved?—Yes, and the place and the surroundings, in order that it might not spread, as it were, either to the inmates of the same house or to people in that district.

NOTE.—*The Witness subsequently sent the following Memorandum, relating to Question 1834, et seq.:—*

I have carefully re-considered this part of my evidence, and would now suggest:—

1. That the nature of the employment—and not the maternal condition *per se*—ought to be considered.
2. Medical inspection and supervision.
3. That all children under three years of age ought to be cared for, either by the mother or some reliable person, or in some *crèche*, nursery, or school;
4. No life assurance till after five years of age.
5. That drunken fathers be compelled to support their families, and, if necessary, employers have the power to retain part of their wages for that purpose.
6. That the laws of health and hygiene—chiefly practical—be taught in school;

Alexander Scott.

actively at work from birth to maturity, as for instance among the very poor in our old industrial centres, and is especially noticeable in the case of poorly paid and unskilled indoor workers, the women suffering about equally with the men. This degeneracy can be best studied in certain textile industries, or wherever the remuneration is so small as to attract the lowest in the social scale.

1916. You place the wage first as a factor in influencing physique, but may you not in certain cases be rather putting the cart before the horse. Is it not physique which often determines the wage? I mean that the class of population is so poor in physique that they are not entitled to a good wage, and it is the fact that they will do work for an inferior wage, which not only keeps them in a condition from which they can never emerge, but also tends to press the class above them who but for their competition would be in receipt of a better wage?—I fancy I am rather misunderstood. I mean that it is the wage of the parents which determines the physique of the offspring. A man's own personal wages have very little effect upon his own physique, at least after maturity. The wage determines more or less the following: (1) The class of house the parent can live in; (2) The class of food he can supply his family with; (3) The locality in which he must reside; (4) The quality and quantity of the family clothing; (5) The age at which the children must commence labour, and the trade they are to be put to; (6) In certain instances whether the mother must be a wage earner or not. From the above, it will be observed that in the case of an unskilled labourer, assuming that he personally is physically strong, by no means so common as one would imagine, if in receipt of a wage under 20s per week, he will be compelled to live in a very small house, say one or two rooms, and necessarily in a central locality, for his wage will not allow of railway or tram fares to and from his employment. Houses of this class are usually in the poorest localities, frequently overcrowded, and the death rates for infants and adults almost invariably high.

1917. What are the chances of the children under such circumstances?—A child born in such circumstances commences life handicapped from birth, possibly even from before birth. Assuming that the parents or either of them were in a low state of general health due to overwork, underfeeding, or intemperance, at conception, it might be expected that the offspring would exhibit signs of constitutional debility after birth, and I am not aware that the employment of mothers during pregnancy in arduous indoor-work, possibly in high temperatures, such as a spinning mill, necessitating prolonged standing,

contributes in the least to the child's benefit; rather, one would expect the reverse.

1918. And then in the ensuing years?—If the child survives the first year in the city slum, fed at times with cold tea administered by means of dirty bottles and tubes, seldom bathed, and rarely carried out and aired, he yet may carry to his grave the effects of parental neglect and ignorance during this period. Infectious diseases always associated more particularly with the densely populated town areas, will probably attack him during his childhood, and his food almost to a certainty will from time to time be insufficient in quantity or unsuitable in quality.

1919. You do not think that is at all a highly coloured picture of the conditions of childhood among great numbers of the class from which factory operatives are provided?—They vary so much in different cities. That is rather understating than overstating the condition of affairs in Dundee, for instance.

1920. You speak with a special knowledge of Newcastle?—And of Dundee also. I have had three years experience as an inspector in Leeds, and I was in East Lancashire for a short time. I was five years in Dundee and I have been three years in Newcastle.

1921. We heard from Dr. Scott that Dundee was probably the worst town in Scotland, or even Great Britain?—Yes, I could give you a great deal of evidence on that point, because I had a great deal to do with the operative class there.

1922. There is a great deal of half time?—It is now reduced to 1,200 or 1,300 children.

1923. That is considerable?—There is a large proportion of women there—many more women employed than men.

1924. With regard to half time, can you say from your knowledge that it is very prejudicial to physical development?—That is the impression I gather from my experience there, and I had a great deal to do with it.

1925. You confirm what Dr. Scott said?—Yes; but there are special circumstances why these children should be so bad. To begin with it is usually only the very lowest class of child who is sent to work half time, because the parents are so poor. The wealthier parents do not send their children to work until they are fourteen years of age, so that they do not come under the unhealthy conditions of factory life until they are rather further advanced in growth and development.

1926. Then will you continue your description of the children from school through adolescence?—Yes. White bread and tea one constantly finds supplied to growing children and to boys and girls of fifteen and upwards, working long factory hours at exhausting duties. That was the case in Dundee. I have been time after time in the houses of the working classes there during the meal hour and seen them have bowls of tea without cream and sometimes without milk, and wheaten bread.

1927. And strong tea which has stood for a long time?—Yes, that was the habitual custom there. Immediately on the expiration of the compulsory school attendance period, fourteen years of age, this child will commence to labour for his own bread. If he resides in a textile district, employment at relatively good wages will be readily found for him, but the hours will be long, fifty-five per week, and the atmosphere he breathes very confined, perchance also dusty. Employment of this character, especially if carried on in high temperatures, rarely fosters growth or development; the stunted child elongates slightly in time, but remains very thin, loses colour, the muscles remain small, especially those of the upper limbs, the legs are inclined to become bowed, more particularly if heavy weights have to be habitually carried, the arch of the foot flattens and the teeth decay rapidly.

1928. Are these effects the effects of factory employment under the most favourable conditions, encouraged by the law?—These, I should say, are largely gathered from my experience more particularly in Dundee. I could not speak of them in Newcastle because the industries there are more of an open air character or partially so. In the shipyards the men are working in the open-air all day.

1929. And therefore it is pursued under more healthy conditions?—Yes, in the jute mills and the flax mills in

Dundee; and the cotton manufactories in Lancashire and the woollen mills in Yorkshire, this is very much the condition of affairs. Mr. Wilson.

1930. You think the recruiting returns indicate the effect upon health?—Yes, I think so, from examining them. Hundreds of factory youths answer to this description, and an examination of the Recruiting General's annual reports will confirm my statement. Were the females submitted to a corresponding examination they would be found little superior. They exhibit the same shortness of stature, the same miserable development, and they possess the same sallow cheeks and carious teeth. I have also observed that at an age when girls brought up under wholesome conditions usually possess a luxuriant growth of hair, these factory girls have a scanty crop which, when tied back is simply a wisp or "rat's tail."

1931. Do you think that as a whole girls resist the effect of these surroundings better than men?—That is my impression. I weighed and measured a few and that is what I gathered at the time. My impression is that, generally speaking, females withstand the evil effects of adverse environment slightly better than males from birth to at least maturity.

1932. Can you explain this?—I am unable adequately to explain this, but the heavier mortality among male as against female infants is quite recognised. You know these facts better than myself, but I understand that during the first year of life the statistics show there are a larger number of deaths amongst males than amongst females, and I am rather inclined to suppose that that delicacy continues even after the first year. During puberty, girls appear to shoot upwards and develop rapidly; they seem to receive a stimulus which the boys do not experience, and I have frequently noticed members of one family brought up under exactly similar conditions exhibit marked contrast in physique, the lads being singularly thin and undersized, while the sisters appear better nourished and relatively taller.

1933. Have you formed any opinion of the relation of employment to development?—The character of employment has a profound effect on development, as it covers a considerable period of the growing age usually from fourteen to twenty-one, but in the case of half-timers it may commence as early as the age of twelve. The most unsuitable class of occupation has been described; the most beneficial, perhaps, is farm labouring, after that industries partially conducted outside, such as ship-building, rope-making, iron-rolling, quarrying, and fish-curing. The best all-round muscularly developed men I have met with among working classes are undoubtedly navvies; almost without exception these fellows are country bred and hail chiefly from Ireland. The most powerfully built are I think West Irishmen, and particularly natives of County Kerry.

1934. I suppose occupations have some selective effect?—Yes. Occupations have a powerfully selective effect, the strongest following the calling where their physical powers will have the maximum advantages in wage earning, and the weakest drifting to those where their lack of vigour will tell least against them. Thus one finds splendid men working as navvies, pig iron carriers, that is in blast furnaces, bleaching powder packers—a very trying occupation, one of the most trying, I should think—cement workers, labourers in steel plate mills, and to a slightly lesser degree, as steel smelters. These occupations are not only exceedingly arduous but throw a severe strain on the powers of endurance and speedily sift out the inefficient. The vast majority of these workers are country bred and have grown to maturity at farm or outdoor work.

1935. Where do you find the worst types?—Persons of poor constitution, or suffering from slight deformity, frequently become tailors or shoemakers, and the great mass of ordinary tradesmen with medium development and stamina one finds working as joiners, printers, moulders and fitters, etc. I would place barbers, clerks, shop-assistants, textile operatives, and bakers, etc., below ordinary tradesmen in point of physique, their occupations not being of a character to foster development; but the very poorest are met with in the lowest paid and unskilled textile operations, as casual labourers, and occasionally in potteries. Personally the poorest specimens of humanity I have ever seen, both men and women, are working

Mr. Wilson. in the preparing and spinning departments of certain Dundee jute mills. There are special reasons, of course, why they should be so extraordinary bad there.

1936. Because the wages are poor and they come from the very poorest class?—Yes. I think in my annual report for 1900 to the Chief Inspector of Factories, I made some remarks about the textile industries of Dundee. I could give particulars of 169 boys and girls that I weighed. I am now speaking of the number of half-timers: “By far the largest proportion of children in the district are employed in Dundee itself, the number engaged outside being relatively small. I append a table shewing the substantial and steady decline in the numbers of children working in Dundee during the five years I have been in the district:—

In 1896 there were	2,793	children.
„ 1897 „ „	2,617	„
„ 1898 „ „	2,437	„
„ 1899 „ „	2,135	„
„ 1900 „ „	1,824	„

I believe now it is down to about 1,200. “If this reduction continues for a few years more, child labour in the staple industry will become a thing of the past. As you are aware, I have remarked year by year upon the poor physique of the typical Dundee half-timer, and suggested certain causes for this unfortunate condition of affairs. Many of these children are born and brought up in single and double-roomed houses, or in large tenements, where the conditions of life are almost as unnatural and injurious as it is possible to imagine. Overcrowding often exists, in conjunction with general squalor and intemperance on the part of one or both parents. Injudicious and unsuitable feeding during the susceptible period of infancy, exposure to inclement weather, and general neglect appear to be largest the cause of infantile deaths, as the children who survive seem to suffer more or less from weak constitutions throughout life. The latter class are often very short and far below the normal standard in weight. Un-

doubtedly, factory life, although not specially injurious to workers who have naturally strong constitutions or who commence labour after having reached maturity, nevertheless neither fosters growth nor development, and has a distinctly harmful effect on undersized or badly nourished young persons. Thus I have frequently conversed with full-grown men of twenty years and upwards who do not stand more than 5 feet or 5 feet 1 inch in height, and who scale less than nine stone. These men have not the physical strength for heavy manual labour, or indeed any task which demand prolonged efforts, but must accept unskilled labourer's wages in mills or factories all their lives.” As a matter of fact these men are doing women's work very often. They get from 10s. 6d. up to 17s. a week. “Such wages are usually very small and quite inadequate to support a wife and family. The degeneracy exhibited in males is similarly remarked in females, but in a slightly lesser degree. The present race of mill workers in Dundee are the descendants of generations of operatives, there being little intermarriage in this class with persons of rural origin. The operatives in the surrounding towns of Forfar, Arbroath, and Brechin are taller and more robust looking than their colleagues in Dundee.” I have here the figures of the children that I weighed and measured:—“Towards the close of last year I measured 169 boys and girls and weighed them, with a view to discovering the exact amount of degeneracy as compared with the recognised normal for children of the ages specified. The heights were measured in stockings, and the weights include ordinary winter clothing. The children and young persons were exclusively employed in jute mills in the heart of Dundee, and were taken indiscriminately, so as to secure as far as possible a fair average. The following are the results, two tables being ranged alongside for comparison, selected from ‘Treves's Physical Education,’ and (Holts) treatise (American Authority) on ‘Diseases of Infancy and Children.’ Assuming that the figures given by these to be approximately normal, the Dundee children will be remarked as decidedly deficient in both height and weight; indeed the contrast is remarkable.”

BOYS.

That figure of 62·8 lbs. in the first column is lower than the worst children in Edinburgh, according to the Scotch Blue Book. The figures for Dundee all contrast very unfavourably with those given alongside. Then I also give some figures for Brechin.

1937. It appears that the difference grows as they grow older?—Yes. It would hardly be credited that the children of these diminutive dimensions are earning their bread at laborious work. I gave an instance of the way in which children are brought up by intemperate parents.

1938. In the way of mal-nutrition and so on. It is admitted that that is the poorest and most ineffective class in Dundee; it is not the average type of the population of Dundee?—No, it is typical of the poorest. I do not think you could get them worse than that.

1939. You have considered minor causes of degeneracy as well, have you not?—Yes. If a child has been systematically ruined from birth by insufficient and unsuitable nourishment in infancy, lack of fresh air while asleep and awake in the helpless period of existence, and no means of exercise during summer or winter, but that afforded by playing about the staircase of a densely populated city tenement, it is obvious that a frame so stunted even under the most favourable subsequent environment can rarely attain to the standard of height, weight and vigour which nature intended. I mention that because those who are familiar with the very poor of a city will know that young children are rarely carried out and aired as they are among better class people. Until a child is able to creep about, or get outside itself it gets very little fresh air.

1940. What sort of tenements do the people in Dundee occupy?—There are a great number of single room tenements and two room tenements in Dundee and big blocks.

1941. Blocks which are perhaps in some respects no more healthy than the others?—A great many of those have no privy accommodation at all except a common one in the yard.

1942. What are the municipal authorities about in Dundee to permit that? You have the same laws in Scotland by which the local authorities can enforce a remedy for these things if they choose?—Yes. They are better perhaps than they used to be.

1943. Are they doing much in the way of progress?—When I left they were making a little progress.

1944. You have lived there some time?—Yes, five years, but in that respect they are still very bad. Among the minor causes of degeneracy I would include excessive cigarette smoking, a habit which is vastly commoner than it was even a few years ago among very young boys. When I went to Dundee in 1895 there was very little cigarette smoking amongst young factory lads.

1945. Do you think cigarette smoking brings intemperance in its train very often by creating a sensation of thirst; would you connect the two at all?—I believe the two might be connected, but this cigarette smoking which I noticed was amongst very young boys, eleven, twelve and thirteen years of age, a class of boys who do not drink, although you get lads of fifteen and girls of fifteen and upwards drinking in Dundee and getting intoxicated. I have frequently seen them intoxicated at fifteen or sixteen years of age—quite helpless. Early intemperance commencing at fifteen or sixteen, and insufficient sleep from infancy to maturity is an important item.

1946. That is almost inseparable from the conditions in which they live?—It is to a very large extent.

1947. Where there are single tenements or two room tenements?—Yes; there is always noise and fuss going on, and then in the morning the parents are getting up to work and they disturb the children. The children are running about the streets till 9 and 10 o'clock at night in the slums of most towns. This latter statement is important and can be easily verified by a study of the working classes in large cities. It is difficult to account for the subtle effect of fresh air, but it has an extraordinary influence on the health and growth of children, and undoubtedly also so has sunlight. Both these necessities are largely denied the very poor, the child breathes an impure atmosphere at home, at school and in the factory.

1948. Is it the case at school?—The air analyses of

schools which I have seen reveal a very bad state of affairs. *Mr. Wilson.*

1949. But that is from preventable causes and so also in the factory?—Even though there is not a very large amount of carbonic acid present in the air there are probably other influences at work, such as organic matter expired from the lungs and emanating from the skin.

1950. Noxious dust and so on?—Yes, which do not benefit a susceptible young creature. For nearly six months in the year he goes to work in the dark and returns in the dark, that is literally true—his only experience of sunshine being limited to the brief Saturday afternoon and Sunday. I have hardly touched on the question of general health, but my investigations lead me to believe that sickness is far more prevalent among the very poor than in any other class, and their powers of resisting cold and high temperatures correspondingly lessened.

1951. Now we come to the important question: Is degeneracy progressive? that is to say, are the conditions which no doubt make for the increase of degeneracy being gradually brought under control by ameliorative tendencies or otherwise?—I am in great difficulty in answering that question. I have been thinking a good deal about it since I prepared my evidence. I am not prepared to say that physical degeneracy is progressive. I have a suspicion that the lowest forms die out, not through sterility, but the offspring are too feeble to survive the first year or so of life.

1952. What does that suspicion rest on, have you any direct information on the subject?—When I was in Dundee I had a good many conversations with parents of children working in factories, and it was quite a common thing to find a woman had had as many as thirteen children and had lost eleven or twelve out of that number, in some cases the whole of them. It was quite a common thing for a woman to have had seven and lost five. The infantile death rate in certain of the worse parts of Dundee was extraordinarily high.

1953. Do you know how many per thousand it came to?—I could not exactly say now but it was comparable with some of the Lancashire towns. There are certain areas in the town in which it was far higher than for the whole town, infinitely higher. I myself have seen children who have subsequently died in Dundee lying very ill, wasted, over and over again. I have seen the operative causes at work very distinctly, where the mother was intemperate and giving the infant almost no nourishment. I have no doubt however that the number of inefficient and undersized men and women are rapidly increasing, owing to the greater proportion of the population being bred in unwholesome environment and nourished on unnatural foods. What I mean is that there are a larger number of the population now born and bred in towns and brought up in more or less unnatural conditions. They are not necessarily really unhealthy people or unsuitable for work, but they are not so big as if they had been brought up in the country.

1954. You attach some weight to the increasing knowledge of hygiene and so on, and the greater sanitary precautions which are taken. I suppose the organisation of sanitary appliances is higher in the town than in the country?—I understand that tinned milk is vastly more used by the working classes now than a few years ago. Its use is enormously increasing in Dundee and the Newcastle district, and there are about a million people in the vicinity of the latter city now.

1955. Do many of the parents get access to a decent supply of fresh milk?—The impression I have at Tyneside is that fresh milk is becoming too costly for them. It seems to me that that factor is at work.

1956. There is no municipal or charitable organisation upon a more or less commercial basis by which they can obtain it, is there?—Not that I am aware of. With the rural depopulation there is a corresponding decrease in the number of strong country bred men and women who in years past have helped materially to maintain a healthy stock by intermarriage with town dwellers.

1957. Have you formed any opinion as to how far the evil influences which you have described can be counteracted, mitigated?—It is a very big question. There are many ways in which it can be done.

1958. Would you like to see stronger municipal action taken? Do you think that educating the rising generation

Mr. Wilson. of parents to a better knowledge of their duties would do it?—I would certainly say the senior girls at school ought to be taught how to wash and bathe a child, how to clean the feeding bottles, and what is wholesome and what is unwholesome food for children. It struck me that the want of that knowledge in Dundee was very marked. You will find quite young girls becoming mothers there who have not the least idea of what to do or how to nourish a child.

1959. Would you regard this as a proper ideal in the instruction of girls, "A course of instruction should be given to the older girls in school in the practical tending and feeding of young children and in the practice of household cleanliness. Such a course would embrace the choice of milk supply, the sterilization and storage of milk, the preparation of the infants' food, the management of the infant as regards dress, cleanliness and simple elements, proper mode of cleaning the house and so forth?"—Yes, but a child is almost too young to benefit by that.

1960. A child of fourteen?—Yes, she seems to forget it. After she leaves school she goes to work in a factory, and by the time she becomes a mother she forgets it.

1961. The factory occupation tends to denaturalise women rather?—Yes. I believe she would acquire some of it, and it would be in the right direction—she would not be totally ignorant.

1962. We were furnished the other day with a return of the number of women working in factories. I suppose it would be possible for the departments of the Home Office to give us statistics as to the number of the male population working in factories?—Yes, statistics are almost ready for 1901. I do not think they can give you the number of married women, but they will give you the male and female.

1963. We know there are not statistics about married women. You say, in the course of your experience, that the conditions of factory life have very considerably improved?—Yes, in certain directions they have advanced very much, but that has been more in combatting the effects of dangerous trades, and, after all is said and done, these dangerous trades only affect a comparatively small number of the working population.

1964. Has much been done to improve the general sanitary conditions of factory work?—There has been some advance, but still it has not been great.

1965. You do not think legislative interference has by any means reached its maximum?—No, I do not think it has. To take a concrete instance of a child in a textile factory, it is the long hours in a high temperature, breathing a somewhat impure air, which tend against its general health more than anything else, I think; and it is difficult to see how you would overcome that unless you shorten the hours of labour. The child starts at six o'clock in the morning and works till six at night, and the only opportunity he has of getting fresh air comes after that, and in winter time that is not much.

1966. It does not work twelve hours, surely?—It has twelve hours, with two hours off for meals, except Saturday. And along with those long hours, of course, to begin with, the child is physically small, and its food during its growth is frequently poor.

1967. Does your experience as a factory inspector suggest to you any change in the law which you think would further the cause of public health?—I do not know that the Factory Act is the proper weapon to attack the question with. I am afraid the problem must be attacked from the outset—the child's birth. It would have to be applied to the parent in the home. I quite agree with what I heard the last witness say—that the first years of life are the most important, and especially the first year of life. I have noticed the children boarded out, who have been sent to a little place called Tomintoul in the Highlands of Banffshire. You could pick out those children who have come from the slums of Glasgow, although they have been living there on exactly the same class of food as the local children; they have retained that pinched appearance which is characteristic of slum children. I think also one might get useful information from industrial school children. I believe everything is done for their benefit, yet I question whether they are quite so big and strong as children born and brought up under the healthiest of conditions, because the mischief is done before they go to these institutions.

1968. A good deal is done to counteract it?—I may say I have some more figures, if you want them, of some men I measured at Tyneside, some navvies and outdoor workers, and I mention cement work as being an instance of an industry where the duties are so exhausting and arduous that only the most powerful men can stand them. They have found that the only fellows that can do that kind of work seem to be outdoor brought up men, especially Irish navvies. Town men cannot do it. They simply are physically unable to do it. It is a pretty severe test to put a man to, of course, and only applies to certain works.

1969. (*Dr. Tatham.*) I want to ask you a question or two bearing upon this tendency to migration from country to town, upon the general condition of the labouring classes. I understood you to say, and what you say confirms that which we have heard from other witnesses, that country-bred people of both sexes are much more robust than those who are bred in the town?—Yes.

1970. That is your experience?—Yes, certainly it is.

1971. The effect, of course, of the migration of so many of the best of the country-bred folks to the town deteriorates the country population considerably, does it not?—Yes.

1972. I mean to say their best blood goes to the town?—Yes, probably it does.

1973. Is there any other way in which the country population becomes deteriorated, do you think?—Yes. On the question of food, the quality of the food is changing, I believe, as it has changed in the towns. From my experience of farm labourers in the North of Scotland, I know they get vastly different food from what they got when I was a boy.

1974. Do you mean better food?—No, it is more expensive, but I do not know that it is better. For instance, some of the best built men I have ever seen are working on the Spey salmon fishing, their food as children has been oatmeal and milk and cheese, a little butter, meat perhaps only once a week; at present they are working twelve hour spells on night and day shifts, are out in all weathers, and have very hard work. They have broth in the morning before they go out, in the middle of the day oateakes and cheese with some milk, and at night when they come home they have a large soup-plate of porridge. After that they may have one boiled egg and a cup of tea, and some bread, jam, or cheese. That is their diet, pretty much, from one week's end to another, except that on Saturday they may have Scotch broth with boiled meat in it. In place of porridge they may vary with mashed potatoes, rice, pea, or potato soup.

1975. The reason I am putting this question is that whilst the best blood of the country migrates into the town on the one hand, on the other hand the domestic servants, when they are taken ill, and people when they become too old to work, return to the country to die?—I believe so, to some extent.

1976. Do you think that that, to some extent, is the cause of the deterioration of the country population—it is believed to be so generally, and I want to know whether it is your experience?—Do you mean as affecting the death-rate?

1977. No, the general physique. Of course, eventually it affects the death returns, but I was not referring to those?—If you mean that the strongest men, physically and mentally, leave the country districts to go into the towns where their abilities will benefit them, I agree with you.

1978. That is unquestionable?—Yes, I have noticed cripples and imbeciles, and that sort of people, are left about country villages.

1979. They are?—Yes, I have often noticed that.

1980. So that in both ways the country population stands to become deteriorated?—Yes, and yet, of course, you cannot really point your finger and say that the country population are smaller than they used to be.

1981. Speaking now of the town populations, more especially of the lowest class of the town populations, do you think that they are deteriorated, as compared with what they were, say twenty years ago—the dregs—I do not wish to use an unkind term, but the lowest class?—I am hardly old enough to give a really valuable opinion.

1982. Say, as compared with ten years ago?—I do not know that they are worse than they were ten years ago. Judging from the number of very small old men I have seen, I do not know that they are worse.

1983. My reason for wishing to get this opinion from you, since your experience is large and valuable, is this: that there has been in England at any rate for some time past, a generally expressed opinion that there is physical deterioration amongst the lower classes of the population, and it is very important to this Committee that we should know from gentlemen like yourself, who have had a large and varied experience, whether that is the case?—I certainly think that there is deterioration from the type of people that used to live in the country districts—I certainly think that, but if you get down to a certain level, I question whether it gets worse.

1984. Taking the population as a whole, and not dividing them into country and town, do you think there has been deterioration amongst the poorest class of the population?—Most undoubtedly.

1985. Within the last ten years, a progressive deterioration—it is very important that we should get to know this?—I would rather like to know what you mean by “progressive”? Do you mean that the off-spring of a father gets worse than the father, and so on—that the race gradually deteriorates?

1986. No, I mean this—taking the whole of the labouring classes of the country, do you think, or do you not think, there is a progressive physical deterioration in their condition?—Yes, if you put it in that way, I certainly think there is progressive deterioration—I mean as soon as a couple come in from the country and have children, those children will not be so good as the parents. I have remarked that over and over again. I have seen pig-iron carriers, blast-furnacemen, coming over from Ireland with their Irish wives, and I have looked at their children, and not always, but as a rule, the father is a big man and the son is a smaller man. City life seems to tell at once, even though the race characteristics are transmitted.

1987. Taking the country generally, and without distinction of town and country, do you think that the labouring classes in the entire population are deteriorating?—I find a difficulty in answering the question unless I divide the classes. Among the purely rural artisans there appears to be very little degeneracy, but among the town workers, who after all constitute the largest proportion of our industrial population, there is a marked deterioration going on, becoming more accentuated the lower one descends the social scale, and I have no evidence pointing to the younger generation being in any way superior to their fathers, but the reverse. I qualify this statement by observing that possibly the very lowest types are disappearing, but against this I notice a more general degeneracy affecting an increasing number of working people both male and female.

1988. I may tell you—I think I am entitled to do this—that as regards the evidence which we have had up to the present time, the contrary seems to be the case, namely that there is not only no progressive physical deterioration, but that there is evidence of the reverse, evidence of an improvement; is that in agreement with your own experience?—I believe myself that the worst types are dying out. Perhaps the very poor specimens in towns are getting fewer. But there is a very much larger number of men in industrial cities, varying in height from 5 ft. 1 in. to 5 ft. 5 ins., than you find in the rural districts—a very much larger proportion.

1989. (*Mr. Legge.*) But are there more to-day in any particular town? Is the proportion of those undersized men from 5 ft. 1 in. to 5 ft. 5 ins. greater to-day in any particular town than it was ten years ago?—I think it is. There has been such an enormous migration into these towns from the rural districts.

1990. But that is an impression. You would naturally expect to find that. But have you any observations upon which you can base that opinion?—I have had 300 or 400 men in iron-works in Hartlepool through my hands, and it was astonishing to find the small proportion of town-bred men there were among them; they were nearly all country-bred men, because the work was so hard that town-bred men do not readily take to it.

1991. (*Colonel Fox.*) Just now you admitted that the country folk, both men and women, do migrate into the town; they are healthy and strong people?—Yes.

1992. Would not that tend to improve the breed, the population of the towns; would not that tend to improve the physique of the towns?—I say that when their children come into the world in the towns, they do not compare favourably with the corresponding children in the country because the unsuitable environment tells on them at once.

1993. But the town people would intermarry without fresh blood being brought in, and would not the effect of strong men and women coming in from the country naturally tend to improve the physique of the population?—Yes it tends to keep it up, but what I wish to say is, in my opinion there is a much larger proportion of undersized men and women in the country to-day than there was some years ago, owing to the fact that there is a much larger number of people engaged in industrial work, and especially in town industrial work. I understood by the word “progressive” that it was meant going from generation to generation, getting worse and worse.

1994. (*Dr. Tatham.*) With regard to the question of factory life you have had a considerable experience?—Yes, I have been in the Factory Department twelve years.

1995. In factories and workshops?—Yes, inspecting them.

1996. Do you think amongst girls approaching puberty the tendency of life in factories is to produce laxity of morals?—It is rather a wide question and it varies in different centres and in different industries. I should say that a great deal depends upon the character of the foremen who are in charge of the department in which the girls work. I have known mills which had a very bad name because they had rather a low lot of foremen there, probably immoral foremen who had immoral relations with some of the women, and in that way no decent girl would go near the place. There were other works where they were strictly looked after and I cannot say that there was any particularly immorality in them.

1997. You think it is a question of management?—To a very large extent.

1998. Do you know whether the proportion of illegitimacy among the factory girls is higher than among the general population?—That I cannot say. In Dundee there was a good deal of it, but then there was such an immense amount there of couples living together who were unmarried. It was an extremely common thing there, but confined I may say to only the lowest classes of workers.

1999. With regard to infant mortality have you taken note of that?—Yes. I consider that is an important thing. You generally find it is associated with degeneracy, I think.

2000. The Chairman asked you a question as to infant mortality in Dundee: do you remember anything approaching the figures which have been reached of recent years, taking the normal for England and Wales at something like 150?—My recollection is that Dundee runs from 170 to 180.

2001. It is distinctly high?—Yes, and the real evils are masked by the fact that the very healthy suburbs of Dundee are included. I think taking the very worst areas I found they were eight times as bad as outside, but I do not wish you to take that as certain.

2002. (*Mr. Legge.*) You may correct that if necessary? Yes, if it is possible.

2003. (*Dr. Tatham.*) Do you know of any other town in Scotland where the infant mortality is markedly higher?—No, Dundee is unique. There is a different class of working people there from any other district.

2004. You think there are no worse spots?—I do not think so. The working population which I referred to to-day are not really Scotch, they are a mixture of Scotch and Irish, and a very degenerate lot of Irish at that. The real Scotch operatives are a better class and the weavers are distinctly superior women; it is the spinners and hands in the preparing departments who are the worst as a rule.

2005. Do you think a fair amount of attention is given by mothers to young children in Dundee compared with other towns you know?—In Dundee the attention is shockingly bad, among the lower operatives.

2006. Is it because mothers leave their children at an early age?—Yes. They nearly all work at the factories there. They send their children out to neighbours to

Mr. Wilson. look after and the children of course are not properly cared for.

2007. Is there any legal restriction of the time after confinement in which the mother may return?—One month in the Factory Act, but it is difficult to administer that because a woman can say it is a month since the child was born and you cannot verify it, at least it is difficult in every case, and the women remain in the factory up to the very last moment.

2008. Till just before their confinement?—Yes, it was disgusting to see them.

2009. The law has not been altered in that respect in regard to the period before confinement?—No.

2010. The period before child-birth has not been interfered with?—No. I have had anonymous complaints from workers in factories complaining of young girls being associated with women in that advanced condition, but of course we could do nothing.

2011. (*Mr. Legge.*) You have a very strong opinion as to the superior physique of country bred children and men to town bred?—I have.

2012. Are you aware of any statistics which throw any definite light on that point?—Practically what I have got myself, but I may say I have looked at that thing pretty carefully for years, and I have constantly contrasted the countrymen with men working alongside them and noted the difference.

2013. Have you, for instance, compared the two, class for class?—Yes.

2014. Do you believe, for instance, that the tinker children of Scotland are physically better than those Edinburgh children who formed the subject of a report of the Royal Commission on physical education?—I have seen so very few of these tinker children that I could not say.

2015. You know, at any rate, the class is a considerable class in Scotland?—Yes. But you only see two or three at a time. They look very healthy.

2016. They are the slum children of the country?—Yes. They look very healthy and brown, but I do not know that they are very big; but I would not give an opinion on that.

2017. Are you acquainted with the rural districts in England?—Some of them—Yorkshire and the northern counties.

2018. You do not know Dorsetshire and the eastern counties.—No.

2019. You cannot express any opinion as to whether there is a class in Scotland corresponding to the agricultural labourer class in England?—Judging from the agricultural labourers which I have come across in cement works and heavy iron works in the north, Norfolk and Suffolk men are fine big fellows, almost as big as the Irishmen, but not quite.

2020. You mean agricultural labourers?—Yes, those that come up there to work in the iron works at any rate. They are not at all bad fellows.

2021. But still you would be surprised to learn that according to the census of the Anthropometric Committee of the British Association, which published a valuable report from 1882 to 1884, the physique of the lower classes in the country did not show any very great superiority over that of corresponding classes in the town?—Yes.

2022. For instance the artisan in towns is pretty well up to the decent agricultural labourer in the country?—I do not think you will find that now. I am certainly prepared to believe that you will not find that now. In the figures you are speaking of I think the lowest were in a county in the south of England, while the agricultural workers in Galloway were amongst the best.

2023. Knowing both countries I myself am inclined to think that the rural population of Scotland, setting aside the tinker class, is distinctly superior to the rural population in England in physique, but that is a mere impression. You think it would be valuable then to collect comparative statistics of this definite sort?—I do indeed. It seems to me that that is a thing you must

have if you are going to find out the facts. I think you must have that done. You could do a good deal by training yourself to observe in the same way that a farmer can judge of the weight of a cow. By experience, you could do a great deal to train your eye to estimate the size of a man, and if you do that for a period of years you get a fair idea of the size of people you are meeting.

2024. I think there are great dangers in depending on the evidence of the senses. I think one's condition for observing differs so much from day to day and before and after a meal. However, you agree in the advantage of having some method of collecting comparative statistics?—I do.

2025. And as regards your work a good deal could be done by operating through you inspectors, if you had the time, and the certifying surgeons?—Yes, I think so. They are distributed all over the country and might do a great deal. I myself had a weighing machine: I arranged a spring balance on to which a man could hang and in that way I have taken the weight of as many as 100 or 150 men in an hour or two.

2026. What is the absolute minimum of detail which it would be useful to call for: I suppose you would like height?—Yes.

2027. Do you think it worth while to have the weight?—Yes, because the weight includes development to a large extent.

2028. And the chest?—The chest measurement would be very useful, but of course it takes a great deal more time. You can weigh and measure a man in a few minutes, but it takes a long time to take his chest measurement.

2029. What about grip?—I do not know that that is of so much importance.

2030. The Belgians in their great enquiry about linen workers made a special point of this grip?—Yes.

2031. (*Colonel Fox.*) And in addition to this they test the power of the back, arms, and legs, I saw their anthropometric measurements the other day and they are too complicated.

2032. (*Mr. Legge.*) What about the reactionary movement tests, the object of which is to see how long it is before a person actually does act on an impulse given! Would you attach much importance to that?—I do not know that I should. It seems to me that the most important thing for the working population is that they shall have good sound health, that they shall be fit for the work they have to do daily, and that they should have endurance. That is the great test I think, and that is the thing which seems to be weeding out the inefficient just now. I can give you a concrete instance of want of endurance. In a certain operation in cement making the material has to be put in barrows and wheeled away. It is hard work, but in addition to that the men are working on hot stone slabs of a high temperature which tends to make a man rather faint, almost sick, and it has been found that townsmen cannot do it well, at least that is what I have been told, but country-bred Irishmen experience little difficulty.

2033. I should like to suggest to you another explanation of the fact that the hardest work done in towns is done by country-bred people and not by town-bred people; it may be very much the same reason why in Switzerland you find all the hard work done by Italians—the native Swiss on the spot naturally selects for himself the least arduous work; he is more up to the ropes?—Yes.

2034. Similarly in the town they know perfectly well that the hardest work may be connected with the ship-building or cement works and they say, "This will not suit me at all," and they find an easier job; they are in a better position to do so. The raw countryman coming in has to take what he can get, which is the hardest work?—Yes, but you rarely find big men among indoor workers.

2035. I gather that you look to the general ameliorative tendencies of social legislation and administration to effect any improvement?—Yes, I think we should catch the children very young.

Mr. Wilson.

2036. And there is one detail which you would like no doubt, namely, to see the factory law strengthened so far as it assists in producing an improvement. You say you have seen very little improvement. Take such a detail as ventilation: have you seen no improvement in the last ten years in the ventilation of factories?—We have got a great deal done in the way of providing fans for exhausting dust and that sort of thing and keeping down the temperature slightly, but we have got little advance yet in the way of ventilating work-rooms where people are engaged at sedentary occupations—tailors and dressmakers.

2037. You think there is the chief point where we can effect more improvement if we determine to get it?—Yes, I do. Do not you think yourself that the important thing is to benefit a youth when he is growing, not so much after maturity?

2038. But let us get at both—let us do what we can for both?—Yes.

2039. You have already alluded to the emphatic evidence of the last witness on one point. Would you go so far as he did as to absolutely prohibit by law any mother from working in a factory or workshop up to a certain age?—No.

2040. You would not be prepared to do that?—No, I think that would be cruel, seeing the absolute poverty some of these women are in.

2041. But if you could by some other means provide the woman's support, granting compensation as it were, for her being deprived of the capacity of earning wages in a factory or workshop?—Do you mean that the Corporation should assist a woman with young children, such as a widow or deserted wife?

2042. Yes?—I certainly think the municipalities might step in there with benefit.

2043. (*Colonel Fox.*) You were speaking of the crofters

as being such a sturdy race of people can you tell me what their staple food is?—These Spey fishermen are partially crofters because they have little crofts which they work during the winter, and I have told you their food.

2044. Do they feed well. I was under the impression that they, like the Irish, feed on potatoes and inferior food?—No, the working classes of Scotland I think, taking them all over, really live well, and the food they eat seems to benefit them. It is plain food, but it seems to be very wholesome food—oatmeal and milk and cheese with sometimes a little fish and potatoes and vegetables.

2045. That is a good varied food?—Yes, of course, tea is coming in and bacon, which used to be almost unknown.

2046. (*Chairman.*) You do not think the use of oatmeal is being displaced by other things?—It is to some extent.

2047. But not to a large extent?—Well, I believe amongst the very poor it is. Amongst the very poor in Dundee there is hardly any oatmeal at all and in Newcastle and Tyneside there is hardly any, and among the miners' children little or none.

2048. Was there ever much?—I do not know that there was, but at the present time there is not, whereas among the better classes it is a good deal used.

2049. (*Mr. Legge.*) Have you any statistical tables which you have compiled yourself?—I have measured and weighed some hundreds of men, but I have not had an opportunity yet to average them up, I have only made one or two notes here which show the slight difference in height and weight.

2050. (*Chairman.*) Then perhaps you will send that in when completed and we can see if it is desirable to print it in the appendix?—So far as I have gone it tends to show that country-bred men both in height and weight are distinctly superior to town workers.

Dr. THOMAS FRED. YOUNG, M.D., M.R.C.S., called; and Examined.

2051. (*Chairman.*) You are President of the Association of Certifying Factory Surgeons?—Yes.

2052. This note which you have left with the Secretary does not indicate very exhaustively the opinions you are able to express, but I understand you have had considerable experience as a Factory Certifying Surgeon?—I have been twenty-five years in the north half of Liverpool.

2053. Your experience has been gained in Liverpool then?—Yes.

2054. What evidence of the physical condition of people has come under your notice there?—In Liverpool our people are very mixed. There are different classes; I mean to say you have the artisan class, the dock labouring class, you have people working in jute works and people working at varied employments, and in each place almost you find that there is a different physical condition. In the last few years there has been certainly very great improvement in the general artisan class. Then since the Factory Act has become more stringent there has been a weeding out from all the employments where good wages are paid. In the first place the employers do not wish to have the expense of the Factory Surgeon coming unnecessarily, because they have to pay a fee when they come, and therefore before the Factory Surgeon is sent for all the youngsters who come in for employment are carefully gone through by the taker-on or by the time-keeper.

2055. All the ineffectives are weeded out?—All those who are likely to be ineffective are weeded out. The youngsters will apply for trades which are perhaps not so favourable, where there is dirty work and which they do not like so well, and some will be taken on; others who are not will gradually go off as shop boys and to run messages and such employment as that. But in the other trades such as the engineers, carpenters and joiners and all those boys, there has been a very marked improvement in the last few years.

2056. What becomes ultimately of those who are weeded out of chances of employment in the more remunerative industries, do they sink lower and lower?—Yes. They

sink lower and lower. There is a regular gradation through the factories. You get the best class and strongest looking boys amongst the engineering and ship-building classes.

2057. That is outdoor employment?—Practically outdoor employment, but it embraces foundry boys. There are a certain number of boys in the foundries who are engaged in the riveting works, and there you find a small and poor type of boy. But amongst the engineers apprentices and the moulders and the higher branches of engineering you get a very good class indeed. Only last week I went to one of the engineering places and took occasion to tell the employer that I wanted to see what his boys were like. He brought up all the apprentices he had—he had twelve varying in age from fourteen to twenty-one one years of age. They varied in height from five feet three inches to six feet; they were muscularly strong and particularly healthy. Out of the whole twelve there was only one whom one would call below the average.

2058. Were those town-bred boys?—Now, in Liverpool with the facilities we have for getting about, with cheap trams, the most of the people really are living out except those immediately engaged about the docks. Those I should say are really the best, although the town-bred boys are living on the outskirts.

2059. (*Mr. Legge.*) Of what social class?—The better class artisan.

2060. Have they attended Board Schools?—Yes, all these boys mostly attend Board Schools.

2061. (*Colonel Fox.*) But are these boys you are speaking of, these well-grown boys, of the lower class? They do not come from any special class, do they?—They are usually the sons of engineers and people who have been in trades.

2062. A better class than the ordinary lower class?—Yes, decidedly better.

2063. (*Chairman.*) Men in receipt of say £2 a week?—Yes and more. £2 and £3, quite.

2064. (*Colonel Fox.*) They are of a special class?—Yes.

Dr. Young.

— — —

Dr. Young. 2065. They would not be the pick of the lower class?—No. The fathers of these boys have probably been engineers before them. The class tendency runs very strongly in that way, for fathers to get their sons into the same employ, both in the ship-building and also in the engineering. When you come to the saw mills, of which we have a large number, you find a different class of boy there again.

2066. A lower class?—Yes. They are not so well educated. They do not come of as good parentage, and generally all round, both mentally and physically, they are a lower class. I have some measurements of just a few—not picked, simply as I was going round on my day, as I came to them. The boys of fourteen years of age whose average height ought to be 4 ft. 11 $\frac{3}{4}$ in., I took them seriatim, as they came: these are boys of fourteen years of age—4 ft. 10 ins., 4 ft. 11 ins., 4 ft. 9 ins., 4 ft. 7 $\frac{1}{2}$ ins., 4 ft. 6 ins., 4 ft. 3 $\frac{1}{2}$ ins., 4 ft. 9 ins. The physical condition of all these was fairly good, though they are below the height. I have not weighed them but they were muscularly good. Then I have girls of fourteen, whose average height ought to be 4 ft. 11 $\frac{3}{4}$ ins.: I found them 5 ft. 1 in., 4 ft. 11 ins., 5 ft., 5 ft., and 4 ft. 9 $\frac{3}{4}$ ins. Their condition was fairly good. We come then to boys of fifteen whose average height should be 5 ft. 2 $\frac{1}{2}$ ins.: we have 5 ft., 4 ft. 9 ins., 4 ft. 9 ins., 5 ft. 5 ins. The boys of 5 ft. were very good; the boys of 4 ft. 9 ins. were very poor. The average height for boys of fifteen should be 5 ft. 2 $\frac{1}{2}$ ins. These are the measurements from the Anthropometrical Society.

2067. (*Colonel Onslow.*) Those are averages you are taking?—Yes.

2068. (*Chairman.*) Do you mean the report of the British Association, 1882 and 1884?—Yes. With regard to girls of fifteen, whose average height ought to be 5 ft. I have two cases here, one 5 ft. $\frac{1}{2}$ in., and the other 4 ft. 10 ins. One was very good and the other was poor and had phthisis. For girls of sixteen, the average height should be 5 ft. 1 $\frac{1}{2}$ ins. I have one case of 4 ft. 8 ins., good, then a boy of sixteen and three quarter years of age, 5 ft. 3 ins., very good.

2069. There is nothing in the figures which you have collected which is at all disquieting as to the condition of things?—These show somewhat below the average in height and the physique is perhaps below the average. Some of them are very poor and had to be weeded out; but these have all been creamed before I saw them. There has been a large percentage of those who are indifferent who have been creamed out by the time-keeper before they were presented to me. We would find some of the weeded out boys probably in the soapboiling works. That is not clean work and not favoured by the boys. After they have been refused in other places they gravitate to these more dirty industries, the soap works and the jute works, &c.

2070. (*Colonel Onslow.*) They come under inspection?—Yes, when I come to these works I find we get a distinctly lower class of boys. There is the biscuit factory, the soap works and the jute works; they are all dirty employments and the boys will go everywhere else, and until they find they cannot get employment in other places; then they gravitate to them.

2071. (*Colonel Fox.*) Do you mean lower classes physically or a lower class of people?—They are lower physically and a lower class of people as a rule.

2072. Do the people you speak of, who are biscuit workers and all that sort of thing, all come from about the same class?—Yes, except the engineering class. These are low class.

2073. They are all of the same stratum?—They are a lower class.

2074. Lower again?—Yes, physically and mentally.

2075. (*Colonel Onslow.*) Very bad physically and very low socially?—Yes. You find the difference very marked. I have been assured by some of our School Board teachers that there is a very marked difference in the educational powers, the powers of receiving education amongst the children who have come of parents like the engineers who have had a fairly good education, and the others; the children of the engineers receive education much more easily, and are very much brighter and very much more intelligent than the class who come

from what we call the dockers and the indifferent class. That I think is a very well-marked observation with all the different Board School teachers. I have collected some evidence from a large number of the different certifying surgeons—we sent round asking them for their views—and the results of all those letters show very divergent views in different places. I have epitomised a good many of the letters, which, with your permission, I will read.

2076. (*Chairman.*) First I will ask you whether the proportion of rejections within your own experience have increased in number or diminished?—They have diminished for this reason.

2077. That they are more careful in presenting them?—Yes, but there is a further reason than that. At one time I was in the habit of rejecting all cases which were not absolutely physically strong, but I found there was such an amount of distress that by refusing them employment I practically refused them food.

2078. And you relaxed the standard?—Yes. Cases of bad anæmia and cases of eye trouble and cases of nose and throat trouble I gave provisional certificates allowing them to work, but conditional upon their being in attendance at the nearest hospital. I marked all my cases in the certificates to whom I gave permission to work under those conditions, and I notified on my certificate that it was a provisional certificate.

2079. The last Factory Act permits you to exclude them from certain industries while permitting them to go to others?—Yes.

2080. And that system of differentiation works well, I suppose?—Yes, it works very well. Also in some of the works you have different branches. Take Hudson's Soap Works. Some of them suffer from bronchial troubles and it would never do to allow them to remain in the packing rooms, where they fill the boxes with soap powder, because in many of those the room is saturated with the floating particles, but you can say to those who are suffering from bronchial troubles "I will not certify this boy for work in this room, but he may work in the packing case room where they have no dust."

2081. That system of adjustment works well?—Yes, it works very well; it is good for the employers and good for the employed.

2082. Will you give us a summary of those reports which you have been kind enough to collect?—Yes. Dr. G. Bird, Edgware Road, says he has not noticed any marked alterations in physical conditions; there have been a fair proportion of well grown and well developed children, especially amongst girls. Dr. Oxley, East India Road, says that the percentage of undersized, etc., is not greater. Dr. Atkinson of Camberwell New Road, has noticed deterioration. Then Dr. Neston's letter from Newcastle is very important and I should like to read that in full. He says: "There is undoubtedly great deterioration in the physique of our City population, and this is attributable to two chief causes, first a decadence in home life which entails improper food and clothing, irregular habits (drinking and gambling) absence of order and thrift; second, the miserable housing and high rents which prevail; overcrowding, with its consequences, is an important factor in physical and mental degeneration. The fathers and mothers of the rising generation do not recognise, in their gravity, the obligations of paternity, which are left to the authorities, educational or parochial. There is an undoubted falling off in the physical condition of the infants vaccinated and young persons presented for employment during the last quarter of a century, and this is due to the fact that they are the offspring of town-bred parents, who produce *sui generis*." Then Dr. Crossley, Weight, Halifax, says that he has convinced himself that there is a certain deterioration progressing amongst the people; Dr. Dudley, Stalybridge, states that there is no deterioration, and Dr. Eames, Manchester, says that there has been some amount of deterioration, the rejections having increased over 50 per cent., and being due to anæmia. Then a doctor in Sheffield writes that the physical condition is not improved. Dr. Dudley's letter is also perhaps one that I might read to you because it shows there the point I wish to bring before the Committee, that there are a class of local conditions which tend to alter the physical condition of the people in different places. He points out very strongly

that while food and work were good the people improved considerably. "I have been in Sheffield now for twenty-five years and have during that time been in constant contact with the labouring and poorer classes of these inhabitants"—the factory employees—"as certifying factory surgeon. My first impression of the working people of Sheffield was bad. I thought I had never in any other place seen so many small, undeveloped, and deformed people, but looking back on this I have no hesitation in saying that the physical condition has distinctly improved. Sheffield is a cold, hard place to live in, but the work is healthy, the wages are good, and the work people live well and take plenty of holidays." Of course he does not include the steel and knife grinders and people like that, but owing to the generally improved conditions there with regard to wages the people live in a healthier condition, more in the open air, and have more physical employment, and he has noticed an improvement in the people themselves on that account. Now Dr. Watson of Manchester says that there is very considerable physical deterioration, more generally than twenty years ago. He is at Ardwick. There, of course, they have not got the open spaces in Manchester and there is that contrast between them and Liverpool. In Liverpool both the municipal authorities and private people have done a great deal for the working classes in open air spaces and physical recreations of different kinds, encouraging them in it. Our Board Schools are exceptionally good. I do not know any place where the Board Schools have such care given to them, and do so well. Everything which is possible to be done in the way of ventilation and proper looking after the children is done. We are particularly well off in Liverpool in that way and the Liverpool suburbs. In Bootle, where I live, we have very large open air spaces and large parks and there is every inducement given to the youngsters for physical exercise. With regard to Dr. Fraser of Wolverhampton, I was surprised to find that he noticed a great improvement because I did not think Wolverhampton would be so good. With regard to Dr. Hall, I am not certain whether you have come across his work at Leeds. I have a very important letter from him and also a pamphlet in which he has shown in a very strong and striking way the different effects of feeding.

2083. I think we have copies of that pamphlet?—Yes. The letter is as follows: "I have observed the following facts:—(1) The average boy and girl between thirteen and sixteen years of age is undersized and poorly developed in stature, muscle and bone, and presents a marked contrast in these respects, as compared with young persons of like ages of the more opulent classes. The average boy of fifteen in the factory class is about the same size and weight of a boy of thirteen in the classes above them. (2) The prevalence of dirty and decayed teeth. It is exceedingly rare for me to find a sound permanent molar. I have made a point of frequently comparing the birth certificates with the dentition of the young person on examination, and very often finding the second permanent molars uncut at fourteen or fifteen years of age. I have been particularly struck with the fine clean and undecayed which the Jewish children generally have. (3) The prevalence of rickets, about 15 to 20 per cent., I should guess it at. It appears to be more common among the girls than boys. The rickety dwarf with bow legs, narrow pelvis and big head, is no very uncommon object among girls, but rare among boys." That is his observation in Leeds, and he is certainly a most observing man. But, in contrast to that, in Liverpool I did not get such a quantity of rickets. We are not so crowded and I think that really, perhaps, on the whole the people in Liverpool are better fed, but I do not notice that prevalence amongst the children of rickets.

2084. We have it that the condition of things in Leeds is infinitely better than in Manchester?—I should say it was from Dr. Watson's letter. Dr. Watson is in central Manchester. The overcrowding is very much more. We were very much worse some years ago in Liverpool, but since we got that insanitary house property Act our corporation have been particularly active, and they have destroyed an enormous amount of insanitary property and they have built up in many places very healthy sanitary houses for the people. They have got the public baths where they can go and bathe for nothing, and there is every facility given to the people to wash themselves. In

all the small houses now the rents are still a great deal too high and there is a necessity to many of the people to have lodgers, but then we again look after them with our nuisance inspector who makes periodic night visits to all these. Every lodging house has to be licensed and our inspector makes surprise visits and we very severely fine any of these people who are licensed lodging house keepers, if we find them with a greater number of people than we allow.

2085. There is a prescribed maximum?—Yes, per cubic foot. The rooms are all measured up and there are a certain number allowed to each room and if there is a larger number in the house we fine them.

2086. That is by the municipal bye-laws?—Yes, "I have no facts proving physical deterioration of the factory class during my tenure of office, but can only say that my impression is that, if anything, there is now a slight improvement in the average physique as compared with my early experience."

2087. He is a certifying surgeon?—Yes. Dr. Browne of Preston says there is a gradually improving condition.

2088. Preston has rather a bad record for mortality?—Yes; but they have wakened up to the necessity of doing something, and they are certainly doing an enormous amount now, both public and municipal. I have one or two extracts here. He says, "I believe that instead of deterioration a gradual improvement is taking place. When I was appointed in 1863, a child could commence work at eight years of age; now it cannot do so until it is twelve. There has been an improvement in the ventilation of factories and workshops; in the amount of moisture allowed in weaving sheds and in the water closet and urinal arrangements, but as regards the last mentioned, by no means to the extent which is desirable. In 1874 a medical officer of health was appointed. There are now five male and two female sanitary inspectors, whose duties consist in ascertaining the causes of disease and endeavouring to remove them. Cellar dwellings and back to back houses are no longer allowed." That has been an enormous source of trouble in the past, those back to back houses; you have them with the old open privy at the back, most intolerable. In Liverpool we have practically done away with them altogether. I do not know that there are any left at all. In other towns they are doing away with them: "Cookery and laundry classes have been established, the Food Adulteration Act has come into force, there is now compulsory military drill at all the national schools, and this cannot fail to exercise a beneficial effect on the physical development of children. The Inebriates Act has already done much good by checking the tendency to intemperance. A committee of ladies was formed, nearly twelve months ago, for the purpose of visiting the houses of the poorest and most neglected people. Five ladies are told off to each ward in the town, and they visit the worst houses in the worst streets, give advice and instruction in matters which relate to health, and either themselves give lectures in the cottages or streets, or obtain the services, for that purpose, of some medical man who is willing to undertake such work. The restriction imposed on married women in reference to the period of pregnancy at which they must leave the factory, and the date after confinement, at which they may return to it." Those are very important matters; that is in Preston. Those are all matters which have been taken into urgent consideration in Preston, and which are now in full swing there. I wish to bring those matters forward to show that there is a divergence in the opinions of many of the doctors and certifying surgeons as to there being no deterioration and as to there being great deterioration.

2089. But the general effect of what you have read to us is favourable?—It is so.

2090. That is your own impression?—Yes.

2091. (*Colonel Onslow.*) The deterioration is marked in some of the places and not in others?—Yes, according to circumstances.

2092. (*Chairman.*) They are waking up in Manchester?—Yes, they are doing a great deal in Manchester just now, but still there is a great deal to be done there. Dr. Purdon, of Belfast, is a very painstaking and thoughtful man. His father wrote a paper some years ago on the question which is before us at the present time, and really he might have

Dr. Young. written it just for the present time. He goes in a good deal more for the effects on the constitution of the people there of the flax work and the different branches of the flax work. I think that the Ventilation Committee which has been appointed and which went so very carefully into the question of ventilation and the conditions surrounding it, has done a good deal of good. I do not think there is very much in Dr. Purdon's father's paper, but Dr. Purdon himself draws a strong and striking line between country-bred children and town-bred children in Belfast. Belfast has rather an unenviable notoriety for its insanitary conditions. There is a great deal of typhoid fever, scarlet fever, and diphtheria there. Dr. Purdon says: "As far as my observations go, I would say that the children of the respectable artisan class, such as mechanics, carpenters, shipwrights, etc., have not deteriorated. On the other hand, the city-bred and city-reared children of the factory and labouring class have deteriorated very much in physical development. However, for the last four or five years I think we are at as low a condition as possible and at a standstill. Country-bred children coming into town with their parents are well developed. I attribute the want of physique, etc., in our town children to (1) weakly parents who have deteriorated; (2) to whisky and intemperance in parents; (3) to insufficient food and clothing in winter." I have noticed that myself. It is quite natural that the growth of children who have insufficient clothing and insufficient food must be arrested. It must arrest their development, and if they do not die off, they grow up weeds.

2093. (*Dr. Tatham.*) What town is that you are speaking of?—Belfast. In Liverpool I have noticed the same thing, of course. Our police have a supply of clothing, which they give as far as they will go to the street children, who are certificated now for trading in the streets, and they look after the feeding a little bit as well. Dr. Purdon draws attention to what I think is a very important point in the matter, and that is that these people are living so much on tea and white bread and jam, instead of oatmeal and milk. They are using these cheap jams, and there is the white bread which is supplied so cheaply, which does not contain all the elements of nutrition. In former times the children used to live on oatmeal and butter milk and potatoes, and the country children still live on that, but the town children live more on tea, and this white bread and jam. Dr. Purdon considers—and I quite agree with him—that that has a very decidedly deteriorating influence.

2094. (*Chairman.*) Tea drinking is especially so to the young, is it not?—I am very much inclined to think that bread, jam and tea, are the source of a great amount of anemia. I have under my care the Diamond Match Works of Messrs. Bryant & May. Messrs. Bryant & May have laid themselves out particularly to consider the physical welfare of their employees. They have the most up-to-date works that it is possible to have both in ventilation and general hygienic arrangements. Further than that, when the employees come in the morning, before they go into the works, they supply them with hot tea or coffee; at luncheon time, three days a week, they give them rice and milk, and the other three days they give them soup free. Besides that they have a perfect kitchen there, and an excellent cook, and they give them a good plate of meat and vegetables for 3d., so that the employees could not be in a better or more sanitary condition than they are at Bryant & May's.

2095. (*Mr. Legge.*) That place was built by an American company?—Yes. But it is Bryant and May's now. It was American machinery.

2096. And it was an American company first of all?—Yes, that is so. The American company introduced this Diamond match machinery, but Bryant and May have bought it up.

2097. The sanitary conditions of the American company were very good?—Oh yes.

2098. You are acquainted, no doubt, with Ogden's factory in Liverpool?—No, they are in the south district; they do not come under me.

2099. (*Chairman.*) Do you know Port Sunlight?—Yes, it is on the Cheshire side.

2100. That is a very elaborate place?—Yes.

2101. And a highly organised industrial place?—Yes—very highly organised, and Mr. Lever has bought a large amount of sanitary cottages for his employees, where they are well housed at a moderate cost.

2102. Do you think that his type of organisation might be developed?—With great benefit.

2103. With ease —Yes, I do not think there would be any difficulty. The towns are being so built up now with warehouse property—I am speaking more particularly of Liverpool—that they will have to build more in the out districts, and are doing so at the present moment. North of Liverpool they have built a great number of works where there would be great facilities in the way of acquiring the land moderately cheaply for building workmen's cottages. The one matter in connection with this, that I think has had a very great influence on the health of the people, both in Hudson's Soap Works and in the Diamond Match Works, has been the appointment of lady superintendents to look after their welfare. They have been trained as nurses, and can look after their minor injuries, and besides that they are ladies and have good business capacity. It is very much better, more humanising and more educational to have these women brought into contact with the women than to have them brought into contact simply with the foreman. The foreman looks after the work, and has only to do directly with the work, and all other matters are carried out by these lady superintendents. I think it has a distinctly elevating influence on the girls, and I am quite sure that both in Hudson's and the Diamond Match Works the improvement that has taken place there is great. Of course the Diamond Match Works have been only there eight years, but I have been going to Hudson's for twenty-five years. Unless you had seen it you could not realise it. There is another thing which has assisted in the larger towns—I know it has assisted with us. I have been surgeon of one of the Liverpool Military Corps for twenty-six years, and I am perfectly satisfied that the volunteer movement has had a very great influence in improving the physique of the people. It gives them an occupation for the mind. They are not very inventive in the way of finding occupations for themselves and if they have not got something to do they generally get into trouble, but the volunteering occupies their minds and keeps them in healthy pursuits, and they are brought into contact with others who help them.

2104. That does not affect any large proportion of the population?—We have 750,000 people in Liverpool. I should say, and we have some 6,000 or 7,000 volunteers.

2105. (*Colonel Onslow.*) I think Liverpool has a larger proportion of volunteers than any other town in the Kingdom?—I think we have.

2106. (*Colonel Fox.*) Then there are the lads' brigades?—I am not speaking of them. We have those over and above.

2107. They keep them out of mischief too?—Yes, that is the time when most of the trouble comes in young people, the time when they leave school at fourteen. In Liverpool that is the great trouble, when they leave school at fourteen years of age. They then throw off all parental authority. They get congregating about street corners at night time. I do not think our technical system is altogether really what it ought to be. Of course to a certain extent, not being compulsory, it is at a disadvantage.

2108. You mean the evening classes?—Yes. I think the evening classes want altering altogether to suit the requirements of the people. We do not get so many people to them as we should like, but it is at the age of fourteen that all our youngsters gravitate into evil and become what we call "corner boys," and get drunken habits. They get round the corner of streets; they chew tobacco and smoke, and their highest ambition is to get drunk. Even with regard to girls, I have been on the Bootle Bench for some fifteen or sixteen years, and although we do not find so many cases of youthful drunkenness, even yet we have girls of fifteen and sixteen years of age brought up for being drunk. I think something should be done for the young people. The highest idea would be the compulsory continuation of their education after fourteen, allowing them to learn the work and compelling the continuation classes up to the technical schools. That I think would be the method. Over and above

that there should be some form of compulsory disciplinary service. Our young people have no idea of discipline or subordination. They would not subordinate themselves to anybody. That is, I think, a very great evil.

2109. Do you not find that is carried out in the schools? —Not so much. It is up to fourteen.

2110. When I went there I was very much struck with Liverpool. I thought they were exceptionally good?—You mean our schools?

2111. Yes; and the whole town—I was struck with it. It is such a progressive go-ahead town?—Oh, very. At Liverpool to-day our schools are excellent. I do not think any schools can beat them.

2112. They are magnificent?—The only thing which beats us is the Manchester Technical School. In the Liverpool Technical School they spent an enormous sum of money on the fabric and in furnishing it. I think it has cost about £150,000. But there is nothing like the facilities for educational purposes that Manchester gives. In fact, if young people want to get technical education that Manchester gives they have to go to the University for it. Then I have made a summary, what I consider to be an epitome not only of my own ideas of the cause of deterioration which has been and which still continues in some places, but also of the other doctors to whom I have written.

2113. Will you give us that?—Coming of weakly stock—that is, of course, town-bred children—drunken parents, overcrowding, deficiency of food and warm clothing in the young, insanitary houses, early marriages, cellar dwellings. We have done away with all our cellar dwellings altogether, but in time past when I was a young practitioner there were streets and streets of houses with an underground cellar where no daylight could get in at all, and there could be no possible ventilation at all.

2114. All that must make for great improvement, surely?—Yes. That is why Liverpool shows so favourably.

2115. Do cellar dwellings exist in many towns?—There are a good many cellar dwellings still. Of course, there are certain trades which tend to deteriorate—miners, stone-masons, and steel grinders.

2116. (*Colonel Onslow.*) In what way are the miners deteriorated?—The coal miners on account of the dust; they are liable to get it in the chest. Dr. Carter, of Cork, wished to draw attention to phthisis in millinery establishments. He has paid very special attention to that, and he says he finds that one source of the spreading of phthisis is a girl getting into a millinery establishment where there is no ventilation; that will cause phthisis to spread all over the place. Dr. Prosser White has drawn attention to the working in dark damp cellars. He is in Wigan. He is certifying surgeon there, and has a great number of cotton factories. There are some processes of the cotton factories which he thinks more particularly seem to produce deterioration than others. Perhaps those more particularly are working in cellars in which the moisture is kept out—working in dark damp cellars with no light.

2117. (*Chairman.*) That is the home industry, not the factory?—No, this is the factory. These are the weaving places, not in their own homes. But there are certain processes in the factory. It is rather too long to read you the whole, but I can get you out some parts of it:—

“I find that the commonest causes complained of for employees changing their occupation (excluding of course such instances as increased payment, cruelty of the mistress overlooker, change of residence, &c.) are general weakness, headache, malaise, anæmia, &c., brought on they think by their work, and that these changes are more common, from my general observation, in certain rooms, such as the spinning department amongst the girls and in the twist cellars amongst the lads in cotton operatives, and in the pressing rooms in cloth workers.

The physical condition of the individual depends upon three things—(1) constitution, that is, the resultant of the inherited tendencies; (2) the home standard, that is, feeding, clothing, housing, education, &c.; (3) the industrial standard, depending upon, pollution of air, the continuousness and arduousness of the work, the amount

of light, exceptional heat and moisture, &c. . . . *Dr. Young.*
If the same lad be employed in a vitiated atmosphere, such as exists in a sunless and damp twist cellar or an overheated spinning room, the effect must be most serious, and *vice versa*.

I am doubtful whether the industrial standard is the main or only cause of the physical deterioration of the young people—presuming they are deteriorating, of which I have my doubts—though no doubt in certain instances the industrial standard requires to be vastly improved. The same remarks apply in my opinion to the home standard.”

I have also a letter from Dr. Edjinton, of Birmingham, and from Dr. Bryant, of Leicester.

Dr. Edjinton writes, “I should not say that the young persons employed in factories in Birmingham have materially deteriorated during the last ten years, in fact, I do not find it necessary to reject so many now as I did in the past.”

Dr. Bryant writes, “Leicester, as a manufacturing town, stands very high, as the death rate is exceedingly low, and I am quite sure that the children and young persons whom I pass during the year are of better physique than formerly.”

Of course that is so, because they make the things more sanitary, and the people do not suffer so much. When they begin to find themselves bad they change and go to something else. With regard to the working in cellars without light, and with an excessive amount of moisture in the air which is necessary for the processes, when they have to go there it makes them feel bad, and they give it up. Dr. Watson has drawn attention to one point which I should like to emphasise very much, and that is with regard to the artificial feeding of infants—adults’ tea, white bread and jam, overcrowding of houses, and absence of suitable physical exercise. I can show you here, by the kindness of the dental hospital, some of the arrangements they have for lecturing to show the different deformities which take place, which are really evidence of deterioration. (*The Witness exhibited some plaster casts of mouths.*) We have here a typical healthy jaw. You will notice the perfect equality of all the teeth. Then the point of the greatest importance is the breadth of the arch, and the height it is *there*. I would like to contrast that with the arch of this one, and the irregular irruption of the teeth *here*. This jaw is like a sheep’s mouth—this is the upper jaw. Dr. Watson is inclined to put that down to artificial feeding, but I am perfectly certain of one thing—that that arching would not be brought on by artificial feeding alone. Artificial feeding, improper feeding, first of all, produced a softened bone which leads up to the condition, but I am perfectly satisfied that that condition is produced by the mothers everlastingly giving their children the teat to suck, a little rubber teat to keep the child quiet. Young children have this thing in their mouth, it forms a vacuum in the back of the mouth which causes this arched condition, and the muscular contraction of the walls biting on the softened bone drives that in. The next direct result is that, the floor of the nose being the other side of the roof of the mouth, this encroaches on the air passages of the nose and interferes with the breathing space; and when they get that interfered with they cannot sleep. At night time this soft palate falls down, and all the time there is a snoring noise made. It injures them; they become mouth-breathers. The original source of that in a large number of cases is due to the everlasting sucking of the teat. The mothers do not nurse their children: that is where trouble begins, that is the case among the wealthier classes and also among the poorer people. In the town they cannot get good milk, and even good milk is not so good for the child as mother’s milk.

2118. Would not the mothers who do not go to factories be just as reluctant to nurse their children?—Yes, they are just as reluctant. Many of them get other employment besides that. They go out charing and get offices to clean, and that kind of thing, and they do not nurse their children. Some of the working class people will nurse their children up to nine or twelve months, because they think it prevents them getting any more babies. Otherwise they do not bother. At one time in Bootle there was one part where our proportion of infantile deaths was 75 per cent. of all the children born—75 per

Dr. Young. cent. died within the first twelve months but that is very much improved now with the alteration of the people. Here is a bad mouth. This one not only shows the high arched condition, but it also shows hereditary syphilis. The teeth are shaped in a way which is a peculiar characteristic of hereditary syphilis—what are called Hutchison's teeth. That has been a great source of deterioration amongst our people in Liverpool, but I am sure that it is less than it was. I do not see the number of marked Hutchison's teeth amongst the factory employees now that I used to see.

2119. Is the seafaring population of Liverpool a healthy class or otherwise?—Fairly healthy.

2120. You do not see the signs of deterioration amongst them which you have observed amongst others?—No. Most of the seafaring people that we have really now belong to the large ships, the large steamers, and they get fairly good wages and are fairly steady men because they are kept on them. The sailing vessels are mostly foreigners sailing vessels; the timber ships are mostly Norwegian, Scandinavian, and German. We do not have very much to do with them; we do not have much opportunity; but the engineers there are all well-to-do and well educated men and there is a large number of the other men there who are really steady, sober men, and it pays them to stay on such lines as the White Star, the Cunard, the Inman, and Leylands. It pays these men to keep on as permanent hands. You see a marked degeneration of the past generation in one thing. I am sorry I could not get you photographs. At the time of taking on of dock hands the usual mode is this: the time-keeper and his clerk comes out in front of the dock say of the Cunard or the White Star, and all the dockmen are hanging round and as soon as they come out they all form up into a circle. Then the time-keeper calls out the different men that he knows who are good workmen whom they keep on as constantly as they possibly can. If there is more work than they can do he picks out others, and then the others who are not called simply disperse. The number of undersized men that you could see there, from eighteen to thirty and forty and fifty years of age, show in a very marked fashion the deterioration of the people of the last generation, those people that I used to pass as young boys at the factories and who at that time would come with bare feet, ignorant, illiterate, dirty and mentally deficient, I do not say in any sense that they are idiots or lunatics, but without the brightness and quickness of intellect you find in young people now.

2121. They have drifted into the ranks of casual labour?—Yes. I would like to draw your attention just as a contrast between the feeding and the non-feeding to the photographs of Dr. Hall.

2122. We have seen them?—Would you just look at the child No. 1, ten years old, and the child No. six in the Christian group. Out of the whole of them there are only two who show really good mental capacity. They are not very well fed and they are undersized; they are below the height; but they are mentally bright. No. 4 is approaching the hydrocephalic child. It looks almost as if there were water on the brain there. I think they are most telling photographs of the effect of feeding and non-feeding. Dr. Crosby Wright, of Halifax, emphasises also the difference between children when they get food, and children when they are not fed, the effect which is shown on them in the results. Dr. Bates, the medical officer of health for the Metropolitan Borough of Bethnal Green, wants to draw the attention of the Committee to this. He says he does not find any great falling off but he says "I do notice that more female young persons are employed in rough trades, such as fire-wood cutting, laying-on at printing machines, box making etc., and I think some steps should be taken to limit the association of young girls with grown men in those places." That is more with regard to moral influence than physical deterioration, but I thought it was just as well to tell the Committee that. Dr. Foker, of Staffordshire, draws attention to the ignorance of the poor people of cooking so that they cannot even get the benefit from good food. He said "I think the volunteer movement did a great deal to improve the men, but the women on the contrary have not improved. Their houses are dirty and neglected; they do not know how to cook and their children are sadly neglected and dirty, which together with very early marriages accounts for this state of things." I will just

point out what I have noticed myself as conditions which have helped to do away with the deterioration condition which came within my own observation. First of all I have put down the Education Act as being the starting of the doing away with the deteriorate condition of the people and I think by the time we have another generation our people will be as good as any other, being a good deal better than any other poor people in the world, the Americans not excluded. Next to the Education Act I am satisfied I have seen the direct result of the Factory Acts, the factory surgeons, I am speaking impersonally. They do an enormous amount of good not only in simply rejecting the cases that are not fit for employment, but they have a moral influence as well on the people. Because we do not simply tie ourselves down to passing a case for one kind of work, and another case for another kind of work, and so on. We note everything in the shape of want of cleanliness, want of morale and general appearance about the children. We have a considerable amount of influence and we always get what we want. We never allow anything in the shape of ragged dresses or dirty teeth or anything of that kind. I am quite certain that Bryant & Mays have caused an enormous amount of moral improvement in Liverpool, not simply confined to their factories, because the number of hands who pass through there have their teeth put in perfect order and are taught to keep their teeth washed every morning. They are supplied with tooth powder and brushes free. Getting them into one tidy habit alone has caused them to take a little pride in their personal appearance. One great defect in our people is the want of pride in personal appearance. I try if possible in every way to impress upon the youngsters as they come before me the necessity there is for them showing a little more care about themselves, and getting them to take care of themselves. Next to the Factory Acts I think the doing away with insanitary houses and the Lodging House Acts come in; and then there are the municipal people who have made open-air spaces and have encouraged the games of football and cricket. But there is one important point in Liverpool which I do not know is followed in any other place and that is the supply of sterilised milk to poor people at a nominal price.

2123. It is done at the expense of the municipality practically?—Yes, it is.

2124. (*Mr. Legge.*) Have they power to take money out of the rates to do that or is it done by voluntary agency?—It is done by the municipal authorities. They have a case of six bottles and bring that down, and as the empty case is returned another one is handed to them of sterilised milk. There is enough in each bottle to last for a feed for a baby. If they leave them open at all, they are so careless that the whole of the good of the sterilisation will be done away with in those dirty, filthy houses. But each bottle contains a feed for the child so that when they open it they have enough. That has reduced our infantile mortality from diarrhoea in the summer very largely, and one can easily see how the better feeding of the children at that young age must tend to the building up of their constitution.

2125. (*Chairman.*) Do parents avail themselves of the opportunity of obtaining this?—Oh, yes.

2126. They come for it?—Oh, yes.

2127. (*Colonel For.*) I suppose they have depôts?—Yes, in different places they have depôts for the supply of it. We have also done a good deal with district nurses and the public baths. With regard to the evidence of deterioration, we find there is rickets, malformed heads, muscular atrophy, malformed mouths, imperfect dentition, facial appearance of age instead of youth, and decrease in the population. There is one point I noticed very distinctly, which I really look upon as a sign of deterioration, and that is barrenness in the women. I do not speak of the cases in which owing to the exigencies and the difficulties of procuring a livelihood they take means to prevent themselves having children.

2128. (*Chairman.*) You are speaking of increase of sterility?—Yes, those who are sterile, who are desirous of having children but cannot have them.

2129. Not from any malformation?—No. When I was in full practice I used to do a good deal of gynaecology

Dr. Young.

and a large number of women of every class presented themselves to see if there was any reason why they should not have children. That is still the condition, that there are a large number of sterile women. I cannot help but think it is a sign of deterioration.

2130. Does it not supply a corrective to what otherwise might be a transmitted deterioration?—I should hardly think so. It is evidence of neurosis, a disease of the nervous condition which I should class with deteriorated nerve centres. There is no malformation to be found. Of course it is unnecessary for me to talk of the increase of lunacy, which is a very serious matter, and the increase of cancer. We are tackling that now considerably.

2131. Is the cancer due to deterioration?—I think it must be deterioration.

2132. It is more prevalent among the richer classes than among the poorer?—There is deterioration of tissue.

2133. (*Colonel Onslow.*) Is the increase of lunacy a sign of deterioration?—I should say so—of loss of nerve power. Cancer is very largely on the increase with us.

2134. (*Mr. Legge.*) Amongst both sexes?—Yes.

2135. But it is more markedly among the females is it not?—There is a great deal of cancer in the rectum in the males now. Cancer in the rectum used to be fairly exceptional, but it has very much increased.

2136. (*Dr. Tatham.*) I wish to ask you one or two questions with regard to physical deterioration, although you do not believe there is evidence of general physical deterioration—I think you said that?—I think there is rather an improvement.

2137. I understood you to say that in certain cases amongst the lower classes there may be and probably is deterioration?—Yes.

2138. According to your professional experience generally and your experience as a factory surgeon do you trace any degree of deterioration to alien immigration?—We have not so many of the aliens with us.

2139. Not in Liverpool?—No, and the aliens we have are rather of the better class. We have a considerable number of Poles who are really well educated people; we have a considerable number of Germans, but certainly in my district they are the only ones. They are engaged in sugar refineries and they are fairly well educated and clean living people.

2140. Amongst the dock labourers have you met with a large contingent of aliens?—We have not so many; we have a few here and there; we have not large masses of them.

2141. Speaking of your examination of factory workers I should like to ask you how you ascertain the age. By certificates?—According to the last Factory Act, the Factory Act of about fourteen years ago, each child under sixteen years of age is compelled to supply a birth certificate. It is supplied at a nominal cost—sixpence. They get a certificate for sixpence and they produce that birth certificate.

2142. You were speaking just now of the prevalence of rickets amongst young children: you said you observed it in a much smaller proportion of cases now than a great many years ago?—That is so.

2143. In what form do you find rickets?—There is the malformed head, the bony malformation, and the bow legs, but they are not so well marked with us, and then there are the enlarged joints; they are not so marked; they are not a striking feature by any means with me now.

2144. So far as that is concerned there is no evidence of deterioration but rather the reverse?—Yes, rather the reverse. There is another point too which I have noticed rather a diminution in, and that is the tubercular disease of the joints.

2145. I was going to ask you about tuberculosis?—While you have a very large proportion still of tubercular disease of the lungs, you have not the amount of tubercular disease of the joints that I used to meet with thirty years ago.

2146. And as regards the prevalence of phthisis: do you think that factories contribute to the increase of phthisis?—I am sure they do. There is one feature about that which presents difficulties. Some two years ago I was asked by one of the factory employers to see one of their women. She did not come under the Factories Act; she was outside the age. This was a woman who had been brought up very well, a nicely educated woman who had been in very different circumstances, but owing to the unexpected death of her husband she was left to educate and bring up two children. She got work in this confectionary place and she was so clever that in a very short time she was earning 25s. a week, which was very small and very different to the condition she had been educated and brought up to, but still it enabled her to live very comfortably and bring up her two children. Her employer asked me to see her and I found she was suffering from phthisis. I wrote to the Medical Officer of Health for Liverpool asking what was to be done under the circumstances. He said "Send her to the workhouse." I could not take it upon myself. It was not my business to do that. She was able to educate her children, and for a theoretical injury, for a theoretical possibility it was outside my business to do that, and I was very thankful to leave it outside my business. I think that is a class of case that ought to be legislated for, because where it is for the good of a community that a woman should be taken away from educating her children and keeping herself and her children, I think it is extremely hard that she should be sent to the workhouse.

2147. Do you think it would be for the good of the people if the notification of phthisis were made compulsory just as in the case of other infectious diseases?—I would make it compulsory in the case of all factories where there are large numbers of people working together in close atmospheres, but I do not think it could be made compulsory notification for general practice. I think there would be difficulties in the way. But at the same time I think that certifying surgeons ought to make this one of the cases for notification under the Factory Acts in special factories where he found it, as you have now in this millinery place which Dr. Clark, of Cork, speaks of. I have known some who have only recently come under the Factory Act because they have adopted electro-motive power for sewing machines, but they are more stuffy rooms than any I have been in. Having boys and young people there of fourteen and fifteen years of age, a phthisical person there would be very likely to spread it.

2148. You spoke just now of the presence of ophthalmia. Do you mean granular lids?—You get that, but you also get different forms of eye disease—shortness of sight and loss of sight generally. Of course, granular lids you do not get so very much amongst the youngsters; you get them more in the industrial schools. They get them there very badly.

2149. (*Mr. Legge.*) Do you mean the industrial schools?—Yes.

2150. Are not you thinking of the Poor Law schools?—We have what we call industrial schools.

2151. I happen to inspect the industrial schools under the Home Office, and it is certainly not true of them?—The industrial schools that I speak of are schools that are used for drafting off the children from the Liverpool workhouse.

2152. Those are called Poor Law schools?—We call them the industrial schools. At these industrial schools there was so much granular lids that the surgeon there refused to take any more from the workhouse. He sent them all back to the workhouse hospital, because the first thing he had to do with them when they came down there, was to turn them all into the infirmary where he had the treatment of them.

2153. I should like to ask you your opinion as to the value of a more codified scheme of physical statistics. I suppose you would be in favour of that if it could be secured?—I think there would be an enormous amount of useful information got from it.

2154. I suppose, for instance, the certifying surgeons could be of great use?—They could. The certifying surgeons, I think, would perhaps have more facilities for it than anybody else.

Dr. Young. 2155. So far as the working-class population of all ages is concerned ?—Yes.

2156. When you examined children and young persons, for instance, at such examination, part of the certifying surgeon's duty might be to take certain particulars ?—Yes.

2157. What is the smallest amount of detail which you think they might go into with advantage—height ?—There is height, weight, and chest measurement. I do not know that the weight would be absolutely necessary, because if you get chest measurement and the height you can form a very good estimate of muscular development.

2158. You would be satisfied with the chest measurements in the rough, with the tape ?—Yes.

2159. You would not want calipers ?—No, that would not be necessary.

2160. Do you attach any importance to testing the reactionary movement ?—I think if you get good muscular development, that is sufficient. Our tactile development is such that we can get hold of an arm or leg and get the muscular resistance.

2161. I suppose a certain remuneration would have to be attached to work of that sort—the certifying surgeons are paid a fee for every examination ?—Yes. Sometimes they contract with the employers for so much to be paid for doing their work.

2162. There is another kind of statistics, no doubt, which you would also favour—I mean special inquiries into particular trades and industries ?—Oh, yes.

2163. And localities ?—And localities.

2164. Would you like to have the problem really solved, for instance, as to the actual physical measurements of town-bred and country-bred children ?—Yes ; it would be very necessary to draw a distinction between them.

2165. You are satisfied that the social legislation and administration in a particular form of it, the factories and workshops legislation and administration, is having a certain effect ?—I am quite certain it is.

2166. And you would be prepared to see extensions on similar lines of the powers already granted by the Legislature ? Extensions of the factory powers ?—Yes.

2167. Yes, and what extensions ?—I think it would be a very important matter. I think the certifying surgeons ought to be given the power of a medical officer of health in regard to factories, because there are certain conditions which one sees when going round. I wrote a little while ago to the employer of a factory, calling his attention to the disgraceful condition of the urinal there, and he very nicely said they would have it looked after, and it has been attended to.

2168. (*Chairman.*) That is outside your duty altogether ?—Yes.

2169. (*Mr. Legge.*) Then one detail about the married women after childbirth; would you go for an extension of the period within which they must not return to work ?—Yes, I would. I do not think any woman after her confinement should attempt to work again for three months.

2170. Would you go so far as to say that when a woman becomes pregnant she should leave off working in a factory ?—I do not think that would be necessary. If you take such work as that of a woman at the pit brow, there is tremendously hard work there, but a good deal of work a woman can do easily up to the end of the sixth month. In some works they could even still continue it to the end of the seventh, but I would stop them after that.

2171. And for three months afterwards ?—Yes.

2172. Then you spoke of continuation classes ?—Yes.

2173. And you spoke of their being specially adapted for a class of the population who are rather at a loose end ?—Yes.

2174. They require a special curriculum ?—Yes.

2175. You are aware that the Liverpool educational authorities are already considering a scheme for such a night school in connection with one of their day industrial schools ?—Yes.

2176. Would you approve of that ?—I strongly approve of that.

2177. And you would go further and say that as regards the ordinary day schools for the poorer parts of the town a special school might be established with a curriculum adapted to the particular class living in that district ?—I think that I would go even further than that. I would have what the Americans call "mucker" schools. They have a class of schools there which they put down in the lower slums of the town. They put all the dirty children into them, and have special masters and a special curriculum.

2178. Do you know the Bootle day industrial school ?—Yes.

2179. Do you think schools with a curriculum such as that would answer ?—I cannot say the curriculum they have got.

2180. A sort of half-day schooling and half-day light occupation and manual instruction ?—I think that is a very necessary thing.

2181. And a good deal of drill ?—I would make drill compulsory.

FIFTH DAY.

Monday, 25th January, 1904

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary.*)

Dr. D. J. CUNNINGHAM, M.D., LL.D., D.Sc., D.C.L. Oxon., F.R.S., called; and Examined.

Prof.
Cunningham

2182. (*Chairman.*) You are Professor of Anatomy of the University of Edinburgh and Chairman of the Anthropometric Committee of the British Association?—Yes.

2183. Do you think there is any evidence of general deterioration?—I do not. Of course, one may have impressions, but so far as solid fact goes I do not think that there is evidence of any serious deterioration.

2184. Have you any impression that there is?—I have, in Ireland.

2185. We will come to that later. But of course you will admit that the influx of rural population into the towns is detrimental to national physique?—Most distinctly so. It is true that, owing to agricultural depression and other causes, there has, during the last half of the century, been a great movement of the people of Great Britain from the country districts into the towns. It is calculated that the rural districts have been depleted in this way to the extent of 27 per cent. of their population; and as all authorities—both anthropological and medical—agree that urban life tends to lower the physical standard of the people, it is reasonable to suppose that this migration has not been unattended by some such effect. The marked reduction of the death-rate in the majority of cities, however, points to the fact that the deteriorating influence of overcrowding and poverty has in some degree been counteracted, and that through the efforts of philanthropists and also through useful legislative measures, the national health has in a large measure been preserved.

2186. What evidence do you think there is available in regard to the national standard of physique?—I am afraid that there is not very much evidence. At the present moment what evidence there is upon the physical condition of the people is founded first, upon statistical records of recruits who present themselves for admission into the army.

2187. You do not think that this goes far?—I do not. And second, upon the anthropometrical data which have been from time to time obtained by anthropologists and also by educationalists who are interested in the growth of the schoolboy. In no case are these sufficient to give an absolutely satisfactory idea of the national physical standard; and much less are they capable of affording unimpeachable evidence of any general deterioration of the race.

2188. What reason have you for saying that evidence derived from the statistics of recruiting is unreliable?—Because the class from which recruits are derived varies from time to time with the condition of the labour market. When trade is good and employment plentiful it is only from the lowest stratum of the people that the army receives its supply of men; when, on the other hand, trade is bad, a better class of recruit is available. Consequently the records of the recruiting department of the army do not deal with a homogeneous sample of the people taken from one distinct class. I may mention that a still better answer than I have given to this question is contained in the admirable reports which have been submitted to the Home Office by the Royal College of Physicians and the Royal College of Surgeons.

2189. We have those reports?—They are very admirable reports.

2190. There is some information from the report of the Anthropometric Committee of the British Association on this question?—Oh, yes; most valuable information. You refer, of course, to the reports of the years 1878 to 1883?

2191. Just so?—That really is the most valuable information we have upon the national physique. But these data were obtained more than twenty years ago, and there is really very little information of a similar kind which has been acquired either before or since that, with which these data can be compared. All other anthropometrical details which have been gathered since these Reports were published have been the result of private enterprise on the part of anthropologists or of educationalists who have interested themselves in the growth of school-children or of university students; and private effort is not capable of collecting the mass of facts which are required to enable us to pass a judgment upon so large a question as the standard national physique. Further—and this, I think, is rather an important point in this matter—owing to the divergency of methods employed by different enquirers, data obtained in this way do not possess the same value as those that are collected by a central body which controls and regulates the manner in which the work is carried out.

2192. You think it is essential that the inquiry should be conducted on those lines?—It is absolutely essential, and instances could be given of the great divergency of results which are occasionally obtained by independent workers—workers whose only desire is to obtain uniform results, and yet they obtain by the adoption of different methods very different results. I saw in the *British Medical Journal* a few weeks ago a very striking statement bearing upon this point. It referred to an inquiry which had been started independently in different European countries, in regard to the hearing of school children, and the results obtained showed marked discrepancies, owing apparently to the different standards adopted in each case. The result was as follows: In St. Petersburg, in 1888, 280 children were examined, and 14 per cent. were found to have defects in hearing. In Kreise more than 7,000 children were examined, and there were 28 per cent. with defects in hearing. In London the number examined was not given, but Dr. Cheadle found that in 1902 there were 43 per cent. with defective hearing, and in Grossvartenburg, out of 700 examined, 15 per cent. were found defective. No one I think would come to the conclusion in looking at these results that they represent the true state of affairs. Anyone who has been accustomed to investigation of this kind would at once say: Well these men are trying to get a uniform result, but they have not done so, owing to the different methods which they have adopted; and in consequence I would very strongly urge upon the committee this fact, that if uniform results are to be obtained they can only be obtained by workers, all working under one central controlling body.

2193. Upon uniform methods I suppose?—Yes. That is the only way in which uniform results can be obtained.

Prof.
Cunningham

2194. Have you formed any opinion upon the influence of environment on the development and physique of the people?—Every anthropologist has considered this question, and this point is very fully and admirably brought out in the Report of the *British Association* to which you have referred. One point which is established beyond all question is the remarkable influence which environment and nurture exercise upon the development and growth of the child as well as upon the standard of physical excellence attained by the adult. This is brought out most clearly in the tables given by the Anthropometric Committee of the British Association (1883), and it has recently received striking corroboration at the hands of Professor Matthew Hay and Dr. Leslie Mackenzie, in the Report of the Royal Commission on Physical Training. According to the statistics supplied by the British Association Committee (1883) children vary to the extent of five inches in stature, and adults to the extent of three and a half inches in stature, according as the circumstances under which they are reared are favourable, or otherwise. In the selection of officers and recruits this is a matter which is fully recognised at the War Office. The physical equivalents required in the case of a young man seeking a commission are of an altogether higher standard than those required in the case of a private. In the report of the Committee (1901) appointed by the Secretary of State for War "to enquire into the regulations under which candidates for commissions in the Army as well as recruits are physically examined" (a Committee on which I had the honour to serve) it is stated that the Committee consider "it is unnecessary to retain the weight test for recruits of sixteen years and under, for the reason that these lads in most cases, on offering for enlistment are underfed and that they speedily put on flesh in the barracks." In the case of candidates for commissions, however, it was unanimously recommended "that the weight test should be retained for all ages, the same reason not existing as with recruits." That is the Report of this Government Committee and I have received the permission of Sir Edward Ward to refer to it. This is the only copy that I have.

2195. (*Chairman.*) We shall be able to get copies of it?—I do not say that there is anything in it that is valuable for your purpose, but it is of interest, as it represents the minimum in the way of physique that this Committee considered it safe to adopt in the selection of officers and recruits. So sensitive, indeed, are the laws of growth to the influence of the surroundings amidst which an individual is placed that, quite apart from racial distinctions, it has been shown that people who live in the more elevated and bracing districts, where there is a freer circulation of air, are physically superior to those reared in the alluvial plains. That was a point brought out in the *British Association Report*. A pure atmosphere and proper food are the chief essentials for the building up of a good physique.

2196. Have you any opinion as to the period of early life which is most sensitive to the influences of environment? Is it the first few years of life, or is it later?—It depends very much upon circumstances, but the most important periods of life, in so far as growth is concerned, are the early years and also the period of puberty.

2197. Would you say the first five years?—Yes. One can see that by the statistics of mortality of infants. The statistics of mortality of very young infants are shocking.

2198. They have undergone no diminution, you think, during all these recent years when such advance has been made otherwise?—I cannot see how that could be the case, seeing that in large part the heavy mortality during infancy is accounted for by the fact that a child is now-a-days seldom fed from the breast.

2199. You think it is largely due to that?—I am certain of it. They are fed upon skimmed milk, and starchy trash, and all sorts of abominations. It is not perhaps that the parents are not able to get better food, but it is owing to the absolute ignorance of the parent of the proper kind of food to give. That you will find to be an opinion almost universal amongst those who have any knowledge of this subject.

2200. Have you formed any opinion as to the effect of the lowering of the death rate on the national physique?—Yes, I have considered that point. Of course during the

last fifty years the conditions of life have changed so much that it is reasonable to suppose that some disturbance of the physical standard of the nation, either for better or for worse, has taken place. I have referred to the lowering of the death rate, chiefly through improved hygienic measures. Through this, the elimination of the weak or unfit has not been so complete in recent years as it formerly was, and there can be little doubt that the addition of these to the population must have tended to lower the general physical average of the people of these countries. But, on the other hand, the same hygienic measures have, at the same time, improved the conditions of living of the general mass of the people, and acted in such a way upon the average standard of physique as to counter-balance the lowering effect produced by the survival of a greater number of the weaker members of society. It is very difficult—in fact, it is impossible—for one to say which of these two influences has acted to the greater extent; but I should imagine that they very nearly counter-balance each other; that we have obtained a better and higher physique by improved hygienic measures, whilst at the same time a very considerable number of the weaklings, who would otherwise have succumbed, have been able to live.

2201. You have formed some special opinion with regard to Ireland, have you not, in the course of your investigations?—Yes, I think that the conditions of Ireland are such as to require separate consideration. If there is any part of the United Kingdom in which physical deterioration is to be expected more than another it is in Ireland.

2202. Yet we have been told by one or two witnesses that particularly hard kinds of work are done by Irishmen, who are very often the best workmen?—That may be so. Of course, the labouring population in Ireland is relatively more numerous, I should imagine, than it is in these countries, and these men are trained to that particular kind of work.

2203. They were picked men, you think?—I should not say that, but they are men who are trained to it. Here, the labourer is a man very often who has come down from a higher condition, and he is absolutely unfit for the work he undertakes.

2204. That no doubt is the case?—Yes. For many years there has been a constant outflow of the people from Ireland by emigration, and it is the young, the strong, and the enterprising members of the population that have gone. I can testify to that from observation—have seen them go.

2205. You have made some investigations in Connemara, I think?—I have made no investigations which directly bear upon this point, but I have been able to see the character of the people who have gone out of Ireland. I know Ireland very well. I have been all through it, more so than Scotland, and I have taken a great interest in the people, and I have often been made very sad to see the best of the people go out of Ireland, and to compare those with the people that have been left. So that this is really an important matter in connection with your inquiry in so far as Ireland is concerned. Still, it must be admitted that there is no absolute evidence available that deterioration has taken place in the physique of the Irish people. This is an impression, I wish to say, because I have got no evidence of it. For ten years systematic measurements of the people have been undertaken as part of the work of the Anthropometric Laboratory in my former department in Trinity College, Dublin, and yearly reports have been published by Dr. C. A. Browne of the results obtained. But I wish it to be understood that these observations are not of such a kind as to throw any light on the general question at issue. They were undertaken entirely from the ethnographical point of view, and each year a small, isolated district (chosen on account of its isolation) was selected for study. In this the people were measured and their mode of life recorded. Any inferences, therefore, which may have been drawn from these reports, in regard to the deterioration of the people of Connemara, are not warranted. It might interest you to know the field over which our inquiries have extended, but I do not think that even if these reports were before you you could get any information from them that would be useful to you.

2206. You think that there would be nothing reliable?—Nothing that would be of value to you in your present inquiry. The reports include the Aran Islands, Inish-

Prof.
Cunningham

bofin, and Inishshark, in the County of Galway; the Mullet, Inishkea Islands, and Portacloy, County Mayo; Ballyeroy, County Mayo; Clare Island and Inishturk, County Mayo; Garumna and Lettermullen, Galway; Carna and Mweenish, Connemara; Dunquin, County Kerry, and Mallinmore and Malinberg, County Donegal. The investigations covered a very considerable area.

2207. You cannot say that they can be compared for our purpose with any facts collected by the Anthropometric Committee of 1883?—So far as your purposes are concerned they may be left out of account, because the end we had in view in this inquiry was a totally different one. It was an ethnological inquiry. The probability remains, however, that the people of Ireland have deteriorated in physical characters. It is not only from impressions which have forced themselves upon me during my long residence in Ireland that I am led to express this opinion, but also from the well-established fact that insanity has increased to an alarming extent. In 1851 the proportion of insanity and idiocy to the population was 1 in 657; in 1901 the ratio was 1 in 178. These figures are taken from an instructive paper on this subject by Dr. John Macpherson (*Edinburgh Medical Journal*, May, 1903). This paper gives valuable information in regard to the relation of fertility to insanity. Perhaps I may be allowed to state the sources from which my impressions are derived. In Dublin one has particularly good opportunities of comparing the country with the town people, and of course one who has an anatomical eye like myself generally looks at these points with some little interest. In Dublin there are frequent processions in connection with certain national events, when delegates come up from all parts of the country, and you see the town contingent marching side by side with the country contingent, and you can draw a line between them.

2208. Very much in favour of the country contingent, I suppose?—Very much.

2209. There has not been any large displacement from the rural to the urban districts in Ireland, has there?—Not nearly to the same extent that there has been elsewhere. There has been in connection with Belfast, but not in connection with Dublin.

2210. Among influences that may counteract deterioration, do you attach much value to the existence of a mean physical standard of the race and the tendency of the classes which deviate from this to return, under improved conditions, to the mean standard?—Yes, I do. I would refer to the manner in which changes in the conditions of life affect the growth of an individual class, and more especially how poverty with its squalor, its bad feeding, and its attendant ignorance as to the proper nurture of the child, lowers the physical standard of the lower classes. In spite of the marked variations which are seen in the physique of the different classes of people of Great Britain, anthropologists believe, with good reason, that there is a mean physical standard which is the inheritance of the people as a whole, and that no matter how far certain sections of the people may deviate from this by deterioration (produced by the causes referred to) the tendency of the race as a whole will always be to maintain the inherited mean. In other words, those inferior bodily characters which are the result of poverty (and not vice such as syphilis and alcoholism) and which are therefore acquired during the lifetime of the individual, are not transmissible from one generation to another. To restore therefore the classes in which this inferiority exists to the mean standard of national physique, all that is required is to improve the conditions of living, and in one or two generations the ground that has been lost will be recovered.

2211. But you do not think that that is the case with the effects of alcoholism transmitted from parents?—That is a very doubtful matter. I myself, perhaps on insufficient evidence, do believe that the effect of alcohol, as seen in alcoholism, is transmitted.

2212. And that it results in the permanent disablement of the offspring?—Exactly.

2213. In successive generations?—How far it would go it is very difficult to say. I think the evidence is insufficient to form any definite opinion.

2214. But the sober son of a father who has been a soaker all his life might transmit the effects to the grandson, you think?—It is more than likely. It may skip one generation and appear again in another. I have not

the slightest doubt that both in the case of syphilis and alcoholism the taint gradually would wear out if this particular stock persisted, provided there was an influx of healthy and fresh blood.

2215. Have you had proof of syphilis having increased or decreased among the population?—I have had no experience of that. Although I am a medical man I have not practised.

2216. Do you know, from what you have heard of it, whether that is so or not?—Of course, every medical man considers that syphilis requires special legislation. I never met any medical man yet who did not hold that it was a monstrous thing for the State not to take measures to check this most deteriorating disease. One can hardly use words strong enough about it.

2217. You do not think that the operation of other causes has tended to check it?—I am not sure what you mean.

2218. From what you hear, would you say that there is more syphilis and that it has attained a more virulent form than it did twenty or thirty years ago?—I should imagine that it is not more virulent from what I have heard but I have no actual knowledge on this point.

2219. From your experience as an anatomist have you noted any changes in structure unfavourable to development?—No, I have not, except in the one case of the teeth. In other directions, I think I might almost say, there has been an improvement; but there is no doubt about the teeth. It is an obvious fact that the teeth of the people at the present time cannot stand comparison in point of durability with those of the earlier inhabitants of Britain. Those who have the opportunity of examining ancient skulls cannot fail to be struck with this. In such skulls it is common to notice the teeth much worn down through the coarse and gritty character of the food used in these early times, but still they are usually firmly implanted in the bony sockets of the jaws. Further there is evidence that within comparatively recent times this degeneration of the teeth has been proceeding with especial rapidity. It is a significant fact that in a table issued by the Director General of the Army Medical Department (see *British Medical Journal*, Nov. 21st, 1903, page 1339), the number of recruits rejected for defects in the teeth is shown to have increased from 10.88 per 1,000 in 1891, to 49.26 per 1,000 in 1902. Probably this increase in the number of rejections from this defect partly arises from a greater stringency in connection with this physical requirement.

2220. That is, I think, admitted by the medical authorities for the army?—But at the same time it is not all due to this. Indeed, the increased tendency in the present age to dental caries, and to early absorption of the walls of the sockets in which the jaws are implanted are matters which have recently been attracting very special attention on the part of the medical men. In connection with this question there are two other points that occur to me. The one is the feet and the other is the female chest. I think—and I think I can speak on this point with some little authority—that in both these respects during the last twenty years there has been an improvement. I do not see now (of course it is only the very low classes that I can speak of) in studying their feet the same amount of deformity that I used to see about twenty years ago. Then, with regard to the female chest, which used to be so shockingly distorted by means of the corset, not only in the upper classes but also in the lower classes, there again I do not see the same amount of distortion. It is very rare indeed to meet with a female chest which is absolutely normal. It is one of the rarest things possible; but the amount of distortion, I think, has very considerably lessened. It is really a very long time since I have seen a chest which one would say was excessively distorted from this cause.

2221. You think that ought to have a valuable effect upon the health of the women?—Most valuable. No one, except those who know the anatomy of the thoracic and abdominal cavities can realise the important effect that it must have.

2222. (Colonel Fox.) What do you attribute that to—the increase in physical recreation?—I think it is largely due to the improved æsthetic taste of the people.

2223. They do not tight-lace so much as they used to, you mean?—Yes. I think that the æsthetic taste is

Prof. Cunningham to some extent shocked now when one sees a spider waist in a woman.

2224. (*Chairman.*) May it be the fact that owing to the out-door exercises they indulge in now, they find the corset is an impediment to them?—Yes, that very strongly comes in. The young women have quite a different idea in regard to athletics and exercise from what they had in the first half of the last century.

2225. (*Mr. Legge.*) But that would not affect the poorer classes, on which you based most of your observations?—I think that it would, because they follow the upper classes in matters of fashion. It was a surprise to notice how many of the lower classes had pinched-in waists. A study of the female thorax shows that it is not confined to one class but that it occurs as much in the lower classes as in the upper classes. While I state my belief that, except in the case of the teeth, there is no sign of structural deterioration in the race, I would not have it supposed that I wish to assert that no structural changes are going on in the human body. The changes to which I refer, however, are slow of progress and minute in degree, and have to do with the gradual evolution of the race. In the present enquiry, such evolutionary changes may be disregarded—not merely because they can hardly be considered germane to the subject under consideration, but also for the very cogent reason that no legislative measure, short of one devised with the view of arranging the matrimonial alliances of the nation, would have the slightest effect in retarding or accelerating their progress. Two of these evolutionary changes may be briefly referred to, seeing that they have an indirect bearing on certain points that have been raised in connection with the subject under consideration. It is probable that in civilised peoples the volume of the brain, and with it the size of the cranium, are undergoing a slight increase. Certain anthropologists believe that this is the case. For my own part I am inclined to think that whilst in all probability the head of the newborn child shows little or no increase in its dimensions, the range of growth and the period of growth of the brain and cranium after birth have both been extended. There is reason to believe that education acts as a stimulant to brain growth. It would likewise appear that, in the white races of Europe, the jaws are undergoing a slow process of shortening. The stunted character of the wisdom or back-most teeth, the small amount of space allotted to them, their variability, their late appearance and indeed their frequent failure to appear at all, bespeak this change in the jaws. Through this jaw-shortening the teeth are reduced in size in civilised races, more crowded together, and therefore more liable to disease. Indirectly, this may tend to favour the early degeneration of the teeth, which is so marked a feature of the present age; but I take it that the real cause of this degeneration is the striking change which has taken place in the character of the food.

2226. (*Chairman.*) Has that striking change taken place in the character of the food at the early period of life, or does it apply to the food of the adult classes as well?—All through life. Of course not during the time that the child is taking the breast, but as soon as the teeth begin to be used. There cannot be a doubt that the teeth are not so useful as a functional factor as in former times when they had hard and gritty food to masticate, and we see in those races who give greater employment to their teeth that the teeth have not undergone so great a change as in the civilised races. This is no doubt also partly due to the fact that in many of these races the jaws have more room for the implantation of the teeth. The teeth are larger and they have more room, but it is also in all probability due to the fact that these teeth get more and harder work to do.

2227. The teeth are failing because they are becoming useless, I suppose?—Partly that.

2228. (*Mr. Struthers.*) I heard when I was down in Edinburgh last week that some of the legal students who came from the West Indies and from European races came with excellent teeth, but it is found that even in the course of their residence in Edinburgh they rapidly decayed?—I did not know that, but I should think it is not impossible.

2229. (*Colonel Fox.*) That bears out your statement that it is due to that fact?—In civilised races the teeth are a subsidiary matter, but also, for what reason I cannot tell, the jaws are apparently shortening.

2230. (*Chairman.*) You think that the vitality of the race goes to strengthen parts of the body whose functions

are in more request at the present time than the teeth?—Yes; in the case of the head we have got the cranium and the face. The cranium is the important part and the face is becoming a subsidiary part.

2231. (*Mr. Struthers.*) Do you think that this decay is as common among the well-to-do as among the poorer classes?—Quite. But there is a very interesting point with regard to the teeth. Anyone who can look back twenty or twenty-five years can recall the fact that a person who had lost his teeth through decay at those times would become very early old-looking, and used to get the nut-cracker appearance of face. Now the dentist has stepped in and the parts of the face that have disappeared are built-up and the two jaws are thereby kept in a proper opposition to each other, and the angle of the lower jaw is preserved so that the youthful appearance is retained. It is an interesting point, that, owing to the dentist, you see very few old-looking people about. And that also applies in the case of the lower classes as well as the higher. You do meet more of them among the lower classes, but the lower classes are paying a great deal of attention to the matter now.

2232. (*Chairman.*) False teeth are very expensive, are they not?—But they have dental hospitals in towns where they can get almost any attention that is required. I do not say that the aid thus rendered is sufficient. It would be better perhaps if it were more extended, but still a great deal of attention is paid to their teeth nowadays.

2233. In connection with this point I want to call your attention again to the Anthropometric Report of the Committee of the British Association of 1883. I shall quote first of all a passage from the report, and then the note. This is from the report:—"It would appear therefore that the physical (and most probably the mental) proportions of a race, and their uniformity within certain limits are largely dependent upon the size of the female pelvis, which acts as a gauge as it were of the race, and eliminates the largest infants, especially those with large heads (and presumably more brains) by preventing their survival at birth." And then there is a note attached to that:—"It is probably in this direction we must look for an explanation of the degenerative influences of town life and sedentary occupations, as they, together with the new movement for the higher education of women, favour the production of large heads and imperfectly developed bodies of women in this and other civilised countries, and a corresponding disproportion between the size of the head and the circumference of pelvis. Have you considered that?—Yes, that is a paragraph with which I am quite familiar, and it opens up a number of very interesting points, although I may say that I do not agree with the general tenor of that paragraph at all. I have not the least alarm with regard to the deteriorating effect which it is alleged may ensue from the higher education of women—quite the reverse. There again, of course, we are dealing more or less with impressions, and therefore I would guard myself in this statement by saying that sufficient time has not elapsed to enable us to judge with any degree of certainty of the full bearing of this movement upon the national physique. Indeed the higher intellectual training of women, in so far as their bodily structure and the proper fulfilment of their physiological destiny is concerned, must still be considered to be in the experimental stage. I think, if I am not wrong, the movement towards the higher education of women only began in the early sixties; it was not taken up with any degree of vigour, but it was about that time that secondary schools were founded. The Universities did not take up the matter until the early seventies, and at first only in a very partial manner indeed, and it is only within the last twenty years or so that this matter has been pushed with any degree of vigour at all, so that I do not think that we have got materials at the present moment to judge, and therefore we must go entirely upon impressions; but my impressions are very strong that the whole life of the women at the present moment is ever so much more healthy than it used to be.

2234. You think that applies to all classes?—Yes. There is more life in the open air and more exercise.

2235. Some forms of exercise, I presume, may be injurious?—I do not think, so far as I can see at the present moment, there is any exercise that is injurious.

2236. How about bicycling in relation to child-bearing?—I do not think that bicycling in moderation will be injurious except at particular physiological periods.

*Prof.
Cunningham*
— — —

2237. Does it not tend to the rigidity of the muscles in that part of the body?—The only way in which it could affect the body would be in modifying the form of the pelvis; of course the pelvis during the period of growth is not consolidated in the same way as it is later on. It might affect the pelvis, but still, at the same time, the hereditary influences of growth in healthy people are so strongly impressed upon the different parts of their body, that I say in moderation I imagine that physically it would not be injurious.

2238. Yes, in moderation.—In moderation. Of course one could quite understand that young persons might injure themselves by excesses of any kind. I have seen the physique of young men destroyed by over-study. But these are extreme cases.

2239. But extremes are very often met with, you know?—We do meet extremes, and I have instances at the present moment.

2240. There is more immoderation among women than among men, particularly when games are taken up with all the zest of novelty?—Yes, of course it goes without saying that all systems of female education in which the marked sexual peculiarities of women, both as regards structure and function, are not considered, are bound to act perniciously on their proper development. In the British Association Note, to which you have referred, special attention is called to the pelvis in its relation to child-bearing. In dealing with this statement, I regret that it will be necessary to enter slightly into detail. The influences which regulate the growth of the pelvis in the two sexes are hereditary, and by their operation a different result is produced in each sex. During the process of parturition the child has to pass down through the bony ring which is formed by the female pelvis, and in connection with this requirement the interior of the pelvis in the well-formed female is roomier and wider than in the case of the male. So strongly are these hereditary laws of growth impressed on the individual during the course of its development that even in the unborn child or foetus certain of the sexual characters of the pelvis are apparent. It is a very interesting matter—as well as curious—however, that after birth and in the earlier years of childhood these sexual characters would appear to disappear.

2241. With regard to the pelvis?—Yes. The later investigation of these matters shows that during the first eight years of life these differences in the sexual characters between the pelvis of the boy and the girl would appear to vanish and they become similar. In the eighth year of her life the girl enters upon her second stage of childhood, and about this time the pelvis goes along different lines from that of the boy. This deviation from the mode of growth of the pelvis peculiar to the boy is clearly preparatory to, and a necessary preliminary to, the changes which occur in the female at the period of puberty. At the time of puberty, the form of pelvis characteristic of the female is attained, and although the pelvis continues to grow in accordance with the general growth of the body, its general proportions are maintained. That is the last investigation of the matter, and it is a very curious and interesting point. Muscular action has little—if indeed it has any—influence in modelling the form of the pelvic interior and determining its relative size in the two sexes. The fact that, in the erect attitude maintained by man, the weight of the trunk is transmitted through the upper half of the pelvic ring to the lower limbs, may have some influence in modifying the pelvic form, but even this is doubtful. It is under this head that the alleged evil effects of excessive bicycling would come in, because the weight of the body in bicycling is not transmitted through the lower limbs. It is thrown on the pelvis, and through a different line, and through that there might be a certain detrimental influence upon the normal growth of the pelvis. Such being the case, it is clear that outside morbid processes (and the pelvis is very subject to morbid processes which modify its form in various ways) the degenerating influences of town life, etc. can only affect pelvic growth in the same general way that they influence the general growth of the body. But I would wish to add that no conclusions of any value can be derived from the measurements which are given in the British Association Note, to which you have referred, on this subject. It is true that, in each race, the capacity of the female pelvis and the dimensions of the foetal head must present, within certain limits, corresponding proportions, but it is absolutely impossible to determine

the correspondence, as was attempted in the course of the British Association investigation, by measuring the circumference of the pelvic ring, and comparing this with the circumference of the adult head. The circumference of the foetal head is determined solely by the volume of the contained brain; other factors besides the volume of the brain tend to increase or diminish the circumference of the adult head. In the lower part of the forehead large air-spaces develop in the interior of the bone at the time of puberty and greatly alter the proportions of the adult head. The mean cranial capacity of the Scotch male is 1,478 cubic centimetres, whilst in the native Australian male it is only 1,293 cubic centimetres. In spite of this difference in the volume of the brain, the mean circumference of the head of the male Australian is 533.6 millimetres, as compared with 531 millimetres for the Scotch. Notwithstanding this large circumference of the Australian adult head, I suspect that if the Scottish children had to be born through the Australian pelvis there would be a rapid depletion of the Scottish population. I merely mention that to show how absurd it is to draw any inference as regards the adjustment of the female pelvis and the foetal head from the condition of the adult head—it is absolutely impossible. The size of the foetal head alone can give a just conception of the co-relations which exist between it and the pelvic circumference. There is absolutely no proof that the size of the foetal head has increased, nor is there any evidence that the adjustment of the co-relations which nature has established between it and the female pelvis has in any way been interfered with. Indeed, evidence of a kind may be adduced which favours the opposite view. If any serious disturbance had taken place in the adjustment of the pelvic and foetal proportions, the percentage of still-born children at full time would show an increase corresponding to the disparity between the foetal head and the bony passage in the mother through which it has to pass during the process of parturition.

2242. You are aware that there are no general statistics of still born children?—Yes.

2243. Do you think it desirable that there should be?—I do. When this matter was first brought to my notice, I found that no statistics were available which would assist me in determining the point at issue. I consequently endeavoured to obtain information from several of my friends, amongst others a professor of midwifery of Edinburgh, but above all from the man who is able to give better and more full information than any one else—that is, Dr. William Smyly, who was for many years at the head of the Rotunda Hospital in Dublin. I received some information from him on the matter, but the information was not of such a kind that you could absolutely answer the question one way or the other. Apparently the proportion of children who die during parturition at full time has not increased. That is the general impression. But of course there are also other factors—very many factors to be taken into account in connection with this matter. Of course nature has a way of her own in adjusting the proportions between the foetal head and the female pelvis so as to maintain the proper balance. Women with narrow pelves have more difficult labours; the child runs greater risks at the time of birth, and thus the tendency is for this character (that is the narrow pelvis) to be eliminated, and for the women with roomy pelves to transmit this character to a greater number of female children.

2244. Have you any opinion as to the advantages to be derived from an extended enquiry into the physical characteristics of the nation?—I have long had very strong views on that point, and I was very much struck with a sentence which occurred in the Report of the Royal College of Physicians of England to the Home Office. They say: "Could an enquiry be made into the present physical condition of the nation, it is self-evident that it would be of great value; but one dealing with a portion only of the population would be likely to lead to error." With this view I most fully concur, but I would go further and insist that for the purpose of the present enquiry it would be necessary that this examination into the physical characters of the people should be continuous and carried out on a permanent basis. It is only by such a measure that statistics could be accumulated which would enable us to note the upward or downward tendency of the national physique. Valuable as the results of the British Association Committee of 1878-1883 are, it is no disparagement

Prof.
Cunningham

of its work to say that these results are admittedly incomplete. In its final Report the Committee itself alludes to this, and expresses regret that the time and funds at its disposal are not sufficient to enable it to prosecute its enquiries to the end it had in view. Indeed, all the Committee claims to have done is to have laid a substantial foundation for a further and more exhaustive study of the physical condition of the people. That the time has come when this more extended inquiry is urgently called for is self-evident, and it is with this end in view that I would press upon the Committee the importance of recommending the establishment of a Central Anthropometric Bureau supported by Government and commissioned to carry out this work.

2245. You have been good enough to sketch out a scheme of such a Bureau; will you kindly explain it in brief?—Yes. I think, the skeleton of such a Bureau might be the following:—1. The formation of a Consultative Committee; 2. The Bureau itself; and 3. the employment of Surveyors or Measurers. I think that the Consultative Committee would be important for the purpose of obtaining absolute uniformity in the methods of procedure in the three countries.

2246. The point you referred to before?—Yes. This Committee, I think, should consist of three members, one from each of the three kingdoms. These appointments should be honorary, but the ordinary allowances for travelling expenses should be granted. The members of this Committee should be anthropologists of acknowledged reputation who are acquainted with the structure of the human body and the laws which regulate its development and growth. They should be likewise men of weight and influence. It might be possible to carry out the work in England and Scotland without such local representatives, but I do not think that it would be possible to do so in Ireland; and indeed I consider that in each of the three countries the enquiry could be much more advantageously prosecuted by having a Committee of this kind co-operating with the permanent officials of the Bureau. Then I would propose that the duties of the Committee would be:—1. To determine the measurements and observations to be made; 2. To determine the instruments to be employed; 3. To construct, in connection with the Director of the Central Bureau, the form of card by which the observations are to be recorded; and then, lastly; 4. Each in his own country to do what he could to assist the permanent officers, and, above all, to induce the people to take an interest in the work. Then the Central Bureau, that of course should be established in London, and I think it should be organised somewhat upon the same plan as the Geological Survey Office. It would probably be necessary to appoint a Director and Deputy Director. One of these should be an anthropologist acquainted with the anatomy and development of the human body, and with experience in anthropometrical work; the other should be a statistician trained in the methods of Professor Karl Pearson. A statistical Department would also require to be organised in the Bureau. The work carried out in this office would be the following: 1. To keep the standard instruments and issue all the instruments required in the enquiry; 2. To issue the cards on which the observations are to be recorded to those engaged in the measuring, etc.; 3. To arrange surprise visits at intervals to different schools, etc., with the view of determining whether the surveyors were obtaining accurate results; 4. To receive the cards after they have been filled up, to classify them, to prepare the requisite statistical tables, and publish a yearly report; 5. To form in London a centre where the different classes of the people may be measured, and a centre also where the surveyors or measurers may be instructed in the methods of making their observations, and in those anatomical details which are requisite for the acquisition of accurate results; and lastly; 6. to disseminate information on anthropometrical work and create an interest in the public in regard to the importance of maintaining the national physique. Then with regard to the surveyors or measurers, I believe that it is here that the real difficulty comes in in devising a working scheme. If the labours of the Bureau were to be confined to school children, the matter would be easy enough. All that would be necessary would be that one teacher in each school (or, in the case of schools where there are boys and girls, a male and a female teacher) should be instructed in the methods and made responsible to return at stated periods

the cards which they have filled up. Such a limited conception of the functions of the Bureau, however, could not be entertained. If the full measure of good is to be obtained, and if precise information is to be attained regarding the national physique and its tendencies, it will certainly be necessary to measure and test large samples of the adult people of defined districts every ten years or so. This renders it essential that a staff of surveyors or measurers should be maintained. It is needless to conceal the fact that in all probability it will not be easy to induce the people of all classes to submit to the investigation. In the work which was carried out in Ireland this was a constant source of trouble, and in many cases, even with the assistance of the parish priest, it was only possible to obtain a comparatively small number of observations. Still, were the Bureau established and the Government thereby to indicate its interest in the work, the investigation (in England and Scotland at least) would be placed upon a more favourable footing. Further, the operations in the schools would familiarise the people with the methods, while the example shown by the better educated classes would conduce to remove prejudice on this matter. One point would certainly require to be attended to, viz., that an equal number of male and female surveyors be appointed, so that both in schools and in the adult survey each sex might be measured by surveyors of a corresponding sex. I am afraid to hazard an opinion upon the number of surveyors that would be required. Mr. Gray has gone into this matter very carefully and I should prefer that you should get the information from him. I have not the necessary amount of information.

2247. What particular classes would be subject to these measurements?—Sufficient samples from all classes should be examined.

2248. Would you state briefly the facts which it would be expedient to know and classify?—That is a very difficult matter to do offhand. The Committee of the British Association is, I may say, reconstituted very largely for the purpose of endeavouring to get at the essential points, but I have jotted down some points, and further if you would kindly accept them I would like to show you the cards that we worked with in Dublin.

2249. That is in reference to Connemara is it not?—Yes; and also to the work carried on in my own laboratory, (*handing in the document*). This is the survey sheet that we had; and it worked very well from the ethnographical point of view. For the purpose in view in connection with the enquiry at present under consideration, I would try as far as possible to make the observations as few as possible and as simple as possible so that the examination of any one particular individual should not be prolonged. I think further that a certain amount of interest might be given to the investigation if certain points were introduced which perhaps are not very valuable in themselves, but which might interest the people. In our work at Trinity College we introduced at the beginning a number of tests such as relative strength of the two hands. We did that believing that it would lead to important results, but we found that it did not, but it was most useful to retain it on account of the interest to those who were examined. Again, another matter, speed of blow and a number of things of that kind, which may be looked upon as absolutely useless, well we retained them simply because in this way we could gather a crowd into a laboratory, and having them there, then we proceeded to take the more essential details.

As I have said the measurements and tests in the proposed inquiry would require to be selected with very great care and judgment, and they should not be too numerous. Probably the following would be sufficient, but should the project which I recommend be carried out this matter might advantageously be relegated to the consultative committee.

1. Height.
2. Chest girth—(a) maximum.
(b) minimum.

This gives the range or thoracic play which is important.

3. Weight.
4. Cranium—(a) length.
(b) breadth.
(c) height.
5. Breadth of shoulders (callipers);
6. Breadth of hips (callipers).

7. Vision—(a) tested by Snellen's types.
(b) tested by different colours.

8. Degree of pigmentation.

Information regarding parentage, district of birth, and conditions of living, &c., should be obtained.

2250. As regards chest measurement, you mean the inspiration and expiration?—Yes. I put no stress on the spirometer. We worked with one in our laboratory, and it is largely a matter of trick in getting various results.

2251. This is mentioned in the Report of the British Associations of 1893?—At one time everybody believed in it. Then weight, head (and speaking of head I mean the cranium) the length, breadth and height.

2252. You think that is essential?—I think that it is very important. In connection with many of these questions which you have raised since I came into this room, several of them could be answered if these points were gradually recorded, especially in the young.

2253. (*Colonel Fox.*) I see in that card, it deals with the measurement of the face as well as the cranium?—Yes. Of course you understand that the card was drawn up chiefly from the ethnological point of view.

2254. You do not believe in that?—Yes, from that point of view, but not from the point of view of testing the physical standard of the people. I hope that face-measurements will find a place in the card, but I understood that I was only to deal with those points which were considered essential in connection with the subject before us.

2255. As this is a matter of health, do not you think that a strong well-formed face denotes health, and therefore do not you think that the measurements are useful?—No I can hardly say that I would agree with that. You will find that many people have fine types of face who are in very bad health. I should say so.

2256. There is another thing I wanted to ask you. You spoke just now of the spirometer, which is really to get the mobility or the cubic capacity of the lungs, but the difference between the full and empty chest also denotes the capacity as also the mobility of the chest, does it not?—It does.

2257. Do not you think that the spirometer would be useful? In measuring the chest, does it not often happen that people who have not been accustomed to breathe properly have but little mobility of the chest walls, whereas after a certain amount of practice the mobility is greatly increased?—Yes.

2258. So that if you deal with people untrained, those two measurements merely show the mobility of the chest?—Perhaps it might merely show the mobility of the chest at one particular time, but it would show that the chest required development in a young person, which is very valuable information.

2259. When you take the full chest and the empty chest with people unaccustomed to use their lungs much, you will find very little difference between the two measurements; it is almost a fixed chest. Therefore it is hardly a guide with the large mass of people?—It would be a valuable guide in the young, because it would show serious defects in chest mobility in the child; and then if, as I propose in the further remarks I have to make, for the establishment of carrying out this work there should be repeated examinations of the child, we would have a record of the advance which is made in this extremely interesting point of pulmonary play. I look upon this pulmonary play as one of the most essential points with regard to health. The important part which fresh air plays is universally recognised, and in order to take advantage of that fresh air one must have pulmonary play. Then breadth of shoulders, the breadth of the hips, the vision tested by Snellen's type.

2260. (*Chairman.*) Is that with reference to acuteness of vision?—Yes. Then testing by different colours, and the degree of pigmentation. There are many other things that it would be difficult to get accurately. I thought for a considerable time about hearing. I do not think that the ordinary surveyor would have sufficient knowledge to test hearing. You have to consider the agents who will be employed. Information with regard to parentage, district of birth, and conditions of living, etc., should be obtained. Then I really do most sincerely trust that if

an investigation of this kind should be instituted the Government will not lose sight of the very important scientific matters which could be gathered with very great ease through the medium of such a Bureau. I have not put down any of these, but the Committee may judge the anxiety of anthropologists and others to obtain this information by just looking at the individual efforts which have been made in different directions, and not only in this country but over the whole world. How men have spent money, and time, and labour, in trying to get information with regard to many points of the utmost anthropological value in connection with the people. I have not mentioned one of these, but I take some credit for restraining myself, and I sincerely trust if the Government should think of carrying out this very desirable work some opportunity would be afforded of extending the investigations.

2261. If you have further information on this point you could furnish us with some memorandum and we might put it into the appendix, because it is germane to the subject of our investigation, and it would be well to have it?—Yes, I could give it more weight because I could speak for the Committee of the British Association.

2262. You think that results of scientific value, apart from the question of national physique, might be derived from the establishment of such a bureau?—Yes. In schools I would consider it essential to undertake periodic—say six-monthly—examinations of the children. Only in this way could we obtain data in regard to individual growth and improvement. That is the point that Colonel Fox referred to, I think. These re-measurements could be undertaken by the teachers if they were properly instructed by the surveyors.

2263. You feel no doubt upon that point?—I do not. There is another point, too, that I might add to strengthen what I say here. It is a very extraordinary thing, but there is no certain evidence at the present moment as to when growth stops. The anatomist will tell you that after twenty-five years of age there is no possibility of growth, and yet if you look at statistical tables you see it going on till thirty and even beyond that age. And there cannot be a doubt that this apparent growth after twenty-three and twenty-five—because I look upon it merely as an apparent growth—is owing to the fact that the weaker and shorter members have died out in the later years. It is a fallacy in the statistical tables. But still in all ethnological teaching it is a matter which is dealt with, and there is always some difficulty in stating the precise age at which the growth of the individual stops.

2264. Will you state your reasons for saying the country has suffered from the lack of information on matters touching the physical development of the people?—I think a sufficient answer is to be found in the fact that at the present time, when the subject of the supposed deterioration of the race is engaging the attention of Parliament and the public generally, there are no available data by which a satisfactory decision on this matter in all its bearings is rendered possible.

2265. You are familiar with Professor Karl Pearson's investigations as to the correspondence between physical and physical characters inherited from parents?—Yes. I think it may be assumed that the results which are obtained in moulding the character by the influence of home environment and of education are not transmitted from one generation to another. The investigations of Professor Karl Pearson render it probable that the degree in which physical characters are inherited from parents corresponds more or less closely with the degree in which the physical characters are inherited. In collecting the data on which this conclusion is based Professor Karl Pearson has found it impossible to obtain "a quantitative measure of the resemblance in moral and mental characters between parents and offspring." He has therefore confined his attention to fraternal resemblance, and he considers that should this be "less than, equal to, or greater than the fraternal resemblance in physical characters we may surely argue that parental inheritance for the former set of characters is less than, equal to, or greater than that for the latter set of characters." On this matter I speak with some little hesitation, because it is one in which I have not done any work, but I must say that it would have been more satisfactory to me if at the same time he had gauged the extent of these resemblances by estimating

*Prof.
Cunningham*

Prof.
Cunningham

the resemblance between individuals who are not brothers and sisters but who were grouped at random as if they were, and examined in the same way.

2266. You mean the accidental resemblance?—Yes, because unless we know that we cannot estimate the full value of his investigations.

2267. Do you think that the better stocks as represented in the upper and middle classes, are not reproducing themselves at the same rate as formerly?—There is a very general impression with regard to that point, that they are not. I do not think that this is due to any loss of inherent fertility in those better classes, but it would rather appear to result in large measure from a love of luxury, and ease and a desire to keep free from the pains, cares, and restrictions which are imposed by motherhood, and from the obligations which attend fatherhood. Artificial restraints upon fertility constitute a predominant cause of this deficiency in the reproductive properties of these classes. It is generally understood that in the United Kingdom such restraints are less employed than in the Continental countries and in America. There is no cause to believe that in England and Scotland the birth-rate of the intelligent classes has reached a lower level than in other civilised races—indeed it is rather the reverse—but we have not the information. Another condition which may tend to lessen the fertility of these classes is the postponement of marriage to a later period of life owing to the greater struggle for existence which is a character of the age, and also to the higher requirements in the way of living which are characteristic of the present generation.

2268. Do you agree with Professor Karl Pearson that an inquiry into the relative fertility of the different classes of the community would be most desirable?—Most certainly I do. I think it would be a most important piece of information to get, and all the more so if statistics of a similar kind for previous generations could be obtained with which these could be compared.

2269. I am afraid there are none?—I am afraid that is so.

2270. Have you considered the statement with which Professor Pearson concludes the Huxley lecture for 1903. He states that there “does exist a lack of leaders of the highest intelligence in science, in the Arts, in trade, even in politics,” and that there is “a want of intelligence in the British merchant, in the British professional man, and in the British workman” as compared with fifty or a hundred years ago. And there is a further statement which he makes that “we stand I venture to think at the commencement of an epoch which will be marked by a great dearth of ability.” Do you think he has any reason for these statements?—I think that the statement is a pure assumption. I do not know how we can possibly measure this supposed loss of inherited intelligence—we are dealing with inherited intelligence because all his remarks refer to inherited intelligence—and I do not think there is a single solid fact in support of such a view. I am astonished that one for whom I entertain so high an admiration as Professor Pearson should have put forward such a statement, and more especially to claim for it, as he does, that it emerges from the “calm atmosphere” which is supposed to surround the anthropologist.

2271. Have you anything further to say upon that?—Not upon that point. It is not necessary to follow it out any further. There are one or two other points in connection with this. It should be borne in mind that it is stocks and not classes which breed men of intellect. These intellectual stocks are found in all classes, high and low. No class can claim intellect as its special perquisite. This is a fortunate circumstance seeing that the conditions which affect the degree of fertility in the higher classes are not as a rule present in the lower classes. The conditions under which genius or outstanding ability appears are peculiar and very little understood. It likewise has a residence I believe in no special class and very probably in no special stock. It is not improbable that the physical conditions upon which genius depends may not, in certain cases, be far removed from the domain of pathology.

2272. Genius, then, is a form of disease?—I mean certain incipient pathological conditions which have occurred during the growth period of the brain, and which produce certain physical states of the brain, which curiously enough have tended to develop this outstanding mental condition. I may mention that in an exceedingly

interesting paper which was written upon the brain of Helmholtz it is stated that certain appearances suggested the presence of incipient hydro-cephalus in early life.

2273. (*Dr. Tatham.*) The very carefully reasoned and very complete character of the evidence you have given us covers the ground so thoroughly that really one has not many questions to ask you, but I should like to put to you, almost by way of summarising what you have said, this question: Has your experience led you to the belief that, speaking generally, there is or there is not progressive physical degeneration among the people?—Speaking generally, I do not think that there is any progressive physical deterioration of the people. I clearly say there is no evidence of it.

2274. You spoke just now in the course of your evidence on the question of mortality?—Yes.

2275. I think I gathered from you that whilst the mortality amongst people of all ages has decreased, mortality amongst infants has not decreased at all?—So far as I know it has not decreased. There is some very interesting information on that particular point referring to infantile mortality in the towns. I think it has been proved in the town of Sheffield by Mrs. Greenwood that 21 per cent. die under two years of age.

2276. What you say is in accordance with the well-established fact as gathered from the Registrar-General's returns?—Yes, under two years.

2277. That the mortality under one year has not decreased materially?—Yes.

2278. Whereas the general mortality of persons of all ages has considerably decreased, say, within the last quarter of a century?—Quite so, that was my impression.

2279. With regard to emigration you, in your evidence, say that “The conditions of Ireland are such that its people require separate consideration. If there is any part of the United Kingdom in which physical deterioration is to be expected more than another it is in Ireland. For many years there has been a constant outflow of the people by emigration, and it is the young, the strong, and the enterprising members of the population that have gone. It is distressing to think that during the twenty years ending in March, 1901, close upon two millions of people have left Ireland.” Still it must be admitted that there is no absolute evidence available that deterioration has taken place in the physique of the Irish people?—No.

2280. Do you think that the same statement may be made with regard to other parts of the Kingdom, so far as your experience goes, that it is the young, the strong, and the robust who emigrate, and the weaklings are left behind?—I do not think quite so much so in the case of Scotland and England, because the conditions of life are so totally different. Those who emigrate from England and Scotland are led away more by family ties. It is the pressure of absolute want that is the cause of emigration in Ireland, and a different state of affairs absolutely, the lack of employment and the means of gaining a living; that is the pressure which has pushed out the people from Ireland—not so much now, I hope, but it has been so in the past.

2281. You speak of the well-established fact that insanity has increased to an alarming extent—that is in Ireland?—Yes.

2282. Have you any knowledge as to whether the same obtains in England, at the present time?—I believe there has been an increase but not to the same extent, but this is a point I do not know.

2283. The assumption suggests a very important question with regard to insanity and it is this: Do you think that the increase of insanity in Ireland, which has been established, is the result really of the fact that more cases of insanity are brought to light now than used to be the case—is it not more apparent than real?—I think there is something of that in it, but unquestionably it is a real increase.

2284. You think it is real?—Yes, unquestionably. It is explained in the paper to which I referred, by the fact that the marriage age has been so greatly increased as to affect the fertility of the people and at the same time the bodily characters of the people.

2285. And it is also your opinion that the effects of inherited syphilis are handed down from parent to offspring?—There cannot be the slightest doubt about that.

Prof.
Cunningham
—

2286. And you expressed the strongest opinion that the State ought to interfere to take some steps, if possible, to reduce the evil?—I hold the strongest views on that point—that the State is incurring at the present moment a great responsibility in not taking measures in this direction.

2287. And what measures would you suggest?—Of course everyone knows that measures were adopted or proposed to be adopted, and these were put a stop to by a sentimental outcry which occurred at the time. But unquestionably there should be some supervision exercised in connection with the unfortunate class of women through whom the disease is propagated.

2288. You think that there should be some legislative provision?—Yes, in connection with this unfortunate class who hire themselves out for immoral purposes.

2289. You think if legislative pressure were brought to bear it would be possible to diminish the present evil effects produced by syphilis?—Most unquestionably I do. We know perfectly well that one person affected may spread the disease far and wide—one affected person; and not only to those who are infected immediately, whom we might not be inclined to let our sympathy go out to, but we may consider what happens to those whom they marry and the children that they breed. It is there, of course, that the real pinch comes in.

2290. You spoke also in the course of your evidence of the possible evil effects from over-bicycle riding?—Yes.

2291. Have you had it in your mind to compare the effect of excessive bicycling with excessive horse riding?—I think that that would affect persons in much the same way, because the weight of the body is transmitted down through the same pelvic bones.

2292. (*Chairman.*) There is a bigger buffer in the case of the horse saddle than in the bicycle saddle?—I think that it comes to the same thing, because the points of the bony pelvis through which the pressure is transmitted to the seat are very small. They are padded by nature to look large, but in reality they are quite small.

2293. (*Mr. Lindsell.*) One question with regard to the matter of still-birth. Do you think from your experience that the time has really come now when still-births should be compulsorily registered in Great Britain and Ireland?—Most unquestionably.

2294. Do you think that great advantage and safety to the public would arise?—Most unquestionably.

2295. (*Dr. Tatham.*) With regard to insanity which you mentioned just now, do you trace any connection between the increase of insanity and the increase of the excessive consumption of very strong tea among the lower classes in Ireland?—It is a well-known fact that the habit of tea drinking in Ireland has grown to an enormous extent, and further that a very large amount of money of the poorer classes is expended on high qualities of tea, but I have no way of judging the effect that that has had with regard to insanity.

2296. The tea being kept all the deleterious elements are gradually extracted from it?—I do not think that those materials which are extracted by prolonged infusion would have effect upon the brain so much as on the stomach.

2297. It is stated that tea has an effect upon the brain, a very marked effect?—So it has, but the constituents of the tea which have this effect I think are extracted early—in the first ten minutes or so of infusion.

2298. Do you agree that very black tea might tend to anæmia and perhaps neurosis?—I think it would, through affecting the stomach. I do not know that it would have much effect upon the nervous system.

2299. You think that probably the greater abstention from the use of tea has altogether a beneficial effect?—I should say not. I should say the use of tea is very much abused now.

2300. Does it take the place of alcohol or is it in addition to alcohol?—I think it is merely an addition. I do not think that it has stopped the taking of alcohol.

2301. Is there a great falling off in the quality of alcohol that the lower classes in Ireland drink?—I think that the whisky in Ireland is very much better than the whisky in Scotland.

2302. But are there not several substitutes for whisky that are more within their reach now than used to be the

case; I have seen it stated that all sorts of horrible fluids are sold in grocers' shops?—They do that everywhere.

2303. They even drink methylated spirits, I understand?—They do not drink that more in Ireland than in this country. The people are much more unsophisticated in Ireland than in Scotland, but in certain parts of Ireland, in the north of Ireland, the habit of drinking ether became very common, and it is a most obnoxious drink.

2304. It is very obnoxious you think?—Yes, but it was quite a limited vice. It was merely confined to a very narrow district indeed, and I question whether there is any of it now.

2305. Now of course it is a notorious fact that the percentage of the population of the British Islands in towns as compared with dwellers in the country has and is still largely increasing?—Yes.

2306. I am not talking of slum life, but ordinary urban life has in itself a tendency to physical deterioration?—The slum life?

2307. In slum life there are conditions which must necessarily tend to deterioration, but ordinary urban life, under ordinary sanitary conditions, does that tend of itself to this physical deterioration in the race?—I do not think it would be possible, even under the very best forms of town life, to produce conditions which the poor could live in which would equal those of the country.

2308. Therefore if urban life is necessarily less favourable to human development than country life, it might follow that physical deterioration is in progress because there are relatively more dwellers in towns now than there used to be?—Of course the assumption is that this great influx of people into the town has not been unattended by a certain amount of physical deterioration—the presumption is that.

2309. That would be progressive in each generation?—That would not be transmitted from generation to generation at all. It would merely affect those living under these conditions. But if you take the progeny of these people who are living under these unfavourable conditions and put them into favourable conditions I believe that you would restore completely any loss in the way of physique, so long as these people had abstained from the vices to which we have referred.

2310. Then the establishment of new conditions of urban life like these garden cities that they talk of, or the extension of salubrious suburbs where the working-men could dwell, and come to their work in the towns—you think that would tend to improve these conditions?—There is no doubt about it, that urban life—the more nearly you can approach the rural life, the greater amount of certainty you will have that there will be an improvement in the physical conditions of the people.

2311. You do not think that might be discounted to a certain extent by the physical strain of going greater distances to work?—It depends upon how this locomotion is effected.

2312. Well, the excessive daily travelling night and morning to reach their work would counteract the advantages of the better air in which they live?—Probably there would be improved methods of locomotion, motor-cars, and so on, which would be really a healthy rather than an unhealthy experience to undergo. They would be taken into the open air, and it would be rather to their advantage, I think.

2313. (*Mr. Struthers.*) I understood you to say that the degeneracy owing to urban conditions was temporary?—I believe so.

2314. And that they would recover from this degeneracy if they were transported to good conditions in the country, say?—Certainly, or, at least, their children would.

2315. But there is an interesting point arising there; supposing they remain in towns and they have children, is the next generation worse than the first generation—is there reason to suppose that it would be worse?—I should imagine that there is reason to suppose that it would be worse, not because they have inherited any worse qualities, but because most likely the power of raising healthy children would be less in the second generation than in the first.

2316. If you have them continually under unfavourable conditions in three or four generations, do you think that it would lead to some degeneration?—Yes.

Prof. Cunningham 2317. And the power of recovering under favourable conditions would be lessened?—I would not go so far as to say that.

2318. Is the power of reproducing themselves diminished by this continued living under urban conditions?—I do not think we have any evidence upon that.

2319. Because you have heard the statement casually made that there is no such thing as the fourth generation of Londoners?—I do not know that it is founded upon fact, and I do not think so myself. With reference to what you have mentioned, there is an extremely interesting point in natural history, which bears upon this, because every question upon life and reproduction has a direct bearing upon what we are considering. I remember in Belfast, at the meeting of the British Association there, Professor Weldon, who is a well-known authority upon heredity, gave a lecture to the people, and he mentioned a very astounding fact in regard to the water-flea. He told us, as we all knew, of course, that this water-flea has the power of reproducing itself in broods, and if you kept it in fresh water those broods went on increasing and increasing, and in physical characters everyone was similar to the one before, and each one had the short but very conspicuous tail. If, however, you took a certain number of those water-fleas and put them into impure water, the next generation of tail was shorter, and if you kept them in bad water the tail actually disappeared, and in successive generations they went on breeding and breeding, the tail always absent, until you took a certain number of them and put them into fresh and pure water under better sanitary conditions, and the tail reappeared. I think that is a most distinct analogy, because the laws of life are the same in the water-flea as in ourselves.

2320. That is very hopeful for the future?—Yes, but it does not lessen the responsibility of the State one single bit.

2321. (*Dr. Tatham.*) Do you consider that there is any direct connection between size and health?—I certainly think that a race during the time that it was placed under unfavourable circumstances would diminish both in stature and in weight, but most likely if those unfavourable conditions were removed, I say they would regain what they lost.

2322. Have you noticed at all that the female is improving disproportionately to the male in modern life; that the physical development of the female is progressing while that of the male is stationary?—I do not think so.

2323. It is said so?—I know.

2324. It is quoted as a sign of degeneration?—But there is absolutely no proof that that is the case. I think that the female did fall off very much indeed, as I was saying, in the first half of the last century, when her great beauty was considered to consist in her languishing ways, but I think she has improved tremendously during the last half-century. I do not think that the male has fallen off.

2325. It is said so?—Yes, but many of those statements have no foundation in fact whatever.

2326. (*Mr. Legge.*) We had a Witness who stated that he had a suspicion that the lower forms in a race die out, not through sterility, but because their offspring are too feeble to survive—is there any physiological truth in that?—I do not think there is any evidence of it, but I think that it is very likely; there is a sort of flavour of likelihood about it.

2327. And now for a question or two about this scheme which you have described so well. The part that seems to give rise to some difficulty is from the administrative point of view, the measurers and the surveyors—is not that so?—Yes.

2328. No doubt you are aware that in connection with the Home Office there is a vast staff of certifying surgeons throughout the country, some 2,000 of them?—Yes.

2329. And it is the duty of those men to examine children who work in factories, to ascertain their fitness, and at a later stage to examine young persons with the same view?—Yes.

2330. Now, would it not be possible for these certifying surgeons to act as surveyors, and when they are making examination for the purpose of the Factory Department make it also for the purpose of any Anthropometrical Bureau?—I am quite satisfied that they could not carry out that work, and for this reason, that I believe that

their work is quite hard enough already without adding so largely to it. To make an effective survey Mr. Gray has calculated that it would be necessary to examine (I would rather leave him to explain it because the figures are not quite clearly in my mind), but it is perfectly clear to my mind, from figures which he has supplied, that it would take the whole time each day of many surveyors to cope with the large amount of work which would be required. Then there is another point, too, that the work which you would have to ask these medical men to undertake would be work which would require to be paid at a much higher rate than work carried out by surveyors who are only trained up to this one point, the Anthropometrical point. You could get them at a much smaller salary, but if you employ medical men it would be necessary to pay them on a higher scale. Perhaps the work might be done better in the end if it were done in that way, but I think it would break down through the large amount of money which you would require to carry it through.

2331. Of course you in your scheme desiderate a very much smaller number of surveyors giving up their whole time than the total number of certifying surgeons who, it is suggested, could give each a little of their time?—It might be carried out.

2332. We might put this question to Mr. Gray, you think?—Yes, because he has gone very carefully into the statistics of this matter. But still I do hold that the fewer surveyors you have got the better; you will get more uniform results; you will have them more completely under the control of the central body. Although in the case of medical men you would be dealing with men who would naturally have a much better idea of the points to look for, yet I think that that advantage would be counteracted by the greater uniformity of results by taking regular paid surveyors.

2333. Of course the Factory Department would have to go on using these certifying surgeons for getting statistical facts for its own purposes, and even so, would you think it well that the Factory Department or any Government Department carrying out a special inquiry of this sort should consult any Anthropometrical Bureau that might be established?—I would.

2334. So as to see that their terminology corresponded with the generally accepted terms?—I think that would be an advantage. Of course, you will understand, in recommending the bureau, I am not in any way recommending a scheme which would replace medical supervision over schools, or children or factory hands—the two things are totally distinct.

2335. But you do not see your way as to how they could be dove-tailed into one another?—No, I think that the scheme I have suggested would work better.

2336. As regards these facts which you have set out as being the topics on which it is desirable to get information these, I take it, form the minimum of information you desire?—Yes, that is what I intended.

2337. You are not prepared to cut out weight in the case of the children?—No.

2338. The object of the information to be acquired from such an inquiry as this leaves the individual out of account. We do not care whether any particular individual goes up or down, therefore, if it is generally found that the man's weight follows height with a curious regularity you would not, for that reason, omit weight?—No, because one knows that weight and stature do not exactly follow each other with any degree of regularity.

2339. Not in children?—I am doubtful if it does.

2340. Why do you attach importance to the degree of pigmentation?—I think in investigations of this kind one must make some attempt to separate the different racial elements (it is difficult to do that, I know), but the race comes in in a very awkward manner in inquiries of this kind, and I think that pigmentation is one of the most important means that we have of determining this matter.

2341. I should like to ask one question as to the measures to combat syphilis: Do you think that there is anything like adequate hospital provision for the treatment of syphilis in the country?—So far as I have seen there is.

2342. So that you do not think much improvement is necessary in that way?—I do not.

2343. In measures for the cure?—Those are not the measures that I referred to at all. I think that the Government has done a great deal in the way of hospital accommodation for syphilitic patients. I should, perhaps, add that I speak merely from my experience in Dublin.

2344. And local authorities, what about them—have they played their part too?—I cannot tell.

2345. Have you any views—it seems a small point, but is one which, in many people's eyes, is an important one—namely, tobacco?—I have; I think every one has.

2346. What is your view about juvenile smoking?—I think it is most deleterious. I think that every one who knows the effect which smoking has upon children must be shocked to see how this habit is growing. I had it in my mind to speak about this, but it escaped my memory. But since I have gone to Scotland I have made one or two inquiries with regard to the prevalence of smoking in schools. I do not refer to public schools where the boys are under proper supervision.

2347. You mean public schools in the Scotch sense?—I mean schools where children go as day scholars, where they are immediately under supervision during the day, and then disperse to their homes. I understand from questioning boys attending these schools that I can trust, that more than half the boys smoke. I asked where did they get the tobacco from, and it seems there is a regular trade now in cheap cigarettes.

2348. (*Chairman.*) At sweet shops?—Yes; and at shops where other things are sold to children. It is not at orthodox tobacco shops. I am informed that they can get cigarettes in packets of five for a penny. But I was told also that some of the girls were following suit, and there was a school mentioned to me (I do not like to mention it, because it is a school with a deservedly high reputation) in which one or two girls had actually been caught in the passage of the school smoking.

2349. (*Mr. Legge.*) Then would you be prepared to approve legislation which prohibited the selling or giving of tobacco to children of certain age?—I would most undoubtedly, and I think one might go even further, and I think that it might be possible in some way or other to check the habit in children of tender age. They do it perfectly openly, and generally when they do it they are not under the control of their parents. I think that it might be possible to introduce some preventive measure.

2350. (*Colonel Onslow.*) You say that while the results of poverty, not vice, which are acquired during the life time of the individual are not transmissible from generation to generation, unfortunately not only alcohol but also syphilis and many other diseases which may be attributable either to excess or vice are transmissible?—We believe so, but syphilis and alcohol are the worst.

2351. The father, for instance, has syphilis or any venereal disease badly in his system, and he is almost certain to transmit it to his child?—Yes.

2352. It does not matter how many years have passed, does it?—The danger becomes less and less then.

2353. But it will come out in various forms?—Yes.

2354. In one form does it not come out and show its effect on the teeth?—That is merely one sign.

2355. But it is rather a prevalent sign, is it not?—It is.

2356. That would account for such a very large proportion of young boys, such as are recruited for the navy, who come from a decidedly superior class to the ordinary recruit, being rejected for defective teeth?—I think only to a small degree. I have no doubt that some have been rejected for that reason, but I do not think that the majority have been so rejected.

2357. From the ages that they are enlisted, from fifteen to sixteen and three-quarters, the proportion that are rejected by not only the medical examiner but by recruiters is very large; do you know that?—Yes.

2358. Two hundred and nine out of 2,000 are rejected by medical examiners, but heaps of others have been through the hands of recruiters and have been rejected, are you aware of that?—Yes.

2359. At that age one would have thought that the teeth would not decay from causes such as want of care, etc.?—One's experience nowadays of the teeth is that they require to be attended to from the earliest ages, and even the milk teeth require to be looked after.

2360. You think it is attributable to all sorts of causes?—I have not the least doubt that syphilis works to some extent. *Prof. Cunningham*

2361. I have this in mind, because many of the boys are the sons of men who were in the army or navy, and we know that there has been a considerable amount of syphilis prevalent in the army and navy from men being abroad very much in other countries, and so on, and it would occur to one that that may be one of the causes?—I have no doubt of it.

2362. Especially as those lads have been well attended to as far as their feed and bringing up is concerned, and they have not come from the slums?—Yes. At the same time I do not think that this degeneration of the teeth is confined to any one class, it is all over.

2363. (*Mr. Struthers.*) Do you think that the degeneration in the teeth in all classes is due to some extent to the character of the food?—I think so.

2364. What is the nature of the change?—The teeth are not used so much as they were formerly.

2365. What sort of food would you say was good for preserving the teeth, or preventing the decay, or what was likely to lead to decay?—I am not prepared to specify any particular foods.

2366. Could you not give us the general characteristic food?—Yes, the food that will give the teeth good and proper play, and bring them into healthy and active opposition the one side with the other.

2367. You could not specify any food distinctly of that character which is in common use?—I suppose that our ancestors used very largely farinaceous foods baked rather hard and perhaps mixed a good deal with the debris of the stones between which they were ground, and so on.

2368. Such food as oat cakes for instance?—Yes.

2369. Then about tobacco smoking and its deleterious effects upon children. There is no doubt as to the increase of the habit, and I have no doubt that we are all agreed that it is bad for the children, but what direct evidence is there that it is bad for the children, because in this Committee, even in your own experience of this morning, we have come across so many popular opinions that there is no evidence in support of. Is there any evidence that we can put before the public to show that tobacco smoking is proved to have had a bad effect?—I do not think that there is any direct evidence, unfortunately. But in lecturing upon this very question, so firmly am I convinced that smoking is deleterious that I mentioned it as one of the causes of physical deterioration, but you may take that for what it is worth.

2370. You do not have any personal experience to go upon?—No, beyond this, that we know tobacco has a powerful action on the nervous system.

2371. Your opinion is that tobacco smoking is worse for the children than for adults?—Unquestionably.

2372. But there is no actual evidence of it?—That is so.

2373. (*Mr. Legge.*) Would not you take as actual and direct evidence the undoubted fact that when a boy or young man or a grown up prize-fighter goes into training to get fit he drops smoking as the first thing; is not that evidence?—That is evidence of a kind.

2374. (*Mr. Struthers.*) But is not that kind of unfitness produced by smoking one of a passive and temporary kind; that is to say, that it does not affect the man permanently. He goes back to his smoking later on and is none the worse for it?—It keeps him at a permanently lower condition of life—less fit—if he finds it necessary to cease to indulge in tobacco on special occasions.

2375. But it is a common experience that an athlete is a smoker, and during his period of training he gives up smoking and then resumes it afterwards. Is there evidence to show that he is worse than if he had never smoked?—I do not think that smoking is deleterious in adult life. I am a smoker myself, but I do object to children smoking when the whole of the growth processes are full of activity, and when the nervous system, which unquestionably the smoking affects, is so sensitive to injurious influences.

2376. It certainly offends the moral sense of the grown-up person?—Certainly.

Prof. Cunningham 2377. (*Colonel Fox*.) One continually meets with people who say that cigarette smoking especially is far more injurious than pipe smoking?—So I am told.

2378 You also inhale the smoke with the cigarette but not with the pipe?—Yes.

2379. If it is bad for a grown-up man is it not evidently a great handicap for a young boy who requires all his vitality when growing?—No doubt.

2380. So that cigarette smoking for young boys is not only injurious, but it tends to stunt their growth?—I am quite of your view.

2381. (*Mr. Struthers*.) Then as to a point somewhat of the same kind. I think you have a pretty strong opinion that the urban conditions of life are unfavourable as compared with the country?—Yes.

2382. Of course that is an opinion we all hold; but there has been no investigation made into the point, has there?—I think those reports of the British Association are pretty clear upon that point—I think they are very clear and convincing.

2383. You know the island of Lewis?—No, I do not know it.

2384. That is a large island with a large population centred on the seaboard, living in excellent air, no doubt in somewhat insanitary houses, and with almost a minimum of food. The impression that one gets from seeing them is that they are above the average in physique. Their food is much worse than would be taken by the plump dweller, being inferior in amount, but still their physique is splendid—that would be a point rather in favour of the country than the town?—It would. Fresh air is most essential.

2385. That is the sort of thing which would be brought out in any well organised system of collecting statistics such as you mentioned?—Yes, on this point.

2386. And it would be very important to have this brought out before we begin to dogmatise?—I think that it is absolutely essential. I do not think that anyone can proceed to combat the evils of poverty without these statistics and we have not got them.

2387. There are one or two very small matters. You have seen Dr. Mackenzie's Report on the examination of school children in Edinburgh and the corresponding one at Aberdeen?—Yes.

2388. Do you think that the basis of examination was sufficiently wide to form a very definite opinion as to the conditions of life in Aberdeen and Edinburgh?—No. But I think that it brought out this main, broad point, that children living under favourable circumstances show a much better development and growth than children under unfavourable conditions. That is brought out very prominently from their investigations, but I would not follow them into details, and in many points I would not follow their mode of work. But still the investigations were of very great value.

2389. Do you think that the facts of the Report on Edinburgh are a justification for the health of children in Edinburgh as compared with other towns?—No, I do not think so.

2390. One of the measurements taken for example was the power of grasp. Do you think that is important?—No. I have had a large experience in measurements. That is a measurement that we adopted rather by way of attracting people than as being of any value.

2391. Very much as you use the spirometer?—Yes.

2392. It depends on dexterity does it not?—Yes.

2393. (*Colonel Onslow*.) It is more or less a trick, is it not?—Yes.

2394. (*Mr. Struthers*.) Do you consider that skipping is a dangerous exercise?—No, I think it is an admirable exercise.

2395. You do not see any physical danger in any reasonable amount of skipping?—I am in favour of exercise in reason, and I think that skipping is an admirable form of exercise if reasonably indulged in.

2396. I understand that you lay considerable stress, at any rate to an extent that has not been done by previous Witnesses, upon the influence of race, of stock, as against conditions of environment, variations in food and con-

ditions of life?—I do. I think the question of race is unquestionably a very important one. Considering the fact that we in these countries have inherited such magnificent racial characters, I think it is highly important that we should do everything to maintain them. Do you wish me to enter into this question, and to explain what I mean?

2397. I think it is rather important to have your views upon this point, because we have not had it brought forward before to my knowledge?—Of course all questions of race must be dealt with with some degree of caution. We cannot speak with any great degree of certainty, but so far as we know, the race in which we are at present interested is one which began with the influx of people from the northern part of Africa, the Iberian race, not a particularly fine race. The substratum I should say upon which our racial characters are founded is not a particularly high class one, that is, the Iberian race. It represents the very early period in Britain, the Neolithic. Then we had the influx of people to whom we owe many of our good racial characters—we had the Gael and the early Britons probably from mid-Europe. That was a very fine race, but still better was the influx we had of the Teutons, the Angles, and the Jutes, forming the Anglo-Saxon race. And then of course we had the Norman influx, also good, and the Scandinavian influx, represented by the Danes, and men from Norway and so on. I may say it is very questionable indeed if any country can boast of such magnificent racial elements as we in this country can, and of course we have been able to preserve these qualities intact to a greater extent perhaps than many other countries owing to our insular position.

2398. It would be important, I suppose, in any statistics which might be got together, for the purpose of ascertaining what the physique of the nation was from time to time, that account should be taken of any variations in the race stock that can be ascertained?—As far as possible, I think, the race question should be taken into account. I think it would be necessary to take it into account so far as we are able to do so, because it certainly does affect the question of physique.

2399. (*Chairman*.) That, I understand, is the value of the element of pigmentation, that you have referred to in your heads of evidence?—Yes, I put that in my scheme very largely from that point of view.

2400. I mean it is not purely ethnological; the facts under that head might serve to correct erroneous impressions derived, say, from a stature below the normal?—Certainly.

2401. Because of the presence of some racial peculiarities in that part of the United Kingdom?—I did not put it in on account of its scientific interest at all, but merely to check our physical results.

2402. (*Mr. Struthers*.) Does that affect such a matter as the colour of the hair and eyes?—Yes.

2403. These are important things to be brought out as checking other influences, such as environment and amount of food?—I consider so, because if you look at these very valuable statistics, which we have had so frequently to refer to—the statistics of the British Association—you will find that the physical characters of what we call our four great stocks—English, Scotch, Irish and Welsh—are very considerably different. Sir William Aitken, who wrote upon the question of recruiting for the Army, says that we should have a different set of physical equivalents for those different districts of the country, and I think there is a good deal in that. The Scotch are the tallest, the Irish come next, the English next, and the Welsh are the shortest. That is pretty well-established. But when you come to weight you find that you get a different result, because, although the Scotch still keeps to the top, I think the Welsh come second, then the English, and the Irish are at the foot of the scale.

2404. Is there any value in weight divided by height as an indication of physical fitness?—I would very much rather judge of the two qualities separately from each other.

2405. (*Colonel Fox*.) You mentioned just now that insanity was on the increase?—In Ireland, yes.

2406. And you said that you did not consider that the excess of tea-drinking had anything to do with it. But

is it not a fact that the drinking of alcohol is a general cause of insanity?—I think the absolutely certain end of any man who goes on soaking himself in alcohol is a species of insanity.

2407. Is not insanity as a rule due to over-drinking?—I do not think so.

2408. Excessive drinking?—Yes. Of course we all know that a man who goes in for continuous and excessive drinking ends more or less in a state of madness.

2409. Do you consider that the physical training that is now in vogue in schools, a well-thought out system, tends to improve the physique of the children of the country and the race in general?—Most unquestionably, especially if that physical training be done in the open air, and if the very young children are allowed, under a certain amount of proper guidance, as much freedom as possible, and the means of enjoying themselves as much as possible in their own way, shouting, dancing, and jumping, and doing everything that annoys their seniors.

2410. (*Mr. Struthers.*) Like students at a graduation ceremony?—I think that is going a little too far.

2411. (*Colonel Fox.*) We have been attaching a great deal of value of late to what we call respiratory exercises, breathing exercises, always done in the course of the ordinary physical training: do you think that would do much good?—I do. I think it is very valuable. I think I mentioned before that seeing that fresh air is probably one of the most important elements that we have to consider in connection with a good physique, one must have proper pulmonary play.

2412. In addition to that, we insist upon its always being nasal breathing, especially in these exercises—the mouth shut and the whole breathing done through the nose?—That is the proper way of doing it, but I think when a person is undergoing more or less excessive exertion—

2413. These are not excessive exercises, but gentle exercises, purposely devised for what we call deep breathing—taking in full inspirations?—In natural exercise, in the ordinary easy exercise, the natural form of breathing is through the nose, and if the nasal passages are healthy, there should be no difficulty in breathing properly and sufficiently through the nose.

2414. (*Dr. Tatham.*) In your answer to Mr. Legge this morning, you spoke of the practice of juvenile smoking of tobacco?—Yes.

Sir LAUDER BRUNTON, M.D., D.Sc., L.L.D., F.R.C.P., F.R.S., called; and Examined.

2425. (*Chairman.*) You are physician to St. Bartholomew's Hospital, Foreign Honorary Member of the American Academy of Arts and Sciences, and Correspondent of the Academy of the Natural Sciences, Philadelphia?—Yes

2426. Will you give us the evidence you have prepared?—First of all, perhaps, I may be allowed to remark that I think that the term "physical degeneration" is unfortunate, because it involves a comparison in the physique of the British people at the present time and at a former period. What we really want to know is first, whether the physique is satisfactory, and if not, then, secondly, what are the causes of its deficiencies, and, thirdly, how are they to be remedied. Probably some sections of the people have improved in physique, as is shown by athletic records being constantly broken, and by the pages of *Punch*, which show a very definite increase in the size of women within the last forty years. But there can be no doubt, from recruiting returns, as well as from an examination of the slums of large towns, that the physique of a large number of people is unsatisfactory. The reasons for this are probably numerous—greater accumulation of people in towns, where there is more crowding; less exercise; early marriages; and unsuitable food in infancy, childhood, and adolescence. It may be worth inquiry to ascertain how far compulsory attendance at school has interfered with the growth of the body, for it has been shown by Professor Angelo Mosso that mental exertion lessens muscular power, and it may well be that greater mental exertion tends to increase the deteriorating effect of insufficient food upon the growth of the body. As Professor Angelo Mosso's books may not be accessible I have taken the privilege of bringing with me some copies of a paper by myself in which I have quoted his observations, reproduced his diagrams,

2415. And you said that, as far as you knew, there was no actual evidence of mischief accruing from that practice?—We are all perfectly certain in our own minds that mischief does accrue from it, but I would not like to state dogmatically that I have seen anything definitely detrimental.

2416. No documentary evidence?—There may be documentary evidence.

2417. Does not that rather point in your mind to the desirability that, in the interests of the public health and the public safety, we should have in Great Britain and Ireland a registration of sickness as well as of death, in order to provide the very evidence which you say we lack now?—It would be extremely important if its carrying out was at all feasible. It would be a very large order.

2418. Do you think it is practicable, assuming that sufficient interest were attached to it?—I would like to think it was practicable.

2419. So far as regards the public institutions, do you think anything of the kind could be done?—I think it could be done in the public institutions most certainly; I do not know whether it could be done in connection with the public at large, because it would be an investigation of such a vast extent.

2420. So far as it could be got, you think it would be desirable?—Unquestionably.

2421. And it would probably enable you and other investigators to answer satisfactorily to yourselves such a question as the one put to you?—Exactly so.

2422. With regard to the question of smoking being harmful to persons undergoing physical training, such, for instance, as would be required for rowing, you know, I dare say, that at universities men who are training are not allowed to smoke?—Yes.

2423. Does not that go some distance at least to prove that it is considered detrimental?—I think it goes a great distance.

2424. And proved to be?—Yes, and proved to be, because when persons wish to put themselves in the fittest possible condition they find it absolutely necessary to stop smoking. I am a smoker myself, and that is what I always do; naturally and instinctively I drop smoking if I have to do anything which requires special care and attention.

and given the reference to his original papers. (*Copies were handed to the Chairman.*) It is not unlikely that increase of sanitary science, by preserving many children who would otherwise have died, tends to lower the general average of physique while increasing the average length of life. In addition to general want of stamina, recruits were found by Sir Frederick Maurice to fail in regard to their teeth and their feet. Flat feet may be regarded as a local evidence of weak physique due to feebleness of the ligaments, and of those muscles whose tendons act like a string to a bow in maintaining the proper arch of the foot. The decay of teeth is ascribed by dentists to erosion by acid formed by decomposition of particles of food, and it is also on evidence of an imperfect supply of lime salts. I may perhaps be allowed to quote a very instructive case which came under my own observation. While a mother was nursing a child it began to show symptoms of rickets. I gave to the mother phosphate of lime along with her salt and in a very short time all the symptoms of rickets disappeared in the child whom she was nursing. Shortly afterwards she began to complain of toothache, and, thinking that this might be due to loss of lime salts from her own teeth, to supply the drain upon her system I gave her phosphate of lime, and the toothache disappeared. It is well known that during pregnancy women's teeth are apt to decay, and this decay is, I think, due to the lime being abstracted from the teeth to supply the bones of the offspring. I am inclined to think that another cause of deficient teeth is absence of lime salts, due to the more common use of fine white bread. In the process of preparing fine flour the outer part of the wheat which contains most of the salts is removed, and without lime salts an animal can no more form bone than a hen

*Prof.
Cunningham*

*Sir L.
Brunton.*

Sir L.
Brunton.

can lay an egg with a shell unless lime salts be supplied to form it. Another question arises in regard to the decay of teeth, namely, that some children have well developed bones and yet have decayed teeth. The enamel of teeth differs from ordinary bone in containing fluorine, and it might help to elucidate the causation of decayed teeth if inquiries were made as to the condition of teeth in Derbysire, where fluorine may be present in the water from the fluor-spar so common in that country. There can be no doubt that caries is frequently due to fragments of food lodging between the teeth becoming decomposed, and generating acid which will erode the teeth. It is quite impossible for poor people to provide toothbrushes for their children, but the teeth may be perfectly well cleaned with lucifer matches that have already been used to strike a light, and are therefore of little or no value. One end of this cut into the shape of a wedge can be used, not only to remove from between the teeth particles of food that are lodging there, but also any tartar that may accumulate round the gums. If children were instructed in the dangers of neglecting the teeth, and were shown how easily they could protect themselves from toothache by the use of old matches, aided when necessary by a little prepared chalk, or the ordinary whitening which is used for walls, they might save themselves a great deal of pain, and it would also be useful to teach them that toothache may very frequently be removed when present by simply washing out the mouth with a little bicarbonate of soda in warm water. Another cause of decayed teeth may be the quantity of sugar in the form of sweets or jam that is now used. There is no doubt that sugar is an excellent food, and it has the advantage of being cheap. When taken only at meals it will probably do no harm. Sugar is an excellent food for minute organisms as well as for larger animals, and if it is constantly present in the mouth, and especially if fragments of other kind of food have lodged between the teeth, it may increase the growth of those organisms which produce the acid which erode the teeth. I believe that in the West Indies, where sugar cane is sometimes chewed the whole day long by negroes, their teeth are exceedingly good, but chewing sugar will have the same effect as constant brushing, and the result will be very different from that produced by little shreds of butcher's meat impregnated with sugar, and sticking between the teeth for hours together. During the day the movements of the tongue and lips tend to keep the teeth clean, but during the night any food that is lying between the teeth has ample time to undergo decomposition, and this should be taught to the children at school. It would be a most useful thing if the teeth of children in school were examined from time to time. In addition to the care of the teeth, children should be instructed in the necessity of attending to the bowels, and the closets attached to the schools should be scrupulously clean so that delicate children should not be deterred from making use of them on account of their dirty condition. While I think that instruction should be given to children in some of the elementary laws of health I think this should be given in place of, not in addition to, the instruction they already get. I believe that the hours that children have to work at school are much too long, and it is recognised in Germany and in Switzerland that there ought to be a break between each successive hour of study. During this break, in Switzerland, the children are turned out of the class-rooms into the corridor, and all the windows are opened so that the class-rooms are thoroughly ventilated before the children return. During the break the children should be allowed to play, and I feel very strongly that any physical training such as drill should not be superadded to mental training, but the time employed in it should be deducted from mental work. Physical exercises should be looked upon by the child as an employment and should on no account be taken from the time which would be devoted to play. In considering the physical exercises which a child should undergo we must remember that there are three parts to be developed, the muscles, the nervous system, and the heart and lungs. For developing the muscles simple exercises of bending and stretching, either with or without weights, and simple exercises with gymnastic apparatus are what are required. For the development of the nervous system, exercises are needed which involve co-ordinated movements, and the best of these are marching to words of command, games of balls in all their different forms, skipping fencing, and some exercises on the horizontal

bars. For the training of the heart and lungs running is required, and here again games of ball cannot be surpassed. In order that the weaker children, who require physical training more than the others, should not be neglected, the games in Switzerland are considered as part of the school training, and are supervised by masters. In the small book I have here, *Turnschule für den militärischen Vorunterricht der Schweizerischen Jugend* there are rules that no scholar shall be left out of play. All must take part, and the teachers are instructed to see that this is so.

2427. (Colonel Fox.) Is that a Swiss book?—Yes.

2428. I have another one which they have now in all the schools for scholars up to sixteen years of age; this is in French?—Most of the Swiss publications for schools are in the two languages; the French are for the southern cantons, where French is generally spoken, and the German are for the northern cantons. Probably this supervision of the play, instead of being done by masters, would be still better done by making the bigger boys in every batch responsible for the supervision of the smaller ones. But exercises of all sorts in rooms are apt to raise dust, and they should, if possible, be performed out of doors, either completely in the open air, or under a roof protected from rain, but without any side walls. I may say a question has now been raised amongst the authorities on education in Germany and in Switzerland as to whether physical exercises should be performed at all in closed rooms, on account of the possibility of the dust in these rooms containing germs, which would be raised by the shuffling of the feet. This would be inhaled by the children and might thus cause disease, either in the form of sore throat, bronchitis, or even phthisis. In relation to this the question of nasal breathing is of very great importance. In my lectures at St. Bartholomew's Hospital I used to put it to the students very simply. I said to them that in the Book of Genesis we are told that "God breathed into man's nostrils the breath of life, and man became a living soul." Man forgets to breathe through his nostrils; he breathes through his mouth, and he dies. In the nose there is an arrangement for killing all the microbes, and thus preventing the entrance of infective disease germs into the deeper air passages, and there is also an arrangement in the mucous membrane for thoroughly warming the air before it is inspired. These two things, taken together, very greatly lessen the chance of a child getting any pulmonary mischief so long as it inspires through the nose. It may expire either through the nose or mouth. The chief objections to cricket and football as agents for the physical training of children in towns is the very large space required for a very small number of players. Baseball in various modifications lends itself better to exercise for a large number in a limited space. In the little Swiss handbook to which I have referred a number of exercises are given, and the plays in which the players take part, in which a great deal of exercise can be obtained by each scholar without the necessity for having large playgrounds. I feel quite certain that all physical exercise should have as much as possible the aspect of games, and that drill, which might otherwise be monotonous, should be so varied as to make it a game, at least in great part. Some of it might be regarded as a lesson in simply learning to obey sharply at the word of command, but where the attention of the children is thus strained it must be recognised that physical exercise is no longer a purely physical exercise, but is really a severe mental exercise, and the strain should not be kept up long, as it is much more exhausting than when they simply march to the sound of music. I have lately been in Switzerland, and through the kindness of my friend Professor Kronecker in Berne, from whom I obtained much information regarding physical exercises in Swiss schools, I have here various books and papers bearing on the subject, should the members of the Committee wish to consult them. Every boy in the Swiss schools must learn gymnastics unless he has a certificate from his doctor and signed by his parents that he is unfit. The gymnastics consist of movements with and without instruments, exercises on the horizontal and parallel bars, etc. But it is useless to give children training, either mental or bodily, if they are badly fed, and it may be necessary to provide food at schools, and this could probably be done at a considerably less price than the parents could do it at home. In cases where the parents are absolutely unable to pay, food might be provided out of the poor rates. The

Sir L.
Brunton.

preparation of a quantity of food at the school would also give the girls more opportunity of learning how to cook than they might otherwise be able to get, and such teaching in cookery I regard as a most important factor in tending to lessen the drinking customs of the nation generally. I may mention in this respect that some observations made years ago as to the comparative amount of drinking and eating that were carried on in some of the Swiss cantons, and it was found that where the cookery was good and the people ate well, they did not drink nearly so much alcohol.

2429. (*Chairman.*) Do not you think that gluttony may be as dangerous as drunkenness?—I do not think it is. I grant that in the upper classes gluttony is of course a danger, but gluttony brings about, as a rule, its own punishment sooner than drinking does. A man may continue to drink for very many years, and in fact he may render himself a useless citizen all his life by drinking, but if a man over-eats himself everyday of his life he generally pays the penalty in a much shorter time, and is unable to continue. At the same time I think that a glutton suffers more in himself and does not do much harm to other people.

2430. (*Colonel Fox.*) Do you think that drinking when one does not eat means that the stomach requires bulk? If it get bulk in the way of food it is satisfied, but if it cannot get that bulk in that way it wants to be filled up with something else, and it takes fluid?—I think it is not the quantity of fluid. I believe that you are right in the sensations, but it is not exactly bulk that you want, because when a man has taken an insufficient quantity of food he feels a craving, but that craving may be gratified by taking a small quantity of neat liquor. It is a chemical stimulus. You can sometimes also satisfy that craving without giving much more food by giving something very savoury at the end of the meal. For example, if a person has had an insufficient meal, and you give him some sweet preserves or some strong-tasting cheese, that gives the necessary fillip, and he feels satisfied without having any more bulk. But there is no doubt whatever that when all the food is much concentrated, bulk is wanted, so that in cases of scarcity, when there has been very little food, people who have been half starved make up the bulk with indigestible matter, innutritious matter, such as some kind of sand, siliceous earth, and the bark of trees, containing bulk in itself, but containing almost no nutriment at all. After leaving school many youths have no proper opportunities for using their spare time, and they become loafers or hooligans, and being thrown much together with girls in the same predicament they contract early marriages which are productive of misery in themselves and injury to their progeny. To prevent this, lectures, entertainments, gymnasia, and drill halls throughout all large towns, and all associations which tend to afford at the same time amusement, instruction, or physical training should be encouraged. More especially I think the volunteers should be encouraged instead of being neglected, for even leaving out of account the utility of the force in defending the country, the occupation and training, both mental and physical which it offers, are of the utmost utility. Associations should be formed for teaching mothers how to feed their children, and how to manage their houses, and this would probably do much to lessen the consumption of drink, for a clean fireside and a well-cooked evening meal might keep many a man at home who would otherwise go to the public house. I feel sure from cases I have seen at the hospital that some men are induced to drink because when they go home, instead of finding some well cooked food, as a French workman would do when he went home, they find that it is washing day, the whole room is filled with steam, the clothes are hanging up to dry across the room, there is nothing that they can eat, there is no place where they can sit down in comfort, and so naturally they go to the public house. The problem of physical education is an enormous one, and involves not only the health of the body but the health and strength of the mind, for unless the body be fairly strong and healthy much mental education will tend to render the children nervous and irritable, and to increase the growth of the malady which has only within recent years come to have a name, namely, neurasthenia. It is evident that while the present Committee, as well as the Royal Commission, which has already sat in Scotland, may do much in collecting information as to the best methods of increasing the physique of the population of this country, an enormous organisation will be required to carry into effect any recommendations that may be made. Although

this organisation is at present in embryo, it is, I believe, an open secret that it is in process of formation, and already almost all the presidents and ex-presidents of the most important medical bodies in the three kingdoms have united to form a National League for Physical Education and Improvement, which, if carried out in its entirety, will probably have an almost incalculable influence for good upon the whole country.

2431. (*Dr. Tatham.*) I noticed in the opening part of your evidence you seemed to object to the term "progressive physical deterioration," for reasons which you give?—My reason is this, that, while the question of whether the physique of the nation is improving or not is a very interesting one, by raising that question one is apt to draw attention away from the point that is of most importance to one that is of minor importance, to fritter away energy in discussing whether physical deterioration exists or not, when what is of the greatest practical importance now to decide is: Is the physique of the nation quite satisfactory, and, if not, why is it not so?

2432. Would you oblige the Committee by saying whether, in your judgment, there is actual progressive physical deterioration amongst the people generally?—I wrote a letter to the *Lancet* on February 14th of last year, a letter which, I believe, to a great extent started this question, because in it I asked for the appointment of a Commission, and I know that this letter was seen by Sir William Taylor because he quoted it. Here are some copies of it. (*Copies were handed to the Chairman.*) I have pointed out in that, that to discuss the question of physical deterioration in the country generally is an exceedingly difficult thing, because while one or more classes have gone up, I think others have gone down. I believe that the better classes, perhaps a large proportion of the population, have improved in physique, as is shown at the universities by the records of running, jumping, cycling, and races being beaten again and again, and especially swimming, perhaps. This shows a progressive improvement in the physique of certain classes. Yet at the same time I think it is highly probable that there is perhaps a larger proportion of physical insufficiency than there was at previous times, my reason being that while in many respects the provision for the poor of this country is better than it was, we preserve now a number of the weakest. The increase of sanitary science enables men to preserve a number of weakly lives that would formerly have been lost. These, instead of dying off in infancy, grow up, but they remain weak. That is one cause, I think. Another is that it is well-known that, as a rule, the physical size and stature of the country populations is better than that of the slum population in the town. The slum population tends to increase. We must distinguish, in regard to town population, very carefully between slum population and population of the better parts of the town, because I believe that records of policemen show that the best members of that force, both in regard to physique and intelligence, come from small provincial towns; that they neither belong to the absolute country, where the peasantry are rather slow-witted, nor the slums of the big towns, where the physique is insufficient, but rather from the small country towns. The same class of people exists largely in the suburbs of the cities, and I doubt if you would find very much better people anywhere than in some of the suburbs of London—either physically or mentally.

2433. You say that there can be no doubt, from recruiting returns as well as from an examination of the slums of large towns, that the physique of a large number of people is unsatisfactory; with what standard do you compare them?—The standard that I had in my mind was partly an ideal one and partly a standard of the recruiting in France and Germany. The ideal one is this: Is it satisfactory, and is it a condition that we are quite pleased with and think we have nothing to improve upon, if we find that out of every five recruits who have, first of all, been sifted by the recruiting-sergeant and afterwards by the inspecting examiner, and have been admitted as recruits into His Majesty's Army, that out of these five selected recruits two only at the end of two years are found fit for service? It seems to me that such a condition as this in the physique of the country is not one where we can sit down and say we are perfectly satisfied with things as they are. I take that statement about the conditions of recruits after service from Sir Frederick Maurice's essay.

*Sir L.
Brunton.*

2434. (*Chairman.*) It was not those that were rejected by the doctors and those turned out of the service, I think, from which Sir Frederick made up his figures?—Two out of five remained, I understand.

2435. He included an estimate of the rejections of the recruiters as well, I think, of which there is no definite knowledge?—In that case, I have made a mistake.

2436. (*Colonel Onslow.*) Two out of five was the record at Woolwich, who were discharged after some time in the service?—That is what I understood.

2437. That is only at Woolwich and he said that was a special case. To begin with, you are speaking of those men who enlist in the army. Do you consider that those represent the type of the nation? It is generally considered that those men who enlist in the army are men who cannot get on in civil life, and they have to fall back on the army for a living?—Yes.

2438. So that you may almost call those men, not exactly the scum of the country, but at any rate they are not the representative men of the nation?—It was precisely to avoid that difficulty that I began as I did. The whole of those questions are open to discussion. To settle these questions would require a very long investigation, and you might at the end of this investigation have more than one apparent answer. It might be decided one way or another. But to avoid that, I say that this may or may not be so. What we are really concerned with now is, I think, the existence of a large substratum of unsatisfactory physique. We have to deal with a large substratum. How did it come there and how are we to get rid of it?

2439. (*Dr. Tatham.*) I follow you quite; but I should like to put it to you that the initial difficulty of this Committee is that we want to fix the standard with which the condition of the so-called labouring classes might be compared. That is a very great difficulty with us, and it is in order to arrive at that standard that I am putting these questions?—May I suggest, then, that probably as one of our problems nowadays is the commercial competition, especially with Germany, the Committee might find out what is the general average of the German recruit, taken as he is from all classes of the population? They take them in without any exception, barring that of actual disease. That would give the standard with which our population might be compared, although, no doubt, one might say there is the racial element to be taken into consideration. Still, it would give a certain amount of standard by which we could compare our own population with the German population.

2440. Do you not think that the conditions obtaining in Germany are so essentially different from those in this country—the conditions, I mean, with regard to compulsory service in Germany which do not exist in this country—that that would almost vitiate the German returns for comparative purposes with ours?—I do not think it would, because what we want to do is this: If we find, taking the German statistics, that the general standard of our population is below it, or if we even find that there is a large class of our population which is so low down that it is not represented by a similar stratum in Germany, I should say “Let us at once set about finding out why this stratum exists and how are we to put it right.”

2441. With regard to Sir Frederick Maurice's essay, you have said, in addition to the general want of stamina, the recruits are found by Sir Frederick Maurice to fail in regard to their teeth and feet. Were you quite satisfied with the evidence which Sir Frederick Maurice produced in his essay?—Do you think he proved his case by the evidence he produced?—It is such a large question that I could not go into the evidence myself. I accepted his statements without going into them, because I had not the time or the ability to do so; but I think they are corroborated, from what I have heard about the difficulty that some of our men have had with hard biscuit in the Transvaal. I think it is a common observation that the teeth of the present population are not so good as they used to be. That, again, of course is a thing that is very difficult to prove. It is a general impression that teeth are failing now at an earlier age than they used to, that there is a more rapid decay of the teeth of children.

2442. You are aware, of course, that there is a very satisfactory decrease in the prevalence of, and in the mortality from, pulmonary tuberculosis, amongst other diseases, as

compared with the state of things twenty years ago?—Oh, yes; and, with proper care, in thirty years pulmonary tuberculosis should be as rare as leprosy.

2443. In the course of your evidence you speak as one who thinks that improvement may be effected in the teaching to which the children in our public schools are subjected?—Yes.

2444. Do you think there is probably too much book-work?—Yes, a great deal too much—too much book-work and too many subjects.

2445. I am sure the Committee will be glad to hear your view as to how that may be improved?—I should cut down the hours of work and should have a break between every two hours.

2446. As they do in Switzerland?—Yes, as they do in Switzerland. A small break seems to be useful. Too long a break, for instance a break of half-an-hour when the children run about and get excited, seems rather to interfere with the next lesson, because the attention of the children has been distracted by the play and they find a little difficulty in concentrating themselves again; but a short break seems to do them good.

2447. In what direction do you think the influence of excessive book-work at school may be traced—in connection with what diseases?—Not so much with diseases; I think it is a more general lowering of the physique.

2448. Not in regard to diseases of the nervous system?—Yes, that has been said, but you will be able to get definite evidence on that subject from nerve specialists. I do not know whether you have had Sir James Crichton Browne or Dr. Jones, of Claybury, before you.

2449. We have not yet had them?—I cannot give any definite information about that, but you will be able to get it quite readily from them I think.

2450. Now you speak of the uselessness of giving to children training, either mental or bodily, if they are badly fed, and you follow that up with a recommendation that it may be necessary to provide food at schools?—Yes.

2451. This may be done at considerably less cost than could be done by the parents at home?—Yes.

2452. Do you think there is any danger of pauperising the people by a suggestion of that kind?—It has been suggested that it would have that effect, as I daresay you know?—I do not think that it would, because there is no more danger in feeding children physically than there is in feeding them mentally. We insist that they shall have mental pabulum, and I think we might come down upon the parents to pay for the physical pabulum. If the children were inspected, and if it were found that they are deficient in their physical power or in their mental power, the inspector should be able to see how they are fed, and should insist upon their being fed by the parents. If the parents do not feed them properly, the food should be provided at the school and the parents charged for it; and if the parents do not pay, the law should be brought to bear upon them if they are able to pay. If they are not able to pay, then the food could be supplied either by a charitable organisation or out of the rates. In Switzerland apparently there are very few poor people. Some of the communes instead of having to pay poor rates, or rates of any kind, actually receive every year a benefit from the commune. The sale of the timber, which belongs to the commune, more than supplies the rates of every kind, and leaves a balance over for the people to receive. In Berne the great majority of the children are children of well to do parents; at least they are fairly well to do, and they can feed them properly. But there are a few who are not able to be well fed, and these are generally supplied with food by charitable organisations. They get one good meal a day, which is supplied by this charitable organisation. This might be carried out in this country, but I think that every effort must be made to avoid doing that, and rather to force the parents to pay properly for the food. Make them feed their children, and if they do not do it at home, supply the children with the food and then charge them for it.

2453. Towards the end of your evidence you speak of the enormous organisation that would be required to carry into effect any recommendation which may be made by this Committee. Will you kindly give the Committee a definite idea of what you mean by that?—The causes of deficient physique are very numerous. First of all we may

take it that before a child is born the mother sometimes is not very well fed, that she is working at the time when she ought to be resting, that if the child is born she is too weak to suckle it, and it is fed upon various foods, excellent perhaps of their kind but not suitable for the child. A little later in infancy it is still badly fed, and so through adolescence, and even in cases where the father is making a good income, he spends a good deal of it in drink, his wife whom he has married early, and who has had no training whatever in the management of a house, keeps the house in any kind of way; she does not know how to cook, and so the poor child is badly fed throughout. It is very likely that in order to eke out the scanty earnings of the father and mother the child is sent, out of school hours, to earn a penny or two, and so it comes to school wearied out in body by having had to work early in the morning, exhausted by not having had food, and then is set to learn. Well, it cannot learn. Then in school, as I have said, I think there is room for improvement in the teaching, in the exercise, and especially in the play. For that one would require alterations in the rules of the school, one would require larger playgrounds, and these are expensive. We want girls' clubs and so on, to teach girls cookery, to keep them employed, to keep them out of the public house, and we want various clubs and agencies to keep young men employed—rifle clubs, volunteer clubs, cricket clubs, football clubs, and all the rest of them. In order to do this we want a very large organisation which should be divided in two ways.

2454. A state organisation?—No, a voluntary organisation. It should be divided first of all into districts territorially. You would have in every parish, in every village, in every county, an organisation—small village ones, large parochial ones, larger still in districts, and then counties, and then a general organisation throughout the whole country. Then in every village you would have people to undertake various duties. First of all, we want to get the parson to superintend and to take an interest in the children generally, and in the schools we want a schoolmaster who should be educated in physical training. He ought to know enough about it to have a general idea whether the children were being overtaxed, and should, if possible, know how to train them physically as well as mentally. I think that in the Swiss Rules the teachers are obliged to know this, or if they do not know it themselves they are obliged to get somebody to supplement it. Then we want the ladies of the district to take it up and to teach the mothers how to cook, how to feed their children, and how to manage their houses. We want to get lawyers and statesmen to work so that where it is necessary to have laws they should be passed. For example, if it is necessary to pass a law forbidding a woman to work in the last month or two of pregnancy a law should be passed. Although it interferes with the liberty of the subject, it is passing a law for the good of the people, in the same way as one interferes with the liberty of the subject in passing a law that a child shall not work more than a certain number of hours. Then the children should not be forced to work, to do things out of school hours. If the State is paying for their schooling they should be in such a physical condition as to be able to make use of the teaching, so that we want to get all classes. I think I might as well say that we are getting all classes. The League is not quite ready. It has not got all the names it wants by any means. We have a number yet to be applied to, and before bringing it before the public naturally everyone wishes to get it very fully supported, but at present I may say that Sir William Turner, the President of the General Medical Council, has given a great deal of time and attention to it, and has been exceedingly good in helping to get it on its feet. Now nearly all the presidents and ex-presidents of the medical corporations have signified their approval of it and their willingness to act as vice-presidents. It has been felt that its being to a great extent a question of health upon which medical men might be qualified to give a better opinion than others, it was advisable before proceeding to other classes of the community to get the approval of medical men, so that we are trying first of all to get a large number of medical men to show that the thing has been thoroughly considered from the medical aspect, and then when that is done other classes of the community will be approached, their names will be got, and I think that in a very short time the League will be made public.

2455. Have you followed up the question so far as to be able to suggest the machinery by which such an organisation should work: you speak of a voluntary association?—Yes.

2456. You mean an entirely voluntary one?—Yes.

2457. Have you thought out for yourself what machinery could be used for giving effect to it?—I am practically acting as unofficial secretary to this league, because it is not yet in a position to have a secretary, so that it is advisable not to have it published until the whole of the members or at least the Committee has been duly formed; but I can send down a number of copies of the draft scheme which is under consideration by the medical men who have already given their names, and which will be amended by them. I can send down any number of copies.

2458. You have a scheme formulated?—Yes. It is under consideration by the medical men now. I will send ten copies.

2459. (*Mr. Lindsell.*) You said you attributed the decay of teeth at the present time very much to external causes?—Partly to external and partly to internal causes.

2460. Would you think that the present decay of teeth which we know has been detected, to a great extent is a proof of physical decay generally?—No.

2461. A person might have very bad teeth, and yet be a healthy and strong man?—Yes. The cause of decay of teeth is attributed by the Americans to the acuteness of the American intellect in making fine machines. It is said that the American dentist is the best in the world, because the Americans have the worst teeth, and so the dentist has the most practice. It is said that the teeth of the Americans are exceedingly bad, because they have made the most perfect rolling machines in the world, and are able to separate the fine flour in the interior of the grain more perfectly from the outer than any other nation. It might be a question for consideration by this Committee as to how far the teeth are beginning to decay in consequence of the substitution of steel rollers for old fashioned grind-stones. There is another question which might come in incidentally as a question of physical degeneration, and more especially as one involving a risk to the health of soldiers, and that is the increase of appendicitis. It has undoubtedly increased, but the question would arise how far the introduction of the steel rolling machinery, has caused this disease. Many years ago I came in contact with a man who had been, I think, a commissioner to the Red Indians on the Reservation. He took a great interest in the Red Indians and he said that they were dying off in consequence of three things—whisky, syphilis, and fine flour. Syphilis and whisky one could understand, but I said, "Why should they die of fine flour?" He said "I do not know, but they are very fond of it, and it kills them. How it kills them I do not know." They are co-incident, I think, anyhow—the increase of the finer qualities of flour in use, and the increase of appendicitis.

2462. The last Witness said that it might possibly be that the decay in teeth at the present day was part of an evolution; that in consequence of the cessation of the use of articles of food which require good mastication, there was less use for the teeth than there used to be, and that therefore nature was adopting this means of reducing the power of the teeth, and also that the area of the jaw was diminishing?—That is quite possible, but there may be also another reason, that the softer foods are more apt to leave particles behind. If you get a good hard food, the mere mastication of it tends to clear away a lot of the organisms. One sees that very markedly on the tongue in a case where a patient has been fed for some days upon milk. The tongue, mouth and lips are very apt to get crusted, to get disagreeable, covered with a thick white mucus, whereas if the same patient gets hard toast and chews it, after two or three times, the tongue and the teeth become clean.

2463. (*Colonel Fox.*) You were saying just now that acids had a very great effect upon the teeth?—Yes.

2464. Take the case of farinaceous foods, take a biscuit or a crust, before you swallow that you have to masticate it very fully and it becomes mixed with saliva, which causes a chemical change and converts the starch into sugar; that is the first process of digestion?—Yes.

2465. And that is all the digestion that farinaceous food goes through. When it arrives in the stomach it is already digested. But, on the other hand—take the case of those people who get pulpy food and wash it down with tea, the starch which ought to have undergone a chemical change has never undergone it, and it reaches the stomach in an

Sir L.
Branton.

Sir L.
Brunton.

undigested form, and then acidity takes place in the stomach which affects the teeth, does it not?—It does, but the acidity that I am speaking of was formed in a different way. In circumstances such as you have detailed the formation of the acidity and of gas occurs in the stomach from the starchy food by the bacteria present there; the acid which affects the teeth is generated between the teeth in somewhat the same way, but by other bacteria.

2466. By the lodgment of the food?—Yes, there is a local formation of acid between the teeth, just as there is a general formation of acid in the stomach in the case you describe.

2467. Do you not think that when a man had hard food to bite and his teeth performed their proper function—he had to bite and chew—the whole process of digestion went on thoroughly before it arrived in the stomach in the case of farinaceous food, biscuits and hard bread, and so on?—Yes, that is so.

2468. That does not exist now, they generally take things which are easily bolted; slops and things?—Yes.

2469. That must affect the whole system, surely?—Surely it does. There one gets into a vicious circle, because taking that kind of food, I think, affects the teeth, and when the teeth become affected they try to get soft foods to avoid the pain caused by masticating the hard food. When the Roman soldiers were in Great Britain and they had to grind out their own meal every day before baking it, I do not suppose many of them had bad teeth.

2470. (Mr. Lindsell.) You said, I think, that the long school hours which school children have to go through now is possibly a cause of deterioration in health?—Yes.

2471. And you said that all school meetings ought to have a break in them?—Yes.

2472. I suppose that you are aware that in the rules for governing elementary schools in England there is that rule in force at present, that every school meeting of two hours or more must include an interval for recreation of not less than ten minutes?—Yes.

2473. That would meet your point, would it not?—Not quite. Every school meeting of two hours or more would include recreation for ten minutes, but then you see you may have one of three or one of four.

2474. No, because the meeting is not more than three hours at the outside, and there they would have an interval of fifteen minutes?—It should be stated, as it is either in this Swiss hand-book or some of the others, that every hour should be followed by a break.

2475. The time would come in the middle?—But it would be better to have it definitely stated that after every two consecutive hours there should be a break.

2476. Then you have said that physical training ought to form a part of the regular school hours and not be made an extra?—Yes.

2477. That is the case now in the English schools, that part of the time given to physical training may be included in the two hours of the school meeting: do you consider that the State ought to make the provision of playgrounds in all schools compulsory?—Yes.

2478. (Mr. Struthers.) Is it your proposal that this voluntary association which you spoke of should set itself to provide playgrounds?—Yes; it is perhaps easier to get that done than to get the State to do it. The State as a rule shunts everything upon voluntary work that can be shunted. But the necessity for having playgrounds is very great, and I think we should get playgrounds provided as soon as possible. If these things cannot be done voluntarily then we must get the State to do it; we must have compulsory powers.

2479. (Mr. Lindsell.) I think you mentioned that one of the very worst causes was that children in actual attendance at school work before and after school time?—Yes.

2480. You are aware that in consequence of the report of a Committee like this on which I served two years ago an Act was passed last session, which has now come into operation, which allows all local authorities to regulate and prohibit the employment out of school hours of children who are in attendance at school during those hours?—It was in consequence of evidence given when that Act was being brought forward that I spoke of this. I knew the Act was passed and I was anxious to draw attention to

it in order that care should be taken that the Act was carried out.

2481. (Mr. Legge.) You agree it is not an absolute essential to secure the preservation of teeth that all children in the country should be forced to use tooth-brushes?—You cannot do it.

2482. You agree that that is impossible?—Quite impossible.

2483. And that it would be far better to urge them to take care of their teeth even though they simply used their finger nails?—Certainly.

2484. It would be better to do that than to try to force an artificial scheme of universal tooth-brushes for every child in the country?—Yes. If one considers that parents may have only 18s. a week and have half a dozen children, it is impossible.

2485. And the curiously instinctive reluctance which exists in the child against any act of cleanliness is also a factor to be considered?—There is one reason which is often not taken into consideration, I think—namely, that the children's skin and mucous membrane are excessively tender, that what to a grown up person would cause no pain and no inconvenience may cause a child a good deal of pain and discomfort. The child does not like a hard tooth-brush rubbed against its gums, but it would not mind a piece of stick, like soft pine. One sees in India how carefully the people keep their teeth. Of course, this is a mere general impression, but looking at people in India one gets the idea that their teeth are very much better than ours, and all they use is a little bit of stick.

2486. You will agree that a dirty tooth-brush is a very insanitary thing?—Certainly.

2487. You go further, and say that it would be a useful thing if the teeth of children in the school were examined from time to time?—Yes.

2488. Would you extend that to further medical examination of the school children as a regular hard and fast system?—I certainly should; that is being done in Germany. This is a copy of the schedule which is used in Frankfurt for the notification of the condition of the child in regard to the number of diseases and conditions at the various periods of school life. (The document was handed to Mr. Legge.)

2489. You further said that you would like instruction given to children in some of the elementary laws of health, care being taken that this was not an additional subject. You are aware, no doubt, that in many of the elementary schools of the present day there is some such instruction attempted?—Yes.

2490. You are perhaps not quite satisfied with the method?—I do not think the instruction in this country is equal to what it is abroad.

2491. You know, no doubt, also that there are cookery classes quite common under our leading educational authorities. Have you been able to form any judgment as to the value of the instruction given in those?—No, I have not been able to give time to the inspection of those.

2492. Do you think that the sort of instruction given in those classes should be of a severely practical kind, and the dishes prepared suitable for a working class household, or that they should insist on the chemistry of food, and instruction in preparing all kinds of pastry and made dishes?—They should have some instruction in the chemistry of food, but I think I could perfectly well give all that is necessary in ten minutes at the beginning of the course.

2493. That is the amount of chemistry of food that you consider necessary for them to know?—Yes. The remainder should be entirely practical instruction in the preparation of foods suitable for working people.

2494. Do you think it would be better that such instruction should be given to girls of, say, twelve years of age, or that it should be concentrated in the last six months of their school life?—I do not know which would be the best. I have not sufficient practical knowledge.

2495. Would you like to see special schools established for special districts, the slum districts in big towns, with a curriculum something like that of the day industrial schools, that is to say short hours, three hours book work, two hours or so manual occupation and instruction of various kinds, and considerable extension of the ordinary time

allowed to drill and physical exercises?—Yes, I think that would be the sort of thing.

2496. As regards this question of doing physical exercises indoors and the dangers of dust and so on, of course you would agree that the arguments against carrying on physical exercises indoors in the case of school rooms would not apply in the case of a special room, namely, the gymnasium itself?—No, they would not apply to the same extent. At the same time in such a country as Switzerland, which I again take as an example, they are very strong on the advisability of all these things being carried on out of doors.

2497. As far as possible?—As far as possible.

2498. That is to say weather permitting?—Yes.

2499. Weather not always permitting open air exercise in this country, at any rate, one must have one's gymnasium indoors?—It is preferable, instead of having a building with walls, to have an open space with a covering to it—simply a protection from the weather.

2500. Taking your interesting remarks on hooligans, I wonder whether you have seen the recommendations of the Royal Commission on Physical Training in Scotland? Yes.

2501. They recommend the compulsory attendance at continuation classes and further, in default of such attendance, possible incarceration for a short time in a sort of senior truant school: do you agree with those recommendations?—With these or with an alternative. I believe there are a number of those who turn out Hooligans who have no faculty for learning book work, and continuation classes would simply be a pain and a labour to them, and that you would have to compel them to come in; whereas if you could get something that would interest them and take its place, such as volunteering, I think that would be just as good for them.

2502. These evening continuation classes which the Commission had in its mind were classes with a very special curriculum in which gymnastics for instance would find a place?—In that case—

2503. Your objection would disappear?—Yes.

2504. Then as regards this organisation of yours?—May I put in a *caveat* there? It should not be called my organisation.

2505. I mean the one which you referred to. You are aware, of course, that there are one or two Leagues covering some part of this field, such as the British Empire League and the Boy's Brigades. Is it the view of the Association to absorb those?—The view of this League is that it should not supplant them in any way, but that it should co-ordinate them, and as a preliminary step Mr. Loch, of the Charity Organisation Society, has kindly made a list of all those Associations to which you refer and those are now printed. I shall send you a copy of this list also. This list is at present only a preliminary one, but it will form the nucleus of a larger one presently.

2506. Though this organisation is to be a purely voluntary one in its nature, I hope it will have no objection to trying to work through officials if it thinks their assistance may be of any service?—It will be glad to get assistance of every sort.

2507. I mean it will bring its influence to bear, I suppose, on the Departments very much as the Navy League sticks pins into the Admiralty?—Yes, certainly.

2508. As one definite sphere of operations I daresay it will help in carrying out another recommendation of the Royal Commission in Scotland, namely, the formation of Games' Committees and Sports' Committees in every school district in the whole of the country?—Yes, that is certainly one of the objects. I may say that in the formation of this League Sir Henry Craik has taken a very active part, and I think I may say that Colonel Fox also very kindly took part in the very initiation of it.

2509. I hope this League will also have two or three active inspectors to keep it informed as to how things are going on?—If it is not asking too much I would ask you to do this. I will send down duplicate copies of the draft scheme. The League is simply in its infancy. All suggestions are welcome just now. If you would not mind the trouble of putting in these suggestions in the proof which I will send down, then they could be submitted to my committee and incorporated.

2510. (Colonel Onslow.) You have referred to the recruiting returns as being an example showing the physique in a large number of people is unsatisfactory; do you think the tests of recruiting returns adopted for the Army and Navy are a very good guide?—They are a guide to the physique of a certain stratum.

2511. To what stratum?—That I cannot say

2512. Is there any particular stratum from which the two services, the Army and the Navy, are recruited?—That I cannot answer.

2513. In reference to Sir Frederick Maurice's remarks that at the end of two years only two out of five men remain in the army, do you know how he made up his numbers?—No.

2514. Do you know that he first calculated so many per cent., a figure which was never ascertained, rejected by the recruiting sergeants, then so many per cent. rejected by the doctors, and that the remainder were rejected at the end of or at any time within the two years' service, so that after all only a certain proportion of those were men who were unfit before they entered the Army; the others were unfit, perhaps, but after a very severe test, a far severer test than the ordinary civilian would undergo. You have not ascertained that?—No, I confess that I have not.

2515. Then with regard to flat feet, I think you say they may be regarded as a local evidence of weak physique, but are they not attributable to other causes, sometimes, as for instance, soil and the nature of the work?—That may be, that wherever you get either from the nature of the employment or the nature of the soil, a greater strain laid upon the foot than it can bear, you are likely to get it.

2516. In some cases would it be a guide to show inferior physique? For instance, from the recruiting point of view I happen to know that in the County of Lincolnshire, which is a heavy soil, and in Devon, which is also a heavy soil, flat feet are very prevalent. That does not necessarily show bad physique in individuals, because it is good there. The farm labourers of Lincolnshire are notoriously flat footed. I know that when the arch is right down on the soil, it is bad; but flat feet are not a true guide to bad physique, are they?—No, certainly not.

2517. Our rejections for flat feet are enormous: they would not prove bad physique?—No, but it is evidence of a local weakness. To a great extent I believe it is due not merely to the giving of the ligaments but of the tendons—some of the muscles which pass along the heels and fasten to the front of the foot so that it maintains the arch. To show that is so I think one may point to the fact that you may get rid of flat feet to a great extent by proper exercises. Give a child a bar and let him work himself up and down with his toes.

2518. If you take it in time it can be remedied?—Yes. Colonel Fox knows much more about that than I do.

2519. (Colonel Fox.) I have had a great many cases sent to Aldershot of what they call flat feet, but when I examined the feet they were not only flat but they were badly formed feet as well. It was not simply the flatness, the instep being flattened out, but the toes were all bent under—dreadfully crooked feet. I do not think the flat foot would have mattered so much. When a man marches with a flat foot he does not use his calf, he walks from his thigh; the thigh takes up the work?—Of all that I was ignorant.

2520. (Colonel Onslow.) As regards the cleaning of the teeth you have mentioned that the natives of India were always using some sort of stick, but is it not the fact that the natives of India and the Arabs and other dark races have very different food to Englishmen?—Oh, yes.

2521. It is food which is not liable to cause decay of the teeth?—That is so. The Arabs have almost entirely dates,

2522. Yes, and the others grain?—Yes.

2523. (Mr. Struthers.) Oat cake would be a good thing for cleaning the teeth, would it not?—Yes, very good.

2524. You do not regard bad teeth as an indication of weak physique any more than flat feet are?—No; it is a local weakness, but a weakness that has to be guarded against as far as regards the efficiency of the man in work sometimes.

2525. No doubt, but it is no more an indication of weak physique in one class than it is in another?—No.

Sir L.
Brunt n.

Sir L.
Brunton.

2526. You may have it in the comparatively well-to-do classes as well as in the slums?—Surely.

2527. So that when we have brought to us statistics of the number of men in South Africa who were useless for want of teeth, that was no indication of weak physique in the nation?—No. One sometimes gets very much the same results from too much riches as from poverty. One of my old teachers, Professor Hughes Bennett, said that he regarded two of the chief causes of phthisis as being the abundance of pastrycooks and the dearness of butter. The rich girls went in for pastry at various times of the day and disordered their digestions and in consequence they got phthisis; and the poor children could not get butter or fat of any kind, because that is a dear food, and in consequence their nutrition suffered and they got phthisis.

2528. But it lies neither in the quality of poverty nor of riches: it is also found in middle class people?—Yes, in all classes.

2529. You spoke of the schools in Switzerland and contrasted them with the schools in this country; were you speaking from personal knowledge of the schools in Switzerland?—Yes. I went to Berne last August to have a look at the schools.

2530. Were the schools in session then?—I went first of all in August and they were not in session. Then I went to Grindelwald and when I came back they were in session.

2531. In September, I suppose?—I think it was. Then Professor Kronecker very kindly took me round and introduced me to all the men who he thought would give me information. I found them very kind. They said they would give me any information I wanted, and if there were any questions that I wished answered they would furnish me with the answers as soon as they got them. So that if there is any information regarding any point in the schools in Switzerland which the Committee would like I can get it for them, if they would simply notify it to me.

2532. You do not happen to remember what the length of the school day in the Swiss primary schools is, I suppose?—I have it all noted, but I fear that the paper upon which I have it has been left at home. I will send that to you.

2533. Do you remember what were the subjects of the primary school?—That information is amongst the papers I have got and I will send it down.

2534. I want to know (1) the length of the day of the Swiss primary school—that is children from seven to fourteen years of age: (2) the number of subjects which form the curriculum of the primary school: (3) the proportion of the actual school day which is given to physical exercise?—Yes, I will supply that information.

2535. I suppose you have made similar visits to schools in this country—to schools in London and in the country?—No, I have not.

2536. You are only speaking of the over-crowded curriculum and the absence of a period of exercise and so on from report?—Yes.

2537. I think my colleague on the English Board of Education has stated the facts with regard to the necessary intervals in the schools day. Those also apply in Scotland. It is not merely a matter of regulation, but a matter of personal knowledge from the reports of our inspectors, that a class never lasts more than one hour without a break. I think we shall probably find that the subjects of the curriculum are not more numerous in this country than they are in Switzerland. You also heard that a law was passed last year which applied to Scotland equally with England, which enables school boards, at

any rate if they care to take the trouble, to ensure that children shall not come to school in a condition which unsuits them for taking their usual school course. On all those points I fancy there is not very much for your Association to do, probably?—Perhaps not, but would it be asking too much to ask you to note these points?

2538. I shall be very glad?—The Association wishes to gather members from every class so that perhaps all those who are interested in it might be willing to join.

2539. How would the policy of the Association be decided? I suppose it is going to put forward a definite policy and carry out a propaganda?—Oh yes. I am hardly in a position to say that yet, because the whole thing is under consideration.

2540. You spoke of the lady visitors going round and instructing the people how to keep their houses clean, how to nurse the baby, and so on: you have, no doubt, considered the possibility that these lady visitors may themselves require instruction?—Oh surely. I took that for granted.

2541. You used rather a striking phrase to the effect that school feeding was necessary, physically as well as mentally, and should equally be provided?—Yes.

2542. But you know that the State compels attendance at school, and on the other hand provides education free for all who wish it free—in an ordinary elementary school the parent gets education for his children free?—Yes.

2543. You do not propose to put the free feeding on the same footing—that the child is also to be provided with food free?—No. Make the parent pay for it if possible. On no account pauperise the people.

2544. (*Colonel Onslow.*) If they cannot pay for it how would you do it?—If they were too poor I should throw it on the rates, because the rate payers would probably see that proper pressure was brought to bear upon parents who could pay.

2545. (*Chairman.*) I want to refer to the remark which Sir Frederick Maurice made with regard to two men out of five remaining in the army after two years, and the somewhat erroneous conclusion which has been drawn from it: Colonel Onslow has shown that two-fifths of the elements of Sir Frederick Maurice's calculations were purely conjectural. But granting that 60 per cent. of those who desire to become soldiers are unfit for it, we had a very competent medical witness here the other day who said this: "Having regard to the conditions under which the British Army is recruited"—that is to say, looking at the class which is supposed to supply the great body of recruits—"the fact that 40 per cent. of those that present themselves to the recruiting agencies become good soldiers is more to the credit of the physique of the British people than the fact that under a system of conscription in Germany only 16 per cent. of those liable for military service are rejected." Would you agree to that?—I do not think I have data enough to enable me to form an opinion.

2546. Supposing those facts are correct, should you agree that that condition of things, even if it is as bad as Sir Frederick Maurice describes, in this country, is more to the credit of British physique than the other fact, which is quite well ascertained, namely, that 16 per cent. of those who submit themselves for the German Army, under a system of conscription, are rejected?—One requires to find out whether the standards are quite the same in both countries before one could answer that question.

2547. The standards are directed to producing good soldiers in each case?—Yes.

SIXTH DAY.

Wednesday, 27th January, 1904.

PRESENT.

Mr. ALMERIC W. FITZ ROY (*in the Chair*).
 Colonel G. M. FOX.
 Mr. J. G. LEGGE.
 Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
 Mr. JOHN STRUTHERS.
 Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary*).

Mrs. CLOSE, called; and Examined.

2548. (*Chairman.*) You are in a position, I understand, to compare England and Scotland, town and country, with the condition of things some years ago?—Yes, forty years ago.

2549. And you are also in a position to compare the condition of this country with that of foreign countries?—Yes, many countries.

2550. At any rate to a considerable extent?—Yes.

2551. You have had great opportunities of seeing foreign countries, have you not?—I have had every opportunity.

2552. And you have pursued a method which is not exactly common?—That is so.

2553. Will you explain how you got a very intimate knowledge of the conditions under which poor people live in different countries, in other countries than England?—Yes. I have ridden on horse-back over eleven foreign countries, and I have been in the habit every night of sleeping in a cottage, never in an hotel; and the same in England. I have had a two-wheeled trap, by myself alone, and I have put up at a cottage every night for years and years. I know and I have visited the greater part of England very constantly. You have a list of most of the places I have visited abroad—Bosnia, Herzegovina, Montenegro, Italy, Austria, part of Hungary, the North of Spain and the central plains of Spain, also France, and Norway. I have ridden on horseback.

2554. Would you take this country and tell us what you remember of it forty years ago? You are under the impression, I believe, that the physique of the people is deteriorating?—Yes, undoubtedly.

2555. Deteriorating both in mental and bodily vigour?—Both mentally and bodily.

2556. And the knowledge of cookery is not what it was forty years ago?—It is not comparable with what it was forty years ago; it has gone down immensely.

2557. Have you any reasons to assign for that?—Yes. When I was a child I lived a great deal on my father's estates in Cheshire and also in Scotland, always among the poor people, having tea and breakfast and dinner with them constantly. The cooking was first rate then. The home-made food was delicious, and the cooking and everything was good.

2558. Then you consider the change is for the worse: what do you think the change is due to?—That the girls, first of all, have no sort of sense of duty; not the slightest. It is only amusement and pleasure with them. The last thing they think of is duty and, therefore, they do not take the trouble to cook or get up in the morning, and the children go to school without breakfast, because the woman is too idle to get up in the morning, and she is utterly indifferent and has no sense of duty.

2559. Do you wish to make that charge against the people as a whole?—Yes, all the young people. Of course there are exceptions, but the bulk of them have not any sense of duty as they have abroad.

2560. In regard to the comparison between food that the poorer classes obtain abroad and in this country, should you say that the English housewife is inferior both in

the selection and in the preparation of food?—Absolutely *Mrs. Close.*
 in both ways. She is foolish, and she selects her food badly, and chooses badly, and cooks it infinitely worse.

2561. You admit that their monetary resources are probably better than they were forty years ago?—Much better, and far better than they are abroad.

2562. Do you know France intimately?—Yes, intimately.

2563. Do you know Auvergne?—I know the neighbouring provinces, but not Auvergne.

2564. Here is a description of the peasant life of Auvergne, and I ask you whether it is much the same in France, generally—"Four times a day, and five at midsummer, the farm hands take their bowl of cabbage soup, where the bacon, potatoes, black bread and cabbage make a mess so thick that the spoon stands up in it; they eat also a crumpet of buckwheat, and a noggin of Cantal cheese; and often a dish of curds and whey, when a cheese is in progress; a sausage if the pig has been lately killed; a fry of mushrooms in September; a tart of wild cherries in July; or carrots sliced and fried with snippets of bacon; sometimes a queer stew of potatoes and curds; or some other homely treat which, at mid-day, serves to mark the importance of dinner, always washed down with a glass of the strong bluish-red wine they call Limousin, brought from the neighbouring departments of the Lot and the Correze"—That is an excellent description.

2565. Here is another of Touraine?—I do not know Touraine.

2566. "The peasants live uncommonly well in Touraine. Two or three times a day, according to the season, they have an excellent meal consisting of soup—generally cabbage soup—followed by a dish of beans and bacon, or a ragout of mutton, or a piece of braised beef, or may be a fricassee of veal or a civet of rabbit, but meat of some sort, and very seldom merely bacon; for dessert they have goats' milk cheese, for every farm has its goats, with fruit, and plenty of common red wine, for every cottage has its acre or so of vineyard"—That is also an excellent description.

2567. Is that a truthful description?—It is an admirable description.

2568. Of course there is nothing in England at all to compare with that?—Nothing—it is miserable. My experience last year driving from Cornwall to London was literally terrible.

2569. Will you give us your experience of that?—The more remote the province is from London the better the food—that is undoubted. The nearer you come to London the more infamous the food, and the more infamous the cooking, and the only thing the women think of is luxury and pleasure and amusement. They will not give it up. They only think of theatres.

2570. Not the poorer classes, surely?—Yes, I am speaking of the lower classes.

2571. Do cottagers' wives come up to the London theatres?—Constantly. I have seen them myself.

2572. (*Mr. Struthers.*) What distances would they come?—From a place in Kent, say three-quarters of an

Mrs. Close. hour by rail. That is where I have seen greater misery than in any other part of the world, and worse physique. At Windsor itself, that was the only place in Europe where I have not been able to go into the bed, and have had to lie outside it.

2573. (*Chairman.*) What bed?—The lodgings. It was so filthy. The place had a very smart bow window over a shop, and it was in the High Street of Eton looking into the street. It was the only place in Europe where my daughter and I were unable to go into the beds, and where you could not touch the food for supper or breakfast in the morning.

2574. What sort of food was it?—It was absolutely uneatable.

2575. What was the material?—It was an excellent bit of steak, but it was rendered uneatable from the cooking. And the same in Wiltshire. There, the food was absolutely uneatable. The roast joints for the Sunday dinner were absolutely uneatable, and the farmer could not get a single slice off the joint, it was so badly cooked.

2576. Yet you would say that the facilities for cooking are better?—They are excellent.

2577. And so with regard to the modern kitchen ranges?—Yes, they are very much improved.

2578. Their mechanical arrangements were better altogether?—Yes, if you would like me to tell you what there was there, I shall do so. The gardens at the farm were over-flowing with young rhubarb, and sorrel and those sort of things, but we had nothing but tinned vegetables and tinned fruits.

2579. And do they allow those fruits to rot on the ground?—Yes, to rot rather than gather them or cook them.

2580. They do not sell them?—They do not take the trouble to sell even, but they allow them to rot. We had tinned food for breakfast, for dinner, and they were too idle to make their own cakes. They would buy all the cakes from a wholesale firm in Edinburgh.

2581. Where was this?—Didcot was the worst place. It was a farm house in the parish of Didcot—I do not like to mention names, of course, they will remember me and it would not be kind. They were civil and nice girls, but the girls think of nothing but amusement, and they are idle.

2582. Do you think that that description might fairly be made of the young women of that class all over England?—Not all over England. In Yorkshire and Lancashire they are exceedingly good.

2583. Would you say within a hundred miles of London?—Yes, in Hertfordshire and Kent, and say from Didcot on the Great Western up to London, all these people are idle, feckless and good for nothing people.

2584. These evil influences are gradually extending the further you get from London?—Yes, very much.

2585. And so that the whole of England will become contaminated?—I am afraid they will be in a state of helplessness. Yorkshire was first-rate—I have not been there for two years and therefore I do not know whether it has gone back, but the cooking there used to be admirable.

2586. The tinned foods that these people procure, are they good in themselves, so far as tinned foods can be, or are they of an indifferent quality?—They are good. The cakes are atrocious.

2587. But in regard to the class, rather below the farming class, the agricultural labouring class, have you anything to say about their dietary?—It is just the same with them. If there is an old woman about that is a different matter, in fact I choose the cottage where there is an old woman.

2588. You think that good qualities are now the exclusive property of the old people?—Yes, I am in the habit of getting up early. In my drives I put up in cottages, and I get up at six o'clock and constantly find the young women are never up until eight o'clock. The consequence is that the children are taken off to school with a scrap of bread, and milk or tea.

2589. Is not it tea without milk?—Without milk.

2590. Strong?—Yes, that depends upon circumstances. It is sometimes frightfully strong and has been standing for a long time.

2591. You think it is allowed to stand all day, and it is warmed up in the evening?—Well it is done anyhow.

2592. You have seen its effects on young children in the farmhouses?—Yes, I think that they are better brought up on beer. I have seen many brought up on beer, and they seem to be better than those brought up on tea. I have no statistics.

2593. The tea produces anæmia and forms of neurosis, does it not?—Yes, and what you call ricketty, they have no muscle and no bone. May I add, that in Bracestead, in Kent (because I know it, and I have stayed there some weeks) the mothers there were in the habit of cooking nothing at all but a mass of boiled turnips once a week and shovelling them out for dinner and supper cold. We know that boiled turnips have about 80 per cent. of water in them; it is not unwholesome, but it has less nourishment than any other English vegetable.

2594. Do not these people give their children a fair complement of bread?—They give them lumps of bread, but it is very inferior bread. I see by analysis in the Blue-book—

2595. Would you say that it is inferior in strengthening qualities?—Yes; and it does not sustain you as foreign bread does, and you cannot go very far on it. I have gone a long way on bread abroad, but you cannot go far on English bread.

2596. Do you find that they take much porridge?—No, except where you find Scotch people, and occasionally in Yorkshire. You know that it is a very troublesome thing to make porridge, and therefore this thing is only done abroad.

2597. You therefore have formed a somewhat depressing opinion of things generally?—Exceedingly depressing.

2598. But you think that it is quite capable of improvement by the adoption of simple and reasonable methods?—Yes; and by putting a sense of duty into the women. I feel it my duty to say so—they have no sense of duty at all.

2599. Well, it is a very difficult thing for men to put a sense of duty into women, is it not?—I am sorry, but you will do no good with these women until you do put a sense of duty into them; they are not like old French women, who will get up early and cook the food for the children, and who will say, "that is why the good God puts me here."

2600. The sense of obligation has become very weak in the women near London in that class, then?—Yes; the moment they marry, if they are in the country, the wages cease. What is to make them get up? Nothing but a sense of duty.

2601. You do not think that any of them are neat and clean?—Comparatively few.

2602. The houses, you will admit, are better than you remember them forty years ago?—Yes, the houses are excellent. There is not a fault to find with the houses in the country.

2603. The women do not take any pride in them?—It is very rare. Of course, there are exceptions, but as a rule they take no pride in them. When you see behind the muslin curtains, you find the filth.

2604. Then you do not think that the teaching of the management of the household and of cookery in schools has had any effect yet?—It has hardly had time.

2605. Do you think that the methods employed could be improved?—I should like to make it obligatory.

2606. If the methods are not good the further extension of the teaching would not do much good, would it?—I should suggest very strongly that the children should cook a tangible meal and see it and eat it.

2607. Such a meal as they would eat in their own cottages?—Yes.

2608. Have you any knowledge of the teaching of household management in Sweden or anywhere else?—Yes, personal knowledge; in Sweden they spend the entire day in cooking. It is obligatory, and they spend five to six hours a day upon it.

2609. Not throughout the whole time that they are at school?—For three weeks at a time. It varies according to the health of the child.

2610. Up to what age do they stay at school?—They generally stay until they are fourteen.

2611. So that for two or three years they receive lessons in cookery and household management, to which they devote two or three weeks continually, and they go through a course?—Yes, and may I add that it is not quite as lessons—as it is here—ground into them as lessons, which, although they enjoy very much, it becomes more or less disagreeable, owing to the demonstration lectures, which are of no use whatever.

2612. You would have more practical work?—Yes, and they should cook a tangible meal, and see it, and eat it themselves. At present it is put on a shelf. In Bethnal Green, for instance, it is thrown away, because they will not eat stews.

2613. What is the prejudice against stews?—I cannot say, but they will not touch a stew.

2614. However savoury?—I have eaten it myself. I saw at Bethnal Green several dishes thrown away and nobody would buy them.

2615. It was absolutely unsaleable?—Yes.

2616. That is your practical suggestion, that the teaching of cooking should be more continuous?—Yes, more hours a day—the entire day. At present a batch goes in at nine o'clock and comes out at twelve. They do not see the result of their cooking. It is probably not half cooked. I suggest that the same children should stay in all day.

2617. And the material that they cook might be utilised for the children who are in a half fed condition?—I do not wish to see them fed free in the school, but the parents would be glad to pay 1½d. or 2d. for it.

2618. Do you think that by this system you would get a sufficiently continuous supply of food to meet the demand?—I think it would be perfectly easy. I have been down to the slums a good deal lately. I was at Whitechapel the night before last. I do not go from house to house, but I meet the people at concerts and speak to them in a friendly way, and they are all keenly in favour of more cookery being taught.

2619. On a more intelligent system I suppose?—Yes. They backed me up in having less subjects taught in the school; they want to take up domestic economy in lieu of those subjects, and they would be delighted to pay 1½d. or 2d. for a properly cooked meal in the middle of the day to be taken on the school premises.

2620. Do you think that the exodus from the rural districts to the towns might be arrested if the rural housewife made the house more attractive to the family?—Undoubtedly. The misery of their houses is beyond words—the discomfort in the home. I have seen a man constantly come home, and he has had his supper placed on the dirty breakfast plate, and he has had to eat the cold miserable food on the plate that his breakfast had been standing in on the scullery table the entire day. I have never seen such a thing abroad, and I have lived among literally beggars abroad, and stayed for days with them, but never seen such a thing.

2621. Have you anything to say about the exodus of the rural population into the towns?—Yes. It is owing to the amusements.

2622. Do you think that they lack interest in country life?—Well, I do not agree with that, because the old people were full of interest in it; but the younger children lack the interest, and they long for the amusements of the town, because they are fed on amusement.

2623. Do you think that anything could be done to interest children early in life more in rural life; do you think that the school curriculum could be adapted to it?—I think that these object lessons in nature have a very good effect and it interests them very much.

2624. Here is the opinion of a distinguished French educational authority who has gone into this subject, and he says:—"First of all, teach the children to take an interest, not only in books, but in the life of the fields. Teach them gardening, and how to keep bees, the making of cheese, and the management of a dairy. Show them

the reason of these things, their cause, and the possible improvements. Above all, in educating your little rustics do not impose an ideal from without; work your reform from within. Make your scheme of education deliberately rural; be sober, just; teach them courage, and the contempt of mere ease and well being; give them a wholesome, ample way of looking at things; instil the taste for an active life, the delight in physical energy. Try and turn out, not a mandarin, but a man of the fields." Would you agree with that?—That is excellent. I would endorse every word of that.

2625. (Dr. Tatham.) I gather from what you say that you think that there is not only deterioration amongst the working classes now as compared with forty years ago, but that that deterioration is progressive and progressing?—I am afraid so, and must continue so under present conditions.

2626. Speaking from your knowledge—which is evidently very extensive—of the children in towns, as compared with the children in the country, do you think that they compare badly or well?—Do you mean in England?

2627. Yes, I restrict my observations to England?—Well, it is very much of a muchness now, barring the extreme provinces, such as Cornwall and Devonshire and Northumberland, which are far away and remote from the excitement of London. It is the excitements and amusements, and, I hope nobody minds my saying so, the excessive charities of London, that demoralise the people. They look upon charity for everything, whatever the difficulties of life.

2628. In your judgment you think that the children, say, in Cornwall, present a more healthy appearance and markedly so?—Yes, they are better fed, and the cooking is better.

2629. May we consider that the deterioration of the working classes is due to neglect and ill-treatment or improper treatment by young wives?—Not ill treatment, but thoroughly injudicious management.

2630. Speaking generally is it your experience that young children get any substantial amount of good milk to drink as a part of their diet?—No.

2631. In place of that they get tea, do they not?—Yes, and anything going.

2632. In your judgment that is deleterious?—I think so, strongly. It all comes back to the original thing, that it is the duty of the woman to go and get the milk, but she has no sense of duty and will not go and fetch it. All these farm-houses will supply it, but the women are too idle to go half a mile to fetch it.

2633. Do you think this is due to the fact that a good deal of the milk which used to be consumed in the country now goes to London?—Yes.

2634. That seems to be the general opinion?—Undoubtedly, but if the women chose to arrange with the farmers they could have it; they will not get up in the morning and there is nobody to go and fetch it. If you do not get up till eight you cannot possibly get the breakfast ready or walk even a quarter of a mile to fetch the milk.

2635. It is not poverty or ignorance?—It is ignorance and idleness, a want of sense of duty. They will not exert themselves to get up early and do their duty.

2636. Would it be correct to say that in a great many instances children are sent to school imperfectly fed?—Yes, with nothing at all but a mug of cold turnips, as I have told you. It is a common breakfast for a woman, nothing but cold boiled turnips. They are too stupid or too idle to boil the potatoes of which they have learned the analysis in the school. They have been taught the analysis but it is no more use than that paper. They are too idle to make use of it.

2637. In fact the children are half starved when they get to school?—Yes, practically, constantly half starved.

2638. And not in a fit condition to receive information?—Certainly not.

2639. (Mr. Lindsell.) Do you apply that argument to the children in the country as well as town children? You say they come to school half starved: do you mean in the poorer districts of the town or in the rural districts?—I am speaking of the rural districts. I do not know anything

Mrs. Close. of the personal life of poor people in town. I am speaking of rural districts.

2640. Do you often go into rural schools ?—Constantly.

2641. Do you think, if you took the rural school children, and had them stand out in the playgrounds, that, looking through them, the school as a whole at the present day would compare very unfavourably as regards physique with the same school thirty or forty years ago ?—Yes, I am afraid so—very unfavourably.

2642. You are quite sure of that ?—Yes, I am quite sure of that, I have no sort of doubt of it.

2643. You attribute that entirely to the change in the meantime in the food and habits of cooking of the parents ?—Yes.

2644. Entirely ?—Yes, I think entirely, because insani-
tary houses would apply only to London, not at all to the country ; therefore I cannot imagine any other cause.

2645. The sanitary condition of the country cottages are probably better now than they were forty years ago ?—Yes.

2646. And on the whole the material condition of the inhabitants is better ?—Yes. But I think that the adulterated food which they eat in the country is pernicious—the adulterated tinned milk and the extremely bad bacon, and the extremely bad bread—baker's bread. Those three causes also contribute.

2647. Do you think they are worse than they were forty years ago ?—Unquestionably ; incomparably worse.

2648. Do you think that peasants could get more milk forty years ago ?—Certainly.

2649. Are you sure of it ?—I am sure of it, because I lived with poor people to such an extent when I was a girl.

2650. Did you see them have plenty of milk in those days ?—Any amount of it.

2651. Why do not they have it now ?—Because the women are too idle to go to farmers to fetch it. The farmers cannot send it.

2652. Do not the farmers send it to the town ?—Yes, but they offer to sell it. If I may quote our own place in Oxfordshire, the farmers supplied us. They assured me they were only too willing and anxious to supply the poor people. The farmers I speak of have not sufficient milk to send to London ; they are all small dairy farmers. They do not keep enough cows ; therefore they are only too glad to dispose of the milk, but the women will not walk a quarter of a mile to fetch it, and they do not get up early enough to send their children to fetch it.

2653. Does that statement of yours with regard to the laziness of the female members of the household apply to quite the labouring class, or the small farmer class ?—The labouring class—the smallest cottagers. They are seldom up when I get in from my morning walk at eight o'clock.

2654. Through your travels in England I rather gather that the type of house you stopped at yourself was a farmhouse or a shop ?—I have stopped at wretched little cottages such as over the post office, tiny little places and sometimes little roadside cottages. When I have taken my walks I have always taken great trouble to notice when the wife and mother begin to get about in the morning. I notice that half of them are not up. Their windows are not open and their doors are not open. when I come in from my walk at eight o'clock.

2655. You say that another cause is the bad bread which is now sold ?—Yes.

2656. Is that more adulterated than it was ?—I do not know. It has an extraordinary way of being excessively wet when the people buy it. Foreign flour takes up much more water than the English flour, and therefore it is made chiefly of foreign flour. That takes up so much water that it adds considerably to the weight of the bread, and therefore adds to the profit of the baker. The next morning the bread is practically uneatable, it is so dry. The same bread which was wet on one day is dry the following day.

2657. It is neither so nutritious nor so good as the old brown bread they used to get in former days ?—It is not half so nutritious, or so satisfying. You cannot do your work upon it.

2658. (*Chairman.*) They never ask for brown bread, do they, and they would not eat it ?—Not at present. I should give it entirely in the schools.

2659. (*Mr. Lindsell.*) You seem to contemplate a system of providing food in the schools for the children free ?—I think it would be a good thing if that could be done, but not free. They do not appreciate a thing which is free. I should make them pay for it, but I believe they would be extremely glad to be fed ; I think they would be glad of the power of letting their children dine on the school premises.

2660. You would establish these school restaurants in connection with cookery instruction in the school ?—Yes. It is the simplest possible thing and would not add to the expense. There is always a covered shed in every playground where I should enable the children to take their meal and eat it. I would add nothing to the expenses, there is nothing required. There are excellent cookery centres where everything might be done by the children themselves. It would cost about penny apiece.

2661. But those centres serve a large number of schools. The selling of the food made in the board school could only apply where cookery instruction is given in the school itself ?—Yes, but as far as I can see these centres are not far apart. The children would easily run a mile. It would do them a great deal of good.

2662. You are aware, of course, that there is great progress being made in establishing cookery centres ?—Yes, excellent.

2663. And under the new County Councils there would probably be a great extension of them ?—It is very desirable. I should earnestly ask that children might stay an entire day in the cooking classes, and I should earnestly ask that they should have a "tangible meal," cooked, as they do in Sweden.

2664. If they stay the whole day at a cookery class that can only be one day a week or so ?—Very well.

2665. It could not compare with the rest of their education ?—That would quite do.

2666. The food could only be prepared for sale once a week ?—Yes, by that particular batch, but there are other batches of children.

2667. At the centres ?—Yes.

2668. Have you looked at the provisions made in the present Education Code for cookery ?—The Code here.

2669. Yes, the Code for England ?—Yes.

2670. In what respects does that appear to you, as a practical person knowing what is required, deficient or otherwise—"where an inspector reports that provision is made for the practical teaching of cookery," and so on, "grants may be made on account of any girl who has attended not less than forty hours during the school year of which not more than eight hours may be in one week, or more than four hours in one day." If they are taught for a whole day you would not teach them for more than four hours, would you ?—Yes, I should certainly keep them for more than four hours.

2671. That is very nearly two complete meetings of the school ?—Could it be made at the discretion of the teacher as it is in Sweden, so that in hot weather they could be allowed out a little sooner. In hot weather in London it becomes stuffy and hot. In Sweden it is left to the discretion of the teacher.

2672. In any case you would not give more than five hours ?—No, not more than five hours.

2673. So that a very slight alteration from that you consider sufficient ?—Yes.

2674. (*Mr. Struthers.*) The four hours is four hours actual instruction, but there would be an interval between ?—Yes.

2675. So that it really means a whole day of five hours kept for this kind of instruction ?—Yes. I would cut out the demonstration and would absolutely cut out the analysis. It is of no earthly use teaching them the analysis of an egg, as I have found them teaching in Notting Dale, which is the worst slum in London.

2676. (*Mr. Lindsell.*) Does not that come under other heads ?—I do not know which head it comes under. It is in the syllabus, and the analysis of water is the same—perfectly useless.

2677. The proportion here sketched out with regard to practical cookery and demonstration is twenty hours to fourteen hours?—Yes.

2678. You would increase the one and diminish the other?—"Not less than twenty hours cooking with her own hands."

2679. And "not less than fourteen hours' attendance in demonstration"?—I should cut that fourteen hours out. It says "not less than twenty hours," and it says "not more than eight hours may be in any one week." I cannot see the use of that. Why should it be limited to eight hours in the week—"or more than four hours in one day;" I should correct that and say five hours.

2680. It would be better to have the instruction spread over a certain wider period, would it not. If you had that all in one week they would forget it almost as soon as they had learnt it?—I do not think so. I think it would be dinned into their heads rather more. It might be left to the discretion of the teachers, because I find these children move about so very much and so constantly.

2681. You have heard it said that a great deal is left now to the discretion of teachers?—Yes, under the eye of the inspector who would go round and see that it was not in his opinion injudicious.

2682. You have recently visited a London Board School, I understand?—I have seen forty or fifty in these last two months.

2683. The girls' department?—Yes, the girls' department only.

2684. What is the impression left on your mind as to the amount of the curriculum?—According to the standard it is perfectly reasonable and most judicious. But according to the teachers—apparently the teachers put on all those additional subjects which result in utter confusion and muddle in the children's minds.

2685. I suppose you looked at the time table of the school?—Yes.

2686. Did you compare it with what children were actually doing at the time?—Per day do you mean?

2687. No, there is a time table prepared by the school authorities, and approved by the Government Inspector, according to which the teachers are bound as a rule to carry on the teaching. Did you compare what the children were doing on the particular days you were there with what was provided in the time table?—I did not compare it with the time table, but I found out what they were doing.

2688. Did you look at the time table?—Very often.

2689. Did it strike you as requiring too much?—Yes, too many subjects crammed one on the top of the other.

2690. You have drawn out a list of subjects which you found being taught?—Yes.

2691. Of course most of them are in themselves desirable, and even necessary, are they not?—May I look at it again.

2692. Here is the list (*The list was handed to the Witness.*) That was a school, I suppose, of a somewhat higher type?—Yes, somewhat higher.

2693. Attended by children in rather well to do circumstances in life?—The children vary very much. Some of them I should have thought were not intended to attend a Board school—they were doctor's children, but they went down to the very lowest class, and extremely low in intellect, I should think.

2694. Was that in the neighbourhood of Shepherd's Bush?—No, this was Wormwood Scrubbs, Oxford Gardens.

2695. Not a slum population at all?—Not actually a slum population, but bordering on it—what Mr. Booth would paint in, not with black but dark yellow. I should have thought that drawing was superfluous, and the geography overdone.

2696. Do not you think a knowledge of geography very important?—Not to that degree. They were teaching the central plains of England, which I think very unnecessary and perplexing. Personally, I have not the slightest idea of what are called the central plains of England.

2697. (*Mr. Struthers.*) It is very much better than getting up a list of country towns and tributaries of rivers?—

I should think both are utter nonsense. Grammar I should knock out, and singing. *Mr. Close.*

2698. Grammar is taught through the medium of reading lessons, is it not?—That they would pick up by ear instead of being taught the perfect, the pluperfect, and all that bosh; they would take it up by ear. In their composition I am sure they do not write from what they think are the rules of Grammar, but from what they have picked up by ear. If you ask them a question out of school, as I have done in the playground, as to why they put a sentence in a certain form they have not the slightest idea.

2699. You looked at the children, I suppose?—Yes.

2700. What is the general impression on your mind as to their physique, the children who were doing all this?—I thought they were very nice, bright children.

2701. They did not look tired?—Yes, they were.

2702. They were bright all the same?—Yes, in fact almost too bright, too sharp, overwrought. One and all had no sort of hesitation in saying that they were perfectly certain that they would not remember anything they had learnt for six months; and the teachers were of precisely the same opinion, that they would necessarily forget it all. Physiology I should like to see cut out.

2703. Was that being taught in the school actually?—It was in a large book which the school mistress yesterday refused to allow me to take. I was very anxious to bring it here with me, but she would not allow it out of her possession. She did not like me even to copy it down, though I got it eventually by persuasion. While my daughter talked to her I managed to get the book and copied these heads, but she was very much averse to my doing it; she would not let me have the book. I was very anxious to bring it. (*The Witness handed list to the Chairman.*)

2704. (*Chairman.*) Are these physiological heads?—Yes.

2705. You do not remember the questions?—No. I did not want to come to blows. She was a very nice woman indeed, but she had an impression that I was asking for a certain purpose, and she was averse to my taking notes.

2706. (*Mr. Lindsell.*) Did you go at the invitation of the School Board authorities?—No, distinctly not.

2707. (*Chairman.*) Did you go with any credentials?—Not the slightest in the world.

2708. (*Mr. Lindsell.*) Were you admitted? There was no opposition, was there?—Not the slightest. They were most kind and nice and courteous wherever I have been.

2709. On what did you base your desire to go to the school? How did you claim the right to enter the school?—I did not claim the right at all. They were kind enough to let me go.

2710. And in every school it is the same thing?—Yes, everywhere they are extremely nice and courteous, just as they are abroad. They allowed me to go everywhere and see everything. That is why I did not like to press that subject more yesterday.

2711. What practical remedies do you suggest for this unsatisfactory state of things, in the way of domestic life generally—there seems to be idleness, which results in bad and untidy homes?—Yes.

2712. And bad cooking, which results in the children being imperfectly nourished?—Yes.

2713. Have you thought out any practical means of abating these evils? I mean those are the sort of matters which legislation can hardly touch?—No.

2714. Except the fringe of them?—No.

2715. Have you thought out any practical method of grappling with these evils?—I have indeed. I have given a great deal of time and attention to it, but all I can say, is that I should simplify the general education by striking out several of the subjects which have been dumped on in excess of the standard.

2716. I quite admit that is an important point probably, but that will hardly touch the growing laziness of the young women of the present generation?—The only possible remedy that I can suggest is that teachers should be ordered to impress upon the girls that their duty in life is to look after their homes, and to prepare themselves for becoming wives and mothers. The teachers

Mrs. Close. must bring that before the girls throughout their education—or, as I should prefer to call it, their training.

2717. You would look to the teachers—the moral influence of the teachers in the schools in which the younger generation of mothers are growing up—as one of the best means for amending these evils?—Yes. Abroad it is brought before the children throughout their education; that point is brought before them every day.

2718. Are there any other agencies you have in your mind besides the moral teaching in the school?—Those agencies, whatever they may be, I have the greatest respect for, but I say it is better that the children should be taught in their lessons as well, because if the teachers do not impress it upon them the children think what they receive from other sources is nonsense. They take more notice of what is taught in school-hours than what is taught by voluntary agencies outside.

2719. I suppose you have hardly in your investigations seen very much about the evil effects of juvenile smoking—the girls do not indulge in that?—As far as I have seen they have not taken to smoking. I am not aware of it. I should do everything in my power to check the boys smoking. I hope something will be done.

2720. I see you refer to one of the causes as insanitary houses, but you would not deny that there is a steady improvement in that respect?—Certainly there is.

2721. That would not be the cause of any progressive deterioration at the present time?—They have gradually become insanitary owing to the utter carelessness and indifference of the women. They would make the best house in the world insanitary in a fortnight.

2722. You attribute the tendency to congregate to the centres of population as much to a desire for excitement and amusement as for getting better employment?—Yes. In fact, more so.

2723. Do you think that a young woman would prefer worse wages and greater hardships simply because she prefers living in the town?—Yes, because she gets more amusement, more excitement.

2724. (*Mr. Legge.*) I would like to get into definite shape your recommendations about cookery in schools. First of all, I gather that you are not satisfied with the present style of these lessons. You wish them to be severely practical?—Practical.

2725. And you do not attach much importance to the theoretical part, the chemistry of food?—None whatever.

2726. Then you are not satisfied with the methods in which the lessons are given, that is to say, the time at which they are given; the duration of the lesson and so forth?—So much of the lesson is taken up by demonstration which I consider useless, and by analyses which I consider pernicious.

2727. Would you think it well to concentrate the instruction in cookery to, say, the last six months of a girl's school life and give her a continuous dose of it?—No, I should strongly urge that they should be taught earlier.

2728. At what age would you like them to begin—below twelve?—Yes if possible.

2729. Below ten?—Say at eleven. The teachers are most anxious that that should be done.

2730. If they began desultory sort of lessons at eleven—because you could not expect them to give, say, even half their school time to cookery from eleven upwards—would you like them for the last six months of their time to have really concentrated domestic training?—I should ask from the educational authorities whether it would be possible to select the girls who intend to be typewriters and even governesses. I have found several of these. Would it be possible to select them and allow them to form a class by themselves?

2731. There would be no difficulty whatever?—I see no difficulty, and to allow those who have the sense to wish to learn cookery, to take a further course of ordinary practical cookery at a later stage.

2732. You mean, to allow them at an early age, at say twelve and a half, to specialise?—If possible I should like to very much; or say at thirteen.

2733. The last year of their elementary school life?—Yes; let them take all this course if they wish.

2734. A certain number of girls will never go on to the secondary course?—That is so.

2736. Those are the ones who would specialise in cookery?—Yes.

2736. The typewriter, and the governess class, and the teacher class would proceed to the secondary course?—Would they not have to pay for secondary education?

2737. No?—Would it be quite free?

2738. They can get it quite free?—Then they might be exempt from cookery.

2739. I have a further suggestion to make to you. Do you think it would be a good thing in the case of girls having a home with which the school authorities were perfectly satisfied, if these girls could be allowed after the age of twelve or twelve and a half to only keep half-time attendance at the school, and go home to work with their mothers about the house for the half-day?—I should not be in favour of that.

2740. I say where the school authority was satisfied the home was a good one?—No, I should oppose that very much.

2741. But why?—Because they are apt to get demoralised by neighbours. It is not only the home. It is impossible for mothers to keep them in the house.

2742. But supposing they are going home actually to work with the mothers. Supposing it is the mother's washing afternoon. Do you see any objection to allowing the girl to go home for the washing afternoon? Or supposing it was the mother's baking afternoon—suppose she was one of those excellent mothers who bake their own bread—and she selected a particular afternoon in the week in which she could do it, would you object to the girl being allowed to go home under special licence to help her mother to bake the bread?—I should disapprove of it. I should not wish that. First of all, if I may go into my reasons, I should say it is exceedingly difficult to know the inner life of the homes of these people.

2743. You seemed to find it out very rapidly?—Not in towns. I stated that I did not speak for towns; I speak for the rural districts. Are you speaking of rural districts or towns?

2744. I am speaking of both?—In the rural districts it may be done—in really rural districts—because then you can ascertain the facts. But in school life in London, without what I call meddling with people, you cannot find it out. I think the less people are interfered with at home, and the less they are muddled and meddled with the better. I am strongly of opinion that they ought to be left alone.

2745. You do not think it would be an inducement to a mother to keep a decent home if, having satisfied the school authority, she got her daughter's assistance during certain afternoons in the week?—No, I do not think so.

2746. Do you not think that there is some ground for supposing that this sense of duty as regards the home has been lost by girls being taken right away from the home and placed in an artificial atmosphere such as the school up to fourteen years of age?—I think their sense of duty has been weakened and lessened, not by being taken to school—because they always went to school—but by the forced education which renders them unfit to help when they get home. They sit in a state of collapsed idleness when they return from school. And again, as I say, the sense of duty is not put into them by the teachers.

2747. You have been rather severe on the teachers as regards the way in which they pile on subjects: do you think that any teacher under the London School Board or under any School Board?—Any School Board; they are all the same.

2748. Do you think they put in subjects at their own sweet will? Are they not carrying out the instructions of the Board they are serving?—I was unable to find that out. Some told me one thing and some another.

2749. Those poor teachers are under a pretty severe despotism, are they not?—Yes.

2750. These Boards have inspectors prowling round seeing that what the Board wants is being carried out, and that what the Board has not called for is not occupying the children's time?—How do you mean?

2751. Are not the people to get at with regard to these overcrowded curricula, not the teachers, but the authorities?—The local school authorities?

2752. Yes?—That I cannot ascertain. That is what I wanted to know.

2753. I think you will find that is so, that, for instance, this teacher whom you visited yesterday was only carrying out the behest of the London School Board, and as the classes you were inspecting are girls' classes, you will probably find that it is the particular wish of one or two lady members of the London School Board that that teacher was carrying out?—Then I should say those ladies were unfit to be in the London School Board, because they are impractical. But I may say that the head teacher yesterday who was teaching all this, who had these on her list, spoke more specially of the inspector, I understood, as encouraging this large variety of subjects.

2754. (*Mr. Struthers*.) There are two inspectors: which was it?—It was Mr. Helps.

2755. There are two sets of inspectors—the inspectors of the Department and of the London School Board?—It was Mr. Helps, and you would know to which he belonged. I understood from her—of course I am naturally speaking under correction—that he very much encouraged this variety of subjects.

2756. (*Mr. Legge*.) Do you know Mrs. Steel?—No; I do not.

2757. Have you read her letters to the *Saturday Review* on the training of girls, particularly in the rural districts?—No, I have not.

2758. They coincide very much with your views?—I have not read them.

2759. Though I think she would be willing to license girls out as I have suggested, in order to give them this practical domestic training in their own homes. I have two more questions to ask you: one is the question of providing food for children at schools. I quite understand that you are anxious to be on your guard against pauperising parents: you wish to make them pay for the food?—Yes.

2760. But there, again, are you not in danger of going further and destroying the sense of duty about home matters if you actually get the meals provided at the schools?—I quite agree with you that there is that risk.

2761. What home work has the mother to do with regard to her children if she has not to prepare even their meals?—There is a great deal of risk in that, I agree. But, on the other hand, I do not quite see what meal the children who are attending the cookery classes can cook, serve, and wash up, unless we offer that on sale to the children. I do not quite see what alternative there is—what restaurant, for instance, we could supply. It seems to be difficult to manage.

2762. Are you quite satisfied that the cottages of the country generally are in a sanitary condition?—Yes, quite.

2763. You do not think there is much in the outcry one does hear in the rural districts as to neighbouring cesspools and manure heaps?—Oh, dear no.

2764. You don't think the old in the country suffer to an excessive degree from rheumatism?—No.

2765. As a result of living in continual dampness?—No, certainly not.

2766. (*Colonel Onslow*.) In your journeys through the country districts of England, in addition to this craze for excitement among the young women, did you notice any tendency to intemperance?—No.

2767. None at all?—No, I have not come across it.

2768. You have not been to any provincial town and studied life there much?—No, never.

2769. But in London you have?—No, I have never been in a poor person's house in London.

2770. You have studied the children in London a good deal?—Yes, I have talked a great deal to the poor people.

2771. Have you been among the Jewish children?—Yes.

2772. Have you noticed any marked difference between the Jewish children and the Gentile children?—Yes, the Jewish children are incomparably better fed.

2773. What do you attribute that to?—The women have a strong sense of religious duty, unquestionably. *Mrs. Close.*

2774. You cannot say that the knowledge of housewifery is less in the towns than in the country?—No, I think the knowledge is about the same—equally bad, except remote from London.

2775. I mean the want of knowledge?—I should say the want of knowledge is equally bad everywhere. Whatever they do know they do not care to practise; they do not take the trouble.

2776. You spoke of country people eating these tinned foods, and bread so much?—Yes.

2777. You only mentioned milk, but you mean other tinned foods?—Yes, lobster for instance.

2778. And salmon and that sort of thing?—Yes, they are most pernicious.

2779. With regard to the bread, is that very highly refined?—Yes.

2780. Made from highly-refined flour?—Yes, extremely white.

2781. How would it be possible to carry out these cookery classes in the country districts where you have a thinly populated country and a small school. In many cases I have no doubt you have come across a small parish school where perhaps the whole of the population is only 200 or 300?—Yes.

2782. As a rule they are voluntary schools. Do you think the cookery could be taught there as well as in the larger board schools?—I think it would be most difficult.

2783. And that is where it is required very much?—Yes, but more than anything it is required in the sense that it is the woman's duty. She can do it in the country if she chooses.

2784. Could not that be instilled into them by these many voluntary agencies, for instance, the clergy, the district visitors and that sort of thing; could not they instil that into the young women?—No.

2785. You find they will not accept it?—They are too much bothered by the innumerable meddling people who bother them to death: that is their one complaint in Whitechapel and Notting Dale.

2786. Do you think it is the same in the country?—The country is perfectly hopeless. You would not attempt to teach them by voluntary agencies. They would not attend.

2787. (*Mr. Struthers*.) But, after all, the sense of duty is intimately allied to religious feeling is it not?—Yes, religious feeling of some sort. I have lived amongst Mahomedans, Jews, Roman Catholics, and members of the Greek Church—they have some sense of religion.

2788. This is allied with religious feeling?—Yes.

2789. It does not matter what that particular form of religion may be?—Not in the least.

2790. Would you not accept that it is particularly the business of the church, or the various churches, to recreate this sense of duty amongst English women much more than of the schools?—No, I disagree with you. I think the beginning of everything is the school.

2791. I thought we agreed that duty was particularly allied with religious feeling?—Yes.

2792. *Ex hypothesi*, religion is excluded from the Board school?—Yes.

2793. And it is particularly the duty of the church to foster religious life and religious feeling in the country, and therefore the high sense of moral duty which appears to be disappearing?—Yes.

2794. I suggest it is to the church as well as to the school that we should look for this reformation of English ideals?—I agree with you, but I think distinctly that it is the teachers' business to instil the thought of duty into the children. They need not mention religion.

2795. Can we compromise it in this way, that the schools should do all they can, but also the church, to see that nothing is being neglected?—Certainly; the churches in their own denominations.

2796. I listened with almost amazement to your account of the condition of the population in the rural

Mrs. Close.

districts in England, particularly to the somewhat lurid account of how even a well-to-do farmer, as I understand it, puts up with inferior and unsatisfactorily cooked meat for his Sunday dinner?—Yes.

2797. You mention a roast which you say was absolutely uneatable?—Absolutely.

2798. Do I understand that you would have a similar roast every Sunday—absolutely uneatable?—Yes, I generally found it so.

2799. Do you think the average English farmer would put up with that?—They have to. The younger women will not cook.

2800. Is this vice of idleness a peculiarity of the women?—Yes, I think so.

2801. The men are active?—I distinctly think this—that when the men urge that their hours of work shall be limited to eight a day a woman naturally says “Why should not my day be limited to eight hours?” And as it cannot be so limited she limits it all that she can.

2802. But the men do work and bring in their wages?—Yes.

2803. They voluntarily acquiesce in the women’s idleness?—You cannot help it because when a man thinks that he is overworked when he lays more than 200 bricks a day the wife says “I do not see why I should wash or cook.” It breeds idleness all round. The men are responsible for it a great deal.

2804. Apparently the men are to blame to some extent. I thought it was exclusively the fault of the women?—No; nobody asked me about the men. I am very glad you did.

2805. In the case of those children in Kent who are sent to school on cold boiled turnips and nothing else, do you suggest that is a common occurrence?—Quite common. I do not speak only of turnips. I have seen bread soaked in water in the same way—not even in hot boiling water, but in tepid water, thrown on the crusts to make them soft enough to eat.

2806. Are the very poor starving?—Dear me, no. The men are in receipt of 18s. and 21s. a week in Kent.

2807. Bread is an easy thing to get?—Very.

2808. I should think that jellies of various sorts, syrups, and so on, are easy to get?—Yes, but they are most unwholesome.

2809. They may be, but children would take them in preference to cold turnips?—Oh, yes.

2810. What I cannot understand is why children do not insist on getting food, which may not be better for them, but at any rate is more palatable. I cannot imagine children putting up with cold boiled turnips day after day, when their parents are in receipt of good wages?—I have no doubt that when they have pence to spare they may spend it upon luxuries, but I do not suppose children often have the pence handy to buy anything with.

2811. I think your experience is that the mode of life in rural districts improves the further you get away from London?—Yes.

2812. And you find it better up in the North of England in Yorkshire and Northumberland and Lancashire?—Yes.

2813. There are certain considerable towns up in Yorkshire and Lancashire?—Yes.

2814. Which are also centres of excitement?—Yes.

2815. Just as London is for the labouring population?—Yes.

2816. Do not they influence the rural population in the same way?—No, they do not—certainly not very much. I do not know why. You do not mind my adding that perhaps it is because they are not so demoralised by charity.

2817. I gather that you have some knowledge of Scotland?—Yes, an intimate knowledge.

2818. You have visited farm houses in Scotland in the same way as in England?—Yes, and stayed in them.

2819. Did you know them a long time ago?—Yes, thirty-five years ago.

2820. Do you happen to know farm houses in the district of Ayrshire and Lanarkshire, the South-west of

Scotland?—I know round Inverness-shire and Sutherland, and some of the southern counties.

2821. How did you find those farm houses stood with regard to the provision of food and cooking?—They were excellent thirty years ago; the food was perfectly excellent.

2822. Do you find it so still?—No, it is inferior, but not so bad. It has not gone back as England has.

2823. Because, personally, I know farm house life in the South-west of Scotland very intimately, and I should not say, from my own experience, that there was any obvious declination in the character of the food or the way it was cooked?—No, I do not think there is very much. If you remember Scotland thirty-five years ago you will remember the delicious scones in every farm house, and barley bread.

2824. I do not think I know a single farm house where scones are not a staple article of food now?—I am very glad.

2825. Do you know what Scotch broth is?—Yes.

2826. You know that the cooking of the mid-day dinner—it was about eleven o’clock really—occupied the attention of the mistress of the house formerly with the assistance of one servant?—Yes.

2827. The cooking of the broth and various other articles occupied the whole of the forenoon?—Yes.

2828. Do you consider that a healthy state of things?—Yes.

2829. It is not only good for dinner, and good for the health of the people but it provides occupation for the women?—Yes, occupation and interest. Of course it is quite right.

2830. On this question of teaching cookery in schools I think I rather gathered you did favour a system by which, whatever other instruction in cookery a girl might get, she might spend a year or a year and a half before she left school very largely in preparing for and keeping a house?—Yes.

2831. So that you would approve of such an arrangement as we have in Scotland of what we call supplementary courses. It applies to boys as well as girls; there are several supplementary courses, but I am speaking of these for girls, called the household management course; the arrangement is this, that when the girls are about the age of twelve and a half to thirteen and have reached a certain very moderate standard of general education—reading, writing and arithmetic—they may enter upon one of these supplementary courses, and this is a description of the work in the household management course:—“The special aim of this course should be to give the pupils an intelligent and well-grounded preparatory knowledge of the essential branches of housewifery. The course should comprise a series of carefully co-ordinated lessons in housekeeping, the care of rooms, furnishing, and clothing, marketing, and the keeping of household accounts, cookery, laundry-work and needle-work, especially mending, darning, and cutting out.” I need not go through these but it is understood that practical work is to be taken right throughout, and that work of this nature may practically occupy three-quarters of the school time of the girls during that year or year and a half?—As much as that?

2832. Probably as much as that. They must give a certain time to reading, writing, and composition, which is an essential part, but we put no limit beyond that to the amount of time per week they may spend on domestic subjects?—That is a very good thing.

2833. Is that an arrangement which you would approve?—Yes, I should.

2834. (*Colonel Fox.*) To what do you attribute the present absence amongst the lower classes of the sense of duty?—I put it down distinctly to the absolutely secular training, without a mention of duty. Duty to the State and duty to humanity may be pumped into them but it is absolutely useless, it does not touch home life.

2835. How do you propose to rectify this?—There is no drastic remedy possible, but I hold that the inspectors and teachers should be instructed to lead the children to think of duty, that when they are taught their domestic economy it should not be taught as a lesson but with a

view to preparation for home life and a good life. It is their duty to be good wives and mothers.

2836. Do you think that a teacher, especially a female teacher, one of these young ones, who gets up late in the morning herself and hurries off to school without having her own breakfast, is a suitable person to teach them a sense of duty?—I agree with you it is difficult.

2837. Because such teachers are very numerous?—Yes, they are. It is most difficult for them of course.

2838. They suffer very much in the same way as the people of whom you have been speaking, from the want of sense of duty?—Yes.

2839. I know that to be the fact?—But from those I have talked to—I have talked to some sixty or seventy lately—they all feel it is the duty of a woman, and I think the majority of them would be only too glad if they were encouraged to drill it into the girls.

2840. You spoke just now of children having too many subjects to learn. In what way does this affect them injuriously, do you think?—They are absolutely muddled.

2841. It prevents them concentrating their thoughts on any one subject properly?—Yes, precisely.

2842. You consider that prevents them from concentration of thought upon the subject they are dealing with, which is the great secret of education?—Yes.

2843. Another thing I should like to know is this—you spoke just now of typewriters, of girls being taught in the latter part of their training to be typewriters; that does not necessarily preclude them from their being later on mothers of children?—No.

2844. Why should they be exempted from cooking?—Because they have such a distinct objection to it that I think it would make them discontented, and probably worse wives and mothers in the long run: they are in a very small minority.

2845. I come across an enormous number of typewriters in the country?—So have I, but if you ask the girls, as I have asked them, in their playground, you will find there are very few, and the love of cooking is so strong in the girls that they will have no objection, or practically very few will have an objection, to being taught it.

2846. You state that in all continental nations the lower class are more thrifty, and understand the art of cooking better than we do in this country amongst the lower classes?—Yes.

2847. Do they spend as much on alcoholic drink as we do?—No, not a quarter as much.

2848. Then as regards the cause of the male population leaving the country for towns, you stated just now that it is partly owing to the want of comfort in their homes, and badly cooked food, and to love of excitement?—Yes.

Mr. J. B. ATKINS, called; and Examined.

2863. (*Chairman.*) You are the London editor of the *Manchester Guardian*?—Yes.

2864. And you have been editing a series of articles upon this subject?—Yes, entitled "National Physical Training." It began with the notion of discussing the best form of physical education in schools, that is to say exercises, games and so on; and then the subject developed under discussion and went into the whole question of food, infant mortality, the better care of children and so forth.

2865. Did you take this question up as a journalist, or as an independent investigator in the first instance?—I took it up as a journalist first, for the purpose of writing about it in a paper, but the fact cuts the other way, too; I took it up because I was interested in it. It was my own idea; I was not asked to do it.

2866. And you have been able to collect the opinion of a great variety of representative persons?—I think so.

2867. As to the general question of the existence of deterioration, and by that I mean of course progressive deterioration, is there any evidence of that in your

2849. But do not you think that the main cause of their leaving the rural districts for the towns is that the education they receive more suits them to be clerks than to be labourers?—Yes.

2850. The education they receive is the great cause of their leaving the country for the town?—Yes, they are unsuited for labourers.

2851. And you consider that if the education was adapted to rural life more than to town life, that very likely might be a cause of keeping them in the country?—Yes; you are talking of boys now?

2852. I am talking of youths, young men who have hitherto been the labouring class in the country; they now will not put up with the dull life of the country; they like the excitement of music halls and all that sort of thing, and I suppose there is more amusement generally. Then you say also they have an uncomfortable home, but I should say that their homes in the country were perhaps just as comfortable as those in the towns. Do not you think that the main cause is that the education fits them better to be clerks than labourers?—Certainly, it unfits them for country life.

2853. And possibly by having some different form of education for country folk, that might be a means of making them remain in the country?—Certainly.

2854. (*Mr. Struthers.*) Do you think it is the case that the people who come from the country to the town come up in all cases to be clerks; do they not come up to be labourers at the docks, and labourers at the various railway stations, and other occupations of a labouring character?—I do not think so. I think they come up with a definite object. They do not come as ordinary riff-raff dock labourers; they come up with a definite purpose.

2855. (*Colonel Onslow.*) They want to go one better than their parents?—Yes.

8856. They go into shops and so on?—Yes.

2857. (*Mr. Struthers.*) And there is a very little supply of manual labour in large towns from the country?—Yes.

2858. (*Chairman.*) Do you think anything could be done to encourage people in rural England to keep goats, which seem to me to add very much to the comfort of the peasant abroad, especially in France?—It is impracticable in England; there is not waste land enough.

2859. There is plenty of waste land in England. The goat is very hardy and picks up an existence?—Yes. It is more difficult, but it might be done.

2860. (*Colonel Fox.*) In your experience of travelling through the largest part of England have you ever found in any of these cottages people who bake their own bread?—Never once.

2861. Not even in Yorkshire?—In Yorkshire they do not bake much household bread but oatcake,

2862. (*Mr. Struthers.*) "Flat brod"?—Yes.

opinion?—The evidence does not go in my opinion over a large enough field, and has not been kept regularly enough for a sufficient period.

2868. It has not been systematic enough?—No. One cannot prove deterioration. I started with the belief that one could prove it, and began writing on those premises, but I have had since to abandon that position.

2869. Your testimony to there being no evidence is all the stronger?—I am inclined to believe there is deterioration in certain cases, but I have quite given up the hope of proving it.

2870. And still less of proving any general deterioration?—Yes. I should like to give you two diametrically opposite statements which I think are good and able statements from the different points of view. May I first take that of the Rev. W. G. Edwards Rees, who was the Chairman of the Anthropometric Committee of the late Salford School Board?

2871. Is he a clergyman of the Church of England?—Yes. I will not read the whole of the article, but I have extracted from the article important figures. He says his first point is that up to the age of eight, children in the

Mrs. Close.
—

Mr. Atkins.
—

Mr. Atkins. meaner Salford Schools are scarcely inferior to those in the better quarters. He deduces these results from the measurements of the Anthropometric Committee. Then he goes on to say that after the age of eight, a constantly-growing disparity is observable between the scholars in the squalid surroundings and those in the better quarters. For example, he finds that at the age of thirteen a scholar in a school in the slums is four inches shorter and 16 lbs. lighter than his fellow in a good working class neighbourhood. The improvement in physique, he finds, tends to vary directly as the distance from the centre of the town. Even the most favoured boy of the good Salford neighbourhood is slightly shorter and some pounds lighter than the British Association's normal boy of the working class at the same age; he is three quarters of an inch shorter and 10½ lbs. lighter than the average schoolboy in Boston, U.S.A., and four inches shorter and 20¼ lbs. lighter than his coeval at Rugby school—an average public school boy. In Halifax, which he takes for the purpose of comparison, he finds that the measurements are scarcely better. In Rochdale they are even worse. It would take three Rochdale school boys, he says, according to the measurements taken by Archdeacon Wilson, of Rochdale, to equal the weight of two Rugby boys. In Edinburgh at thirteen years of age the average boy in the poor parts measures 55·88 inches in height and weighs 75·61 lbs. Then he goes on to the Manchester recruit in 1899 and points out that out of 12,000 would-be recruits 8,000 were rejected as being virtually invalids and only 1,200 were accepted as being absolutely fit in all respects. And that at a time when the army standard was 5ft. 2in. in height and 33½ in. chest measurement, the lowest since Waterloo, when the drain of the French wars had made the standard terribly low. Next he makes this point, which I think is a very interesting admission, from a man who firmly believes that there is a grave deterioration. He says that he does not think that the physical standard of the slum dweller is necessarily lower than before. If you take the average measurement of the slum, he says, it is not worse than in any given year before in the same slum. But the point is that a greater proportion of persons is now falling to this level owing, as he says, to the capacious maw of the towns, which swallow up so much of the rustic population. That, he says, is really where the degeneration lies. Then if you would care to have them he gives a few figures of the measurement of the British Army in recent years and compares them with foreign measurements. In 1845, he says, the typical private soldier—that is to say 47 per cent. of those who were measured—was between 5 ft. 7 and 5ft. 8 in. in height.

2872. (*Colonel Fox.*) The British soldier?—Yes. Only 10 per cent. were between 5 ft. 6 in. and 5 ft. 7 in. That is in 1845, but when we come to 1887 the typical private, that is to say 52 per cent., is between 5 ft. 6 in. and 5 ft. 7 in.; only 16 per cent. reached the higher standard. In 1873, 412 out of every 1,000 men were under 5 ft. 7 in. in height and 608 out of every 1,000 had a chest girth of less than 37 inches. Then in 1889, 481 men out of every 1,000 were less than 5 ft. 7in. in height and 645 had a smaller chest measurement than 37 inches. In 1889, 2,351 out of every 10,000 recruits were under 130 lbs. in weight, and ten years later this proportion increased from 2,351 to 2,962. Those are the measurements he takes purely for the British Army.

2873. (*Chairman.*) Unless we know what the variations in the standard have been in the years mentioned they are not very valuable for our purpose?—From your point of view I must admit that.

2874. (*Colonel Onslow.*) The measurement of recruits is taken as they pass in, I suppose?—Yes. Some of these figures, I should like to say, are absolute measurements, and they have a value from that point of view, quite apart from variations in standard.

2875. (*Chairman.*) That I understand?—For instance, the weight seems to have increased. That is one reason why I say deterioration cannot be proved. Mr. Edwards-Rees is a very able man and has kept these figures carefully. He has not taken sufficiently into account, however, the constantly varying standards, though of course he is not ignorant of them.

2876. This is what Dr. Cunningham, who was here on Monday, said: "Perhaps the most unreliable evidence is that which is obtained from the recruiting statistics,

because the class from which recruits are derived varies from time to time with the condition of the labour market. When trade is good and employment is plentiful, it is only from the lowest stratum of the people that the Army receives its supply of men; when, on the other hand, trade is bad, a better class of recruit is available. Consequently the records of the recruiting Department of the Army do not deal with a homogeneous sample of the people taken from one distinct class." You would agree with that, I suppose?—Yes.

2877. That is another difficult point?—Yes.

2878. (*Colonel Fox.*) When there is a scarcity of recruits they lower the standard?—Yes.

2879. And then you get an influx of smaller men?—Yes. Mr. Edwards-Rees has some figures here which I could give to you in a few minutes, comparative figures. He says it is not easy to get the German figures, but these he has been given for the year 1889. There is a striking parity, he remarks, between the German conscript and the average English recruit. In 1889 the English recruit averaged 5ft. 5·6in. in height and his chest measurement was 33·6 inches, and he weighed 124·5 lbs.; the German conscript was 5ft. 5·75in. in height, 33½ inches round the chest, and 138lbs. in weight. The German superiority in weight, therefore, he says is remarkable.

2880. There is one thing about that; those are representative men of the country. They represent the whole of the country, but our men come from the lower stratum altogether?—Yes. I was going on to say that. I think that does invalidate the point. He says the German superiority in weight is remarkable, but the German conscript is, on an average, ten months older. So far, he says there is little in it between the two, but then we must consider the percentage.

2881. He is two years older; the German conscript is twenty years of age and our recruits are only eighteen?—Was that so in the year 1889?

2882. (*Mr. Legge.*) Not the average. The average is not eighteen. You take men older than eighteen.

2883. (*Colonel Fox.*) A vast number come in at eighteen, you see?—Yes. Then he goes on to the percentage of rejections, a comparison between Germany and Great Britain. He says in Germany the percentage fell steadily from 24·7 in 1878 to 16·3 in 1889. In about the same interval ours rose from 52 per cent. to 62 per cent.

2884. (*Chairman.*) That 62 per cent., you must remember, is largely based upon the conjectural estimate that something like 23 per cent. are rejected by the recruiters and never come to the medical officer at all?—Yes.

2885. Even assuming that 60 per cent. are rejected, a medical witness of very considerable competence was here the other day who said this: "Having regard to the conditions under which the British Army is recruited, the fact that 40 per cent. of those who present themselves to the recruiting agencies become good soldiers is more to the credit of the British people than the fact that under the German system of conscription only 16 per cent. of those liable for military service are rejected for physical causes"?—Yes.

2886. If that is so, it is clear that the value of these comparisons is very slight?—Yes, but you will understand my point. I was not putting this statement forward as a thing I could accept myself. I have come to the conclusion that I could not accept his proof. But it seems to me, that of all the evidence I had, this was the ablest statement from those who believe in deterioration, and I think from that point of view it is valuable. Then he goes on to the French estimate. The statistics up to 1890 tell substantially the same tale. The percentage of rejections has fallen from 9¼ per cent. in 1831 to 5 per cent., where it now stands. The increase in the average height of French soldiers has been set down at about ¼th of an inch in a period of twenty years, noticed continually between 1830 and 1890. Since then there has been a slight relapse in the French measurements, and alcoholism is a suggested cause.

2887. (*Mr. Struthers.*) Have you the absolute figures of height and weight in any given year, as in the case of the German army?—No. I have given you the only figures he supplied. He has not given them so definitely as in the case of the Germans.

2888. Because these are very interesting in the case of the German army for other purposes?—As for the Swedish army, he says that between 1841 and 1850 the rejections were 36·4 per cent.; this proportion fell in successive decades to 35·7 per cent., then to 27 per cent., then to 23 per cent., and lastly, to 20 per cent.

2889. (*Chairman.*) Do you know on what system the Swedish army is recruited?—It is a conscript army.

2890. (*Colonel Fox.*) They all have to serve?—Yes. Then he asks one to notice that this improvement is coincident with a remarkable decrease in the consumption of alcohol in Sweden under temperance laws. The Dutch army he takes next; he says the proportion of men under 5 ft. 1 in. fell from 13 per cent. in 1863 to 3 per cent. in 1899. Men between 5 ft. 1 in. and 5 ft. 3 in. fell in the same period from 15 per cent. to 8 per cent., while men of more than 5 ft. 7 in. rose from 23 per cent. to 37 per cent. That is the end of the figures; but he admits frankly the improvement in certain classes, and his whole point is, that there is a growing disparity between the favoured class and the highly unfavoured class, a widening of the gulf, as he says, between the giants and the pigmies, and he adds that he thinks that the sanitary statistics on which some people rely simply obscure the truth. Of course he admits that the death-rate is lower, and the expectation of life has increased. Then he searches for the cause of deterioration, and takes a most interesting view which I have never got anybody else to admit so fully; he says that drink is not the *causa causans*; it is not the specific cause, because he thinks bigger men used to be a great deal more drunk than now, and he says that some people on the Continent are actually improving in spite of a greater consumption of drink. Then he says overcrowding is not the whole cause, as the whole of Europe is overcrowded except Denmark, and the physical measurements are increasing in nearly all those countries. Then he says want of food is not the whole explanation. He says it is more abundant and distinctly better than it was sixty years ago. The thing he attributes all the evil to is the want of fresh air and the want of exercise in the towns. He says that the men of Kerry, for instance, who are notoriously badly fed, are the largest in Ireland. He takes the case of the Bedouins of the desert and says they are far finer men than the men who have congregated where food is better and cheaper in the Nile Valley.

2891. (*Mr. Struthers.*) He does not suggest that race may have something to do with a difference of that sort?—He does not suggest that. He assumes that the Bedouins in both cases are the same race.

2892. In the case of the men of Kerry it would not be a matter simply of fresh air but of race—the stock they have come from?—You mean they may be of a different tribe, as it were, preserved within the Irish race?

2893. He says the men of Kerry are tall compared with the slum population, and therefore the inference is that it is not due to the want of food, because the Kerry men are notoriously under-fed, but it may be it is due to the Kerry men being of a different stock, a stock which is naturally tall?—Oh, yes, quite so; but his point is that in spite of being notoriously under-fed they manage to remain fine figures of men.

2894. (*Chairman.*) Want of food does not depress the standard?—Yes. His point is that far too much has been made of the point of food. I have a great deal of evidence on the other side, but I thought I ought to state Mr. Rees's view, which is that that is not *per se* a specific cause.

2895. They have a sanitary society in Salford, have they not?—Yes, and a most excellent society it is, I thought probably you would hear something of it, and so I have not made any notes.

2896. They are going to be represented here. You wish to give the evidence of Dr. Newsholme, the medical officer of health of Brighton?—Yes; I should like to take his statement next, because it comes in direct contrast to that of Mr. Edwards-Rees. He is the author of a book which you may know, "*Elements of Vital Statistics.*" It would only take a few minutes if I might read the essential part. I think it would make it clearer:—

"Before contributing my views on the importance of improved physical training of the juvenile part of the population, it appears to be necessary to consider the validity of one of the main arguments used in urging the

necessity for this. We are informed by the Inspector General of Recruiting (Annual Report for the year 1902, p. 30), that 'the one subject which causes anxiety in the future'—you will note the phrase—"is the gradual deterioration of the physique of the working classes, from whom the bulk of the recruits must always be drawn." Then he mentions the report of the Scottish Commission on Physical Training and quotes their remark that "there exists in Scotland an undeniable degeneration of individuals of the classes where food and environment are defective." He goes on to explain his own position:—"After reading a paper at the Jubilee meeting of the Manchester and Salford Sanitary Association, April 24th, 1902, I was asked to sign a petition to the Board of Education in favour of improved physical education in schools, but was obliged to decline because by doing so I should have been committed to assertions on the question of race degeneration based on figures as to recruits which had failed to convince my judgment. It now becomes my duty, therefore, to state my reasons for the opinions that the factors at work in the community when duly appraised do not support the pessimistic view that the physique of the mass of our population has degenerated. It will be convenient to deal first with the figures as to recruits. The number of recent rejections of recruits is stated to have been exceptionally high, and particularly so in our great manufacturing centres. To argue from this fact that the average physical status has declined is most fallacious. To begin with, there has not been in the last half-century a period at which so many recruits have been required in so short a time as since the commencement of the Boer War. To supply in a given time 10,000 soldiers, with, say, 5 per cent. of rejections for physical defects, may indicate no worse a state of matters among the masses than the rejection of 10 or even 20 per cent. when 100,000 are required. Allowance must be made for the fact that in the two sets of circumstances the recruits are not necessarily drawn from the same social circles, and these circles are depleted more in one instance than in the other. The same question arose some years ago. Sir Thomas Crawford, a former head of the medical department of the army, in commenting on the fact that the rejection of recruits had increased from 37·2 per 100 applicants in 1860-64 to 41·6 per 100 in 1882-86, expressed the opinion that the increase in the rejections could be explained in one way only—'The masses from whom the army recruits are chiefly taken are of an inferior physique to what they were twenty-five years ago.' Further inquiries, however, showed that a large proportion, and probably the whole of the excess of rejections at the later period, was due to improvements in the returns, to more rigid enforcement of standards of height, girth, etc., and to other similar causes." Then he takes the case of the Royal Commission in Scotland. He says: "We come next to such figures as are contained in the Report of the Royal Commission mentioned above, and in the earlier Reports of the Anthropometrical Committee, etc. The figures of height and weight of school-children in Edinburgh and Aberdeen, for instance, show marked inferiority in the Edinburgh children; and the earlier statistics show similar differences in different social strata. Do these figures, however, justify the remark in the Report of the Royal Commission (p. 25) that 'there exists in Scotland an undeniable degeneration of individuals of the classes where food and environment are defective'? Degeneration from what? For our present purposes this statement is beside the mark. If it implies that the Edinburgh children have degenerated as compared with a past generation of Edinburgh children of the same social stratum, the statement is unsubstantiated, and this is the point with which we are concerned. To say that the poor are punier, smaller-chested, and thinner than the well-to-do is to state a sad commonplace, but it does not help us in determining whether there has been any degeneration." After mentioning the familiar case of skeletons in museums, and so on, he passes on to the urban death-rate and the expectations of life as regards their bearing on the question, whether there is physical deterioration or not. "In the last half-century, however, the urban death-rate has steadily approximated more nearly to that of rural districts. Although a higher proportion of the entire population of the country is now subjected to urban conditions of life than before, towns now have a death-rate which is lower than that of rural districts fifty years ago. The urban death-rate has declined between five and six per 1,000, while

Mr. Atkins.

Mr. Atkins. the rural death-rate has only declined three to four per 1,000 of population. Thus town populations now live under conditions producing lower death-rates than those from which rural districts suffered fifty years ago. Unless it can be shown—and I know of no evidence in this direction—that the amount of non-fatal sickness is much greater now than formerly, it follows that our national statistics lead no support to the idea that our urban populations are degenerating, though they do not contradict the view that urban are still less robust than rural populations. The more accurate figures of our national life tables point to the same conclusion. Thus, while in 1851–60 the expectation of life (*i.e.* mean after lifetime) at five years of age for boys was 50·2 years; in 1881–90 it had increased to 52·7; while for girls at the same age it had increased from 50·9 to 54·7 years; and this improvement in the prospects of future life was not caused merely by a large saving of children's lives, but by an increased number of survivors right into advanced life." The chief admission which Dr. Newsholme makes is that one circumstance in the recent death-rates remains unsatisfactory—this is the infantile mortality. "It remains high, and is much higher in towns than in country districts. The artificial feeding of infants and the industrial employment of young mothers must have a detrimental effect in this direction." He goes on to some passages—which I need not read—about the different conditions of life which tend, without exact proof, to bear out his contention. Since food is cheaper, housing cheaper, and so on, he says they must have had their effect. The last point which I think I need trouble you with is how to get children fed better. "A better way, in most instances, though involving much detailed attention, would be the following. The attendance officers are familiar with the home conditions of school children, and by their means it would be practicable to bring strong pressure to bear on parents who were spending a large share of their wages in drink to compel them to do their duty to their children. If the reports of these officers were supplemented by weekly weighings at school of children who are suspected to be underfed, and if the failure, in the absence of disease, to gain weight were regarded as confirmatory evidence of neglect, much could be done to help half-fed children, without pandering to the father's dissipation by feeding his children for him. Such work would involve trouble; but does it not deserve trouble, and would not both parents and children benefit by this increased supervision of neglected children?"

2897. (*Dr. Tatham.*) Is that reprinted from the report of the Manchester and Salford Sanitary Association?—No, this was an article in the *Manchester Guardian* which Dr. Newsholme wrote at my request. It has not appeared anywhere else, but it will shortly appear. These are the proofs of a book that is shortly to be published. I am editing it myself and there are a variety of contributors.

2898. It will be possible for us to get copies?—Yes. It is called "National Physical Training." I will send a copy to the Committee.

2899. (*Chairman.*) What you have been saying points to the value of medical inspection of schools?—That is the most definite recommendation made by Dr. Newsholme.

2900. Are you familiar with the system they have in connection with the High School for Girls Company?—No.

2901. I am told that "every entrant is examined in the presence of her mother by a lady doctor, and if a cause of weakness is discovered the mother is recommended to consult a doctor. The cause of weakness, whether spinal, pulmonary, cardiac or otherwise, is carefully noted, and throughout the whole course of the child's school career her treatment is governed by conditions special to her physical disabilities." Do you think that any system of that sort would be advisable in connection with elementary schools?—Yes, I do. I have not talked to anybody who has a knowledge of schools who really thought that the system of medical inspection is adequate.

2902. There is no system at the present time?—No, a little is done here and there.

2903. Sporadically and intermittently, that is all?—Yes. I have met nobody who thought it was adequate, and I believe that is a great deal the secret of our difficulties in dealing with bad physique. A definite regularised medical inspection means, a constant check kept on the children, and that only, leads on to the

next step, which is the bringing to book of parents for neglect.

2904. You have considered the subject of physical education in schools and its bearing on deterioration?—Yes. I have made a little note here, though, which I should like to mention at once. In writing to a great number of people on this subject, some of whom I corresponded with without inducing them to write, I have discovered that many of them employ this as a test question—"Is there physical deterioration or not?" and having satisfied themselves that we could not be said to be degenerating they then thought, or appeared to think, that their obligation to do anything in the matter, or to encourage other people to do anything, was gone. If I might say so, without any irrelevance or impertinence, I feel sure that a great amount of evidence will be put before your Committee—and I should think very likely has been put—showing how terribly bad the state of things is in some cases. The request for people to help in the matter ought not to be dependent upon the acceptance of this quite unprovable proposition that there is deterioration.

2905. No; bad conditions have nothing to do with whether they are worse or better than they were twenty or thirty years ago?—No, I think they are bad enough. As regards the effect of physical education in schools on deterioration, several of the articles which I have in this book deal with that question, and especially of the Model Course. I think Colonel Fox knows all about that. I do not know whether you care to have opinions upon it.

2906. It is not worth while, because I understand a new scheme is going to be produced in a very short time?—I have enough evidence to show the vast importance of a good system of physical education in schools, and I should like to make this one point. I think it would be valuable since it is quite clear that a great many people resent anything which can be said to be military in form to conciliate those people. I think they are mistaken, but it is quite clear that there are a great many who take that view.

2907. Is that opinion a strong one?—Yes, I have other articles on that point, and it apparently commands a good deal of feeling in this country.

2908. (*Colonel Fox.*) There is a strong feeling against it?—My own view is that therefore it is important in order to bring in the sympathy of these people, to have what might be called a neutral system, not definitely military either in profession or in form.

2909. (*Mr. Struthers.*) I think you will be glad to hear that there is no prospect of our having a scheme which can be properly described as military?—Yes: I am glad to hear that. Although the people who disagree and protest against it may be thought fanatics, it is useful to have fanatics on one's side; and I think it is clearly a case on which the whole country might be agreed.

2910. (*Mr. Legge.*) I should like to ask you one question on that particular point. You are aware that many of the improvements introduced into the Aldershot system by Colonel Fox and others, are based on what they have found going on in Sweden?—Yes, the Swedish system.

2911. And that was primarily a medical and a school system?—Yes.

2912. And therefore it is rather hard when we are introducing in the schools in England practices and principles, which are based on the experience of medical authorities and school authorities in Sweden, to call that introducing military drill?—Those who have objected—Dr. Macnamara and Mr. Yoxall and others who are connected with the schools—all approve of the Swedish system.

2913. But a number of the Swedish exercises they have condemned because they are carried out at Aldershot; they are held out to be a military drill and condemned because, though they are based on Swedish exercises, they happen to be carried out in the training of young soldiers?—Yes.

2914. Should not people be very much on their guard against that sort of thing?—No doubt there are extremists whom one could never hope to conciliate.

2915. Do you think that one should try to conciliate fanatics of that sort? A person capable of condemning the Swedish exercise because it is used in a military

gymnasium you would not wish to make a concession to?—I quite agree. They must have come to a conclusion of that sort absolutely without thinking. But I mean in a general sense it is possible by a middle course—you say that has been done—to command sympathy which it would be valuable to have.

2916. (*Mr. Struthers.*) I do not think there is any fear of that objection being raised against the scheme?—I am glad of that.

2917. (*Colonel Fox.*) I think you will find that Dr. Macnamara and Mr. Yoxall will be perfectly contented?—That is as far as I should wish to go, if they are satisfied. I do not accept their view myself, but I believe it is important to have an agreement on such an important question for the nation. I think whatever we call the new system it will be of the same service to the army in the long run.

2918. (*Chairman.*) We will leave the subject then of physical exercises, as we understand this new scheme is likely to be satisfactory?—There is a little point which comes next with regard to the Manchester Swimming Bath that is rather interesting. The Manchester Corporation have made the swimming baths free for the children, and in a description of it here, Mr. Broadfield, who is a magistrate in Manchester and also a member of the late School Board, says: "We ought not to overlook the benefits received by school children from the free use of the public baths provided by the corporation. The Baths Committee admit scholars—both boys and girls—over seven years of age to the baths without payment if they are in charge of a teacher or master. There are enthusiasts who maintain that no primary school will be adequately equipped which has not a swimming bath attached to it, but Manchester at any rate is well supplied with public baths, and the swimming galas which are held at almost every bath each year show how excellent an effect constant use of the baths has had upon our boys and girls."

2919. (*Mr. Struthers.*) The use of swimming baths in that way is not peculiar to Manchester. Swimming bath competitions between the schools are extremely common; a very large proportion of board school children are regularly put through their instruction in swimming?—Yes.

2920. Then if you make inquiries in other towns such as Edinburgh and Perth in Scotland, where I know it is so, to my own knowledge you find the same thing?—Yes.

2921. So that I rather suggest when a case like this is being quoted as something exceptional, to be followed by other towns, it may happen that it is a fairly widespread practice?—Yes.

2922. (*Chairman.*) I do not understand you to claim that it is confined to Manchester?—No. I said Manchester does it; I did not know whether others did it or not. I think the chief thing which Manchester sets a most excellent example in—a thing which so far as I know has only been followed in two cases—is their Ladies Public Health Committee. I shall come to that in a moment.

2923. Have you anything to say about the bad ventilation of schools as one cause of the deterioration of the health of the children?—I have spoken to Dr. Kerr on that subject.

2924. We have had him here?—I have also read all that Sir John Gorst said on the subject. They are two persons who have great opportunities of judging and they agree that the ventilation in schools is not good at all.

2925. With regard to the condition of the young, you mention here a variety of causes which depress children early in life, below the normal standard; they include the neglect of the duties of maternity?—Yes. I have before me an article by Mr. John Burns. He has described the bad conditions of life and he says: "Is it a matter for wonder that the infantile mortality in certain manufacturing districts not a thousand miles from Lancashire is sometimes 200 per thousand? At Merthyr Tydvil the death rate was 221 per thousand. Then there was an investigation made recently in Liverpool by its medical officer, and it was disclosed that in 1,082 families, 4,574 children were born, of whom 2,229 died. In 12 families 117 were born—that is in Liverpool—" and 98 of the 117 died."

2926. That was in certain areas?—Yes, Mr. Burns has taken bad cases no doubt. Then he gives some figures which show that 55 per cent. of the working class children died before five years of age as against only 18 per cent. in the upper classes.

2927. Has he given any opinion as to the cause?—Yes, as one would expect, he goes a good deal into the question of factory law and drink.

2928. Does he speak of the employment of mothers shortly after children are born?—Yes.

2929. And before they are born perhaps?—Yes. He also mentions tinned foods; he says they are becoming increasingly prevalent among the working classes in order to save the trouble of cooking.

2930. Does he touch upon the difficulty of getting wholesome milk?—Yes, he does touch upon that.

2931. That is felt in a great many towns?—Yes. It led me to go into the question of the municipal supply of milk.

2932. They have that in Liverpool, I understand;—They have it in Liverpool and St. Helens. I have a list of the places.

2933. They have it in Battersea also?—Yes. I have a description of the whole system there.

2934. Will you mention the list first of all and then I will ask you about the Battersea system because I want to get evidence about that?—I have a list among my papers.

2935. Can you tell us how this system of the municipal supply of milk has worked in Battersea?—Yes. You know the district auditor surcharged the Borough Council?

2936. Yes?—It was only a nominal surcharge, I believe, to call their attention to the fact that their action was possibly *ultra vires*.

2937. But it has been done in Liverpool and St. Helens?—Yes. I have now found my list. The system has been tried in Liverpool, St. Helens, Ashton-under-Lyne, Dukinfield and Battersea. Those are the only places I know of, but I should not like to say they are all.

2938. Does it have an immediately good effect upon the health of the children so far as you know?—Here is the statement of a London Medical Officer of Health. He said that he believed that humanised milk had saved hundreds of lives and reduced, in his opinion, the infant death rate by 50 to 100 in a thousand. I may just read the description of the Battersea scheme: "When the Battersea Borough Council opened a dépôt for the supply of infants' milk last June, they had about thirty babies on their list during the first month; now they feed 300 babies daily, and expect to reach 400 before twelve months are out, a number that will make the work self-supporting." When this was written it was not self-supporting.

2939. The aim is to make it self-supporting?—Yes. "Amazing as it sounds, this is at present the only dépôt in London, and the numbers give some idea of the need that exists in crowded and poor districts for such organised help. The work begins at 8 a.m., and the milk is ready for distribution by 11 a.m., at which hour begins a steady stream of children bringing empty bottles for full ones. Though we have broadly divided the milk supply into two classes—the humanised and the sterilised—there are, in fact, two preparations of the former; that for infants under three months old having the larger proportions of lactine and cream added to it before it is put into the steriliser, the other, for infants from three to six months slightly less humanised; that which is little more than sterilised is for the babies from six months upwards. This last preparation can also be supplied for invalids and old people, but the babies come first. The differential treatment, however, is not only in the preparation. The day's allowance is sent out in wire baskets, framed to hold nine, eight, seven or six bottles. For children up to six months the weekly charge for this allowance is 1s. 6d., but the number of bottles varies according to the age of the child, as each bottle contains enough for one meal, and therefore the smaller the child the less in each bottle and the greater the number of bottles. Infants under two months receive nine bottles, as they require feeding less frequently. One of the strictest

Mr. Atkins.

Mr Atkins. rules of the depôt is that a fresh bottle must be opened for each meal; if children are sent for the milk they are specially warned not to tamper with the stoppers; and every mother is warned that a bottle must not be opened until the infant is ready to be fed. Thus every safeguard against contamination is at least attempted. For babies from six to eight months the weekly charge is 1s. 9d., and for older children 2s. per week, or 4d. per day. What the mothers gain is, in the broadest way, that they have prepared milk for their children which they could not afford to buy from a dairy, the gain in a more particular way may be judged by an instance—for 1s. 6d. per week, or roughly 2½d. per day, the child who is allowed seven bottles gets about a quart of humanised milk, so that there is a positive saving on what would have to be paid at a dairy for milk of less value to the child." The writer of this article is able to mention the willingness which is shown all round to co-operate with the efforts of the Council. He says, "This is most remarkably seen in the mothers' sense of responsibility to one another should a case of even mild infection occur in a family. Not only are they careful at once to notify the medical officer of health in a recognisable case, but the manageress of the depot is anxiously asked if the baby's supply may be continued, supposing, for instance, that an elder child has whooping cough. So little is there any attempt to suppress facts that mothers will ask the manageress for advice when the baby 'is not very well.' It is rare that the baskets are sent back with a bottle broken or a stopper missing, and as a rule the bottles are well rinsed before being returned though that is a mere preliminary to the thorough cleaning and disinfecting which goes on at the depot all day. For the convenience of the large district served the daily supplies are also distributed at the Town Hall, the public library and its branch, and the baths." That is, I think, the whole statement. I imagine the number of children up to two months dealt with in this way cannot be large. Most of the mothers would suckle their children.

2940. (*Mr. Struthers.*) Where does this milk come from?—I do not know. I am afraid it is not mentioned.

2941. (*Chairman.*) I suppose they guarantee its purity?—Yes.

2942. (*Mr. Struthers.*) It is not got from these horrible dairies which we were told about the other day?—No.

2943. (*Colonel Fox.*) In Denmark the State runs these things?—Yes. I am sorry to see that this institution was surcharged, and I hope it will support itself.

2944. (*Chairman.*) With regard to infant mortality have you ever considered whether the power the parent has of infant insurance is prejudicial to the life of the young?—I have never doubted that.

2945. Do you think it would be a good thing to prohibit infant insurance up to a certain age?—That is rather drastic, perhaps, but I should like to think the methods of insurance could be watched. It is so easy to overlay the children; that is such a common form of death.

2946. Do you think the municipality might insist in their housing regulations that wherever there was a child a proper cot should be provided?—Yes, I think it might be possible.

2947. You do not think it would be too drastic; I do not think it would.

2948. Nor too inquisitorial?—The parents might say there was not enough room, but that is a question of having sufficient cubic space. As the question of overlaying has been mentioned, may I say that a good deal of excellent advice has been offered on that and kindred subjects in the form of leaflets issued by municipalities. I do not know whether you have had anything on that subject.

2949. (*Colonel Onslow.*) At Manchester?—Yes, and in other cases at Acton, Brentford, and several other places it is done at Woolwich also.

2950. (*Chairman.*) You think the whole question of the treatment of the young, including their sleeping accommodation and their food might be properly treated by leaflets issued by the local authorities?—Yes, I do think that would be a help. I believe that a great many mothers, quite apart from the insurance question, kill their children by ignorance, and are willing to be taught.

2951. And that would be the best means of teaching them?—Yes, it would be a good means. It was brought to my attention by this newspaper cutting:—"The West Middlesex coroner, Dr. Gordon Hogg, told a jury at Willesden yesterday, in a case of overlaying, that in Acton and Brentford there had been no case of infant suffocation for a year. This he said was the result of a leaflet issued by the two district councils, on the advice of their medical officers pointing out the danger of having the infant in bed with the mother. The mischief, the coroner said, was not due to want of affection on the part of the mothers. It was rather the reverse. But many young women married who were unfit to take care of a kitten or a canary, and ignorance made them cuddle a crying child in bed. The registrar, he thought, should issue a leaflet on the care of infants with the vaccination certificate. The jury asked the coroner to induce the Willesden District Council to issue a leaflet similar to that issued in Acton and Brentford. The health department of the Stepney Borough Council has decided to issue a pamphlet for free distribution, giving advice to mothers on the bringing-up of infants. It has been prepared by Dr. D. L. Thomas, the medical officer for the borough, and deals with matters of cleanliness, clothing, and feeding of infants."

2952. Do you think the consumption of tea is a bad thing?—Yes, that is mentioned by Mr. C. E. B. Russell, who is to my mind the most efficient runner of boys' clubs that I ever came across. He speaks of tea and smoking as the two worst things amongst the boys. The tea question was quite new to me. What he says is: "Then there are the evils of tea-drinking and boy smoking. Three or four pints of tea-poison a day! It is a mixture which no one should drink, over-brewed and too strong."

2953. It has probably stood from morning to evening?—No doubt. It is the fashion to let it brew—to let it "draw" as they say. Mr. Russell says, "I have got some lads to cease drinking it, at least once a day, and to substitute cocoa, and to see as far as they can—and in the foundries it isn't always easy—that their cans of tea are not allowed to brew an excessive time. This tea-drinking might be moderated, or even converted into a harmless form of indulgence by wise teaching in the schools."

2954. As to smoking has he noted the full effects of it? We have had a good many impressions upon this, but we have not had information as to what the bad effects are?—There is the evidence of Colonel Leatham, the late Chief Inspector of recruiting in Manchester. "Colonel Leatham who made valuable records of his own observations, attributed the unfitness of candidates for the Army nearly as much to this local tea habit as to juvenile cigarette smoking. He found that the heavy tea-drinkers frequently had one form or other of varicocoe, which of course unfitted them for long marches. Cigarette smoking robs the growing lad of his chance of adult stamina, and Colonel Leatham told me that perhaps a third of the 'rejects' from the army in Lancashire might be attributed to 'smokers heart.'"

2955. (*Mr. Struthers.*) Smoker's heart I understand from medical men who conduct insurance examinations is a purely temporary affection unless persisted in for a long time, that is to say a man going up for an examination and rejected for smoker's heart is put back for a certain time; he comes up and is examined in a month, and if he cares to drop off smoking or moderate it during that time he passes all right?—Yes.

2956. That rather points to smoker's heart being a temporary affection which does not injure a man permanently?—Yes. I suppose the point here was that the boys had smoker's heart at the time of the examination, and very likely they did not give up excessive smoking, and so continued to have it. Then Mr. Russell speaks as a manager of the boys' Clubs and of athletic teams. He says "We find ourselves that it is non-smokers as a rule who get into our junior football teams. The boy smokers have not the stamina for the second half."

2957. (*Dr. Tatham.*) In your own experience at Cambridge you will remember that it was the practice among men training for the river, if the training was supposed to be of a serious character, to give up smoking absolutely?—Certainly, always.

2958. For that reason, that it was known to depress men and render them unfit for severe exercise?—Yes, it

was the wind it affected. That was the case invariably for a month before any race; and in the case of the Oxford and Cambridge boat race it was for six weeks.

2959. (*Chairman.*) We may presume that the question of child labour has been dealt with by the Act of last session?—Yes, to some extent.

2960. Then early marriages, of course they are diminishing in numbers; I do not know that we need trouble you with that?—I may say Canon Hicks, of Manchester, has found that a very good deterrent are the clubs for girls; there are not nearly enough of them.

2961. Yes, we understand the clubs for girls and boys ought to be very much more numerous. Then we have touched on the humanised milk. Is this dietetic hospital in Hampstead?—Yes. The Duchess of Teck is the president I believe, it is the only thing so far as I know of its kind. It takes young children away from the care of their parents—children who are practically being killed with bad feeding or wrong forms of feeding. The staff take them there, and practically they do not give medicine at all. They say they expect to spend not more than £5 a year in the hospital on medicine. It is simply a question of getting the constituents of the food in the right proportion. The whole system is based on the investigations of Dr. Rotch, of Harvard, and also of Dr. Ashby of the Childrens' Hospital at Pendlebury.

2962. What are the conditions of entry? Is it a charitable institution or do they make the parents pay?—I do not think I have any information on that point.

2963. But the effect is wonderful is it not?—When I got this article the hospital had only just been opened—it has only been opened for five months now. I have here a form which has to be filled up from which you will see the sort of questions the staff wish to have answered. (*A document was handed to the Chairman.*) It simply deals with food, and the composition of the food, the proportion of milk, lime, water, lactine, and so on.

2964. (*Colonel Fox.*) Does that touch the question of excessive alcohol drinking, as affecting the health and also poverty of the lower classes?—No, it does not, I think.

2965. I suppose they take it for granted?—There is a description of the whole system here, and I will send you a copy.

2966. You would advise some sort of treatment of that kind as expedient to adopt generally where there is a great deal of neglect on the part of parents of their obligations?—Yes, when possible. Neglect is nearly always attributable to drink. But there is also ignorance, which can be dealt with partly by pamphlets and partly by lectures to girls in the schools. The lecturing is being done now in Manchester.

2967. (*Chairman.*) Have you anything to say on the question of feeding in schools. In Manchester they have gone a considerable length towards introducing a scheme of that kind?—I think we have now got to the point, having decided to give free education, of having to decide whether, and how far, we should give free meals. It is a question which must be decided in principle one way or the other—whether free food in any form is an improper charge on the rates and how far we are going to impair parental responsibility. In Manchester they work on the following lines: they will not spend a penny of the rates, but the School Board, which is now extinct, used to recognise the charity, and made teachers help in distributing the food and waiting on the children.

2968. The food was not cooked in the schools was it?—I think it was. I have the last report on the subject. It is from the City of Manchester Education Committee:—"For many years during the winter months free meals to destitute children attending the Board Schools have been given. The cost was entirely met by subscriptions and by the proceeds from school concerts, jumble sales, and social parties, all organised by the teachers. The balance in hand at the beginning of last winter was £36 9s. 1d., which together with £230 5s. received in subscriptions, £131 7s. 6d., proceeds of school concerts, jumble sales, social parties, and £2 9s. 3d. bank interest, brought up the total amount available for last winter's work to the sum of £400 10s. 10d." This is the other important point;—"During the last six years no less than 668,660 dinners have been given to the Board School children in destitute circumstances.

2969. What percentage of children attending school have received these meals?—I do not think they say that. I have an article on the subject here which I will refer to in a moment. The report goes on to say:—"It should be here stated what has been stated in previous reports, that food has only been given to children whose parents (after investigation of the circumstances of each case by the school attendance officers) have been found to be in real want." Then there is a list of subscribers. It is entirely a private charity, recognised and regularised by the school Board. So far it was only in the School Board, but in the past few weeks the system has been extended. A friend sends me this account, which I think has not been published yet. "One minor but interesting result of the Education Act has been a notable extension of the work in Manchester of giving free meals to destitute school children. For a quarter of a century the School Board made it a part of its business to feed many of the poorest children in the schools." They did not pay the money, they regularised the use of it. "These meals were given, of course, in the Board Schools alone. Under the new régime all the schools in the city are brought under the Committee. Many of the voluntary schools are placed in the most poverty-stricken districts of Manchester, and the children attending them are those who are in most need of being fed. The system of free meals has therefore this winter been extended to many of these schools. Last winter meals were given in twenty-one schools and in thirty-six departments. This winter the children are being fed in thirty-six schools and seventy-four departments. The movement has been steadily growing for years past. Last year 139,000 free dinners were given, and the cost was slightly over £400. This winter both the number of dinners and the cost will be nearly doubled. No fewer than 668,660 dinners have been given during the last six years. Free meals, it may be said, have no legal sanction or basis, and consequently not ½d. of money can be taken from the rates for this purpose. The whole cost of the dinners, therefore, has to be met from private sources."

2970. Is not it possible to recover anything from the parents?—There is no machinery for it at present.

2971. Is any effort made at present?—Of course the machinery by which money used to be recovered in the case of school fees could be set in motion again.

2972. (*Mr. Struthers.*) I presume that children whom the School Board officer after enquiry reported could be fed by their parents were not fed by the Association?—I do not know. I do not gather that any penal machinery was used. But in cases of neglect I should prosecute without remorse.

2973. (*Chairman.*) If a parent can give its child proper food and sends it to school unfed, surely it is open to the manager to exclude it and to prosecute the parent for not sending the child to school. If he sends it in an unfit condition it is the same as if he did not send it?—I think that often comes within the province of the Society for the Prevention of Cruelty to Children, but they cannot cover the whole ground. "For some years past there has been a Free Meals Fund, to which many citizens have subscribed. The subscriptions have been supplemented by school concerts, jumble sales, and social parties which the teachers have organised. It is evident that if the meals are to be carried on over the wider area there must be a large increase of public support." Then there is a description of how the children are selected, that is—which of the children shall be fed and which of the children shall not. "It should be emphasised that every care is taken in Manchester to guard the free meals from abuse. The custom is for the teachers in all poorer schools to send in to the officers of the Education Authority lists of the children in their schools whose circumstances seem to warrant their receiving free meals. The house of each child is then visited by a school inspector, who examines closely into the position of the parents. If the inspector's report is satisfactory the child is allowed to 'stay dinner,' but not otherwise. Every care is taken that no child should receive a free dinner who could get a decent meal at home. The active work of the Free Meals Organisation follows fairly closely the fluctuations of the labour market, when times are bad. The dinner tables at the opening of the year are always the worst—witness the 1,180 respectable working men who have registered their names at the Labour Bureau, and by Easter the absolute

Mr. Atkins.

Mr. Atkins. necessity for free meals almost disappears. They begin shortly before Christmas and end about Easter." Then there are three lines of description of what the meal is. "On the stroke of noon about a hundred boys and as many girls sat down to a good bowl of meat soup and a big chunk of bread." "The teachers take it in turns to wait upon their pupils. All the hard work involved in the scheme is cheerfully done by the teachers in their scanty leisure time. The soup and bread disappeared in a twinkling, and the children ran out to play." On that point my friend, who wrote that article, says in a private letter to me—"There is no doubt that if the physical well being of the children is considered"—this is a man of great experience I may say—"irrespective of social economics as regards the responsibilities of parents, these meals in winter are an absolute necessity. So much is clear to any intelligent person who goes to the schools in the poorer parts of Manchester. This ought to be extended. I have seen children eat their dinners so ravenously that half the good effect of the meal must be lost, and a general system of breakfasts is also needed in the winter months."

2974. Of course, the teaching of cookery in schools can hardly be worked in to dinners of that sort to a very great extent?—No. There is a very common objection to that. It is said that if the instructor shows every step in the process of making some form of food, an hour is spent in making one little thing, and there is no food provided for the whole school. The only example I know of a satisfactory combination of providing food and showing how to cook it—no doubt there are others—is a little village school at Siddington, in Cheshire, where a sister-in-law of mine helped to start a system of feeding the children on payment of a penny. There the cooking is done for the whole school in the presence of some of the children. They go into the kitchen in turns, I imagine the cook may talk to them as she works, but there is no formal lecture. But the fact that they are in the kitchen shows them what is going on, and I understand they almost fight for the privilege of going there, and not only for that but for the privilege of washing up the plates afterwards. That system merely costs a penny for a similar meal to that which has been described at Manchester, and it is paying its way. That system of meals has brought a great increase in the attendance of the school. They have never had so many children. The plan has only been going two months now.

2975. (*Mr. Lindsell.*) What sort of a school is it?—A village school. Eighty children is the most they have ever had, I think.

2976. (*Chairman.*) In some evidence we have had here about London, Dr. Eichholz told us there were about 33 per cent. who require free feeding. Do you think the number in Manchester is as great as that?—Yes.

2977. That includes not only the cases where the parents were too destitute to provide proper food, but where they were neglectful?—Yes.

2978. He argued that they should be made to contribute to the cost of feeding the children?—Yes.

2979. It was made incumbent upon the school authority because of their neglect?—Yes.

2980. It is rather hard that the child who suffers from parental neglect should not gain the advantage of these meals as do those other children who happen to be destitute—Yes. I think that is a case for some machinery being set in motion in future, and if necessary prosecuting without remorse.

2981. (*Mr. Struthers.*) Do they or do they not provide these free meals for children whose parents could provide it, but do not? I understand the inspector inquires into the circumstances, but I am not quite sure whether if he found that the parents could have provided a meal they would refuse to give it?—I do not think there is any definite line drawn. I think it is a matter of discretion, just as in the case of a clergyman who daily has to decide who are and who are not to receive charity. He does not draw a very definite line. He judges whether the circumstances of the case warrant it.

2982. In some cases he exercises his discretion as a means of exercising pressure on parents?—I suppose so. It says here "The custom of teachers is to send in to the office of the Educational Authority lists of the children whose circumstances seem to warrant their receiving it." I think that must mean a discretion on the part of the teacher.

2983. (*Colonel Fox.*) Do they also provide meals for children who are able to pay. Suppose their parents send them with 1½d. or 2d., and they prefer them having their food there instead of having it at home?—I suppose the teachers would have to decide what to do, but I do not gather that they are instructed to receive money.

2984. It is rather considered an advantage, as they would have better food at a lower cost?—I do not think it is so regarded. It says here: "destitute children" are to be fed. Here is the official description of the scheme—"free meals to destitute children."

2985. (*Chairman.*) You also give lectures to girls in the Manchester school, and on the care of children?—Yes.

2986. Have they been established for any time?—Yes.

2987. Are they worked into the curriculum?—Yes, the School Board allowed the lecturers to come in and give these lectures. Of course, I think it is a very important point, because if the mothers go out and work or if they are incompetent or are ill, so much of the care of the children falls on girls, and therefore it is absolutely essential that they should learn. This is the description of what is done in Manchester: "The Manchester School Board after an interview with the physicians for diseases of children to the Manchester Northern Hospital, appointed about six months ago a well-qualified lady to lecture to the senior girls in its schools upon washing, dressing, and feeding of infants. This work is progressing most satisfactorily. The lecturer has gained the goodwill of the parents of the school girls, and often receives through her pupils inquiries from the mothers at home as to how the babies should be fed, etc. It must be evident that the true method of seriously grappling with the great problem, almost the most important in our social life, of endeavouring to arrest the physical degeneracy of many of the children in the poorer quarters of our great towns is to educate the senior girls in the schools and the young women in the continuation classes how infants should be properly fed and tended. Those of us in Manchester who have studied this great question are hoping that the educational authorities will appoint additional lecturers, that before many years it will be rare to see rickets, with all its evil effects, in our hospitals." I think there is nothing to add to that.

2988. Will you explain to us the working of the various health societies in Manchester?—The Ladies' Public Health Society, so far as I know, is the only thing of this sort on quite so large a scale in England. I am told that an imitation of it has been made lately in Westminster, and also one in Macclesfield; but this is really *suu generis* the most creditable thing to Manchester in all the treatment of this question, because the Ladies' Public Health Society has existed forty-three years already. I have here the forty-third annual report. I wrote to the Secretary for it, and it was only published last Friday, so it is the most recent information on the subject.

2989. Will you describe their operations in brief?—The object of the society is to popularise sanitary knowledge among all classes. These are the means to be employed: Personal visitation of districts represented to the Committee as requiring special attention, the formation in those districts of mothers' meetings where opportunity is given for health and sanitary addresses in plain words, and where this teaching can be followed up and impressed on the women by ladies who personally know them. Then sanitary lectures by lady visitors amongst the poor and others, and the distribution of sanitary books and tracts and various other agencies as they may from time to time present themselves. There are twenty-three visitors at the present time, and each visitor is under a lady inspector who is responsible for her work being up to the mark.

2990. She is voluntary?—The lady inspector is voluntary and the Visitor is paid. The salary is 16s. a week, which is probably inadequate, but the Society are unable to pay more. They get a small subvention from the Corporation, but it is really nominal. It does not amount to much more than recognising their work.

2991. (*Dr. Tatham.*) I may explain that the salaries of a certain number of those health visitors are paid by the Corporation direct?—Yes.

2992. (*Chairman.*) And they are recognised servants of the Corporation; they are practically, although not

nominally, inspectors?—These are the rules:—"The business of the society shall be carried on by a Working Committee, consisting of twelve or more ladies, the Lady Superintendents, Lady Lecturers, and Hon. Treasurer and Secretary, and others. The Working Committee shall meet on the first Wednesday in each month in order to transact business. At the committee meetings four members shall form a quorum. No rule shall be adopted or altered without notice at a previous meeting. Occasional meetings shall be held to receive reports from the several districts, to examine the Health Visitors' reports, and to afford opportunity for friendly intercourse." Then every day the Health Visitor has to write a report of what she has done that day. This is really the most important thing—"Rules and Instructions for the guidance of the Health Visitors." First of all they have to live in the district in which they work; they must go through the course of instruction considered necessary by the Committee to fit them for their work; they are required to work six hours every day, Saturdays excepted, and each one is required to write a daily report of the work done. They must visit from house to house, irrespective of creed or circumstances, in such localities as the superintendents direct; they must carry with them carbolic powder." I think that is paid for by the Corporation.

2993. (*Dr. Tatham.*) Yes, that is supplied by the Corporation?—They have to explain its use and leave it where it is accepted; they have to "direct the attention of those they visit to the evils of bad smells, want of fresh air, impurities of all kinds; give hints to mothers on feeding and clothing their children; where they find sickness, assist in promoting the comfort of the invalid by personal help, and report such cases to their superintendent. They must urge the importance of cleanliness, thrift, and temperance on all possible occasions. They are desired to get as many as possible to join the Mothers' Meetings of their districts, to use all their influence to induce those they visit to attend regularly at their respective places of worship and to send their children to school." Then they must report all such cases. Here is a kind of model form of what the report should be:—" (1) Mention general sanitary state of house visited, (a) number of rooms and number of occupants, (b) presence of bad smells; if present, are they such as to arise from deficient ventilation, or from bad drainage. (c) state of the walls and floors. (2) Report upon general mode of living, especially with regard to personal and general cleanliness. (3) Report upon the feeding of children, especially of those under two years old. (a) Is the baby nursed by the mother, or partly nursed and partly fed by hand? If the latter, state upon what it is fed. (4) Report upon any case or cases of illness in the house. (a) Nature of disease. If contagious, when and how supposed to have been contrasted. (b) How many of the family are affected? (c) Is there a doctor in attendance? If so, state how far and in what way they have assisted the people in carrying out his orders with regard to sanitary precautions." That is a short practical set of instructions which gives all that one can want to know if properly followed up. The visitors take with them soap as well as carbolic powder. The soap is sold at 2d. a lb. or 5d. a bar of 3 lbs.

2994. At a loss to the Society, of course?—No, it says, "Cheap though this is, small sums result from its sale." No doubt they get it supplied by the ton. The small sums which result are used in helping to defray the necessary expenses incurred in connection with carrying out the work. "Sanitary powder is supplied to people free by the Corporation." Then a most important point is that the visits of these women are not resented. Apparently the people have got used to their living in the district.

2995. (*Colonel Onslow.*) May I ask this: these visitors are trained in some way, are they not—instructed?—Yes. It says here that they must go through the course of instruction considered necessary by the Committee to fit them for their work?

2996. It is not any person, who is possibly quite unsuited for visiting?—Oh, no.

2997. (*Mr. Struthers.*) There has been no remonstrance of grocers, for instance, against the Society selling this cheap soap?—No, I have not found any mention of that in the report. It says all the babies born in each district which has a visitor are visited; so that they must work rather hard.

2998. (*Chairman.*) They cover the whole ground?—*Mr. Atkins.* Yes. Here is a little human example from the report of one visitor—perhaps a trifling example—of the way in which the poor women meet the advice given. The woman said, "Oh! I always burn my tea leaves and vegetable leaves now, since our lady told us to." The visitors also induce a great many of the tenants to lime-wash their rooms. I think all the Visitors' reports run very much on the same lines.

2999. I think you have told us sufficient to enable us to judge of the operations of the Society. Then as to the employment of women in factories, have you formed any opinion as to its being prejudicial to the health of the community, and in what respect—in regard to the neglect of the young, I presume?—Yes. I rather fancy that we are behind every country in that respect.

3000. We know the regulation with regard to the return of women after child-birth and their exclusion from factories are more stringent abroad?—Yes; you have the facts about that—Germany, Austria, Holland, Denmark, Belgium—I will not repeat those. I want now to summarise, for the purpose of having them on record, a certain number of recommendations I have written down. I think I have mentioned most of them. First medical inspection in schools; second, a more stringent system of laws in relation to women in factories before and after child-birth; third, a regularised feeding system in schools. I do not venture to say on that point whether we have got to the free meal point or not, but we must face the question whether the logical culmination of free education is not free meals in some form or other, when proved to be necessary, it being cruelty, in my view, to force a child to go and learn what it has not the strength to learn; then, fourthly, instruction in the care of infants by pamphlets, by lectures in elementary schools, and by such societies as this, which is worthy of all imitation—The Ladies' Public Health Society of Manchester; then, fifthly, physical training, which, in my view, ought to be of a kind which will command the support of everybody—that is to say, what roughly might be called of a neutral kind; then sixth, the use of games in the public school sense. I do not think that mere drill and formal exercises are enough. "Games," however, cannot be brought in at present by Government statute, but would have to depend upon the help of voluntary agencies. I should like to draw attention to the excellent recommendation made by the Scottish Commission that football clubs, cross-country running clubs, and so on, could all be asked to help to organise what may be called games in the public school sense—quite different from the drill and running about in the school-yard. Games, in this sense, produce a pride of body which is enormously helpful. Directly a man begins to respect his body and wants to get his colours, he hates anything which keeps back his bodily fitness. This result can be produced, I am sure, if we can summon up the kind of patriotism which in recent experience has been summoned up. We can do it again in getting these clubs—private clubs which have grounds of their own—to help in this matter. Then the next point is the need for a quasi-official co-ordinating authority on physical training. I have talked to Sir Lauder Brunton on that very point. We have discussed this possible co-ordinating society for bringing all these agencies into co-operation. The last point of all is a higher form of co-ordination still, of all the Departments which are at present working more or less for the public health. For instance, at present the President of the Local Government Board, the Home Secretary, the Registrar-General, the President of the Board of Trade, the Secretary for War, the Lords of the Admiralty, the Postmaster-General, and the chiefs of the Board of Education—those are a few which I wrote down at random—are all more or less health ministers; each one is more or less responsible for the health of somebody under his control. But all of them rolled into one are not exactly what we want, and I have been led to a conclusion in agreement with that which Bentham made long ago—that there should be a department for Health alone—what Bentham called an "officially-informative and melioration-suggestive Health Minister."

3001. Do you mean a Health Minister? I do not think there would be much competition?—Yes, a Health Minister, but we need not accept Bentham's cumbersome phrase. It was suggested a good long time ago.

Mr. Atkins. The Manchester and Salford Sanitary Association eleven years ago went so far as to send a memorial to the Home Office, pointing out the need for a Minister for Health. Bentham's scheme for a Minister for Health and the recommendations of the Royal Sanitary Commission of 1871 were given in the memorial. Mr. Goschen put the recommendation of 1871 into a Bill, which was thrown out because it contained other matter less desirable. I think one has got to a point where the whole question of developing what Dr. Clouston calls a "health conscience" is so important that the formation of a Department to consider such questions all by themselves is well worth consideration.

3002. (*Dr. Tatham.*) You spoke just now on the question of overlaying children in bed; have you any information as to how far alcohol is at the bottom of that?—I have not said much about alcoholism, because I assumed that that would be continually in your minds. But I think there is hardly one of the papers in this book in which something is not said about alcoholism.

3003. But I mean in relation to the overlaying of children—the fear that women go to bed the worse for drink and overlay their children whilst under the influence of alcohol?—I have not anything in my notes of evidence, but I have often heard that said.

3004. As you say in your evidence, a very large number of children are destroyed in that way?—Yes.

3005. A very large number indeed?—Yes. There was a case in the district where I live, Chelsea, a few days ago. The man and the woman had killed two children in that way—both cases of drunkenness. Nothing happened but a strong censure.

3006. (*Mr. Lindsell.*) With regard to this question of free food, you quite agree, I suppose, that it trenches on very dangerous ground?—The ground of impairing parental responsibility, yes.

3007. We have had evidence that what is bad in the physical condition of the lower classes is due to the increasing carelessness and frivolity of the mothers?—Yes.

3008. That they deliberately leave their homes uncared for for the sake of amusement or drink, or whatever it may be. There would always be a great danger that the more you gave opportunities for the children being fed at schools or elsewhere, whether freely or on a small payment, would either way tend still further to encourage that habit of neglecting the home?—Yes, I quite admit the danger, but I think that danger, perhaps in a slightly less potent form, was considered and over-ridden at the time we decided to give free education. I think it is exactly the same question in another form, and one can only take the next step and see that children are fed, not necessarily by free meals, but by insisting that somehow they are fed, and then prosecuting the parents who do not do it, if they are able to do it.

3009. You mean the child will be taken away from the control of the parents forcibly and given food elsewhere and the parents punished for not providing it?—No. I think the medical inspection, which requires to be very much improved, would decide whether a child was being properly fed at home, and then the attention of the father or mother should be called to the lack of proper food, and if the father and mother within a certain time did not show evidence of feeding the child properly they should be prosecuted. I should not take away the child from them unless it was necessary.

3010. (*Mr. Struthers.*) But if the parent is prosecuted, what are you going to do with the child meanwhile?—The child would have to be fed at the school, certainly.

3011. (*Mr. Legge.*) What you want is an extension of the section of the Prevention of Cruelty to Children Act, which would define one form of neglect as not providing food to the satisfaction of the school authorities?—Certainly.

3012. (*Mr. Lindsell.*) You would agree it is only a remedy necessary to meet an existing evil, but it would be better if the evil itself was removed?—Oh, yes.

3014. That is to say, that the better course of endeavouring to improve these matters is by such agencies as you have mentioned in the way of training up from the very earliest years people in the duties of motherhood and so on?—Yes, certainly.

3013. Such work as has been done by the Ladies' Health Society in Manchester?—Yes.

3015. And by lectures to children and all that sort of organisation?—Yes. I think if a child is taken away from its home to be fed, that is in itself a confession of weakness in the system which has to do it, but I still think it may be necessary, and will for a long time be necessary, to give meals at schools where medical inspection proves them to be necessary.

3016. It will always be necessary in the case of absolute poverty?—Yes. I admit ideally it is a confession of weakness.

3017. With regard to the medical supervision of schools, is there any existing organisation by which that can be carried out?—No. I think it requires to be invented.

3018. It would involve an enormous addition to the total expenditure?—I do not know. I am not experienced in these matters, but I should have thought if one got young and active doctors their salary would not be very much. I understand a young doctor who puts up a brass plate has to wait a long time.

3019. (*Chairman.*) It is a good advertisement for him?—He would be glad, I think, to have the work at, say, £200 or £250 a year perhaps.

3020. (*Mr. Lindsell.*) Then there are the teeth; some people advocate every school child having his teeth periodically inspected?—I think the school should have a dentist too, but at the same time I am not prepared to go so far as some people and say that bad teeth are necessarily a sign of degeneration.

3021. Should it be another set of officers or all combined in one officer?—I think one of the medical staff attached to the school should have a knowledge of dentistry. That is all I would say.

3022. Then there is the question of eyesight again, they would all require specialists to a certain extent?—Yes. I suppose where cases required very expert knowledge doctors could be made interchangeable among the different schools.

3023. I suppose that might be, but it would involve a very large army of medical experts going into these matters?—It would involve a good many certainly, but I cannot think the cost would be prohibitive. One doctor could do an enormous amount. I think that several young fellows while they are putting in their time would be willing to undertake the work. At present one knows that a young doctor takes a voyage because he has nothing else to do and he gets very little for it. He could put in his time in that way, and if he got £200 a year for it I should say there would be any amount glad enough to do it.

3024. Then with regard to the factory laws in relation to child-birth. At present you think the laws are too lax in regard to requiring the mother to abstain from work before and after child-birth?—Yes. I was asked not to go into all these cases, and I thought you had evidence before, but let us take the case of Spain, where I believe the law is that a woman must abstain from work at the time of child-birth and her employer has to pay her wages when she is idle.

3025. (*Mr. Struthers.*) Do you know how far that law is in force; I have come across several instances of excellent laws, which I found on inquiry had no machinery for carrying them out, and I know they were not carried out?—From what I know of Spain I can quite believe it is not in force.

3026. (*Colonel Onslow.*) I can corroborate that?—At the same time there is the fact that Spain, very much behind us in most things, is capable of putting that law on the statute book.

3027. (*Mr. Lindsell.*) With regard to the feeding of children at schools, I rather gather that you are in favour of extending the system of rate-given food and would not confine it, as it is at present in Manchester, to purely voluntary effort?—I should bring in the rate system, but I am not clear yet—I have not had sufficient evidence on the subject—whether the rates should be brought in to pay for the food itself. I am clear as to this point, that the rates might come in to pay for the apparatus, the support of the cook, the room say, and the table and the table cloth if they had one, and all the cooking utensils.

3028. That could be combined easily with the educational part?—Yes. I think the teaching of cookery could be done in a less formal way than some people seem to think. A great many will tell you that you cannot teach cooking because it is so slow and therefore when the cookery lesson is over practically nothing is cooked. Children enjoy being allowed in the kitchen. They can be taught a good deal in that way, to take only the one example which I have already given.

3029. The evils of the free food system, if evils there be, exist equally under a voluntary system as under a system of rate aid: it would not affect the moral effect of the thing?—No.

3030. If it were in any way evil?—No. I should like to say that I feel strongly that the question of parental responsibility was disposed of in principle when we gave free education. It is the same question.

3031. (*Mr. Struthers.*) Is it not possible that the nation made a mistake? I am not giving an opinion of my own. Is it a wise policy to take this as irrevocable and to consider that because we have possibly made a mistake we are bound to go on on the same lines?—Without going into the question of whether a mistake was made or not, I think your question involves a problem of whether we are to go back. Personally I do not think it is possible to go back.

3032. I do not think that quite follows. I think it simply involves this, that we ought not to be prevented from discussing the question of free food on its merits because we have perhaps taken a false step already. We need not go back on free education, but we can hold our opinion free as to whether we will take another step in the same direction or not?—In the abstract perhaps that is so, but practically I could not agree.

3033. (*Mr. Lindsell.*) We have had it pretty definitely stated that the critical period with regard to the want of proper food is rather earlier than the school age—I mean absolute infants. It is at that age that the effect of bad or good food is most telling, and therefore this system of free feeding in schools would not to any great extent meet the physical deterioration caused by bad food, and therefore we should logically come to this that if you feed the child at school you would have to provide means of feeding him at the age of one or two, and therefore you come to a much wider question than merely feeding children attending at school. You come to the question of feeding the proletariat infants generally?—I think if these milk supply institutions such as at Battersea, run by the municipality, can be made self-supporting or almost self-supporting, there can be no objection to their meeting the case as far as possible.

3034. They can hardly be self-supporting if the mothers were too poor to buy the milk; you would have to give a certain amount through some agency, a municipal or other agency, a certain amount of milk to parents gratis or at any rate at considerably below the cost price in order to do any good at all?—Battersea is a very poor district and they are already looking forward to the time when the thing will become self-supporting.

3035. My point is that if it is good for the nation that a child between five and thirteen should be fed in order to improve his physique, it is equally important that the child shall be fed between one and five?—I agree.

3036. (*Chairman.*) I suppose your view would be that it is because the State compels him to learn that we must see his physical condition is commensurate to the strain placed upon it?—Yes, that is so. We force the children to learn; we do not force them to come into the world.

3037. (*Mr. Lindsell.*) That will not remedy the evil?—No.

3038. We are considering what methods there are of checking any possible tendency there is to further physical deterioration, and if the age at which that can be best checked is before the school age, it follows logically that if you do it in school age you ought also to do it before the school age—from the point of view of physical deterioration, not from education?—Yes, I see your point, and as a logician's point I cannot meet it. But I think all these questions of practical politics depend upon expediency. Pure logic will lead one no farther, but will check one at many points.

3039. I do not think it is a question of pure logic; it is a question whether it will be of much use feeding the child after five if his system is already hopelessly ruined by want of food before five?—I should take each point on its merits and treat it according to expediency. As regards the younger age, I should certainly recommend the full consideration of this Battersea scheme of municipal milk, and the encouraging of such excellent institutions as the Ladies' Health Society, which really covers the ground and meets the need in Manchester.

3040. You are not inclined to press the charge of militarising physical education?—No, I do not believe in it. I believe if a boy is taught to use a rifle even—which he is not—that that would rather inoculate him against militarism. He would regard it as a citizen's obligation, and would not be inclined to run away with a wild jingo spirit as some people do who have not been made to share any of the sobering responsibilities of the Army. But men like Dr. Macnamara and Dr. Yoxall represent a large bulk of opinion, and I think they ought if possible to be conciliated. Is it not the counterpart of the religious difficulty on the other side of education—people with conscientious objections? I believe a neutral system is ultimately of the same service to the Army and will meet the wishes of everybody.

3041. Of course on your next point, "Games" obtainable by the help of voluntary agencies, boys' and girls clubs, athletic associations of every kind, for the benefit of the young must necessarily be a very important factor in improving the physique?—Yes.

3042. In towns the great difficulty is to obtain space for games, and so on?—Yes, but even in large towns these private clubs have their grounds.

3043. You would be in favour of this being extended to part of the recognised school curriculum?—I believe that if the teachers were appealed to they would take it up. I think the whole thing would have to be voluntary for the present. You could not make it an official system when you are dependent all the time on the gratuitous help of private clubs.

3044. You would hardly go so far as to say that the State should pay for the attendance of the child while he was playing football?—No, I do not think that.

3045. That is advocated very strongly in some quarters?—I think it would be better for the present to appeal to the generosity and loyalty of private clubs. I am only speaking of games in the public school sense. I am very strong on such games as are possible round the school itself being absolutely insisted upon by law and taught regularly.

3046. How would you distinguish between the two—you mean in the play-hour intervals?—Yes, I would have such games as are possible at the school itself, and physical exercises, included in the curriculum and made absolutely compulsory.

3047. But not such games as football or cricket, you would not include those in the category of physical exercises would you?—I do not think there is room for them, and therefore I think it is unwise to include them. One could not play football properly in the school yards.

3048. They are expressly excluded from the term "physical exercise"?—Yes.

3049. Would you be in favour of boys going out into camp being included in school attendance?—For a fortnight in the whole year?

3050. Yes; that is generally what they go for?—Yes, I should certainly. I have talked to boys who have been in camp, and I know the results are splendid, and therefore I think they are worth paying for by the State, if not too much time in the whole year is taken up.

3051. It has been actually allowed?—Yes.

3052. The attendances at the volunteer camp at Grantham are allowed?—Yes.

3053. (*Mr. Legge.*) I should like to follow up a recent question. With regard to these games of football and so on: would you object to the time expended in playing football and cricket being included in the school timetable in such circumstances as these: supposing a local club, which only uses its private ground on Saturdays and

Mr. Atkins.

Mr. Atkins. on evenings, takes a particular Board school or set of Board schools under its wing?—Yes, in the summer.

3054. Why should not these Board schools whom it invites to use its ground go in the morning at different hours throughout the week?—That is the only time they could go.

3055. Should you object to that being counted in the school time?—I did not understand that point was put. I should not object in the least to that. I should approve of that.

3056. You would therefore allow the time expended in the playing of football and cricket under proper conditions coming, just like a visit to a museum, within the school hours?—Certainly. They would work all the better when they got back. I thought the point was put to me whether the school, or let us say the State, should insist on this football going on and pay the expenses of it, and I did not think that you could have a regularised system of that kind, seeing that you are dependent upon the private clubs for the use of their ground. That is the point I thought was put to me.

3057. Then you approve of the recommendation of the Scottish Royal Commission on physical training on the enlisting of all possible voluntary help in organising?—Yes.

3058. Their recommendation amounted to this, that every educational authority in the country should have one of its sub-committees a games committee?—Yes.

3059. Now, we know there are excellent authorities like Manchester and others quite ready to take up suggestions of that sort, but then there are an immense number of lethargic public bodies in the country; do not you think it would be a good thing if the Board of Education in England and the Scotch Education Department were to issue a circular to every single educational authority in the country, calling their attention to that recommendation, and asking to be informed of their views upon it, and then in three months or so afterwards sending them another circular to ask them if they have formed some such committee or not, and actually in their annual report publish a statement as to the progress of this movement?—You mean, do I approve of that recommendation of the Scottish Commission being made thoroughly practical? Yes, undoubtedly.

3060. Being enforced by the Department so far as it can be by exerting that sort of moral suasion?—Yes. The only way they could enforce it is by giving their official support to it. I certainly should approve of that.

3061. You have told us you are anxious to see a Ministry of Health under the conditions you describe. I suppose in addition to that you would see the great advantage in our having a central bureau to collect physical statistics?—Yes.

3062. You are aware that we have an ordnance survey and a geological survey?—Yes. It would be an anthropological department.

3063. And that bureau might well co-operate with all the public departments you have named—the Home Office, the Board of Education, the Local Government Board, and so on, in co-ordinating such statistics as they could get together which would throw a light on the progress or retrogression of the country?—Yes.

3064. Or of any section of the population of the country?—Certainly, but I imagine that if there were a health department the anthropological department would be a section of that department would it not?

3065. It might be?—I mean a particular arm of its work.

3066. Are you aware of a special class of school known as the day industrial school?—No.

3067. Schools to which truant children are sent?—Oh, yes.

3068. There is a famous one in Manchester and another at Salford—schools to which truant children are committed, many of them truants because they are too miserable to attend the ordinary day school. They have their meals, and they have a curriculum which is half time schooling and half time manual occupation and training?—Yes. You have not referred to the Poor Law Schools?

3069. No?—Then I have no definite information on that subject.

3070. I have just described their curricula. They get their meals; they have half time schooling and they do half time manual occupation and training and a good deal more physical training than is given in the ordinary school?—Yes.

3071. Do you think the extension of that class of school would suit the conditions of the poorer parts of our big towns?—I think that the ratio of physical education to mental education in the majority of our elementary schools is quite wrong at present. I think there is too little physical training and too little open-air exercise.

3072. In two parts of the same town you may have the ratio quite different—in the better part of the town the children could get so much more of their physical training by the clubs outside the school, and so on?—Yes.

3073. Just like boys attending a private day school?—Yes.

3074. Whereas in the poorer parts of the town you may have to have a school where the ratio of physical training to literary training was reversed?—Yes; that would be a question for the inspectors, I suppose, to decide on its merits.

3075. (*Mr. Struthers.*) I suppose you know that games in the manner you advocate are conducted in various other towns such as Edinburgh, where there is an Association who have made an arrangement with the football clubs of the town to hold inter-school matches?—Yes.

3076. And there is a big organisation for that purpose?—Yes, I have heard of that. It is done in Manchester too at the instigation of such men as Mr. C. E. B. Russell, whom I have mentioned.

3077. I understand there is a fairly widespread organisation of that kind for elementary schools?—That I have not information upon.

3078. To the extent of bringing teams from Scotland to compete against teams of children from schools in London?—That I did not know. Where is that organisation?

3079. I do not know where it is. I think it is at Leeds, but at any rate it has the effect of bringing about an international competition?—I did not know it had gone so far as that.

3080. Now I take it that you think this kind of work, games in the sense of football and cricket, must be entirely an out-of-school arrangement?—No. I have just admitted that if one could only get the loan of the ground at certain times, say, in the morning, it would be necessary for the boys—and the girls too if they went—to go in what normally would be school hours.

3081. What I am thinking of is this—that with a school of 1,000 or 1,200 children of all age: you cannot provide games for all those children?—They would have to take it in turns. Say you have in a large town a loan of two or three or four grounds, you would have so many boys and girls going at a time in relays. The whole thing would have to be thought out. I never contemplated the whole school going at once.

3082. The average class in a school consists of thirty or forty pupils?—Yes.

3083. And there is one teacher to them?—Yes.

3084. That is rather a favourable case, because there is a larger number even in the higher classes than that. If the teacher goes with one section in the morning to play at football, what are the other children supposed to be doing? You cannot take the whole thirty or forty to play at once, therefore that is why I suggest this must be a matter of extra-school organisation?—But why could not thirty or forty go down to the ground at once? In Rugby football you have fifteen on a side, and there is thirty straight off.

3085. (*Chairman.*) And you could have twenty a side?—Yes; we used to play twenty.

3086. (*Mr. Struthers.*) Do not you think there would be a certain advantage in having persons outside the school so as not to put the whole burden upon the teachers, to have the assistance of voluntary associations who make this their special interest?—I think it might be possible for estimable people who have no particular

work to do, to be invited to organise the play. Of course the very fact that they were already connected with football, cricket and swimming clubs and so on would guarantee the fact *primâ facie* that they were more competent than the teachers in the schools for doing it.

3087. You want some further instruction for the older girls in the school for health and care of infants and so on?—Yes, I quoted the case of the lectures in Manchester. I think that plan thoroughly sound, and capable of extension.

3088. Do you think that the lectures by themselves are much use unless you have something in the nature of demonstrations, practical work, especially lectures to children of twelve to fourteen years of age?—I think the teaching would have to be very plain. If it is plain I do think it is useful. One would hardly believe what those children do not know. They do not know that air gets exhausted in a room if the windows are shut for a week. That is the kind of thing which I think they should be taught.

3089. I suppose you would approve of teaching of this kind being made obligatory in all the higher classes of schools? The subjects to be:—"The proper care of the body, the value of exercise and of pure air, the proper selection of food, the means of preventing the spread of disease, and various other matters such as might be treated in a slightly extended Ambulance course. Much of the instruction given under this head will necessarily be empirical, but it should, where possible, be referred to first principles, and the teacher should be careful to keep himself as far as possible abreast of the knowledge of the day in such matters." You think that that is a proper outline of a scheme which might be given to children from twelve and a half to fourteen years of age?—Yes, I think so in itself if the teacher put it in very simple language. I think the teachers would have to be people of tact.

3090. They would have to be ordinary teachers of the school who might be under the guidance and direction of expert visitors?—Yes.

3091. If in conjunction with that you provide for the girls of the school a household management course, which includes instruction as to the "care of rooms, furnishing, clothing, marketing, and the keeping of household accounts, cookery, laundry work, needlework, especially mending, darning, and cutting out," and with special extension of such topics from the list I have read as bear upon the health of the individual and the family, and especially with regard to the feeding of infants, do you think that that might be a useful course of instruction for the older girls?—Yes. I do not take in quite so much at once, but most of these subjects, I think, are perfectly feasible.

3092. The general idea is that from twelve and a half to fourteen, say, the girls should be freed from a great deal of their ordinary work, they should still give a little time to reading, English, and arithmetic, but the greater part of the time would be taken up with instruction which bears directly upon household management, taking care of a house, with as much practical instruction as possible?—I should not be in favour of substituting that for what you might call a literary education. I believe the great thing is to prepare the mind. It is not necessary to have what are often called "practical" lessons if the mind is made capable of thinking for itself.

3093. You would have none of this for the girls between twelve and a half and fourteen?—I do think it could be worked in with the other, but I would not agree with what I think I overheard Mrs. Close say when I first came into the room, that the present education should be dropped and that practical education, as she calls it, should be substituted. I would not be in favour of that.

3094. You attach much greater value to the literary side of education?—I do not say we have the best possible education at present. The great thing is to decide what is the best training for the mind. I think we are more on the right lines now than we should be if what Mrs. Close called "practical education" was substituted for it.

3095. Even supposing that they had nothing but the literary education up to the age I am speaking of they must leave the school at some time and must begin practical instruction?—I think that practical instruction most valuable, and I would bring it in

3096. Do not you think it would be as well to have a transition year in the school, in which the child would learn to apply its knowledge of arithmetic to practical problems, such as it would have to face when it goes out?—I think it should be taught all the time to apply arithmetic to practical results. How can it be asked in the last year to make it more practical? There should be such questions as this: if the mother bought so many pounds of meat at such a price, how much would it cost? That should be taught all the time.

3097. We have to spend time in teaching the principles of multiplication and addition and so on. That is what happens in the school. But do you or do you not think that a reasonable idea, that towards the end of the school course there should be a certain modification of the instruction which was given up to that stage, retaining certainly all the main subjects, such as English, arithmetic, geography, and history, to a certain extent, but giving more time to such subjects as cookery, laundry work, and needlework, in the case of girls?—Yes.

3098. Say a year or a year and a half?—I should be in favour of giving what you have named more prominence.

3099. On the other hand, not taking these subjects at all to that stage of the school. At present, you understand, it is taken at eleven, or earlier?—When a girl is old enough to be capable of receiving that kind of instruction and putting it to practical use.

3100. When she begins to look forward to applying it at home?—I would certainly be in favour of putting it well forward, but I understood you at first to propose that it should be substituted bodily for what we now call a literary education?

3101. No; it is a combination of both. This is only one part of the school work. The other is retaining in a minor degree the main subjects of instruction?—Yes, I should be in favour of that, but I thought we were verging on the question whether a "literary" education is good in itself or whether children should only be taught to fill what may be their station in life. I have no sympathy with the latter method at all.

3102. There is nothing of that idea in this proposal at all. Now, as regards this supply of free food and so on, several questions have been raised about it, but there is one little point I would like to put to you, which I have hinted at before: I think that the milk supplied by the Battersea people costs about 2½d. per quart?—Yes.

3103. That is less than it is supplied at by the ordinary retail merchants of the place?—Yes.

3104. I believe that the ordinary price of milk is 4d. and 5d. per quart?—Yes. I remember one company used to go round selling milk which turned out fairly good for 3d. per quart. However, that came to an end, I think.

3105. You see no objection to the increase of such agencies as you propose here, and also, in the case of free feeding at schools, from the point of view of the interests of those classes of the community who make their living by dealing in those things?—I see to a certain extent that there are conceivable hardships, but I could not accept them as a reason against these things, which seem to me essential for the well being of the whole national fibre and backbone.

3106. Might it not be possible to secure a proper supply of food by the ordinary dealer—I mean food of proper quality—by better enforcement of the Adulteration of Foods Act, and without absolutely taking it out of his hands altogether and underselling him by means of an association of this kind?—That would come under the Food and Drugs Act.

3107. Or an extension of that?—I am afraid I am not conversant enough with these Acts to know.

3108. (Chairman.) Independent of this organisation would these people get milk at all? Is it the case that it competes with the ordinary distributor of milk?—It does in this sense, that some people who would get milk in any case now get it cheaper. On the other hand, there are a great many people who now get milk for the first time.

3109. And probably the greater bulk of those who enjoy the advantages of this distribution are among the latter class?—Yes, I think so.

Mr. Atkins.

Mr. Atkins. 3110. (*Colonel Fox.*) As regards physical training of a neutral kind. When I first read that I thought you were going to deal with a class of training suitable both for boys and girls. You do not mean that?—No.

3111. The system of physical training sanctioned by the Board of Education, which is practically a neutral one, is equally suited to boys and girls?—I understand.

3112. Therefore you can imagine that this would not be of a military nature?—Not quite necessarily so. At least from the point of view of Dr. Macnamara and Mr. Yoxall the present training is too military, yet it has been given to girls and most of the female instructors have been forced to learn it.

3113. In the old model course the drill predominated, and a great deal of time was taken up with the actual military drill and perhaps the body was rather neglected. It is considered that two things are necessary. The military drill is necessary to give a certain amount of discipline to which they attach very great importance in schools; it increases discipline and makes the children act quickly, and think quickly, and has a very beneficial result. The only thing is that it should not predominate. The idea is to have one-third of the time taken up by disciplinary drill, or order movements, and the other two-thirds devoted to the development of the body?—Yes.

3114. And that, I think, is the wish of everybody. Then as regards games, I gather from the remarks you made that you are rather inclined to reduce the number of hours of mental instruction: is that so?—I do not know whether I should be in favour of reducing the total number. I believe children are at present taught too long on end. I do not think a child can bear being taught more than three-quarters of an hour on end.

3115. Have you read what Sir Edwin Chadwick stated in reference to the Factory Act?—No.

3116. He stated—and he was supported by many leading physiologists of that time—that the receptivity of the mind of the average child for direct education did not exceed three hours in the day—that was the average child up to fourteen. A growing brain would not stand more than that amount of work, and it was not only a waste of time, but it also wearied the children and did their brains harm. The physical training is carried on during the actual school hours—it is not done in the time for recreation—and am I to understand that you would like

to see more time taken out of the school time and the brain less worried by too many mental subjects?—I should like to see the number of minutes in succession which any child is taught reduced; I believe three-quarters of an hour is long enough on any subject. I am afraid I am not expert enough to know whether the total amount of teaching is too much.

3117. (*Mr. Struthers.*) Do you think more than three-quarters of an hour is given in schools?—I believe it is in many schools. At the end of every three-quarters of an hour the children ought to be turned out to some sort of play—drill, if you like—if possible, in the open air; if in the school all the windows and doors ought to be opened. Ventilation is not good in most cases. If you could get the use of grounds for football, cricket, and so on, I repeat it would be well worth using school hours for the purpose. When arrangements have been made for all the children to go it would not amount to a great deal of time off. I doubt if each child would get more than one game a week.

3118. (*Colonel Fox.*) I do not know whether you are aware of it, but in a very large number of schools, especially voluntary schools, there are no playgrounds whatever, and in those where they have playgrounds there is no room even for drill or physical training?—I know it.

3119. And the only playground they have in some of these towns like Taunton is the gutter; they have no place for any form of recreation?—Yes.

3120. Therefore, if this great League which is in prospect, initiated by Sir Lauder Brunton, is going to provide playgrounds and gymnasia in all the different towns, it will be a very great benefit, but is there any probability of this ever happening?—I believe the whole thing depends on the state of public opinion. If we could get public opinion at the back of it—such a public opinion as there was about the war, when it was felt to be a national question, a question of patriotism—we could do anything. I am sure the grounds would be lent by private clubs.

3121. I think it is the general wish that children should have games?—At present there is no great feeling on the question.

3122. I think, on the contrary, there is great feeling amongst people in general?—There is more recently. There has been a remarkable increase of feeling in the last six months. But there is not enough.

Dr. EDWARD MALINS, M.D., called; and Examined.

Dr. Malins. 3123. (*Chairman.*) You are President of the Obstetrical Society of London and Professor of Midwifery in the University of Birmingham?—Yes.

3124. You have been good enough to attend here in consequence of having been informed of certain evidence that we received the other day in which it was stated by Dr. Eichholz, on the authority of other medical men, that if people are going to have children they will have healthy children as though Nature were giving every generation a fresh start, and he went on to say that healthy births were about 90 per cent. in the poor neighbourhoods, and he suggested that we should go to the London Obstetrical Societies to ascertain how far their experience bore out this statement. What are you able to say on this point?—What I have to say at the present time is more a matter of observation and of opinion. We have not the figures at present to prove the accuracy of it, but I think the testimony of experienced observers would be in accordance with the views expressed by Dr. Eichholz, though, perhaps, not to such a large extent. I should say that from 80 to 85 per cent. of children are born physically healthy.

3125. Whatever the condition of the parents may be?—Whatever the condition of the mother may be antecedently.

3126. And you think the deterioration sets in later?—I do materially so. The weight of children at birth as far as I know—and I have weighed a great many—is generally not below the average; the average keeps up very much no matter what the physical condition of the mother may

be for the time. Since receiving this information we have instituted at the Obstetrical Society of London, in connection with Lying-in Charities and Hospitals in London, a tabulated form for ascertaining these facts—what the weight of children is at birth, their physical condition, and whether there is increase or otherwise during the time a woman is under observation. That time is not very long, not more than ten days or a fortnight generally.

3127. Will you be able to furnish us with these facts when collected?—Certainly. I will give the information later on, but I think there is a general consensus of opinion at all events irrespective of figures which I am not able to give that the average is kept up no matter what the condition of the mother may be.

3128. That proves what you say in your *précis* that Nature intends all to have a fair start?—Yes.

3129. We had evidence of a very interesting kind from a great scientific authority, Dr. Cunningham, Professor of Anatomy in the University of Edinburgh, who, touching more or less upon the same subject, said, “I have referred to the manner in which changes in the conditions of life affect the growth of an individual or class, and more especially how poverty with its squalor, its bad feeding, and its attendant ignorance as to the proper nurture of the child, lowers the physical standard of the lower classes.” Then he went on to say this to which I call your special attention:—“In spite of the marked variations which are seen in the physique of the different classes of the people of Great Britain, anthropologists believe,

with good reason, that there is a mean physical standard which is the inheritance of the people as a whole, and that no matter how far certain sections of the people may deviate from this by deterioration (produced by the causes referred to) the tendency of the race as a whole will always be to maintain the inherited mean." Is that your experience?—That is quite my view. I have not seen Dr. Cunningham's statement, but that is the view that I have long maintained and held. It is absolutely irrespective of the condition of the mother.

3130. You have noticed a great difference between the children brought up by maternal suckling and those brought up by hand?—Undoubtedly. I think that is one of the points to which teaching might be justly directed.

3131. To what do you attribute the reluctance of mothers to nurse their children, has it much to do with employment?—It differs in various classes. In the higher classes it arises from the discomfort and pain and annoyance.

3132. The tie?—Yes, the tie of doing it and the interference with social engagements.

3133. And what is the cause among the poorer classes?—That is more from the mothers having to go out to work very often and not being able to take their children with them, and from what they generally call the bother of doing it.

3134. Indifference enters largely into it?—Yes.

3135. Then you have formed some opinion as to what are the post-natal cause of deterioration; will you enumerate them?—I think, first of all, absolute indifference to the children.

3136. Do you think the system of insurance contributes at all to that?—I do. I think it materially alters the relations between parent and offspring.

3137. Would you go so far as to prohibit infant insurance up to a certain age?—No, I would not prohibit it, but I would hedge it with the most stringent regulations that could possibly be made, more particularly in reference to motive. The temptation to infant insurance is very great, particularly in times of poverty or in times of distress, and it overcomes parental instinct. The fact of a large family existing and the greater number of them starving or having insufficient food, makes them less careful about the latest offspring, I am sure.

3138. What restrictions would you suggest under which it might still be permissible?—It is difficult to say.

3139. Would you limit the sum recovered to the actual expense of burial?—Yes.

3140. So that no profit should be made?—Yes, that would be a wise precaution. I think that would have a very great influence in diminishing the number of infant insurances.

3141. If no profit could be made?—Yes, I am satisfied that that would be a good thing.

3142. Then there is another point in connection with infant deaths: do you think that our system of granting certificates of deaths is faulty? Do you think that it would be as well to make registration of the deaths of infants dependent upon an adequate medical certificate?—With regard to the deaths of infants and more particularly with regard to the deaths of still-born infants.

3143. There is no registration of them?—No.

3144. You think that should be introduced?—Yes; the registration of still-born infants, and the number of abortions.

3145. With regard to the infants who die in the first few years, do you not think it would be desirable to insist that before these deaths are registered there should be some certificate of death from a competent authority?—Undoubtedly.

3146. So that in cases of obvious parental neglect they should be traced to their source?—Yes, they are very lax at the present time.

3147. You are aware, of course, that there are a large number of deaths through over-laying?—Undoubtedly. That, I think, is very often associated with alcoholism. My own observation has shown that it more often happens on Saturday night than any other night of the week.

3148. Do you not think it might be made incumbent for parents to provide cots for their children?—Yes. The objection to that is that very often in the poorer houses there would be the want of maternal warmth to the children, which is a great necessity. The houses are not sufficiently warm, or the cot is not sufficiently comfortable, to adequately supply what is wanted for a child's growth. Therefore they are taken into bed with the mother, more as a means of keeping them warm than anything else.

3149. You have formed some opinion of the other causes of deterioration?—Yes. Women working in factories is another element in large towns. They go out to work and leave their children to the care of others, and in some towns—Birmingham, for instance—there are *crèches* in which children are taken for the day and fed and minded.

3150. We have had Dr. Scott of Glasgow, a certifying surgeon, here. Are you prepared to say that the employment of mothers in factories should be prohibited unless the local authority took upon itself to provide *crèches* of this sort?—I should not say it should be prohibited, because there are a great many industries in certain towns in which women's work is more easily obtained—more facile and cheaper.

3151. But female work need not be done by mothers. There must be plenty of young women or wives without children. It is only the mothers of young children I am referring to?—I should not prohibit them entirely from working. I do not think you should go to far as that. It is interfering with the liberty of the subject a good deal.

3152. But that has been done a good deal already. You put a high value among the causes on the want of knowledge of proper feeding?—Undoubtedly. In Birmingham alone—speaking of the town of which I know most—I have counted twenty-eight different kinds of foods.

3153. Tinned foods?—Farinaceous foods, tinned foods, biscuits, and different kinds of prepared foods.

3154. Are many of them deleterious?—Undoubtedly.

3155. All of them?—No, I would not go so far as that. Some of them are good. But it is the custom of many chemists in large towns to advertise among their wares foods for infants—"Brown's food is the best," or "Jones' food is the best," in their respective localities, the custom is to give probably recognised form of food their own name. No doubt the number is derivable from that cause, but a great deal of ignorance is exhibited in regard to the feeding of children.

3156. Do you think it might be made incumbent on the local sanitary authority to issue leaflets to all mothers dealing with these questions—simple questions touching the attendance on and the bringing up of children?—Yes, it is done very largely by different agencies, but you cannot make it a municipal matter.

3157. It would not be costly?—No. It would be advantageous if it could be carried out, but the mere distribution of leaflets to people who do not read them would not do any good.

3158. But that might be supplemented by such an organisation as the Ladies' Health Society?—Yes, its value would be increased by the lady health visitors.

3159. Have those lady health visitors any special qualification?—Yes, they are educated to a degree, and some of them have been trained nurses.

3160. There is a society called the National Health Society, which gives certificates after examination which are evidence of qualification for work of that kind?—Yes. I think certificates of all incorporated bodies, unless they have some public governmental recognition, are not of so much value. There is competition among the bodies themselves which render their certificates of less value, and the test of their knowledge has no particular standard.

3161. Some combined action on the part of the municipal authorities might establish that standard?—Yes, it would be a very wise provision.

3162. All these municipalities have a kind of joint organisation, have they not, which enables their representatives to consult and decide upon a uniform course of conduct?—Yes.

Dr. Malins.

Dr. Malins. 3163. There is the County Councillors Association, for instance?—Yes. Some kind of uniformity might be obtained.

3164. Would you attach value to that?—Yes. It would be very important to have uniformity.

3165. I suppose even doctors differ a great deal?—I am afraid they differ more than the general public with regard to the feeding of infants.

3166. That is a condition of expert knowledge, I fancy—It is more diverse?—It is very unusual indeed to see any two agree to the mode of feeding and the best kind of food to be used. In some instances the want of knowledge of doctors themselves with regard to the most elementary principles of infant feeding is lamentable.

3167. Much might be done in training the elder girls in schools for the responsibilities of domestic life?—Yes, a great deal might be done.

3168. I suppose the elder children after they leave school are employed by their mothers to tending the young ones, and their knowledge would be put to immediate application?—Yes, I take it that you mean in the ordinary domestic details of the house.

3169. Yes?—In addition to cooking.

3170. Yes, house management generally and attending to children?—Undoubtedly it would be a very great advantage, because in the majority of the houses of the poor it is the eldest girl who has perhaps more influence in bringing up the children than the mother.

3171. Yes. It is from that point of view we advocate it. In Birmingham is it difficult to bring home good milk for the consumption of the poorer classes?—No.

3172. Has the municipality done anything to assist it?—Nothing at present at all. There is a good milk supply.

3173. The health of Birmingham is good, is it not?—Yes; the death rate is low.

3174. I presume the municipality there has always been wide awake?—The Health Department, the Department of the Medical Officer of Health, is very well organised, and well arranged, and the Chairman of the Health Committee has devoted a great deal of personal attention to the subject himself.

3175. I should like to ask you one question on the general issue, from your experience in Birmingham. Birmingham is, of course, one of the great centres of population in the United Kingdom, and you have been there some years?—Yes.

3176. In the course of your experience in Birmingham would you say there was anything to warrant the belief that progressive physical deterioration existed?—Yes. I could not give you figures to that effect.

3177. You think the health of the Birmingham community is not as good as it was?—I think the general health is quite as good as it was, but there would probably be a greater number of rejections if physical examinations were made of a certain standard.

3178. There would?—Yes.

3179. Owing to the abnormal conditions of town life?—Yes. I do not think that it is worse than it was, because the Factory Acts have improved the conditions of the workers. There are a large number of factory workers; they have been very much improved in both sexes. The very large employers of labour are philanthropic men who have given a great deal of attention to the sanitary and hygienic condition of their workers—men like Cadbury, for instance, and Tangye, the great machinists, and others, so that I do not think, as a whole, the health is deteriorating, although there may be a greater number.

3180. You do not think that a large proportion of the population are permanently damaged?—No.

3181. The number is not more than it was a few years ago?—No; I do not think it is.

3182. Do you think on the whole, that the condition of things is encouraging?—Decidedly so.

3183. You think there is a greater public conscience on this question than there was?—I think the outlook for the future is very much better than it has been for

many years past—with reference more particularly to greater attention being drawn to the subject, and a greater number of agencies for facilitating and promoting the objects of health, the greater love for outdoor games, and a greater sense of the need for physical culture altogether.

3184. We had it suggested that want of fresh air was a more potent cause of degeneration than either overcrowding or bad food—they lack open air life?—With regard to that, my impression is, that there is rather a craze for open-air treatment at the present day; you are recommended to live on the roof, and so on. I do not think we have evidence that the physical condition of people who live in the open air is really stronger than others. I do not think we have evidence that farm labourers, or people who live on the land, are really physically stronger than those who exercise a certain amount of care and live in towns.

3185. Under sanitary conditions?—Yes.

3186. (*Dr. Tatham.*) You spoke just now of a decline in the general death rate in Birmingham?—Yes.

3187. Is it within your knowledge whether the mortality amongst infants is decreasing or not?—I could not say with regard to infant mortality. I do not think it is separated from the general mortality. I suppose it would be, but I have not looked at it.

3188. Do you know whether or not the mortality amongst illegitimate children is very considerably greater than amongst legitimate children?—No. I could not tell you that; I do not think it is; I could not give you any figures.

3189. If it were represented to you as a fact that the mortality amongst illegitimate children is very much greater than amongst legitimate children, it would follow that the proportion of illegitimate births in a population would control to some extent at least the mortality of infants, would it not?—As a rule I think it is accepted that the mortality of illegitimate children is greater.

3190. It is enormously greater, and, that being so, you will allow, I think, that the proportion of illegitimate births in a population would be a material factor?—Yes, undoubtedly so.

3191. Is the proportion of illegitimacy high among the Birmingham people?—No, not more than the average.

3192. For a large manufacturing town?—That is so. It is always fairly high.

3193. With regard to distributing leaflets amongst the mothers of the poorer children, you were speaking of the great difference of opinion existing amongst medical men as regards advice given as to the feeding of infants?—Yes.

3194. Do you think that could be got over by an official leaflet being circulated by the Medical Officer of Health?—Undoubtedly it could.

3195. Because he would be responsible for what he wrote, and would probably be in touch with consulting physicians, like yourself and others, who probably would be able to agree?—Yes, a great deal might be done by him. Still more might be done by calling attention to the teaching in the medical schools. It is a subject which is not taught thoroughly. It is picked up by degrees, and not taught so systematically as it should be.

3196. Do you think the system which has been spoken of here, and which obtains in Manchester—the system of lady health visitors—might be utilised to give information to the mothers?—The lady health visitors is a very good institution indeed.

3197. (*Mr. Legge.*) I believe you stated in your *précis* that a Committee of the Obstetrical Society of London has been appointed to collect statistics as to the weight and condition of infants at birth, and their progress during the time they are under observation at various lying-in hospitals or places of confinement?—Yes.

3198. Are they engaged in collecting these statistics now?—Yes; but only since I had the intimation that this inquiry was going on.

3199. Would it be possible for us to have the benefit of the results of that inquiry within the next two months or so?—Yes, up to that point, because it has already started operations.

3200. You will not wait till the conclusion before you send us some result?—No, there will be no conclusion except the number obtained.

3201. Perhaps you could give your information from time to time, as the statistics are got together?—Yes. In two months I should say I could send them to you.

3202. (*Chairman.*) Will you do that?—Yes. I will give you information from different sources. I think it is a point of very great practical value, and of much importance. It bears out the opinion I expressed at the beginning.

3203. (*Colonel Oaslow.*) You consider that the majority of children are born healthy; do you include amongst these the cases of children whose parents are very syphilitic—either or both of them—or who have mental infirmities?—Transmissible diseases?

3204. Yes. These would come out in the infant, would they not?—Many of them would come out at birth. Syphilis does not come out for a few days.

3205. I mean it would come out during the early stages?—Yes. I make allowance for that in the 15 per cent. or so. That makes 85 per cent. who are born healthy.

3206. With regard to outdoor games, we have heard a great deal about that to-day; do you think really the lower class, especially in large towns, would themselves go in for outdoor games now?—No.

3207. As much as their forbears did?—I do not think they would do so so much.

3208. They go to look at others?—Yes, and do not participate.

3209. That must be very bad?—You will find a crowd of 15,000 or 20,000 people go to see, perhaps, thirty players, and then they will go off to drink, as a rule, although it is said they go quietly back home, having enjoyed the fresh air. That is not so. In a town like Birmingham they will give up their work on Wednesday afternoon to witness a football match. However great the pressure of work in a particular factory may be, I am told nothing would induce them to remain at work if they want to see a football match.

3210. Regarding the prevention of mothers from working in factories, in the case of widows who have to support their whole family, for instance, a woman might have lost her husband just before her child was born—you would make an exception in their case?—Yes.

3211. Who would take charge of the children—the public?—Yes, I think that child ought to be kept. Then it falls under the care of the parochial authorities.

3212. What do you say with regard to the pauperising of women?—I do not think they should be pauperised in circumstances of misfortune like that. At the same time the parochial authorities are the proper people to take charge of the child unless there is a voluntary agency, which is most places there is not.

3213. (*Mr. Struthers.*) You spoke of a plentiful milk supply in Birmingham?—Yes.

3214. Even in the poorer quarters?—Yes.

3215. Does that come from the surrounding district?—Yes, within 15 or 16 miles.

3216. Do you happen to know whether the dairies from which it comes are in any degree under the supervision of the medical officer of Birmingham?—Yes. The milk shops where it is sold are directly under the supervision of the health officer.

3217. Do you know if he has any sort of power whatever with regard to the farms where the milk comes from?—None, except that the farmer gives a guarantee to the purchaser of the milk. It is brought in in cans, and a certificate of its purity is given.

3218. Have there been any epidemics of typhoid fever traceable to milk?—Not within recent years in Birmingham.

3219. Do you know if there is much prosecution on account of the adulteration of the milk?—Only occasionally. It is generally found that the milk supply is good.

3220. You would not infer from what you know about the milk supply in Birmingham that the dairies from which it comes are in a state of perpetual filth and insanitation?—I know the surrounding district and I should hardly believe such a statement.

3221. It would rather surprise you, would it not?—Yes, it would surprise me very much.

3222. As regards the difference of opinion among medical men as to the proper feeding of infants, of course it is of no use sending round leaflets to other people until the proper method of procedure has been settled?—I think it would be, because the health officer would be able to formulate systematic rules which would be very few and very simple because the principles are very few and the ignorance is very great with regard to it.

3223. That is to say, in spite of the difference of medical opinion you have spoken of, there is a substantial amount of agreement as to certain things?—Yes.

3224. Which ought to be brought home?—Yes. The right principles are very few in number and might be very easily condensed into a few simple rules.

3225. Such a thing as milk ought not to be replaced by any substitute if it can possibly be avoided?—That is so. The milk alone should be used and not the artificial foods, which are an unknown quantity and which are of unknown composition.

3226. I gather that some of these foods are satisfactory?—Some of them are satisfactory, and foods that are sold under certain proprietary names such as Mellin's food or Benger's food; they are good foods. What I alluded to was the foods made by chemists on their own initiative.

3227. But there are many others which are not satisfactory?—Many others.

3228. Now is there no means of stopping the sale of these foods? Suppose a food is sold as an infant's food which is known by medical men not to be a satisfactory food and one which will do the infants harm, is there no means of stopping its sale?—None. Under the Food and Drugs Act I do not think you can do so because it would contain certain things which would be advantageous—the necessary elements of food. The starchy materials which would be disadvantageous could not be said to be deleterious or poisonous because it was sold as an infant's food and represented to be an infant's food. All you could say would be that it was not suitable as food. You could hardly make it penal.

3229. It would not come under the Adulteration Act?—No. The chemist would say that he advertised it as an infants food.

3230. If it were proved that it was a food that was not suitable for infants?—There the question of standard comes in. You want some uniform standard as to what are the right proportions.

3231. Would not that rather point to the fact that it would be useful to have a Committee appointed by the medical societies to go into it thoroughly?—I do not think the medical societies would take the responsibility of making the standard or even the Education Department. It would have to be a sub-section or an addendum of some kind to the Food and Drugs Act, I think.

3232. I am suggesting a Committee of research by people to go into the matter thoroughly?—A small committee as to the standard and uniformity of food supplies for children would be very valuable.

3233. What do you think would be the proper body now to appoint such a Committee—perhaps several bodies might be asked to take part?—Yes, I should think the Medical Society of London and the Chemical Society would be the two bodies from which the greatest amount of scientific knowledge could be derived.

3234. And, of course, it is scientific knowledge which is wanted, is it not?—Yes, that is the basis for determining the kinds of food to be used. The Medical Society would be essentially practical; the Chemical Society would give the scientific composition of food.

Dr. Malins.

Dr. Malins. 3235-6. (*Chairman.*) There is one question with regard to milk supply. You are aware, probably, that by the Contagious Diseases (Animals) Act, 1875, the Local Government Board is empowered to make orders for the registration of "cowkeepers, dairymen, etc., the inspection of cattle in dairies, and prescribing and regulating the lighting, ventilation, cleaning, drainage, and water supply of dairies and cowsheds, etc., and securing the cleanliness of milk-stores, milk shops, and vessels, etc." Are you aware whether the medical officer in Birmingham ascertains whether those powers are in force in the rural districts from which Birmingham draws its milk supply? Does he take that precaution to see that the dairies from which Birmingham gets its supply of milk are protected by such powers, the exercise of which the law places in the hands of the authorities?—I am not aware that it is done systematically.

3237. Do not you think it would be a good thing if the local sanitary authority did satisfy itself that the milk supply of big towns came from a district where such precautions were taken?—Yes. At present all that is done is to test the milk occasionally to see that it is right.

3238. That only discovers obvious facts?—Yes, certain obvious facts such as dilution. I think it would be

advantageous to put those powers into force systematically.

3239. They may be enforced, and it would be as well to find whether they are or not, before the town is satisfied that its milk supply is good or not?—Yes, it would.

3240. Have you observed the effects of alcoholism in parents upon young children?—Not physically, not their physical development. It must tell hereditarily, of course.

3241. It produces neurasthenia?—Yes, undoubtedly, and degeneration of all kinds.

3242. Have you any of these lady health visitors in Birmingham?—Yes, there are six of them.

3243. Are they organised in connection with the municipality?—Yes, undoubtedly. They are appointed and paid by them under the direction of the Health Committee.

3244. And do you enlist voluntary labour?—No, there is no voluntary labour in that.

3245. That, of course, is done very largely in Manchester?—Yes.

3246. They are virtually sanitary inspectors?—Yes.

SEVENTH DAY.

Monday, 1st February, 1904

PRESENT,

[*Mr. ALMERIC W. FITZ ROY* (*in the Chair.*)

Colonel G. M. FOX.
Mr. J. G. LEGGE.
Mr. H. M. LINDSELL.

Colonel GEORGE T. ONSLOW.
Mr. JOHN STRUTHERS.
Dr. J. F. W. TATHAM.

Mr. ERNEST H. POOLEY (*Secretary.*)

Mr. J. GRAY, called; and Examined.

Mr. Gray. 3247. (*Chairman.*) You are a Member of the Council and Treasurer of the Anthropological Institute and Secretary of the Anthropometric Committee of the British Association for the investigation into the physique of the population?—Yes.

3248. And you have given a good deal of time to it from a sheer love of the subject?—Yes, for the last eight or nine years I have been engaged along with Mr. Tocher in carrying out anthropometric work in Scotland, and we have made some of the largest surveys which have been made in the British Isles.

3249. You are a member of the Civil Service, I believe?—Yes, I am on the technical staff of the Patent Office.

3250. You have something to say upon the constancy of physical dimensions under normal conditions, have you not?—Yes. The whole value of anthropometric statistics as a test of physical deterioration depends upon that. I may mention one or two cases which are accepted amongst anthropologists as evidence that those dimensions are practically constant for ages when there are no disturbing influences. I have mentioned in my memorandum the case of the Egyptians. The statistical investigations of Miss Fawcett have shown that the

predynastic race discovered by Professor Flinders Petrie in Egypt are of the same race as the Copts or modern Egyptians. Comparison shows that the change in the average dimensions of the head which has taken place among the Egyptians, in an interval estimated at 8,000 years, amounts to a decrease of only $3\frac{1}{2}$ per cent. in the length, and an increase of only $1\frac{1}{2}$ per cent. in the breadth. A similar comparison of the neolithic people of Sweden with the modern population shows a decrease of $\frac{1}{2}$ per cent. in the length, and an increase of 3 per cent. in the breadth. The interval in this case is about 4,000 years. Knowing from this and other evidence the constancy of average physical dimensions for very long periods of time, if we find a very great decrease of dimensions in any population in a comparatively short time, we naturally infer that some abnormal force is at work which is bringing about this change in the dimensions.

3251. You have considered what you conceive to be the causes of physical deterioration?—Yes.

3252. I will not trouble you to tell us about the first matter which you have mentioned, because it does not touch our subject, namely, the admixture with inferior races?—I should like to say a little about that because it appears to me to have an important bearing on the deterioration of the national physique.

3253. There is not much admixture is there?—In certain places there is;

3254. (*Mr. Lindsell.*) You mean those people coming into this country?—Yes, the influence on the population of the immigration of degenerate aliens.

3255. What do you mean by the bearing of the law of averages on this question?—I simply meant that the adding to the population of a certain number of degenerates would reduce the average dimensions of the population. That, of course, is an arithmetical axiom.

3256. You have not got that at great length have you in your memorandum?—No.

3257. (*Chairman.*) You have the memorandum on this subject before you, have you not?—Well, I have slightly modified it by adding some more evidence. It is self-evident, as I have already said, that admixture of an inferior race with a superior race, even without intermarriage, will reduce the average national physique, but as long as the inferior race remains isolated the evil can always be remedied in the last resort by the expulsion of the degenerate aliens. If, however, the inferior race intermarries to any considerable extent with the native population, this remedy can no longer be applied, and the high position which the superior race has won by ages of progressive evolution, may, in a few generations, be hopelessly lost. The history of Poland is an awful example of national ruin brought about by the unrestricted immigration of degenerate aliens. About 600 years ago the Jews were invited to settle in Poland at a time when they were cruelly persecuted in every other country in Europe. At that date the Poles had the high average stature which the other races of Northern Europe still possess. Poland now contains the largest percentage of Jews and the lowest average stature in Northern Europe.

3258. That may be the case with regard to emigration into Poland, but we have been told here that the Jewish children are to be found among the best types of children the country can produce in the urban districts?—They may be more intelligent.

3259. Yes, and physically they are very much superior to the average British boys. What you say may be true of Poland and scores of countries, but to my mind it has no application to the conditions in this country?—The enquiry of Mr. Jacobs among the Jews in the East End of London leads to a different conclusion, namely, that these Jews are three inches shorter than the average Englishman.

3260. (*Colonel Onslow.*) They are shorter in stature, but are they of less bulk?—You mean less in weight?

3261. And chest measurement, are they worse nourished?—The chest measurement of the Jews is very much less, it is very small.

3262. But that does not coincide with the evidence that we have had?—That may be.

3263. (*Mr. Struthers.*) That coincides with one's observation in walking down Whitechapel, namely, that the Jews are undersized?—Mr. Jacobs has made a most thorough investigation of the Jewish race, and he has published a paper on the subject which he read before the Anthropological Institute.

3264. (*Chairman.*) Will you continue on that point?—With reference to the recent proposal of the Government to exclude the degenerate aliens I have suggested here that it is not sufficient to ask for a passport of good character, but that an anthropometric test should be also made.

3265-6. As a condition precedent to admission to this country?—Yes; one has to consider the physique of the nation. You may have a good character with a degenerate physique, and the good character would not lessen the physical injury done to the population of the country.

3267. What do you conceive to be the second cause of degeneracy?—Unhealthy environment, which consists of a great many different elements—deficient nutriment and want of fresh air, and disease, and several influences generally associated with town life. It is a point that has been proved and accepted by anthropologists that deficiency in nutriment and other miserable conditions of life lead to decided reduction of stature at least. No investigations, as far as I know, have been made on the influence of unhealthy environment on other dimensions, but there

is little doubt that the stature is very much reduced. At Limousin, in France, the population has a stature of 3 inches less than the surrounding people, and yet it has been proved that it is entirely due to the environment, because the children of races living in this district, when brought up in more healthy regions, recovered their original stature, namely, that of the surrounding population. The influence of nutriment on growth is also shown by the difference in stature of Jews living in the East End and in the West End of London. The wealthy Jews of the West End are found to be 3 inches taller than the poor Jews in the East End. The loss in stature is recovered under the influence of healthy surroundings. A third cause of deterioration is the unequal rate of increase of the superior as compared with inferior classes. Anything which decreases the difference between the birth-rate and the death-rate among the superior classes, and increases this difference among the lower classes tends to produce a progressive deterioration of the average national physique. The tendency of the population in modern industrial communities to concentrate itself in large towns and the increase of wealth appear to have the effect of reducing the birth-rate of the superior classes and of decreasing the death-rate of the inferior classes. It has been established by taking a census of the size of the families of the professional classes in the United States of America, that there has been a great decrease in the size of their families within recent times, and that these intellectual classes are now barely reproducing their numbers, and the same tendency is no doubt at work in this country.

3268-9. You are not following this memorandum of yours?—Not quite.

3270. Do you think it is necessary to amplify much what you have said here?—Not with respect to that point.

3271. This might go into the evidence just as it is?—Yes, it is not materially different. I have merely added one or two illustrations of the arguments.

3272-3. You can add that in the proof?—I mention the effect of the Franco-German War in reducing the physique of the generation born during the war. It was found that a much larger percentage of the conscripts who came up twenty-one years after the war had to be rejected. That was explained by the assumption that the most vigorous men had gone to the front and that the parents of the degenerate conscripts of 1891, were the men who were rejected in 1870 for defective physical deterioration.

3274. Something the same as in the Napoleonic wars in the third and fourth decades of last century, I suppose?—Yes. These examples illustrate the danger which results from a reduction in the numbers of the superior classes in a community.

3275. Can you tell us the effects of emigration on this point?—It has been found in Ireland by comparing statistics of emigration and statistics of insanity, that emigration is closely associated with the percentage of insanity in the population. As the emigration increases the percentage of insanity increases, and if the emigration diminishes the percentage of insanity also diminishes, showing that one is affected by the other.

3276. Is that owing to the intermarriage of the inferior classes left behind?—Yes. That appears at least to be the most obvious explanation, but even though the intermediate train of cause and effect is in reality more complex, there can, I think, be no doubt after analysing the statistics that emigration is one of the primary causes of insanity.

3277. Now to come to the kind of statistics to prove the existence or non-existence of physical deterioration, what have you got to say?—If the population was of uniform type throughout the whole country it would be sufficient for statistical purposes to measure a fairly large sample, say, 2,000 to 3,000, taken anywhere, in order to determine the average dimensions with sufficient precision. But the population of the British Islands is by no means of this uniform type. For instance, according to the British Association Report, 1883, average statures in Great Britain vary from 70·14 inches in the border counties of Scotland to 66·27 inches in Herts and Middlesex. Here we have a difference of about 4 inches; and a still greater difference might be found by selecting smaller districts. Evidently in making

Mr. Gray.

Mr. Gray.

a comparison between the dimensions of the population at different dates we must take our samples from districts so small that there is no sensible variation in the type of people to be found within its boundaries. The British Association (1883) Report also shows that there is a considerable difference in the average dimensions of the different classes of the population. The average stature, for example, of boys between the ages of eleven and twelve, at public schools, is 54.93 inches, while of boys of the same age at industrial schools it is only 50.02 inches. There is thus a difference of about 5 inches in the average stature of boys belonging to the two extreme classes measured. The difference in the stature of the two extreme classes of adults is not quite so great, being only $3\frac{1}{2}$ inches, but even this is a very considerable difference. The bearing of these facts upon the taking of samples at different dates for comparison is evident. The two samples to be compared must be taken from a district of sufficiently limited area, and must either contain the true percentage of all the different classes in the community, or separate samples should be measured from each class.

3278. Do you say "the same percentage"?—I say that from the Census report one would ascertain the percentage of the different classes, and in this way make a true sample of the population. The rules to be followed, in collecting statistics capable of proving the existence or non-existence of physical deterioration may be stated approximately as follows. I have somewhat altered the memorandum. The whole country should be divided into 400 districts with a population of about 100,000 each. In thinly populated rural districts a smaller unit of population may be taken, while in large towns a larger unit may be taken. The object is to choose a district so that the population throughout the whole district is practically homogeneous. Samples of not less than 2,000 (1,000 of each sex) of each homogeneous unit of the population should be measured. In the case of children comparisons can only be made between children of the same age. The classes to which the parents belong should be noted. The measurements of each district should be repeated at intervals of ten years.

3279. Do you think it necessary to go over the whole country?—Yes, but not at the same time. It may be spread over the ten years so that the staff of the survey will be continuously employed. There is no necessity to measure the whole country simultaneously. There might be some advantage in it, but it would be enormously expensive, and one could get the same result practically by measuring forty districts per annum, and measuring them again after an interval of ten years. Assuming that any change is progressive, one can ascertain the amount of deterioration that would happen at any year between the two periods, so that one could make up the state of the whole country at any particular date, simply by calculating the condition of the district from what we know of its condition at the two dates, ten years apart. There would be very little doubt about it. The other method would be very much more expensive. It can be shown by statistical theory that in comparing the average stature of two groups of 1,000 persons each, no difference less than $\frac{1}{4}$ inch is significant of a real change of stature, and as it may be desirable to detect a change of that amount, in ten years a sample of at least 2,000, (1,000 of each sex) should be measured.

3280. I should like to hear you explain briefly what the British Association Committee did?—Yes. Between 1878 and 1883, a Committee of the British Association collected statistics of stature and weight of 53,000 persons of all ages and both sexes, 8,585 of which were adult males. The distribution of the adult males was as follows: England 6,194; Scotland 1,304; Wales, 741; Ireland, 346. The adult material was classified independently (1) according to classes, and (2) according to counties or groups of counties. But in no case is it possible to ascertain both the class and the locality of a given group, a condition which is essential to making a comparison with measurements taken at a later date.

3281. Will you mention any cases in which comparisons can be made between the 1883 measurements of the British Association and measurements made at a later date?—There are only three cases in which more or less legitimate comparisons can be made. The first case relates to the population of the N.E. counties of Scotland. In the 1883 Report the average stature is given as 68.04 inches; in 1895-97 measurements made

by Mr. Tocher and myself in Aberdeenshire gave an average stature of 68.02. There is evidently no significant difference between these two averages, and we may say that there has been no change in the average stature of the people in this district, provided the same classes were measured on both occasions, which, however, is not quite certain. The second case relates to the boys at Marlborough College. Measurements have been made of the stature of these boys since 1874. The British Association Report gives the average stature in the period 1874-78 of these boys between the ages of 14 and 15 as 61.4 inches. From figures kindly supplied to me by Mr. Meyrick I find that the average stature in the period 1899-1902 was 61.96 inches. This means an increase of .56 inches, and since this difference would occur only three times out of a 1,000 among pairs of samples drawn from homogeneous material, we are justified in saying that there has been a small increase of stature among the professional and upper middle classes from which the Marlborough College boys are drawn. The third case relates to the population of the west of Ireland. The British Association Report gives the average of a sample taken from Connaught as 68.72 inches; and recent measurements made by Cunningham, Haddon and Browne give an average stature of 67.41 inches among certain groups of people on the west coast of Ireland. Statistical analysis shows that this difference means a real deterioration of stature, but there is strong reason for suspecting that the same class of people was not measured on both occasions, and for this reason deterioration cannot be said to be proved with anything like certainty.

3282. There is a list of measurements in your memorandum we will put into the appendix without troubling to go through that. But what do you consider the effect of the measurements of Dr. Hay and Dr. Mackenzie, because they are the most recent, and they were taken in connection with the Scottish Physical Education Commission?—The measurements of Hay and Mackenzie are of great value in showing the effect of insufficient nutriment and insanitary dwellings upon the stature of the child?

3283. They have only examined 600?—Six hundred in Edinburgh and 600 in Aberdeen.

3284. Is that enough on which to base any accurate conclusions?—It was enough to show a real difference of stature, because the difference between the Edinburgh and Aberdeen children was considerable.

3285. Will you tell us what you have to say about that matter?—The average stature of the Edinburgh child between the ages of 12 and 15 was found to be two inches less than the corresponding Aberdeen child. Statistical analysis shows that this means a real inferiority in the stature of the Edinburgh children measured. The Report shows that the environment was much more favourable in Aberdeen and makes it probable that this had something to do with the difference.

3286. There was no racial difference to account for that?—Not as far as we know. The head measurements are the same. But that is a presumption; it is not necessarily the same race with the same head measurements.

3287. But what is known anthropologically of the Lothians and Aberdeen; would you say that they were identical in race?—They are not identical. We know very little about it, but so far as we know they have different dimensions.

3288. Are the Lothians the larger or the smaller race?—The Lothians, according to Beddoe, have a higher stature than Aberdeenshire.

3289. And that implies a greater deterioration than the bare fact would seem to show?—Yes, it would, if all the children measured in Edinburgh were really Lothian children. But I have been informed that a considerable number of the children in the Edinburgh slums are Irish children, and the stature of these children might be less than that of the natives. The published statistics do not enable us to calculate exactly what difference between the Aberdeen and Edinburgh samples measured, would be significant of a real difference, because the deviation from the average is not given. But I have assumed that the deviation is the same as in similar groups of children in other schools, and on this assumption it appears that the children in those Edinburgh schools are certainly of lower stature than the children of the same age in Aberdeen.

3290. Certainly that seems to be so?—But I mean that these differences might be due to sampling. It would not necessarily follow that they were really of less stature except where the difference exceeded a certain amount.

3291. Did they take large enough samples, do you think?—Yes.

3292. And was the basis of their system of selection intelligent enough to avoid error on that account?—I think it was.

3293. We shall have Dr. Mackenzie here to give evidence. Now will you go on with your memorandum?—Some of the other conclusions on the Report on Physical Training are not, I think, justified by the statistics. For instance, it is said that they prove that the west end schools of Edinburgh showed superior physique to the east end, but the statistics given are not sufficient to prove that point. The numbers measured were far too small, and the difference found might have occurred between two samples taken from a uniform material. I do not say that the conclusions are not right, but the statistics do not prove that they are right.

3294. The statistics are not sufficient to prove the point you think?—Quite so, and I think that in several other cases where the conclusions on strict examination are found not to be proved by the statistics. It is only in this one case of the difference of stature between Aberdeen and Edinburgh children that I find the conclusion is justified by statistical analysis. Taking into consideration the whole of the available statistics, the only more or less legitimate conclusions we can come to on physical deterioration in the British Isles are: The physique of the population of the slums of large towns like Edinburgh has deteriorated; the physique of rural population of the N.E. counties of Scotland has not changed within the last 20 years; the physique of the professional and upper middle classes in England has improved within the last 25 years; the physique of the population of the west of Ireland has deteriorated.

3295. I thought there was a different conclusion to that?—No.

3296. But there is no guarantee in this case that the racial type of that part of Ireland was the same in both cases?—That is quite right.

3297. That is what you assume?—I take it from the statistical point of view. I go on to explain that the material might not be the same and that of course weakens the conclusion.

3298. Besides, the number was very small, so that the 200 adult males given there would not help us?—That is also an objection.

3299. We should like to hear your general conclusions before we go any further?—The only possible way, in my opinion, of determining the existence or non-existence of deterioration of the national physique is by the establishment of a permanent Anthropometric Bureau to carry out continuously an anthropometric survey of the whole population on the lines which I have already indicated. Then I come to a general discussion of this scheme. May I go on?

3300. Yes, please?—It is not quite the same as you have before you. I have, in some details, altered the scheme I submitted in my original memorandum.

3301. This scheme which you have here is the same as explained by Dr. Cunningham, is it not?—Yes, practically the same. I have made some slight alterations in the statistics. According to this scheme the United Kingdom would be divided into 400 districts each containing on an average 100,000 persons. The school children between five and eighteen years number about a quarter of the whole population. There would thus be in each district 5,000 infants under school age, 70,000 adults over eighteen years, and 25,000 school children. As I have already explained, it is necessary for statistical reasons to measure a sample of about 2,000 (1,000 of each sex) in each homogeneous group. This requires that samples of the children be taken from age groups extending over one year. As there are thirteen groups in the school period the average size of the sample in each age group will be just under 2,000. It is necessary, therefore, to measure the whole of the school children in each district in order to get sufficient samples for every age group of one year. The infants under school age may

be left out of account in this estimate, as they would be rather difficult to get at. It would be possible to get the parents, in many cases, to carry out measurements of this class. With reference to the adults it will be sufficient to measure a sample of 2,000, that is 1,000 of each sex in each district. To sum up, it will be necessary to measure every ten years, in each district, 25,000 school children and 2,000 adults. As there are 400 districts to be measured in the course of ten years, the total number of the population to be measured in that period will be 10,000,000 school children and 800,000 adults. The number to be measured per annum will be 1,000,000 school children and 80,000 adults. That is to say one-tenth will be measured every year. Each surveyor or measurer could, I believe, when thoroughly expert measure about 180 school children per day. The number measured will, of course, depend on the number of characteristics to be noted. I have assumed that length breadth and height of head, chest, stature, and weight are measured. The two latter dimensions could be taken by the teacher who would also do the recording. With this arrangement from thirty to forty children could, I think, be measured per hour, judging from my own experience. That would mean 180 scholars measured per day and would amount in a year of 250 working days to 45,000 measured per annum. Since it is necessary to measure 1,000,000 scholars per annum this would mean that twenty-two surveyors would be required to measure the school children. As adults would be more difficult to get at probably not more than fifty could be measured per day; this amounts in a year of 250 working days to 12,500. Since 80,000 adults have to be measured per annum this would imply that seven surveyors will be required to measure the adults. We may estimate, therefore, that approximately thirty surveyors will be required to measure sufficient samples of the whole population. In my former estimate, I came to the conclusion that only twenty surveyors would be required, but in that estimate I assumed that only three head dimensions and stature would be measured. Professor Cunningham thinks it desirable that more measurements and certain observations on eyesight, etc., should be made. I quite agree with him that the results obtained by these additional measurements would be of the greatest value and they could easily be made by a small addition to the number of surveyors. The employment of school teachers, medical men, factory inspectors, or the like to make measurements, instead of a permanent staff of surveyors has been suggested. Since I sent in my first memorandum I have changed my opinion upon this subject. I have made an approximate calculation of the comparative cost of these two methods of carrying out the survey, and I find that the employment of a large body of teachers or government officials to carry out the survey as an addition to their present duties would cost several thousand pounds per annum more than a permanent staff of surveyors. The following considerations will explain this point:—1. The number of teachers, etc., employed would be at least 100 times greater than the number of a permanent staff. 2. This implies a great additional cost for instruments (about ten times as much). 3. The cost of training so large a number of teachers will be very great as they will have to be brought to London, Edinburgh and Dublin, and kept for several days till they are trained. 4. The most serious objection, however, is that the measurements could never be so accurate and uniform as those made by a small permanent staff continually employed at measurement and constantly checked by the instructors.

3302. If you simplify the measurement so far as the children are concerned, could not outsiders be taught to do it without much trouble?—If one includes head measurement it would be difficult for outsiders, but, stature and weight could be done by them.

3303. (Colonel Fox.) The chest measurement would be the most difficult, would it not?—Yes. I imagine that the chest measurement would be most difficult. The difficulty is to get the children to inhale and exhale to the full extent.

3304. Do you think it would be easy to train outsiders to take the head?—I have trained a number of persons to measure the head and I find that it takes several hours before I get them to make a correct measurement. It looks a small matter, but it requires some skill. I should not rely upon the teacher. It takes two or three hours for people of intelligence, and in many cases a great deal longer.

Mr. Gray.

Mr. Gray.

3305. How is the head measured ?—We do it with the callipers. We do not measure the circumference but the length from the glabella to the extreme point at the back of the head, and the maximum width.

3306. You get the maximum diameter ?—Yes, in both cases, and they can be measured very exactly—within a millimeter with practice. But those who are not skilled might vary three millimeters. It has been found in the case of warders who measured criminals for the police that the average variation was three millimeters, although these people were instructed.

3307. I conclude that they would go on until they ascertained the maximum measurement ?—Yes. You put the callipers down so (*indicating*).

3308. (*Chairman.*) Do you remove the hair in the case of those with thick hair ?—In the case of boys the points of the callipers go through the hair, so that the thickness of the hair makes practically no difference. But in the case of the girls where the hair is tied up, it would have to be let down.

3309. (*Colonel Fox.*) In measuring the chest, do you use callipers ?—No, only the tape.

3310. In Sweden they use the callipers measuring from the sternum breast to the spine. This is done because they find that it does not bring in the muscle ?—Yes.

3311. It is more easy in the case of a child than a man ?—Mr. Maybrick, of Marlborough College, condemns the chest measurement on account of the difficulty of getting the exact measurements.

3312. (*Chairman.*) Why do you propose to include those measurements ?—Well, Professor Cunningham thinks that it is very important, as it shows vital capacity I am giving these more in deference to his opinion than from the anatomical point of view.

3313. (*Colonel Fox.*) As to the weight, would not you make a note as to the condition of the teeth, hair and eyesight ? You would notice very much vitality in those, would you not ?—That would be all useful. But then the scheme becomes so expensive ; one must restrict oneself to the most essential things. But a good many of those things may be noted without much extra time being taken up.

3314. Dr. Kerr puts down those things in the enquiry into London School Board children ?—Yes ; but if you go far in that direction you would have to employ a medical expert.

3315. But you are suggesting that ?—No.

3316. Not for those annual measurements ?—No, not the employment of medical men, but simply men trained to measure. That would be much simpler than a medical examination. I think it most essential to employ permanent surveyors, because where they are only trained as a teacher would be, for instance, to measure a school once in ten years, the measurement would not be so efficient.

3317. Would it not be necessary in drawing up those statistics to confine yourself to the same district and the same class of children ; otherwise you might bring in race. —That is what I propose, that the country should be divided into four hundred districts, and to measure each district, and at the end of the ten years you compare the same districts ; if there was a great difference in one district there must be some cause for the difference. Besides, continual practice in measurements increases the accuracy, and also increases the rapidity in taking the measurements. I know from experience from continued practice in measuring that you can measure two or three as fast as another person who has not had experience, so that that would be a matter of economy. Of course a few teachers and inspectors, who showed interest and aptitude, could be taught by permanent surveyors who visited the schools, and these teachers could make measurements more frequently, perhaps once a year in the same schools. That would not involve the bringing up of the teachers to a centre to be trained.

3318. (*Chairman.*) This seems to be very good, but it does not deviate from what you said in starting ?—Well, at first I thought it would be a good plan to employ teachers to measure the school children but I found on going into the figures further that it would be much more expensive.

3319-20. And that is why you have modified it ?—Yes.

3321. Well, will you proceed with your remarks ?—I was going to read this memorandum on the constitution of the staff, which is practically the same as I have already submitted to you.

3322. Well, will you kindly let us know how that should be constituted ?—The staff should consist, in the first place, of a Consultative Committee consisting of three leading anatomists, who have devoted special attention to anthropometry, one residing in England, one in Scotland, and one in Ireland ; the appointments to be honorary, without salary. The director to be an official with experience in organising and carrying out anthropometric surveys, with a special knowledge of the latest methods of dealing, with anthropometric statistics. He should also have administrative ability sufficient for the management of the permanent staff. His duties will be to determine, in consultation with the Consultative Committee, what dimensions are to be measured, and also the general scheme of the survey. When this has been determined, it will be his duty to organise and carry out the survey, by giving the necessary instructions to the heads of the surveying and statistical departments. The deputy director should be an anatomist with special knowledge of anthropometry. His duties will be to superintend the chief surveyor with respect to measurements, and also to see that the instructors give uniform instruction as regards dimensions measured, and methods of measurement. In the absence of the director, the deputy director will take his place and perform his duties. I have here an estimate of cost of an anthropometrical survey of the United Kingdom carried out wholly by a permanent staff. The chief surveyor will superintend the surveyors. He must be a person with tact and experience in carrying out surveys in the field. He will assign to each surveyor the district where he will measure, and he will, by frequent visits to the surveyors, ascertain that the work is being efficiently and accurately carried out. He will also carry on negotiations necessary to obtain consent to measure. The superintendent of the statistical department must be a person acquainted with the latest methods of statistical analysis as applied to anthropometry. His duty will be to superintend the statistical computers, to instruct them what calculations they are to carry out in order to calculate the necessary statistical constants. He will have to see that maps are made to show the geographical distribution of physical characteristics and also curves, etc., to show the distribution of characteristics in each district. Also to determine at intervals of ten years whether there has been any change in the physique in any district, and work out correlations with circumstances which might influence physique to determine causes of change. The instructors must be acquainted with the methods of anthropometry. They should preferably be assistants to professors of anatomy in London, Edinburgh and Dublin in medical schools having anthropometrical laboratories attached—the instructors in London would use the national laboratory. Their duties would be to instruct the surveyors. They would receive a fee for each surveyor they instructed. If teachers were employed to make measurements, the instructors would be so fully occupied in training the teachers, that it would be necessary to pay them a salary.

3323. You do not suggest that now ?—No, I say they might be paid a fee, as there are only thirty surveyors ;

3324. It would not take long if you gave us that part of your memorandum ?—No. The surveyors must be accurate and reliable manipulators capable of being taught by the instructors to make the necessary anthropometric measurements. Their duties will be to go to districts as directed by the chief surveyor, and to carry out measurements as he directs. About one half of the surveyors should be ladies to measure school girls and female adults. The statistical computers will have to be accurate and reliable arithmeticians, preferably with some knowledge of the mathematics of statistics.

3325-8. Have you formed any estimate as to the cost of this ?—Yes, I have drawn up a scheme on the same lines as the Geological Survey.

3329. What was the total ?—The total amount of salaries would be a minimum of £11,000 and a maximum of £14,000. The amount for the Geological Survey is at present about £20,000. That is a rough estimate.

3330. What salary would you suggest the surveyors should receive ?—I have suggested the surveyors should receive from £200 to £300. I assume the salary would

be the same as for factory inspectors of the third class. But of course that is approximate. One can get men without very much education who are skilful.

3331. You would employ a man locally?—Well, as they do in the Geological Survey; they would be sent out to the district until they had completed the measurements, and there would be very little in the way of travelling expenses because they would go round their districts in ten years, and the travelling expenses would not be much.

3332. And your director and deputy director, what should they be paid?—Director, £850 to £1,000; deputy director, £750 to £850; chief surveyor, £600 to £700; superintendent of statistical department, £500 to £600; three instructors in anthropometry (one in London, one in Edinburgh and one in Dublin), fees; twenty surveyors (twelve male, eight female), each £200 to £300; twenty statistical computers, £200 to £300; record keeper, £150 to £200; correspondence clerk, £150 to £200; typist, £75 to £100; and messenger, £75. Total amount of salaries: minimum £11,340; maximum £14,975. I also estimated the cost of the sets of instruments.

3333. And you think that 200 sets of instruments is the number that would be required?—Of course, if you have thirty surveyors you would only require thirty sets; if you employ teachers you want ten times as many.

3334. And a set of instruments would cost each £8—that is £240. There is not much wear and tear of instruments, is there?—No. They would last ten or twenty years. The set includes samples of hair colours and eye colours. These are necessary to note pigmentation in order to determine what races the people belong to.

3335. Have you anything more to suggest?—In connection with the advantages from the survey, do you mean?

3336. We should like to know what results favourable to public health would follow?—There are one or two. Our position among civilised nations in peace and war depends on the maintenance of a high average physique. The greatest mental endowments have been shown to be associated with the classes having the highest average physique. The statistics collected by an anthropometric bureau would supply exact knowledge of the physique of the whole population. If deterioration was taking place in any section of the population it would be immediately detected; the cause of the deterioration could be investigated and in many cases removed. Where the Government could not remedy the evil, public opinion would be influenced with beneficial results. I made an extract here from an article by Professor Karl Pearson which appears in the *Encyclopædia Britannica*.

3337. Is that with regard to its scientific value?—Its value to the State. He says in short that the statesman should be able to tell whether ten or fifteen years hence we shall be as strong and active as a nation as we have been in the past; and also, for example, what are the effects of urban life, preserved foods, and universally used drugs? This can only be done by an anthropometric census taken at intervals. From this census we should also learn the effects of trades on physique; the district where special physical and mental aptitudes are to be found, and thus direct the establishment of schools. We may attempt to remedy wrongly an admitted national failure through ignorance of its source. I have also notes of what has been done in other countries.

3338. What has been done there?—No country has carried out an anthropometric survey anything like so accurate and complete as the survey which I have just sketched out. The nearest approach to such a survey is that carried out by the Government of India in connection with the last census. Complete pigmentation surveys have been carried out by the state in Germany, Austria, Switzerland, and Belgium. Large numbers of persons, chiefly conscripts, have been measured in France, Alsace, Lorraine, Baden, Wurtemberg, and Bavaria. Very extensive measurements of conscripts have also been made in Norway and Sweden. The German Anthropological Society has quite recently appointed a commission to carry out a survey very similar to that which I have proposed to you, but not quite so complete. They propose to measure from 1,000,000 to 1,500,000 of conscripts, but no female adults or school children. One of their objects is to detect physical deterioration, and they propose to repeat their measurements at intervals of ten years.

3339. Are any of these investigations which are carried out investigations of the Governments of those countries?

—The pigmentation survey of Germany, which was made about 1874, was carried out under the Government. It was recommended by the anthropologists.

Mr. Gray.

3340. But as to the examination of these conscripts, has it been done by scientists?—In Baden the measurements were carried out by scientists, and the scheme was financed partly by the Government and partly by the Anthropological Society. In Sweden the measurements were made by Professor Retzius and his colleagues; he may have got some financial assistance from the Government. In the United States there is a Bureau of Ethnology supported by the Government, but it merely collects information about the manners and customs of the Indians, it does not measure them.

3341. Does that conclude the evidence you intended to give?—That is all.

3342. (Dr. Tatham.) In your experience is there anything like general progressive deterioration of the population?—I do not think there is sufficient evidence to prove that.

3343. Progressive?—There are no statistics which would enable anyone to prove that there is a progressive deterioration of the whole population; one can only guess. What statistics we have seem to show some slight improvement in the professional classes and a deterioration in the lower classes. I strongly believe that there is a great deterioration amongst the manufacturing classes in large towns and amongst the poorer population in slum districts in towns.

3344. Do you think that there is any evidence of deterioration amongst the country-bred people?—No, I do not think there is.

3345. Do you think when country people migrate to the towns, that they deteriorate because of that migration?—I think so.

3346. Do you think there is good evidence of that?—One can only say all the evidence we have points in that direction. I do not say that it is absolutely proved; seeing that we have not got extensive measurements of the two districts, one cannot be certain. I have myself personally measured about 100 persons drawn from all the different parts of England and Scotland, and some from Ireland. These are people I have met in London; and I find that the smallest heads in England are those to be found in the manufacturing towns of Lancashire and Yorkshire; the largest heads are to be found in Devonshire and Cornwall, and also in the North of England. But my numbers were so small that I cannot say that it is proved—it is a probable conclusion, I consider.

3347. You spoke just now of the probable deterioration of the Edinburgh children by an influx of Irish children?—Yes.

3348. I understood you to say so?—Yes.

3349. Do you think that in any other cities besides Edinburgh the same thing is taking place?—Do you mean the influx of Irish children?

3350. Yes?—Yes, there is a very large influx into certain towns.

3351. In Glasgow for instance?—In Glasgow and the manufacturing towns in the neighbourhood. I understand there is a very large Irish population settled there.

3352. The Irish people coming from the Irish towns or from the country, the west coast of Ireland?—I am not quite certain about that, but I believe they belong to the lowest class in Ireland. They are really representatives of the most inferior class in Ireland.

3353. What you said about the increase of lunacy in Ireland very much interested me. You said you thought emigration from Ireland probably was one of the causes at least of the increase of lunacy in Ireland?—Yes.

3354. Have you figures to show that?—Yes. The figures really were supplied by Dr. Macpherson, one of the Commissioners of Lunacy in Scotland, who has written a remarkable paper on the subject. Taking the figures given by Dr. Macpherson, it appears that within the last 50 years insanity in Ireland has increased from 15 per 10,000 of the population to 56 per 10,000. Analysis of the figures also shows that there is a high correlation between emigration and insanity. The paper is published in the *Edinburgh Medical Journal*, May, 1903.

Mr. Gray. 3355. (*Colonel Onslow.*) Is this a matter of increase in numbers or increase of percentages?—An increase of percentage.

3356. Is that partly accounted for by the fact that more cases are taken in these new statistics than would be taken thirty years ago when a lunatic would be merely treated as the silly boy of the village?—Yes.

3357. Now he is certified, that is not the case?—That might probably account for part of the increase.

3358. That might account for a large increase, might it not?—Yes, but still it would not neutralise the fact that there is found to be a distinct correlation between the amount of emigration and insanity. This shows that emigration, if not the sole cause, is one of the causes.

3359. But the increase of percentage would be partly due to the fact that there is more known about them now?—A certain amount of the increase in Ireland and other countries might be set down to that account, but it does not wholly account for the increase.

3360. (*Dr. Tatham.*) You think that there is no doubt about it that there is evidence of increase lunacy, proportionally of course, in Ireland?—Yes.

3361. And that this is largely due to the emigration of Ireland's best sons and daughters?—Yes.

3362. (*Chairman.*) How do you connect it?—It is no doubt true that emigration is greater in Ireland, and it may be that there is more insanity, but it would be very difficult to prove an absolute connection between the two. It may be due to many causes, and you have only given me one?—When one gets a large number of instances at different dates and places and compares them altogether and one finds on the whole that as emigration increases insanity increases, and as emigration diminishes insanity diminishes, one is justified in saying that one of these phenomena is directly or indirectly the cause of the other.

3363-5. But insanity is increasing in this country, but emigration is not increasing to the same extent?—I have not worked the correlation out in this country. There might be a certain amount of connection in that case.

3366. You must get what are the causes of insanity it seems to me, before you can draw those conclusions?—Quite so.

3367. (*Mr. Lindsell.*) Your scheme is rather this, that migration to a great extent tends to leave the weaker behind?—Yes.

3368. And that the weaker left behind have a greater tendency to insanity than the stronger who have emigrated?—Yes.

3369. So that the emigration is not the direct cause, but only indirectly the cause, of insanity, in so far as it leaves behind the least fit?—Yes.

3370. And that the least fit are more likely to produce insane off-spring than the stronger?—That is my point.

3371. That would be only one among the causes?—Yes. Confirmation of this view appears to me to be furnished by the case of the Jews. They have been shown to be an exceedingly degenerate type in Europe, and there is a high percentage of insanity amongst the Jews, much higher than among the surrounding Gentile races. This seems to point to the conclusion that the insanity is connected with degeneration.

3372. I think that you have given up the idea of suggesting that there should be any extensive employment of school teachers?—Yes, it would be more expensive, and the measurements would not be so accurate and uniform.

3373. It might be exceedingly difficult to get them to do it as a body?—They would require to be paid.

3374. But they might say that even if they were paid they have enough to do without it?—Yes.

3375. There is a great movement going on, that they have more extraneous work placed upon them than they ought to be required to undergo; and if without payment, they were asked to perform these duties, they might possibly object?—Yes, it is very likely. I have been informed by anthropologists who have attempted to collect pigmentation statistics in England that the

teachers have asked what they were to be paid for it, and that they objected to do it without payment.

3376. And the concession made by the Government that no teacher shall be required to undertake any duty not connected with the ordinary work of his school would entitle them to object?—Yes.

3377. They might object even if they got the individual payment, and it might be difficult to carry it out through the teachers, might it not?—Quite so.

3378. It could not be done without considerable expense and it might be difficult even then?—That is quite what I thought about it.

3379. (*Mr. Legge.*) As regards the items to be taken into account in the survey, I presume you agree with what Dr. Cunningham gave us?—Yes, I quite agree with him.

3380. Do you think, in the case of children, that weight is essential?—Weight seems to be a very valuable indication of the nutrition of the child.

3381. Of the individual, yes; but supposing it is found in 999 cases out of 1000 that weight in a growing child follows height would you for the sake of the exceptional case insist upon weight being included?—No, I should not, but I should not think that the relation was so very close as that.

3382. Then what about breadth of shoulders—why breadth of shoulders?—I believe that Professor Cunningham, as an anatomist, considers that that is a very valuable measurement. It shows the development of the skeleton, of course. We usually only take the stature, the length of the total stature, but it seems to be equally important to take breadth.

3383. Breadth of hips?—That is an indication of development of the pelvis.

3384. But of the three, dealing with the skeleton alone, height, breadth of shoulders and breadth of hips, which do you consider the most important?—I think the stature is, of course, the most important.

3385. Then what are those instruments you speak of besides callipers—the measures of height and weight?—Some kind of graduated standard with a sliding bar.

3386. For height?—Yes, and for the breadth of shoulders one would require sliding callipers, larger than what is used for measuring the head.

3387. And then a weighing machine?—Yes, I have suggested that, if weight is taken. Then these hair and eye samples would be essential if we are to take the hair and eye colours, and that is so valuable for racial reasons that it should be taken. The most recent method proposed is to have a scale representing twenty different hair colours, made-up hair. This is given to the observer and he notes the number of the sample which is nearest in the scale to the hair-colour of the child. The eye-samples consist of glass eyes. One selects about twenty glass eyes representing the leading colours of eyes. Otherwise one cannot get a true estimate of the eye, because different persons have different ideas as to the names of colours.

3388. You have given us an estimate of the expense of the permanent staff of surveyors, as compared with the expenses of utilising teachers and so on?—Yes.

3389. You say in your estimate the balance is strongly in favour of the permanent staff?—Yes.

3390. But I think you will find that while you have charged teachers with travelling expenses and subsistence you have omitted that on the side of the permanent staff?—Yes; I have.

3391. You just show salaries there?—I have omitted that because in the case of the permanent staff the amount of individual travelling expenses would be exceedingly small.

3392. But there must be subsistence?—Yes, but that I consider is included in his salary. I do not think that the members of the Geological Survey are paid extra for subsistence; they have to support themselves on their salaries I think, but I am not quite certain about it.

3393. The travelling expenses would not be much?—They would be exceedingly small. The permanent surveyor travels through the districts assigned to him in ten years, and I have found that the amount of his travelling expenses would be negligible. It would be quite different in the case of the teachers. It would be necessary to

bring more than 3,000 teachers per annum to be taught in London, Dublin, and Edinburgh.

3394. Yes, if the enquiry were of the precise sort you ask for?—Yes.

3395. Has the extreme difficulty of getting people to submit themselves to examination occurred to you?—I have myself had very large experience in measuring people, and have hitherto met with very little difficulty. It requires tact in approaching the people, but after that is employed we find very little difficulty. For instance, in Scotland we have gone to games where people met for a holiday and we have set up a tent in the grounds, and by inviting the people to come in we got as many as we wanted to measure. They showed slight reluctance at first, but when once a start was made a spirit of competition caught on to each man, and he wanted to know whether he was taller or whether his head was bigger than his neighbours.

3396. Yes, but have you ever entered a busy factory and tried to measure the people; first of all having to ask the manager whether he would have any objection?—No, I have not. I have measured a number of people at Toynbee Hall within the last few months. I went with a friend who gave a lecture on anthropology, and I offered to measure the people after the lecture; I found that practically the whole of the audience wanted to be measured.

3397. But that is a different collection of human items to what you would find in a large factory in Lancashire or the West Riding?—Yes.

3398. And it has already caused a little irritation to some owners and managers of factories that the operatives should be taken by a factory inspector or a certifying surgeon; but if we have a third Government official taking the man away from his loom to measure him and so on there would be very serious objection, would there not?—It might be objected to. But one must remember that one does not wish to measure every person.

3399. But see what a serious difficulty there would be in making your selection if you are to take the personal disposition of individual factory owners into consideration?—Yes.

3400. It seems to me in regard to measuring the working classes you are driven to utilising people who have already access to them. I do not mean the inspectors you speak of, who would not really have time to do it, but the certifying surgeons. Do you not think that the certifying surgeon, who is a medical man, in most cases perhaps the most prominent man in the district, that he would have much difficulty in getting up sufficient skill to make as good surveys as your ordinary permanent surveyor—I am not speaking of your head staff in London who will direct the whole thing, but your ordinary individual surveyor?—I do not think the certifying surgeon would have any difficulty. But my point is that no class of men will measure on a uniform system unless they are personally trained by instructors controlled by a Central Bureau.

3401. But a great many of them would have gone through that training during the medical course?—Not very many. In my experience, even in a medical school where there is an anthropometric laboratory, very few take the trouble to learn to measure, so that they can do it afterwards.

3402. (*Chairman.*) Surely the knowledge could be picked up by a medical man with the intelligence it is to be presumed he has?—Yes, certainly.

3403. (*Mr. Legge.*) Because they take such a keen interest in this sort of enquiry?—Yes, but there would be some difficulty in giving them satisfactory instruction. They would do it very accurately and quickly no doubt, but my objection is to the expense of training them.

3404. (*Chairman.*) Is not training rather a big word? Would not very little indication of what they have to do be sufficient? Would not written instructions do?—No, I do not think so. If you look at the opinions of anthropologists, as expressed in the Report of the Anthropometric Committee of the British Association, you will find that the great majority of them insist upon a very thorough practical training. Professor Manouvrier, of Paris, for example does so.

3405. (*Mr. Legge.*) But against that I claim what Francis Galton says, viz: that a good deal of time has been wasted in taking too precise measurements?—I believe Francis

Galton is the only one out of a large number who holds that opinion.

3406. Francis Galton's opinion is in that leaflet you kindly set?—I know that is what Galton says.

3407. (*Chairman.*) That is a point I want to lay stress upon. The more simple the scheme, the less likely it is to require considerable expense, and the more likely we are to get it accepted. Is not that so?—Yes.

3408. (*Mr. Legge.*) And the more workable in the country?—Yes.

3409. (*Colonel Fox.*) In many districts they have already commenced taking these measurements. For instance, in Rochdale and several other places they have already commenced six months ago?—Yes.

3410. (*Mr. Legge.*) Then, again, as regards schools, you are aware that there is a very strong movement in the country for increased medical inspection in schools?—Yes.

3411. Surely you could not have a better surveyor possible than a medical officer?—No.

3412. Whose business it was to watch the health conditions and so on in children attending the schools?—I quite agree; but would this medical officer do it without any payment?

3413. There are not many of them appointed yet but if there is to be any extension of medical officers among schools this should be one of his duties, and it would be recognised before his salary was fixed?—Quite so.

3414. Now as regards the children, do you think that it is necessary to examine all the children?—I think it is necessary if you wish to get the average of the children in each age group of one year.

3415. Why in each age group; why not reduce them by taking two age groups?—By taking two years together?

3416. By taking them at seven or eight and then again at eleven or twelve, and then again at a later age when the certifying surgeon sees them at fourteen; that would be three ages?—Yes.

3417. That would enormously reduce the amount of work, would it not?—If that was considered sufficient for practical purposes I have no objection.

3418. Then you would have all the children at certain ages?—If you want to get a complete registry of the growth of the children during school age you must measure them once a year. If you do not wish to have that, but if at certain ages you want to know the averages, that would reduce the labour.

3419. You do not see any statistical objection to that?—No. It simply means that you get your points at three intervals instead of twelve.

3420. Only one other question; as to your interesting evidence as regards the degeneracy of the Jewish race on the Continent, you are aware that we have the most striking evidence in this country of the very reverse of your evidence. You have seen Dr. Hall's figures, I suppose, where the results of his examinations in Leeds are given; the Gentiles show very poorly besides the poor Jewish children, and his figures are quite confirmed by figures I have myself got for the class of schools I inspect, namely, the industrial schools?—Were these dimensions as to stature, or head measurements, or chest measurements?

3421. Practically all are given. We have had most striking photographs showing them standing up side by side, Gentile children and Jew children of the same age. Well now is not that odd?—Yes.

3422. (*Mr. Struthers.*) Of course all those photographs must have been selections.

3423. (*Mr. Legge.*) We have got them. They were probably all the Jew children in a school, set out, and a corresponding number of Gentiles in a school.

3424. (*Witness.*) It quite differs from what has been found on the Continent, in Poland, for instance.

3425. (*Colonel Onslow.*) The Polish children or the foreign alien Jews who come into England may be of inferior physique; but what about the English Jews? There are thousands of Jews who have been in England for generations; how do they compare?—Mr. Jacobs found that those in the East End were three inches below the average Gentile.

3426. But we have got absolute evidence?—Quite so.

Mr. Gray.

3427. (*Colonel Fox.*) I went purposely into the schools in Whitechapel and Ratcliffe Highway and I saw those children paraded for physical training, and I asked the headmaster and the headmistress in each of those schools what were their opinions of those children—they consisted of Polish, Russian, and Roumanian Jews and Jewesses, and the headmasters and headmistresses and teachers all agreed that they were of good physique, that they were of higher intelligence than our children, and that they were better fed by their mothers, who were more thrifty, and understood the art of feeding and bringing up the children much better than the English mothers?—I understand that.

3428. And that the fathers were much more temperate in their habits than the English ones—Those are the foreign Jews.

3429. The schools consisted almost entirely of alien children, some who could not speak the English language, and the teachers, headmasters and headmistresses all agreed that individually they were better in every way than the English children?—Yes.

3430. I saw them at work, and they were full of energy and vitality; Dr. Hall states the same as regards the Jewish children of Leeds. His investigations in Leeds show that the Gentile children have bad teeth in the ratio of 60 per cent., and rickets in the ratio of 50 per cent. The Jewish children are visibly superior in these and all other physical respects, and in addition to that, at the age of twelve they measure two inches in height more than the others, and they are seven pounds heavier, and that seems to point to the fact that although they are more densely packed in their houses they are better fed, and their mothers understand the art of feeding them better?—Of course you are speaking of the Jewish children and the most degenerate of the English children.

3431. (*Chairman.*) And so are you?—Of course. These statements that I have made are with reference to the average of adult Jews and the average of adult Gentiles. It did not refer to children.

3432. (*Colonel Fox.*) I am speaking now of children, but they tell me that the Jews, when they grow up, are not ahead of our people?—Yes, the death rate is only one half as compared with that amongst the Gentile children.

3433. During this enquiry it has been impressed upon us by every medical man that the most important time of a human being's life is from its birth to the age of five or six, and that it is during this time that it receives the foundation of a good constitution or the reverse. If these Jewish mothers understand nourishing their children surely we can also by some means, get at the mothers amongst the Christians, and make them feed and look after their children in the same way. If it can be done by one class it can be done by the other. Would not you say so?—Yes. These statistics of Mr. Jacob's refer to adults, and that might explain the contradiction, and they might fall off as they increase in years; that is to say, the average stature might fall off. The average stature of the adult Jew in Northern Europe is only five feet four inches.

3434. I am speaking purely of the young children. But I think that everybody agrees that the Jews do not go ahead after the first childhood?—That is so.

3435. (*Colonel Onslow.*) You speak in your scheme of taking the colour of the hair and of the eyes. That would be very interesting and useful in some respects, but would that be of any use at all as to the physical condition of the people?—I think it would be indirectly necessary because it indicates difference of race. For instance if we have measured a group of people who are brunette, very dark, and we compare them with a group of people having mostly blonde hair, we know that they belong to different races and we would expect their normal or inherited average dimensions to be different.

3436. Do you think that the British Isles generally are so marked—are not the races very much mixed up?—I do not think so by any means.

3437. Have not we each got the blood of several different races in us?—No doubt, in many cases; but the rural population in many districts is of the same racial type as it was hundreds of years ago.

3438. What is the object of having the measurements of head as a physical test? Is a large head an advantage

or otherwise, speaking generally, physically?—As far as the evidence goes the classes with larger heads are the more intellectual.

3439. Apart from intellect, I mean physically?—Generally tall men have larger heads.

3440. But you might find a large head on a very small man?—Yes, in individual cases; I only speak of averages.

3441. You do not lay much stress upon chest measurement?—I think that they are very difficult to take. I consider they are valuable but there is a difficulty in taking them.

3442. Surely, as Colonel Fox said just now, eyesight and teeth are very direct guides to the physical condition of a person?—Professor Cunningham, I believe, proposes to test eyesight. But one must put some limit to the number of observations made, or the survey would become impracticable on account of the expense.

3443. Well but surely if in the comparison with results of ten years apart, it is found that eyesight and teeth had gone down, that there were more cases of blindness or semi-blindness or short sight, and in the same way the teeth were more defective, there must be some cause?—Yes.

3444. Would not it be as necessary as taking the size of the head or even the stature?—Do you think that they could take place without any change in the physique?

3445. I do not know, but I should have thought that it was one of the guides?—Of course the estimation of disease would be very valuable, but that is done already to a certain extent by other Government departments, for instance, by the Local Government Board.

3446. You frequently find a young man of fine physique who has very inferior eyesight or inferior teeth—very inferior teeth indeed—but his physique is good?—Yes, that may be so.

3447. That might be found amongst a large number?—I should have thought that these defects were on the average the accompaniment of deterioration of physique.

3448. You would not include them amongst the subjects to be noted?—No, it would make the survey far too complicated if we noted all the kinds of defects of deterioration.

3449. (*Mr. Struthers.*) You spoke about the population of Limousin in France as being on the margin of subsistence, so to speak?—Yes.

3450. And consequently of low stature and bad physique generally?—Yes.

3451. And if the children are living in more favourable conditions they improve?—Yes.

3452. And if strangers go there and are subject to the same conditions they come down in physique?—Yes.

3453. So that deterioration is dependent upon the physical conditions to a very considerable extent?—That seems to be so.

3454. I wanted to know whether that might go on indefinitely. Would you say that the poor physique of Limousin has, so to speak, reached bed rock, the conditions being so bad that they cannot go further?—I should say so. Speaking generally I should say that unfavourable surroundings produce a certain amount of depression which will not be increased. Such depression is simply temporary, and when the conditions are improved, the race will recover its normal dimensions.

3455. But there is a point beyond which it would not be depressed, or it disappears altogether?—I think so.

3456. So applying that to large towns—we have heard of the present generation of London not reproducing itself in the fourth generation—that would be inconsistent with that theory?—Yes, it would be inconsistent with the degeneration being due to unhealthy surroundings.

3457. So that every race would have its own minimum of physique, which it might be depressed to under given conditions?—That is so.

3458. And that might be different for each race?—It might be.

3459. You have the people of Kerry, for instance, who are living on the margin of subsistence, at least one is told so, and yet they are generally considered to be men of good physique?—Yes.

3460. That is to say the minimum for the people of Kerry might be much higher than the people of Limousin practically under the same conditions?—It might be. One does not take the amount of food only into account, but the conditions of the climate as well. I understand that in Limousin the air is unhealthy down in the valleys where the people live. Perhaps in Kerry there is very good air though the food is deficient.

3461. But at any rate it is not entirely a question of town *versus* country; you have that depression of physique just as much in the country as in the town under particular conditions?—Yes.

3462. You do not know the island of Lewis, do you?—No.

3463. You do not know anything about the population of Lewis do you?—I have seen some of the fishermen from Lewis.

3464. What is your impression of their physique?—The blonde type has usually a very good physique.

3465. Of the Scandinavian stock?—Yes. There is a very small dark type that appear to be degenerate.

3466. You do not consider the conditions of living as to the amount of food and so on affects them?—No.

3467. I think you have studied carefully this report of Dr. Hay and Dr. Mackenzie upon the physical condition of children in Aberdeen and Edinburgh?—Yes.

3468. Do you think, speaking generally, that the basis of examination is sufficient to justify the comparison between Aberdeen and Edinburgh as cities? For example, I will read what they said in one paragraph of the report. "It may be assumed with little if any risk of error that the Aberdeen schools fairly represent the school board children in Scotland generally, and can be contrasted with the scholars in the larger towns, such as Edinburgh, Glasgow, and Dundee." That is to say that Aberdeen is very different from Edinburgh—that it has to be taken almost as rural population as against Edinburgh and Glasgow. Do you think that the figures are sufficient to justify that and that the basis of the examination justifies that?—I think that the conditions under which children live in the country are better in Aberdeen, because you have not such a laegr slum population. The slums of Aberdeen are very small and the town is very healthy—on the whole I should say healthier than Edinburgh or Glasgow.

3469. The value of the comparison between the two towns would depend very much upon the districts from which the children are selected, would it not?—Yes.

3470. And there is a very large element of chance considering that there are four in Edinburgh and six in Aberdeen; I am not saying that this is the case, but it would be quite possible to approximate to this without knowing it, and to be selecting your whole school in one town from a distinctly lower class than you are selecting from in the other?—I am inclined to think that was the case.

3471. You know the Grammar School in Aberdeen?—Yes.

3472. That, of course, represents a very much better type, children of a better class than in the ordinary Board School?—Very much.

3473. You would observe that there was no such school included in the Edinburgh examination. They were all Board Schools?—Yes, and even the West End school was a working class school.

3474. The difference being emphasised by this very important fact, that Edinburgh is full of secondary schools, into which the children in Aberdeen would go; and in Edinburgh they go into the Board Schools?—Quite so.

3475. So that the best Board School in Edinburgh might compare socially, but poorly with the best Board School in Aberdeen?—Yes, I quite agree.

3476. So that, to some extent, weakens the strength of any comparison between the towns?—I think so.

3477. But taking each town by itself, you probably think that the difference between North Canongate and Bruntsfield in Edinburgh corresponds with the difference in the physique in those quarters?—I think that the statistics are not sufficient to prove it. The conclusion may be correct or it may not, but the difference is a difference which might occur between two samples taken from the same school. The numbers measured, I believe,

were very small; thirteen in one school and twenty-five in the other for children between the ages of twelve and fifteen. With these numbers a difference five times as great as that actually found would be necessary to prove that there was a real difference between the schools.

3478. And that applies to any comparison between the ages of twelve and fifteen, because they had some difficulty in finding the number of children to make up the quota between those ages?—The variations found between children at different ages are in many cases due to sampling.

3479. So that you think there is nothing in the statement that Edinburgh, with an index almost uniformly just over seventy-eight, would show, were race the chief cause, a less striking contrast between its schools than Aberdeen. The basis on which they get that is not good enough?—I should say that the statement has no validity. It may be a correct statement, but the statistics are not sufficient to prove it.

3480. They do speak of more uniformity in the population of Edinburgh than of Aberdeen, but I think you have already mentioned as a matter within your knowledge that Canongate is very largely populated by the people from Ireland?—Yes, I have been informed by a friend well acquainted with the schools of the Canongate that that is the fact.

3481. And in all probability in this North Canongate a very large proportion of the children were of purely Irish stock?—That is what I understand.

3482. As compared with Bruntsfield, where there are practically none?—Yes.

3483. Do you have the same proportion of Irish immigrants in Aberdeen?—Very few, indeed.

3484. So I always understood—that there were comparatively few in Aberdeen. There, comparing the lowest school in Aberdeen with the lowest school of Edinburgh, you would be comparing children of the Scotch race with the children of the Irish race?—And probably degenerate Irish.

3485. So that on all these grounds it would scarcely be fair to make the strong comparison there is made between these two towns?—I think so.

3486. I do not want to go into this matter too much, but it struck me in reading through this just now, that if you want to bring out these facts as to percentage of weight and relative stature as between schools, it would have been far better to have taken a certain number from one room, or two rooms, or three rooms, and so on?—Yes.

3487. Instead of taking them indiscriminately?—It would have been very much better.

3488. Than try to form an inference as to the social condition from the accidental mixture of two or three classes in a school?—Yes, it would have been possible I should think to have found in that way the correlation between the number of rooms and the physique of the children.

3489. Then a strong point is made in the Edinburgh Report that everything—comparison of height, weight, cleanliness, and so on—corresponds with the fact of whether they live in one or two or three or four-roomed houses. You have noticed that?—Yes.

3490. But it suggests itself to me, in looking through the Report, that there is the real difference between the two schools of Bruntsfield and North Canongate, that the correspondence of all these variations with the one-roomed and the two and three-roomed, etc., houses, is not quite established?—I think it would probably be impossible with the small number of measurements that they have measured to establish any such conclusion.

3491. Then I also find something bearing upon that in the Aberdeen Report, where Dr. Hay writes thus:—"There still remains the substantial difference in height already fully detailed, and it is proper to consider whether the inferior height of the children from the smaller houses is due to home conditions. A similar difference has frequently been noted by previous observers, but, while it may be admitted that deficient feeding hinders growth, it must not be too readily assumed that this, rather than inheritance, is the chief cause of the differences in height observed in Aberdeen." Would you agree with that?—That the difference was due to what?

Mr. Gray.

3492. He says that ' while it may be admitted that deficient feeding hinders growth it must not be too readily assumed that this rather than inheritance is the chief cause of the differences in height observed in Aberdeen ' ? —Dr. Hay considers that it is due to race.

3493. No. His point is rather a negative one, one must not say due to the feeding or the character of the home ?—One would have to compare a large number of measurements of the people living under normal conditions to discover whether they really belong to the race, and it would be possible then to say whether the difference of stature was due to inheritance.

3494. He goes on to say : " Scarcely any of the children had a starved appearance, and, as already remarked, the apparently ' thin ' children were in larger proportion among the children from four-roomed houses than among those from one and two-roomed houses " ?—Yes.

3495. " Moreover, the disparity in height between the different groups did not, as already remarked, advance with increase of age, as might have been expected had home conditions been exercising a continuously deterrent effect " ?—Yes.

3496. That is to say that, although the children from the four-roomed houses are better than the one-roomed children on the average, that difference did not increase as the children grew up later, which seemed to point out that there is some other cause of variation, and it is not entirely due to the difference between two, or three, or four rooms ?—It seems to point to that. The law of growth is different in the two cases.

3497-8. (*Chairman.*) As to the point about the Jewish children, may it not be the case, that here the Jewish emigrant suffers from the depressing conditions which obtain in Poland and that the care that he takes of his children and the more favourable circumstances under which they are brought up in this country, are conducive to a restoration of the type to its original form. In other words, to use Professor Cunningham's evidence, " they revert to the mean physical standard that is the inheritance of their race as a whole " ?—I think that this is highly probable. In fact this discovery by Mr. Jacobs as to the Jews in the West End being three inches taller than those in the East End appears to support your view.

3499. You agree as to the points included in the scheme that the anthropometrical survey might be modified so as to contain the irreducible minimum of what is necessary for the purpose ? You do not think you presented the irreducible minimum ?—Not at all.

3500. You do not think that simple machinery and a more restricted field of observation would seriously interfere with the usefulness of the scheme ?—I think that the scheme might be started on a very small scale and expanded as experience suggests.

3501. You would reserve your opinion as to the points for measurement, would you not ?—Yes. I would have a few simple measurements for the deterioration, any additional measurements that could be taken would be of very great scientific value, and indirectly would be of value to the State.

3502. With regard to the stress you laid upon the employment of experts, rather than having recourse to

school teachers or doctors, there is that expression of opinion of Francis Galton, in which he says : " I do not think that laxity in measurement matters much, so long as laxity does not lead to error in one direction ; in fact I know that a vast deal of effort is wasted in minuteness of measurement. " Do not you think that it would be a good thing to spare this scheme at its inception, from the tendency to waste a vast deal of effort on measurement ?—Galton is the only one who expresses that opinion, and I think five or six take the exactly opposite view. The majority of anthropologists seem to think that it is necessary to have the trained assistants. Professor Manouvrier, the leading anthropologist in France, says here : " An experience of more than twenty years has convinced him of the necessity for a practical and very careful training in the technique of anthropometry, even when a small number of simple measurements have been selected. Uniformity and accuracy are very difficult to obtain when an investigation is carried out by several persons. Repeated comparison and mutual checking are necessary if an investigation is continued for a long time. " And most of our own anthropologists also emphasise the necessity of training. I think it would be a very dangerous thing to take Mr. Galton's views on that subject. He says that there should be no bias. It is very likely that there would be a bias in untrained measurers. They would always adopt slightly different methods of measurement.

3503. It is not so much untrained measurers as the employment of professional surveyors as against persons of more than average intelligence, and some expert knowledge, who are willing to acquire the requisite technical knowledge ?—Yes, I quite admit, for instance, these medical experts could learn with sufficient training, but my objection is that the cost of this training would be very much larger in proportion, and they could not devote their whole time to the work. A medical man could only give one tenth or one twentieth of his time, and a very much larger number would have to be trained.

3504. My point is that the training would not be of a very arduous, and therefore of an expensive, character, and that there would be very little training required if you utilised medical men, and that is your opinion, Mr. Legge.

3505. (*Mr. Legge.*) Yes.

3506. (*Witness.*) The training from a centre is chiefly necessary to secure uniformity.

3507. (*Chairman.*) You do not think that written instructions would be sufficient ?—No. My experience is that written instructions will not secure the highest degree of uniformity.

3508. As to mere instructions, you think they do not understand the meaning of the words used ?—One has to discover the points, say, in measuring the head, and it would be highly improbable that several persons would fix on exactly the same points from written instructions.

3509. A doctor would know ?—Yes, perhaps better than other men, but still you want to secure uniformity, and even doctors might differ as to the exact point which was indicated, say, by the term *glabella*.

3510. (*Dr. Tatham.*) I am afraid you have a very low opinion of medical men ?—No, I have not.

EIGHTH DAY.

Monday, 8th February, 1904.

PRESENT:

Mr. ALMERIC W. FITZ ROY (*in the Chair*).Colonel G. M. FOX;
Mr. J. G. LEGGE;
Mr. H. M. LINDSELL;Colonel GEORGE T. ONSLOW.
Dr. J. F. W. TATHAM.Mr. ERNEST H. POOLEY (*Secretary*).

Mr. DOUGLAS EYRE, called; and Examined.

3511. (*Chairman.*) Will you kindly state what your qualifications are to give evidence on this subject?—I am the Chairman of the Executive Committee of the Twentieth Century League, and honorary vice-head of Oxford House, in Bethnal Green, and the Chairman of the Executive Committee of the Federation of the Working Lads' Clubs in London.

3512. The general object of these clubs is, I suppose, to keep in touch with lads after they leave school until they grow up to the period of adolescence, and to save them as far as you can from contaminating influences physically and morally?—That is the main object.

3513. Would you kindly enumerate the voluntary agencies with which you are associated?—Yes. I should put first the associations for the promotion of physical drill, and I group them as follows: The Boys' Brigade, the Church Lads' Brigade, and then there is a separate brigade for London, of the London Diocesan Church Lads' Brigade, and then there is the Jewish Lads' Brigade, promoted for Jewish lads only; and the Catholic Boys' Brigade, promoted by the Roman Catholic community; and the Boys' Life Brigade, which is an association formed for promotion of physical exercises, divorced from any military aspect—it is promoted by people who do not believe in the military side of the work amongst lads, but who are very keen indeed about the physical development side, and the moral progress of the boys. Then there is the Newsboys' Brigade, which is in its infancy at present, its object is to turn lads employed in selling newspapers into an organised corps. I think these are the chief brigades which are at work in this connection.

3514. Can you tell us what the total number of boys composing them is at the present moment—have you any figures?—The Boys' Brigade comprises over 7,300 officers and lads. As to the Church Lads' Brigade, I have sent in their report to you, and I can give you the exact figures presently. The London Diocesan Church Lads' Brigade has 6,500 officers and lads, comprised in eighteen battalions of 150 companies. The Jewish Lads' Brigade—the London regiment of that comprises 1,000 Jewish lads, and there is a capacity for developing that number as they proceed with their movement.

3515. Is that in its infancy?—It is not so old as some of the others.

3516. (*Colonel Fox.*) The Jewish Boys' Brigade is 1,000 strong, I think you mentioned?—Yes.

3517. What are they?—They are working lads amongst the Jewish community.

3518. Are any other than Jews admitted?—No; they are a brigade promoted by the Jewish community only. It has nothing to do with the Church of England or any religious English community.

3519. Are they under your own organisation, or are they federated with you?—They have representatives on our League for the purpose of promoting their general object.

3520. (*Chairman.*) What are the numbers of the Catholic Boys' Brigade?—I have not the exact figures.

3521. I should like to have a note of them, and of the whole of the others?—I shall send them to you. *Mr. Eyre.*

3522. I suppose they cover a very small proportion of the ground?—Yes, a very small proportion of the ground that might be covered.

3523. Are their general characteristics more or less the same?—The Boys' Brigade are not confined to any religious community. The Church Lads' Brigade is promoted entirely by the Church of England, and the London Diocesan Church Lads' Brigade is under a different constitution altogether, and is confined to the London Diocese, with the result that nobody can start a Church Lads' Brigade in the London diocese, and he has to limit himself to the London Diocesan Church Lads' Brigade.

3524. The Church Lads' Brigade is not confined to the diocese of London, is it?—Not to the diocese of London. It purports to extend throughout England.

3525. The figures will not be confined to London that you have promised me then?—No. Then under the second head I would comprise the cadet corps. The oldest cadet battalion is that of the 1st Queen's, which was started in Southwark, and comprises now eight companies—the aggregate would be about 600 to 700.

3526. They are rather older boys, I presume?—They are entirely for boys between the ages of fourteen and eighteen, and some boys over eighteen are allowed to stay if they make themselves very efficient non-commissioned officers.

3527. What ages cover the Boys' Brigade as a rule?—The boys soon feel that they are too old for that.

3528. Within what years are they eligible?—I should say from twelve to seventeen. Then as to the cadets corps movement, I should say that that appeals more to Government aid than the voluntary movement.

3529. With regard to the *modus operandi* of all these, apart from their religious complexion, is it pretty much the same? How do you get hold of the lads? Do you get them from the schools from which they have emerged, or do they come from the parochial agencies, or what?—With regard to the Church Lads' Brigade, they are managed from the parochial agencies and to a certain extent the public school missions and settlements. That applies also, of course, to the Catholic boys and the Boys' Brigade; but the other method of getting hold of them is through clubs—the Brigades existing as a portion of the club organisation. Then the third head would be the work done by the Polytechnics.

3530. Which are more educational than physical?—But then the physical side is of extreme importance, and extends rather to the higher classes of the industrial community. They appeal rather to them—they do not really touch the rougher elements of society. Then I would proceed to enumerate the various agencies promoting these clubs. The clubs, firstly, of the parochial clergy are the most numerous. Then there are the clubs of the University Settlements, such as Oxford and Cambridge Houses, Toynbee Hall, and Mansfield House and those of the other Settlements in London. Thirdly, there are the

Mr. Eyre.

public school mission clubs, such as those of Eton, Harrow, Haileybury, Charterhouse, Wellington, etc. Then come those started and maintained by Nonconformist bodies. And then there is a growing number of clubs which are worked on voluntary principles, and use the school buildings of an evening, which it seems to me is a very important side.

3531. These are all of a recreative type of club?—Yes. Those are allowed to hire or use the school buildings after school hours.

3532. Is there any general co-operation between these agencies, or do they overlap to a certain extent?—They do overlap to a certain extent, and the object of the Twentieth Century League was to rather co-ordinate them and procure their representation by one association; the object of the League would be to unite and consolidate them as far as possible.

3533. Have they met that effort on the part of the League?—They are meeting it slowly. They have all procured representatives upon the League, but I should say that they would be anxious to maintain their own independent existence. Of course, that would be naturally so in the case of all those associations which are founded by religious communities.

3534. But they see no objection to co-operation?—No, but they co-operate mainly for the purpose of strengthening their own position.

3535. How long has the Twentieth Century League been in operation?—About three years.

3536. (*Colonel For.*) It is in existence then?—Yes. I handed in their report to show the representatives on the Council: you have the report.

3537. (*Chairman.*) Have you anything to say about the special needs and weaknesses of these several institutions?—Yes. I have noted here what strikes me as their chief needs, and I shall enumerate them. They are in great need in a great measure of better accommodation. The premises are very inadequate in a very large number of cases. Then they are very poor indeed, and some of them have no means of getting even the proper club appliances.

3538. In all cases do they make the members of the club or brigade contribute anything?—The club boys always subscribe a penny or so a week, with an entrance fee.

3539. That does not go very far?—It does not go very far. Then the third is the need of more workers especially of managers of experience. It is not at all an easy thing to work these clubs, and more people who are really experienced in it are sorely needed for the purpose of making them successful.

3540. It does more harm than good to have inexperienced people, I suppose?—Yes, you may do more harm than good with inexperienced people. Then, of course, the fourth need is the insufficient funds for maintenance and development and expansion. I may say about clubs that they are becoming so varied in type that representatives of most of the classes of which the youthful portion of the industrial classes is composed, are becoming attracted to them.

3541. You think that is so?—Yes, I think also with regard to the rougher elements of society, the existing agencies are most adapted for the purpose of grappling with them.

3542. Do you think that they are gradually being tamed and interested?—Yes, wherever they can be got together, but you cannot get the roughs into one institution—you have to deal with them by gangs and small numbers. If I might pass on, I would say that I consider that most important work is being done by bands of hope and juvenile branches of temperance societies in connection with the children of school age, also by the Children's Happy Evenings Association.

3543. (*Mr. Lindsell.*) Are you passing away from that subject?—Yes, I was passing away from the clubs.

3544. Will you tell us something about boys' homes?—Yes, the boys' homes, I think, constitute another branch of very useful work. It seems to me that there is a very insufficient amount of accommodation for lads who come up to London, and go right into offices and places of business and factories.

3545. (*Chairman.*) That is what you mean by boys' homes?—Yes. I refer to them because a very important work is being done with regard to physical development. The homes generally have connected with them agencies for this; evening clubs are generally associated with

them. But I put them in a different category to the clubs themselves because they supply a need not covered by the ordinary clubs, which are for boys who have homes of their own in London and the large towns.

3546. Do you think all these organisations tend to check the practice of juvenile vices prejudicial to health such as smoking, and so on, and to the exercise of a vigilant watch over them?—Yes, the best type of boys club is a club which rigidly prohibits any smoking whatever on the club premises.

3547. They do not all do that do they?—Some of them do not. I have always made an effort to advise those who promote these clubs not to allow any smoking in them. I manage myself a very large club in Bethnal Green, and I prohibit smoking, and the boys are perfectly happy without anything of the kind.

3548. Would you consider one of the best objects of this central office would be to secure a general acceptance of that principle by all those clubs?—It would be one of the most useful pieces of work. People would go to the central office for advice on these subjects, and the experience of the most experienced people would be quoted to them.

3549. Now what have you to say as to the summer camps?—With regard to summer camps, a most important work is being done, both by the brigades and the cadet corps, and the club movements generally for enabling boys to have a week's holiday under canvas during the summer. In addition to the camps connected with these various brigades and cadet corps and clubs, I might specially mention the camps for London boys which are worked by the London Diocesan Society for the welfare of lads. Under that scheme practically any respectable London boy can be accommodated in a well-organised and well-conducted camp for a week—for a small payment, generally 7s. to 10s. per week.

3550. I think you attach very great value to the health-giving effects of these summer camps?—Yes; I think they have a great effect upon the physique of the lads who go there, if they have been confined in London or in any large town without any country experience at all, and that they are enabled to find a healthier condition of holiday than under any other circumstances.

3551. There are certain voluntary associations, I understand, whose object is to strengthen the hands of the agencies you have been describing?—Yes.

3552. Will you tell us something about them, and what their *modus operandi* is?—The first one that I would mention with regard to boys, is the Lads' Drill Association, formed for the promotion of drill in school buildings, and for the promotion and recognition by Government of cadet corps. I think that is capable of doing very useful work indeed under those heads. Then there is in London the Federation of Lads' Clubs, which promotes the union of all clubs for working lads which are in existence in the Metropolis. That has affiliated to it some forty clubs, most of them clubs organised by the University Settlements and Public School Missions. Then there is a similar organisation, called the Federation of Working Men's Social Clubs, which promotes the union of clubs for young men, as well as older men, and has over seventy clubs affiliated to it. Both these associations promote competition amongst the clubs, and so encourage physical exercises and various other forms of recreation by offering challenge cups for competition and so on. The Social Institutes Union is doing much in the same direction. Then I ought to mention the work of the Young Men's Christian Association, which will probably be dealt with by other witnesses before you.

3553. Does that deal largely with boys in the slum population?—No.

3554. That is rather a better class of people altogether, is it not?—Yes.

3555. I presume something is being done for girls at the same time?—There is a great deal being done for girls, but not on the physical side so much as the Association which work among lads. It seems to me to be an important thing that the physical side of club life for girls should be more fully developed than it is.

3556. Do those agencies which you speak of, which are connected with girls, do anything towards developing a high domestic ideal among them?—Yes; they do in a great measure.

3557. Is not that one of their principal objects?—Yes.

3558. To make them good housewives and good mothers ?
—Yes. But I should say that gymnastics are not as efficient as they might be with regard to any of those associations which I have enumerated.

3559. You might go through that part of the subject ?—The Girls' Evening Homes Association, of which the Duchess of Bedford is president, has a number of girls' clubs affiliated to it—I may specially mention those in Bethnal Green, Clerkenwell, and Silvertown. Then there is the Girls' Clubs and Institutes Union, and the most prominent person to be mentioned with regard to that is Miss Maud Stanley. That has a large number of clubs affiliated to it, and there is a similar Association which has clubs affiliated to it in Liverpool.

3560. How many members have these clubs as a rule ?
—I can get the correct membership.

3561. I wanted to know whether they touch any considerable section of the population ?—The girls' does not comprise so many, as a rule, as a boys' club does, and I think I can give you an idea as to the extent of the population touched by the clubs as a whole.

3562. I should like to have that ?—Yes; as far as my information goes at present; and then there is the work of the Recreative Evening Classes Association, and the National Physical Recreation Society, and the Girls' Friendly Society, and the Factory Helpers Union, and the Women's Industrial Council. Then there is another organisation called the National Union of Women Workers. These are the principal organisations which seem to me to have for their object the strengthening and development of the work of institutions for the welfare of girls.

3563. Am I right in supposing that the sphere of each of them is small ?—Yes, it is small. Then with regard to the percentage so far as can be gathered from the returns which have come in to us as members and officials of the Twentieth Century League, I do not believe there are more than five per cent. of the youthful portion of our industrial population who are materially touched or assisted at present by anything in the shape of any well organised recreative agency out of school or working hours. The extent of the work, and the ground that is covered is very small as compared with the ground that ought to be covered. Then might I just mention the objects of this Twentieth Century League.

3564. I should very much like to hear what they are. ?—The first object is the strengthening of the hands of the existing agencies and their consolidation into a representative association; we find them all rather isolated, and to a certain extent overlapping, and very little is known about all that they are trying to do.

3565. Have you done much in that direction ?—The progress we have made is, I confess, somewhat slow at present. What we have endeavoured to do is to get committees formed in every borough in the Metropolitan area for the purpose of investigating the amount of work that is being done and reporting to us as to their needs.

3566. Is the new municipal organisation helping towards this movement ?—In some cases the Mayor of the borough has taken the chair at the meetings, and is acting as chairman of the local council or committee.

3567. What I wanted to gather was, whether the creation of these new municipal bodies in London has led to any increase of local patriotism which exhibits itself in the organisation or promotion of associations of this kind ?—Not at present. I do not think that the municipal authorities have had time to show the extent of their interest in this movement; but as far as things have gone they look promising. The municipal authorities are awakening up to the need of this kind of work in their various areas, and it only requires to be organised and put upon a practical basis. Then our second object is to enable all these agencies to reach the roughest classes. One of our chief objects has been to try and prevent those congregations of cliques of the rougher classes in the streets without anything whatever to do but to hang about and get into mischief.

3568. What is your *modus operandi* in dealing with what you describe as the roughest classes ?—To promote the extension of the club system.

3569. Are they willing to join clubs ?—Yes; they are willing to join them, but there must be special clubs for them. If you start a club in a district, it soon gets filled by people who are not composed of the roughest element,

and even a club which includes originally lads of the roughest portion of the community gets, as time goes on, to be respectable, and then these members do not wish to have the roughest class in their club.

3570. Do you draw up a somewhat indulgent code of rules when you introduce this rough element in the first instance ?—We try and form a committee of the lads themselves.

3571. Of the roughs themselves ?—Yes, and instil into them a sense of responsibility. I certainly find where people know how to deal with them the club system is very successful. But one club cannot comprise a large number of these. You must work them in what I call cliques, and have a special club for special cliques.

3572. But that all adds to the expense, does it not ?—Yes. I have also seen good work done by forming a club in connection with the school buildings. That can only be done on a small scale at present, but in Wandsworth they have tried them with effective results.

3573. Do you get much assistance from the clergy ?—Not in that particular line at present: not for the utilisation of the school buildings.

3574. But for getting hold of the rough classes, I mean ?—Yes, I think in certain parishes in London the parochial clergy are the most competent for dealing with them.

3575. But you would not say that would be so in many cases ?—Not as a rule.

3576. The clergy as a rule do not take up social questions as much as they might—would you be prepared to say that ?—The clubs in connection with the parishes are the most numerous of all at present. They have covered more ground than any other. But their primary object is to get into touch with them religiously, and those they cannot get into touch with in this way are apt to be left out in the cold.

3577. They do not look upon getting hold of these rough classes as a preliminary step to what may be the means of influencing them religiously. You think they are too much inclined to put the religious influence in the forefront ?—Yes, they are inclined to do that, and I do not think you will get hold of the rougher sort of boy or girl originally in that way.

3578. That is what I understand you to say ?—Yes, then, of course, they are justified, it seems to me, in going for that portion of their parishioners who are likely to accept their religious ministrations, and when they have done that they have probably exhausted their resources. Then the third object is to be a central bureau of information, an illustration of which has been already provided with regard to smoking, and we purport to be able to tell people what things to avoid and to point to models for their study.

3579. Have you got such a bureau now ?—We are collecting all the information in the central office, and we have a secretary there whose business it is to be there all day.

3580. And your fourth object is what ?—It is to attract personal service and financial assistance for those various organisations.

3581. Are you able to do that ?—We have not had any particular success, although we have issued a public appeal. But the public will require first, I think, to know that our organisation is on a practical basis; and that its committees have threshed out the subject and will be able to inform them as to the state of each borough area and the work that is going on there. The Executive Committee has taken steps to get all that information together.

3582. What funds have you in hand at the present moment ?—We have next to no funds at present. What we are trying to do is to get a sufficient number of annual subscribers for the purpose of enabling us to run our central office and to promote our organisation, and then we shall hope to attract a sufficient amount of public assistance to enable us to make grants in aid to those organisations which seem to us to do the most effective and useful work.

3583. And accept your methods of guidance, I suppose ?—Yes.

3584. Then you have described your methods of work in stating your object, I think ?—Yes. I should say further that we can only proceed gradually as those local committees show themselves to be in working order and give us the information that we require.

Mr. Eyre.

3585. And you say that that sphere of your operations is enlarging?—Yes, I should say that it is enlarging, but it is small because it is so very difficult to attract London as a whole.

3586. And the persons who come under the influence of these clubs are increasing in numbers you say?—Yes, as we go on the clubs are growing in numbers and in efficiency.

3587. Would you say that they have increased by 10, 30, or 50 per cent?—No, I have not sufficient data for that; but I can say that generally the club movement is increasing and all those voluntary agencies are becoming more and more convinced of the importance of promoting institutions for the industrial population as a whole.

3588. Are they working more efficiently towards that object?—Yes, and they become more efficient as time goes on and as they combine together and derive light from other people's minds.

3589. How many years have you been handling this subject?—For twenty years.

3590. You are in a good position to answer general questions on the subject of physical deterioration in those years during which you have been engaged in work of this kind. Have you formed any opinion as to whether physical deterioration is on the increase or not in the classes that come under your notice?—My opinion is that there is a tendency to physical deterioration, especially in the overcrowded districts, but that can be to a large extent counteracted by the promotion of physical exercises and recreation in those districts.

3591. What about the effect at the present moment of those counteracting agencies so far as it has gone?—So far as covering the ground is concerned they seem to be good—that is they have produced a good effect on the physical development of the youthful population. You can see a marked difference in the members of those clubs physically.

3592. Do they go to school better to begin with?—Yes, and then those who are inclined—I have seen cases in which those who are inclined to be consumptive (the phthisis cases) I have seen them capable of throwing that tendency off in their early days through taking part in physical exercises and healthy forms of recreation in the evening which is provided for by these clubs and institutions.

3593. Have you formed any opinion as to whether any State assistance of a more efficient character should be provided?—Yes, I think that the State might help voluntary agencies, and it also might promote this work itself a great deal more effectually in the future than it has done in the past.

3594. How could that be done?—I should have thought that the State could in the first place help by grants in aid for physical development and drill work.

3595. Who are these grants to be paid to?—These grants in aid should be paid to the several organisations according to the amount of the results which they achieve.

3596. You would require a system of inspection?—They would have to submit to the inspection if they were to expect any aid from the State. Then, I think, that there are certain numbers who would not wish to submit to that. But I can only say for myself that I cannot see how they could expect grants in aid unless they submitted to State control and State inspection and supervision.

3597. Does not the State do anything to support cadet corps?—Very little, only in this way the Government provides arms and ammunition free. But the Government make no grant. My own opinion is that the Government might certainly make grants in aid of cadet corps who of course are prepared to submit to Government control and inspection in every way; and those cadet corps would be more efficient men and cover a far greater amount of ground if more pecuniary assistance were given to them. All the companies have to be maintained at the expense of private people, and what with the provision of uniforms and the provision of money to enable those camps to be run and so on, it is really more than can be managed effectually from private sources. In my opinion the Government should make grants in aid certainly to cadet corps; and camp allowances, for instance, would be a very good way of beginning. I think also that cadet corps require officers with real military training, and especially that should be secured in the case of the adjutants of the various battalions.

3598. Do you think that the local authorities could assist in certain directions?—I think that it is very important that they should assist that movement in particular, because I conceive that there is no movement more capable of securing the welfare of lads who are accustomed to haunt the streets, and to make things unpleasant in the various areas than that cadet corps movement, which is not based upon any definite religious organisation, and does not require any religious tests of the members, and it appeals to people irrespective of their religious opinions.

3599. Are there any alterations in the law which you would suggest?—I think that the rates on buildings which are set apart for these purposes might be remitted. I do not say that there shall be no rates at all upon the building; but it seems to me that it is very hard upon these voluntary organisations to have to pay rates on buildings irrespective of the purposes for which those buildings are actually used; and I think that it is also hard upon clubs and institutions to have to pay Inhabited House Duty on the whole building when they have to have a caretaker who occupies only one room in it. These two points have occurred to me in the working of these institutions. The rating is really based on what the buildings are worth to be let irrespective of the purpose for which they are actually used.

3600. Would you prefer the rate to be put upon the site?—That might be a relief to the voluntary agencies.

3601. You would gain by that—by making the general rating on the site value instead of on the buildings?—Yes. I think we should gain upon that, but still more on a remission of rates.

3602. Not only a redistribution, but a remission?—Remission is what is really needed. I daresay it is not sound policy that those buildings should get off the rates altogether; but I do submit that they should have a modified system of rating applied to them.

3603. You have got a note about the suppression of juvenile smoking; won't you make it penal to sell tobacco to young persons under a certain age?—Yes; I should make it penal to sell tobacco and cigarettes and things of that kind to boys under the age of sixteen.

3604. Would you further make it penal for a boy under that age to be seen smoking a cigarette? That would be rather difficult, would it not?—Yes, it would be difficult.

3605. I communicated the other day with the Inland Revenue, because we had heard that one of the causes of physical deterioration among young people was that cigarettes were sold in sweet-stuff shops frequented by the juvenile population, and therefore it was throwing temptation in their way. In answer to that I got a communication from the Board to this effect:—"That they have no means of supplying you with the information you require." That is the number of sweet-shops licensed for the sale of cigarettes.—"A license to deal in tobacco is supplied to any person who cares to apply for it, and there are about 360,000 licenses issued in the year. No record is kept of whether the holder of such a license is solely a tobacconist, or whether he combines with that business any other trade, and the information could not be obtained without very considerable trouble and expense." Do you think it would be a good thing for the Inland Revenue not to grant tobacco licenses to people who sell sweets or other things which induce children to go into their shops?—I think that a vast deal of harm is done by the existence of those sweet-stuff shops. They seem to be not only centres to promote juvenile smoking, but also for the promoting in great measure of a gambling propensity, and if not shut up there should be a rigid system of licensing applied to them; and I doubt whether there is any check placed upon them. You see those sweet-stuff shops in almost all the areas where the poor are gathered together, and you will also see them filled with the youthful portion of the population; and there is a very strong opinion among the workers in this branch of work which I have spoken about this morning, that there should certainly be a rigid system of licensing and State supervision applied to this kind of shops.

3606. But you see you could hardly make it requisite to sell sweets that you should have a license, and my point is rather whether you should not exclude from those shops where sweets are sold the grant of a tobacco license?—Yes, I certainly think that that ought to be done—if nothing more can be done that should be done.

3607. (*Colonel Onslow.*) In what way does the gambling come in?—There are a lot of those machines.

3608. (*Mr. Lindsell.*) The penny-in-the-slot machines ?—Yes, and others. Of course I do not know whether the suppression of licensing could be applied ; but if it could it should be applied for the purpose of stopping that sort of thing. It has a tendency to encourage vicious practices among the young, which is very harmful to them in other ways. They idle away their time instead of joining in such organisations as I have mentioned this morning.

3609. (*Colonel Onslow.*) You have been working for twenty years past in London. Do you consider that the physical condition of the lowest strata of society, the Hooligan, the very worst class, is worse now than it was twenty years ago ?—No, I do not.

3610. Do you think that it has improved ?—I do not think that it is worse.

3611. Then take the labouring class, the ones who really do try to work, is that worse or better ?—I have noticed a good deal of distinction between the two. I should say the labouring portion of them were in a better state of physical health than the other.

3612. Do you mean a better state now than twenty years ago, relatively ?—I should not say that they were worse.

3613. As you go up the scale in society you come to the families of small shopkeepers, and perhaps office boys of the respectable class, do you think they are better or worse ?—I should be rather inclined to say that they were apt to deteriorate ; and the more the population is comprised of people who are the children of parents who are really a portion of the town population, I should say their children were less well physically developed than the children of those who come up from the country districts.

3614. It is the children of those who are resident in town, and who have been obtaining their living perhaps for two generations, you mean ?—Yes.

3615. From the fact of their living in the town they are deteriorating you would say ?—Yes, but I think that deterioration can be counteracted by better organisation of their physical development.

3616. You mention here in one of your notes that the State ought to support a cadet corps, which you really think is an important part of the military establishment of the country. Is it not the fact that to give cadet corps and lads' brigade and so on more of a military organisation would deter the parents of those boys from letting them join those associations. Is not that your experience ?—No. My experience rather is that a parent would disapprove of his lad joining, irrespective of that, if that is going to stop him joining.

3617. The reason I asked you was, because, two years ago, or more, I had some correspondence with the Council of the Boys Brigade and the Church Lads' Brigade with reference to boys for the navy. We were then requiring a large number, and I had seen those boys at the Military Tournament on the opening day, and they were splendid looking boys, and I spoke to several of the officers, and the result was that I communicated with the Council, and they said they would be only too glad to help, to advertise as you may say, the navy amongst their boys, but they were afraid, if they did so, the parents would at once object and consider that the associations were being made recruiting agencies ?—Yes, that is so.

3618. Therefore, I doubted the utility of State-aid in any way. When you say here that they should be regarded as an important part of the military establishment of the country, —does that refer to the cadet corps only, or does it refer to those Church Lads' and Boys' Brigades, and so on ?—It would refer to the cadet corps only.

3619. Not to the others ?—No.

3620. But you want assistance, do you not, in your brigades, towards furnishing something in the way of a uniform ?—Yes.

3621. Belts and caps, and so on ?—Yes. But they do not go in for the same equipment as cadets.

3622. And then your bands ?—Yes, I think that the State-aid should be extended to all there brigades, but that no attempt should be made to make them part of the military establishment of the country. It is the cadet corps only, and it seems to me that on that ground the cadet corps would deserve more Government aid than what I may call the religious organisation work.

3623. Then the lads in camps you speak of, you say they go on paying something. Those lads belong to some of those societies, I suppose ?—Yes, for the most part.

3624. Can any lad who belongs to any of these societies join ?—Yes, he can join under the London Diocesan scheme for the welfare of lads. They have their brigade camps and their general London working boys' camps, and they can go under that scheme. They are the largest organisation in London for the promotion of camps for the working class lads, irrespective of belonging to a brigade or cadet corps. But it is not as easy a thing as a brigade or cadet camp, because you have not got the boys under a sufficient military discipline.

3625. You mean you have not sufficient discipline ?—Not sufficient discipline to secure you. But that general scheme of the London Diocesan camp is very successful and very well worked. Although the lads are not sufficiently known to those who are responsible for the camp, they are careful as to who they allow to go down ; they have to be recommended by some responsible person. If I might say a word as to the open spaces movement, I should like to.

3626. (*Chairman.*) Yes, certainly ?—It seems to me that in London especially we have had very little done for the purpose of saving open spaces for the national games, and I ought to direct particular attention to the work of the London Playing Fields Society to show what very useful work may be done by even voluntary societies to save areas from building, and so enable them to be devoted to the development of cricket and football and other games.
